to render them vifible. To thefe ramifications Grew and Malpighi have given the name of feminal root; becaufe by means of it, the radicle and plume, before they are expanded, derive their principal nourifhment.

The plume, bud, ot germ (fig. 3.), is inclofed in two fmall correfponding cavities in each lobe. Its colour and confiftence is much the fame with thofe of the radicle, of which it is only a continution, but having a quite contrary direction; for the radicle defeends into the earth, and divides into a great number of fmaller braaches or filaments but the plume afeends into the open air, and unfolds itfelf into all the beautiful variety of ftem, branches, leaves, flowers, fr. , \&sc. The plume in corn fhoots from the fmaller end of the grain, and among maltfters goes by the name of acrofpire.

The next thing to be taken notice of is the fubtance or parenchymatous part of the lobes. This is not a mere concreted juice, but is curioufly organized, and confilts of a valt number of fmall bladders refembling thofe in the pith of trees (fig. 4.)

Befides the coats, cuticle, and parenchymatous parts, there is a fubtance perfectly diftinct from thefe, diftributed in different proportions through the radicle, plume, and lobes. This inner fubftance appears very plainly in a tranfverfe fection of the radicle or plume. Towards the extremity of the radicle it is one entire trank; but ligher up it divides into three branches; the middle one runs directly up to the plume, and the other two pafs into the lobes on each fide, and fpread out into a great variety of fmall branches through the whole body of the lobes (fig. 4.) This fubftance is very properly termed the feminal root; for when the feed is fown, the moiture is firf abforbed by the outer coats, which are every where furnifhed with ${ }_{\text {d }}$ p and air veffels; from thefe it is conveyed to the cuticle; from the cuticle it proceeds to the pulpy part of the lobes; when it has got thus far, it is taken up by the mouths of the finall branches of the feminal root, and paffes from one branch into annther, till it is all collected into the main trunk, which commmicates both with the plume and radicle, the two principal involved organs of the future plant. After this the lap or vegetable food runs in two oppotite directions: part of it afcends into the plume, and promotes the growth and expanfion of that organ; and part of it defcends into the radicle, for nourifhing and evolving the root and its various filaments. Thus the plume and radicle continue their progrefs in oppofite direations till the plant arrives at niaturity.

Plant.

Plate cecxerv. coats are taken off, the body of the feed appars, which is divided into two fmooth portions or lobes. The fmontinefs of the lobes is owing to a thin film or cuticle with which they are covered.
At the bafis of the bean is placed the radicle, or future rnot (fig. 3, $A$ ). The trunk of the radicle, juft as it enters into the bidy of the feed, divides into two capital branches, one of which is inferted intn each loje, and fends off fmaller ones in al! dircetions through the whole fubftance of the lobes (fig. 4. AA). Thefe ramifications become fo extremely minute towards the edges of the lobes, that they require the fineft glafies VoL. XV.

## P L A

It is here worth remarking, that every plant is really poffeffed of two roots, both of which are contained in the feed. The plume and radicle when the feed is firlt depofited in the earih, derive their nourithment from the feminal root; but afterwards, when the radicle begins to thoot out its filaments and to abforb fome moifture, not, however, in a fufficient quantity to fupply the exigencies of the plume, the two lobes, or main body of the feed, rife along with the plume, affume the appearance of two leaves, refembling the lobes of the feed in fize and fhape, but having no refemblance to thofe of the plume, for which reafon they have got the name of dijfunilar leaves.

Thefe difimilar lcaves defend the young plume from the injuries of the weather, and at the fame time, by abforbing dew, air, \&c. affift the tender radicle in nourifhing the plume, with which they have fill a connection by means of the feminal root above defcribed. But when the radicle or fecond root has defeended deep cnough into the earth, and has acquired a fufficient number of filaments or branches for abforbing as much aliment as is proper for the growth of the plume; then the feminal or dillimilar leaves, their utility being entirely fuperfeded, begin to decay and fall off.

Fig. 4. A view of the feminal root branched out up. on the lobes.

Fig. 7. The appearance of the radicle, plume, and feminal root, when at little further advanced in growth.

Having thus briefly defcribed the feed, and traced its evolution into three principal organic parts, viz. the plume, radicle, and feminal leaves, we thall next take an anatomical view of the root, trunk, leaves, \&c.
2. Of the root. In examinining the root of plants, the firlt thing that prefents itfelf is the okin which is of various colours in different plants. Every root, after it has arrived at a certain age, has a double fkin. The firlt is coeval with the other parts, and exifts in the feed: but alterwards there is a ring lent off from the Lark, and forms a fecond 1kin; e.g. in the root of the dindelion, towards the end of May, the original or cuter fkin appears fhrivelled, and is eafily feparated from the new one, which is frefher, and adheres more firmly to the bark. Perennial plants are fupplied in this manner wilh a new flkin every year; the outer one always falls off in the autuma and winter, and a rew one is formod from the bark in the fucceeding fpring. The finin has numerous cells or veffels, and is a continiation of the parenchymatous part of the radicle. However, it does not confift folely of parenchyma; for the microfcope fhows that there are many tubular lig. neous veffels intcreperfed through it.

When the fkin is removed, the true cortical fubtance or Lark appare, which is alfo a continuatio: of the fa-
renchymatous part of the radicle, but greatly augmented. The bark is of very different fizes. In moft trees it is exceeding thin in proportion to the wood and pith. On the other hand, in carrots, it is almot one-half of the femidiameter of the root; and, in dandelion, it is nearly twice as thick as the woody part.

The bark is compofed of two fubftances ; the pareachyma or pulp, which is the principal part, and a few wondy fibres. The parenchyma is exceedingly porous, and has a great refemblance to a fponge ; for it fhrivels confiderably when dried, and dilates to its former dimenfions when infufed in water. Thefe pores or verfels are not pervious, fo as to communicate with each other ; but confif of diftinct little cells or bladders, fcarcely vifible without the affiftance of the microfcope. In all roots, thefe cells are conftantly filled with a thin watery liquor. They are generally of a fpherical figure; though in fome roots, as the buglofs and dandelion, they are oblong. In many roots, as the horfe-radifh, peony, afparagus, potatoe, \&c. the parenchyma is of one uniform ftructure. But in others it is more diverfified, and puts on the fhape of rays, running from the centre towards the circumference of the bark. Thefe rays fometimes run quite through the bark, as in lovage; and fometimes advance towards the middle of it, as in melilot and moft of the leguminous and umbelliferous plants. Theie rays generally fand at an equal diftance from each other in the fame plant ; but the difance varies greatly in different plants. Neither are they of equal lizes: in carrot they are exceedingly fmall, and fcarcely difernible; in melilot and chervil, they are thicker. 'They are likewife more numerous in fome plants than in others. Sumetimes they are of the fame thicknefs from one edge of the bark to the other; and fome grow wider as they approach towards the fkin. The veliels with which thefe rays are amply furnifhed, are fuppofed to be air-veffels, becaufe they are always found to be dry, and not fo tranfparent as the veffels which evidently contain the fap.

In all ronts there are ligneous veffels difperfed in different proportions through the parenchyma of the bark. Thefe ligneous veliels run longitudinally through the bark in the form of fmall threads, which are tubular, as is evident from the riling of the fap in them when a root is cut tranfverfely. Thefe ligneous fap-veffels do not run in direct lines through the bark, but at fmall diftances incline towards one another, in fuch a manner that they appear to the naked eye to be inofculated; but the microfcope difcovers them to be only contiguous, and braced together by the parenchyma. Thefe braces or coarctations are very various both in fize and number in different roots; but in all plants they are mof numerons towards the inner edge of the bark. Neither are thefe veficls fingle tubes; but, like the nerves in animals, are bundles of 20 or 30 fmall contiguous cylindrical tubes, which uniformly run from the cxtremity of the root, without fending off any branches. or fuffering any change in their fize or thape.

In fome roots, as parfnep, efpecially in the ring next the inner extremity of the bark, thefe veffels containa kind of lymph, which is fireeter than the fap contained in the bladders of the parenchyma. From this circum. ftance thcy have got the name of lymphs duts.
'lhefe lymuh-ducts fometimes yield a mucilaginous lymela, as in the complarey; and fometimes a white milky

## I L A

Mant. milky glutinous lymph, as in the angelica, fonchus, burdnck, feorzonera, dandelion, ix. The lymph-dnets are fuppofed to be the veffels from which the gums and balfams are fecerned. The lymph of fennel, when expopofed to the air, turns into a clear tranfparent balfam; and that of the fcorzonera, dandelion, sic. condenfes into a gum.

The fituation of the veffels is varions. In fome plants they ftand in a ring or circle at the inner edge of the bark, as in afparagus; in others, they appear in lines or rays, as in borage; in the parfnep, and feveral other plants, they are mof confpicunsus towards the outer edge of the bark; and in the dandelien, they are difpofed in the form of enncentric circles.

The wood of roots is that part which appears after the bark is taken off, and is firmer and lefs porous than the bark or pith. It confifts of two dittinct fubftances, viz. the pulpy or parenchymatons, and the ligneous. The wood is connected to the bark by large portions of the bark inferted into it. Thefe infertions are mofly in the form of rays, tending to the centre of the pith, which are eafily difcernible by the eyc in a tranfverfe fection of moft roots, Thefe infertions, like the bark, confit of many veffels, moftly of a round or oval figure.
The ligneous veffels are generally difpofed in collateral rows running longitudinally through the root. Some of thefe contain air, and others fap. The air-veflels are fo called, becaufe they contain no liquor. Thefe airveffiels are diftinguifhed by being whiter than the others.

The pith is the centrical part of the root. Some roots have no pith, as the ftramonium, nicotiana, \&c. ; others have little or none at the extremities of the roots, but have a confiderable quantity of it near the top. The pith, like every other part of a plant, is derived from the feed; but in fome it is more immediately derived from the bark: for the infertions of the bark running in betwixt the rays of the wood, meet in the centre, and conflitute the pith. It is owing to this circumfance, that, among roots which have no pith in their lower parts, they are amply provided with it towards the top, as in columbine, lovage, \&c.

The bladders of the pith are of very different fizes, and generally of a circular figure. Their pofition is more uniform than in the bark. Their fides are root mere films, but a compofition of fmall fibres or threads; which gives the pith, when viewed with a microfeope, the appearance of a piece of fine gauze or net-work.

We fhall conclude the defeription of ronts with obferving, that their whole fibftance is nothing but a congeries of tubes and fibres, adapted by nature for the abforption of nourifhment, and of courfe the extenfion and augmentation of their parts.

EEEE, the rays of the wond, in which the holes are the air veffels. N. $B$. This root has no pith.
3. Of the Trunk, Stalk, or Stem.] In defrribing the trunks of plants, it is neceffary to premife, that whatever is faid with regard to them applies equally to the branches.

The truak, like the root, confifts of three parts, viz. the bark, wond, and pith. Thefe parts, though fubftantially the fame in the trunk as in the root, are in many cafes very different in their texture and appearance.
The 1 kin of the bark is compofed of very minute bladders, interpofed with longitudinal woody fibres, as in the nettle, thiftle, and moft herbs. The outlide of the fkin is vifibly perous in fome plants, particularly the cane.
The principal body of the bark is compofed of pulp or parenchyma, and innumerable veffels much larger than thofe of the 1 ki . The texture of the pulpy part, though the fame fubftance with the parenchyma in roots, yet feldom appears in the form of rays cunning towards the pith; and when thefe rays do appear, the $y$ do not extend above half way to the circumference. The veffels of the bark are very differently fituated, and deftined for various purpofes in different plants. For example, in the bark of the pine, the inmoit are lymph, ducts, and exceedingly fmall ; the outmoft are gum or refiniferons veffels, deflined for the fecretion of turpentine; and are fo large as to be diftinetly vifible to the naked eye.
The wood lies between the bark and pith, and conv fifts of two parts, viz. a parenchymatous and ligneous. In all trees, the parenchymatous part of the wood, though much diverlified as to fize and confiftence, is uniformly difpofed in diametrical rays, or infertions running betwixt fimilar rays of the ligneous part.
The true wood is nothing but a congeries of old dried lympl-ducts. Between the bark and the wood a new ring of thefe ducts is formed every year, which gradually lofes its foftnefs as the cold feafon approaches, and towards the middle of winter is condenfed into a folid ring of wood. Theie annual rings, which are diftinctly vifible in moft trees when cut throngh, ferve as natural marks to diftinguilh their age (fig. 10. 11.) The rings of one year are fometimes larger, fometimes lefs, than thofe of another, probably owing, to the favourablenefs or unfavourablenefs of the feafon.

The pith, though of a different texture, is exactly of the fame fubftance with the parenchyma of the bark, and the infertions of the wood. The quantity of pith is various in different plants. Inftead of being increafed every year like the wood, it is annually diminifhed, its veffels drying up, and affuming the appearance and Atructure of wood; infomuch that in old trees there is fcarce fuch a thing as pith to be difcerned.

A ring of fap-veffels is ufually placed at the outer edge of the pith, next the wood. In the pine, fig, and walnut, they are very large. The parenchyma of the pith is compofed of fmall cells or bladders, of the fame kind with thofe of the bark, only of a larger fize. The general figure of thefe bladders is circular; though in fome plants, as the thifte and borage, they are angu. lar. Though the pith is originally one connected chain of bladders, yet as the plant grows old they fhrivel and open in different directions. In the walnut after a certain age, it appears in the form of a tegular tranfverfe hollow divifion. In fome plantsit is altogether wanting; in others, as the fonchus, nettle, Sic. there is only a tranfverfe partition of it at every joint. Many other varieties might be mentioned ; but thefe mult be left to the obfervation of the reader.

Plate cecxesu.

KK, the great air-veffels. LL, the leffer ones. MMM, the parenchymatous infertions of the bark reprefented by the white rays. NO, the pith, with its bladders or cells.
4. Of the Leaves.] The leaves of plants confift of the fame fubfance with that of the trunk. They are full of nerves or woody portions, running in all direcrions, and branching out into innumerable imall threads, interwoven with the parenchyma like fine lace or gauze.

The fkin of the leaf, like that of an animal, is full of pores, which both ferve for perfpiration and for the abtorption of dews, air, \&c. Thefe pores or orifices differ both in Chape and magnitude in different plants, which is the caufe of that variety of texture or grain peculier to every plant.

The pulpy or parenchymatous part confifts of very minute fibres, wound up into fmall cells or bladders. Thefe cells are of various fizes in the fame deaf.

All leaves, of whatever figure, have a marginal fibre, by which all the relt are bounded. The particular thape of this fibre determines the figure of the leaf.

The vefiels of leaves have the appearance of inofulating; but, when examined by the microfcope; they are found only to be interwoven or laid along each oiber.

What are called air-vigels, or thofe which carry no fap, are vifible even to the naked cye in fome leavés. When a leaf is flowly broke, they appear like fmall woolly fibres, conrected to both ends of the broken piece.
flands the young flower, which is not to make its ap. pearance till the following April or May. Fig. 18 . exhibits a view of the tulip-root when diffected in Sep. tember, with the joung flower towards the bottom.
6. Of the Fruit.] In defcribing the ftructure of fruits, a few examples fhall be taken from fuch as are mof ge. nerally known.

A pear, beffdes the fkin, which is a prodaction of the nkinot the bark, confits of a double parenchyma or pulp, fap, and air-vellels, calculary and acetary.

The outer parenchyma is the fame fubltance continued from the bark, only its bladders are larger and more fucculent.

It is everywhere interfperfed with fmall globules or grains, and the bladders refpect thefe grains as a kind of centres, every grain being the centre of a number of bladders. The fap and air-veffels in this pulp are extremely fmall.

Next the core is the inner pulp or parenchrma, which confifts of bladders of the fame kind with the outer, only larger and more oblong, correfponding to thofe of the pulp, from which it feems to be derived. This inner pulp is much fourer than the other, and has none of the fmall grains interfperfed through it; and hence it has got the name of aceiary.

Between the acetary and outer pulp, the globules or grains begin to grow larger, and gradually unite into a hard fony body, efpecially towards the corculum or ftool of the fruit ; and from this circumftance it has been called the calculary.

Thefe grains are not derived from any of the organical parts of the tree ; but feem rather to be a kind of concretions precipitated from the fap, fimilar to the precipitation from wine, urine and other liquors.

The core is a roundifh cavity in the centre of the pear, lined with a hard woody membrane, in which the feed is inclofed. fat the bottom of the core there is it fmall dutt or eanal, which runs up to the top of the pear ; this canal allows the air to get into the core, for the purpofe of drying and ripening the feeds.

Fig. 19. a tranfverfe fection of a pear, as it appears to the naked eye. A, the flin, and a ring of fap-veffels. B, the outer parenchyma, or pulp, with its vef. fels, and ligueous fibres interferfed. $C$, the inner parenchyma, or acetary, with its veficls yhich are larger than the outer one. D, the core and feeds.

Fig. 21. is fig. 20. magnified. AAA, the fmall grains or globules, with the veffels radiated from them.

Fig. 22. a longitudinal fection of the pear, fhowing a different view of the fame parts with thofe of fig. 19. A the channel, or duct, which runs from the top of the pear to the bottom of the core.

In a lemon, the parenchyma appears in three different forms. The parenchyma of the rind is of a coarfeterture, being compofed of thick fibres, woven into large bladders. Thofe nearelt the furface contain the eflential cil of the fruit, whieh burts into a flame when the thin is fqueezed over a candle. From this cutmof parenchyma nine or ten infertions or lamelle are produced, which run between as many portions of the pulp, and unite into on a body in the centie of the fruit, which correfponds to the nith in tuunks or roots. At the bottom and top of the lemon, this pith evidently joms with the zind, without the intervention of any lamella. This circumfance

Plate cecxcy ${ }^{2}$

Plant, circumfance fhows, that the pith and bark are actually connected in the trunk and rocts of plants, though it is difficule to demonftrate the connection, on account of the clofenefs of their texture, and the minutenels of their fibres. Many veffels are difperfed through the whole of this parenchyma; but the largeft ones ftand on the inner edge of the rind, and the outer edge of the pith, juft at the two extremities of each lamella.

The fecond kind of parenchyma is placed betwoen the rind ard the pith; is divided into dittinct bodies by the lamellæ; and each of thefe bodies forms a large bag.
Thefe bags contain a third parenchyma, which is a clufter of imaller bags, diftinct and unconnected with each other, having a fimall ftalk by which they are fixed to the large bay. Within each of thefe fmall bags are many hundreds of bladders, compofed of extremely minute fibres. Theie bladders contain the acid juice of the lemon.
Fig. 12. a longitudinal fection of a lemon. AAA, the rind rith the veffels which contain the effential oil 131 , the fubfance correfponding to the pith, formed by the union of the lamellw or infertions. CC, its continuation and connection with the rind, independent of the infertions.

B B B, \&c, the nine pulpy bags, or fecond parenchyma, placed between the rind and the pith; and the clutter of tmall bags, which contain the acid juice, inclofed in the large ones. C C, the large veffels that furround the pith. D D, two of the large bags laid open, fhowing the feeds, and their conneetion with the lamelle or membranes which form the large bags.

Of the perfitation of PLants, and the quantity of moifure dail/ imlibid by them.-Thefe curious particulars have been determined with great accuracy by Dr Hales. The method he took to accomplifn his purpofe was as follows. - In the month of July, commonly the warmef feafon of the year, he took a large fun- fower three feat and an haif high, whicls had been purpofely planted in a Hower-pot when young. He covered the pot with thin milled lead, leaving only a fmall hole to preferve a communication with the external air, and another by which he might occafionally fupply the plant with wate:. Into the former he inferted a glafs tube nine inches long and ancther fhorter tube into the hole by which he poured in the water; and the latter was kept clofe forped with a cork, except when there was occafion to ufe it. The holes in the bottom of the put were alfo fonped up with corks, and all the crevices thut with cement. - Things being thus prepared, the pot and plant were weighed for 15 feveral days; after which the plant was cut off clofe to the leaden plate, and the ftump well covered with cement. By weighing, he found that there perfpired through the unglazed porous pot two ounces-every 12 hours; which being allowed for in the daily weighing of the plant and pot, the greateft perfpiration, in a warm day, was found to be one pound $1+$ ounces; the middle rate of perfiration, one pound four ounces ; the peripiration of a dry warm night, without any fenfible dew, was about three ounces; but when there was any fenfible though fir .il dew, the perfpiration was nothing; and when there was a large dew, or fome little rain in the night,
the plant and potwasincreafed in weight two or three ounces.
In order to know what quantity was perfiped from a iquare inch of furface, our author cut off all the leaves of the plant, and laid them in Aive feveral parcels, according to their feveral fizes; and then meafured the furface of a leaf of each parcel, by laying over it a large lattice made with threads, in which each of the little fquares were $\div$ of an inch; by numbering of which, he had the fultace of the leaves in fquare inches; which, multiplied by the number of leares in the correfponding parcels, gave the area of all the leaves. By this method be found the furface of the whole plant above ground to be 5616 fquare inches, or 39 fquare feet. He dug up another fun flower of nearly the fame fize, which liad eight main roots, reaching 15 inches deep and fidewife, from the flem. It had befides a very thick bufh of lateral roots from the eight main roots, extending every way in a hemifphere about nine inches from the ftem and main roots. In order to eftimate the length of all the roots, he took one of the main roots with its laterals, and meafued and weighed them; and then weighed the other feven with their laterals; by which means he found the fum of all their lengths to be 1448 feet. Suppofing then the periphery of thefe roots at a medium to be o.I3r of an inch, then their furface will be 2276 fquare inches, or 15.8 fquare feet ; that is, equal to 0.4 of the furface of the plant above ground. From calcula. tions drawn from thefe obfervations, it appears, that a fquare inch of the upper furface of this plant perfpires ${ }^{\frac{1}{6}-}=$ part of an inch in a day and a night; and that a fquare inch of the furface underground imbibed $\frac{\sigma^{7} 7}{}$ of an inch in the fame time.

The quantity perfipired by different p'ants, however, is by no means equal. A vine-leaf perfpires only , or of an inch in 12 hours; a cabbage perfires $\frac{\pi^{\prime 2}}{5}$ of an inch in the fame time; an apple-tree $\mathrm{T}_{\mathrm{O}}^{1} \mathrm{~F}$ in 12 hours; and a lemon $\frac{-1}{5}$ in 12 hours.

Of the circulation in the Sas of PLANTS.-Concerning this there have been great difputes; fome naintaining, that the regetable fap has a circulation analagous to the blood of animals; while others affirm, that it only afcends in the day-time, and defends again in the night. In favour of the doctrine of circulation it has been urged, that upon making a tranfoerfe incifion into the trunk of a tree, the juice which runs out proceeds in grcater quantity from the upper than the lower part and the fwelling in the upper lip is alfo much greater than in the lower. It appears, however, that when two fimilar incifions are made, one near the top and the othe: near the root, the latter expends much more fal than the former. Hence it is concluded, that the juice afcends by one fet of veffels and defcends by another. But, in order to thow this clearly, it would be neceffary firft to prove that there is in plants, as in animals, fome kind of centre from which the circulation begine, and to which it returns; but no fuch centre has been difcovered by any naturalitt ; neither is there the leaft provifion apparently made by nature whereby the fap might be prevented from defending in the very fame velfels though which it afcends. In the lacteal velfels of animals, which we may fuppore to be analogous to the roots of vegetables, there are valves which effectuad-

If prewent the chyle when once abforbed from returning into the inteltines : but no fuch thing is obferved in the veffels of vegetables: whence it mult be very probable, that when the propelling force ccafes, the juice defeends by the very fame velfels through which it afcended. This matter, however, has been cleared up almolt as well as the nature of the fubject will admit of by the i Vegetable experiments of Dr Hales $\ddagger$. Thefe expcriments are fo Statics, vol. numerous, that for a particular account of them we mult ᄃ. $\Gamma$. $\mathrm{I}+2$. refer to the work itfelf? however, his reafoning againtt the circulation of the fap will be fufficiently intelligible without them, "We fee (fays he), in many of the foregoing experiments, what quantities of moifture trees daily imbibe and perfpire : now the celerity of the fap mult be very great, if that quantity of moifure mut, moft of it, afcend to the top of the tree, then defiend, and afcend again, before it is carried off by perfpiration.
"The defect of a circulation in vegetables feems in fome meafure to be fupplied by the much greater quantity of liquor, which the vegetable takes in, than the animal, whereby its motion is accelerated, for we find the fun-flower, bulk for bulk, imbibes and perfpires 17 times more frefh liquor than a man, every 24 hours.
"Befides, Nature's great aim in vegetables being only that the vegetable life be carried on and maintained, there was no occalion to give its fap the rapid motion which was neceflary for the bluod of animals.
"In animals, it is the heart which fets the blood in motion and makes it continually circulate ; but in vegetables we can difcover no other caufe of the fap's motion but the freng attraction of the capillary fapveffels, affited by the brifk undulations and vibrations caufed by the fun's warmth, whereby the fap is carried up to the top of the talleft trees, and is there perfpired off through the leaves: but when the furface of the tree is greatly diminilhed by the lofs of its leaves, then alfo the perfpiration and motion of the fap is proportionably diminifhed, as is plain from many of the foregoing experiments: fo that the afcending velocity of the fap is principally accelerated by the plentiful perfiration of the leaves, thereby making room for the fine capillary veffels to exert their vaftly attracting power, which perfiration is cffected by the brifk rarefying vibrations of warmth; a power that does not feem to be any ways well adapted to make the fap defcend from the tops of vegetables by different veffels to the root.
" If the fap circulated, it mutt needs have been feen defcending from the upper part of large gafhes cut in branches fet in water, and with columns of water prefling on their hottoms in long glafs tubes. In hoth which cafes, it is certain that great quantities of water paffed through the ftem, fo that it mult needs have been feen defcending, if the return of the fap downwards were by trufion or pulfion, whereby the blood in animals is returned through the veins to the heart; and that pulfion, if there were any, mult neceffarils he exerted with prodigions force, to be able to drive the fap through the finer capillaries. So that, if there be a return of the fap downwards, it muft be by attraction, and that a very powerful one, as we may fee by many of thefe experiments. But it is hard to conceive what and where that power is which can be equivalent to that provition nature has made for the af.
cent of the fap in confequence of the great perfpiation of the leaves.
"The infances of the jeffaminetree, and of the paffion tree, have been looked upon as ftrong proofs of the circulation of the fap, becaufc their branches, which were far below the inoculated bud, were gilded: but we have many vifible proofs in the vine, and other bleeding trees, of the fap's receding back, and pulhing forwards alternately, at different times of the day and night. And there is great reafon to think that the fap of all other trees has fuch an alternate, receding, and progreflive motion, occafioned by the alternacies of day and night, warm and cool, moitt and dry.
"For the fap in all vegetables does probably recede in fome meafure from the tops of the branches, as the fun leaves them; becaufe its rarefying power then ceafing, the greatly rareficd fap, and air mixed with it, will condenfe, and take up lefs room than they did, and the dew and rain will then be Atrongly imbibed by the leaves; whereby the body and branches of the vegetable which have bcen much exhaufted by the great evaporation of the day, may at night imbibe fap and dew from the leaves ; for by feveral experiments, plants were found to increafe confiderably in weight, in dewy and moilt nights. And by other experiments on the vine, it was found that the trunk and branches of vines were always in an imbibing ftate, caufed by the great perfiration of the leaves, except in the bleeding feafon ; but when at night that perfpiring power ceafes, then the contrary imbibing power will prevail, and draw the fap and dew from the leares, as well as moifture from the roots.
"And we have a farther proof of this by fixing mercurial gages to the ftems of feveral trees which do not bleed, whereby it is found that they are always in a ftrongly imbibing ftate, by drawing up the mercury feveral inches: whence it is eafy to conceive, how fome of the particles of the gilded bud in the inoculated jeflamine may be abforbed by it, and thereby communicate their gilding miafma to the fap of other branches; efpecially when, fome months after the inoculation, the ftock of the inoculated jeffamine is cut off a little above the bud; whereby the ftock, which was the counteracting part to the ftem, being taken away, the ftem attracts more vigorouny from the bud.
" Another argument for the circulation of the fap is, that fome forts of the graffs will infect and canker the ftocks they are grafted on: but by mercurial gages fixed to frefh-cut tems of trees, it is evident that thofe Atems were in a frongly imbibing ftate; and confequently the cankered ftocks might very likely draw fap from the graff, as well as the graff alternately from the ftock; juft in the fame manner as leaves and buanches do from each other, in the viciffitudes of day and night. And this imbibing power of the ftock is fo great, where only fome of the branches of a tree are grafted, that the remaining branches of the fock will, by their ftrong attraction, ftarve thofe graffs; for which reafon it is ufual to cut off the greateft part of the branches of the ftock, leaving only a few fmall ones to draw up the fap.
"The inftance of the ilex grafted upon the Englifh oak, feems to afford a very confiderable argument againft a circulation. For, if there were a free uni-

form circulation of the fap through the oak and ilex, why fhould the leaves of the oak fall in winter, and not thofe of the ilex?
" Another argument againf an uniform circulation of the fap in trees, as in animals, may be drawn from an experiment, where it was found by the thee mercurial gages fixed to the fame vine, that while fome of its branches changed their fate of protruding fap into a flate of imbiling, others continued protruding fap; one nine, and the other thirteen days longer."

To this reafoning of Dr Hales we fhall fubjoin an experiment made by Mr Muftel of the Academy of Sciences at Rouen, which feems decifive againgt the doatrine of circulation. His account of it is as fol-lows.-" On the 12th of January I placed feveral fhrubs in pots againft the windows of my hot-houfe, fome within the houfe and othcrs without it. Through holes made for this purpofe in the panes of glafs, I paffed a branch of each of the fhrubs, fo that thofe on the infide had a branch without, and thofe on the outfide one within; after this, I took care that the holes thould be exactly clofed and luted. This inverfe experiment, I thonght, if followed clofely, could not fail affording fufficient points of comparifon to trace out the differences, by the obfervation of the effects.
"The 20th of January, a week after this difpofition, all the branches that were in the hot-houre began to difclofe their buds. In the beginning of Fe bruary there appeared leaves; and towards the end of it, fhoots of a confiderable length, which prefented the young flowers. A dwarf apple-tree, and feveral rofe. trees, being fubmitted to the fame experiment, fhowed the fame appearance then as they commonly put on in May; in fhort, all the branches which were within the hot-houfe, and confequently kept in the warm air, were green at the end of February, and had their fhoots in great forwardnefs. Very different were thofe parts of the fame tree which were without and expofed to the cold. None of thefe gave the leaft fign of regetation; and the froft, which was intenfe at that time, broke a rofe-pot placed on the outfide, and killed fome of the branches of that very tree which, on the infide, was every day putting forth more and more floots, leaves, and buds, fo that it was in full vegetation on one fide, whillt frozen on the other.
"The continuance of the frof occafioned no change in any of the internal branches. They all continued in al very brifk and verdant ftate, as if they did not belong to the tree which, on the outfide appeared in the ftate of the greateft fuffering. On the 15 th of March, notwithftanding the feverity of the feafon, all was in full bloom. The apple-tree had its root, its ftem, and part of its branches, in the hot-houfe. Thefe branches were covered with leaves and flowers; but the branches of the fame tree, which were carried on the outfide, and expofed to the cold air, did not in the leaft partake of the activity of the reft, but were abfolutely in the fame ftate which all trees are in during winter. A rofe-tree, in the fame pofition, fhowed long fhoots with leaves and buds; it had even fhot a vigorous branch upon its Atalk; whillt a branch which paffed through to the *utfide had not begun to produce any thing but was in the fame fate with other rofe-trees left in the ground. This brunch is four lines in diameter, and 38 inches high.

## P L A

"The rofe-tree on the outfide was in the fame flate; but one of its branches drawn through to the infide of the hot-houfe was covered with leaves and rofe-buds. It was not without aftonifhment that I faw this branch fhoot as brikly as the rofe-tree which was in the hothoufe, whofe roots and ftalk, expofed as they were to the warm air, ought, it fhould feem, to have made it get forwarder than a branch belonging to a tree, whofe rcots, trunk, and all its other branches, were at the very time frof-nipped. Notwithftanding this, the branch did not feem affented by the flate of its trunk; but the action of the heat upon it produced the fame effect as if the whole tree had been in the hot-houfe."

Of the Perpendicularity of Plants.-This is a curious Memoires phenomenon in natural hiftory, which was firfobferved by M. Dodart, and publifhed in an ellay on the affectation of perpendicularity obferved in the ftems or ftalks of all plants, in the roots of many, and even in their branch. es as much as poffible. Though almoft all plants nife a little crooked, yet the ftems hoot up perpendicularly, and the roots fink down perpendicularly: even thofe, which by the declivity of the foil come out inclined, or thofe which are diverted ont of the perpendicular by any violent means, again redrefs and frengthen themfelves and recover their perpendicularity, by making a fecond and contrary bend or elbow without restifying the firft. We commonly look upon this affectation without any furprife; but the naturalift who knows what a plant is, and how it is formed, finds it a fubject of aftonifhment.

Each feed we know contains in it a little plant, already formed, and needing nothing but to be unfolded, the litttle plant has its root ; and the pulp which is ufually feparated into two lobes, is the foundation of the firlt food it draws by its root when it begins to germinate. If a feed in the earth therefore be difpofed fo as that the root of the little plant be turned downwards, and the fem upwards, and even perpendicularly upwards, it is eafy to conceive that the little plant coming to unfold itfelf, its ftalk and root need only follow the ditection they have to grow perpendicularly. But we know that the feeds of plants, whether fown of themfelves or by man, fall in the ground at random; and among the great variety of fituations with regard to the falk of their plant, the perpendicular one upwards is but one. In all the rcfl, therefore, it is neceflary that the ftalk reftify ifflf, fo as to get out of the ground : but what force effects this change, whicla is unqueltionably a violent action? Does the ftalk find a lefs load of earth above it and therefore grow naturally that way where it finds the leaft obitacle? Were this $\mathrm{fo}^{2}$, the little root, when it happens to be uppermoft, mult. alfo follow that direction, and mount up.
To account for two fuch different ations, M. Dodart fuppofes that the fibres of the ftalks are of fuch a nature as to be contrasted and fhortened by the heat of the fun, and lengthened ont by the moilture of the earth; and on the contrary, that the fibres of the roots are contracted by the moiture of the earth, and lengthened by the heat of the fun. When the plantule therefore is inverted, and the root at the top, the fibres which compofe one of the branches of the root are not alike expofed to the moiture of the earth, the lower part being more expofed than the upper. The lower mult of courfe contract the molt ; and this contraction is again promoted by the lengthening of the upper, where-
on the fim acts with the greatelt force. This branch of the root muft therefore recoil towards the earth, and, infinuating through the pores thereof, mult get underneath the bulb, \&c. By inverting this reatoning we diforer how the falk comes to get uppermoft.

We luppofe then that the earth attracts the root to itfelf, and that the fun contributes to its defcent; and, on the other hand, that the fun attracts the fem, and the earth contributes to fend it towards the fame. With refpect to the flraightening of the falks in the open air, our author imagines that it arifes from the impref. fion of external caufes, particularly the fun and rain. For the upper part of a flalk that is bent is more expofed to the rain, dew, and even the fun, \&c. than the under; and thefe caufes, in a certain fructure of the fibres, both equally tend to ftraighten the part moft expofed by the fhortening they fuccellively occafion in it ; for moifure thortens by fivelling and heat by diflipating. What that Aructure is which gives the fibres fuch different qualities, or whereon it depends, is a myRtery as yet beyond our depth.
M. de la Hire accounts for the perpendicularity of the fiems or falks of plants in this manner: he fuppofes that the root of plants draws a coarfer and heavier juice, and the fecm and branches a finer and more vola. tile one. Moft naturalifs indeed conceive the root to be the flomach of the plant, where the juices of the earth are fubtilized fo as to become able to rife through the ftcm to the extremity of the branches. This difterence of juices fuppofes larger pores in the roots than the flalk, \&c. and, in a word, a different contexture. This difference mult be found even in the little invifible plant inclofed in the feed: in it, thercore, we may conceive a point of feparation; fuch as, that all on one fide, for example the root, fhall be unfolded by the groffer juices, and all on the other fide by the more subtile ones. Suppofe the plantule, when its parts begin to unfold, to be entirely inverted, the root at the lop, and the flalk below; the juices entering the root will be coarfert, and when they have opened and enlarged the pores fo as to admit juices of a determinate weight, thofe juices prefling the reot more and more will drive it downwards; and this will increale as the roct is morc extended or enlarged: for the point of feparation being conceived as the fixed point of a lever, they will at by the longer arm. The volatile juices at the fame t me having penetrated the falk, will give it a direction from below upwards; and, by reaten of the lever, will give it more and more every day. The little plint is thus turned on its fixed point of feparation till it become perfectly erect.

When the plant is thus ereged, the falk fhould fill sife perpendiculatly, in order to give it the more firm ahiding, and enable it to withfand the effort of wind and weither. M. Parent thus accounts for this effect: If the nutritious juice which arrived at the extrenity of a riting ftalk evaporate, the weight of the air which sncompaffes it on all fides will make it atcond vertically: hut if, intead of cvaprating, it congeal and remain lixed to that extremity whence it was ready to go cff, the wei nht of the air will give it the fame circetion; fo that the falk will have acquircd a fmallnew fart vertically laid over it, juft as the flame in a candle hold in any way ohliquely to the horizon fill continucs vertical by the prefiure of the atmof here. The new drops of
juice that fucceed will follow the fame diregion; and as altogether from the falk, that mult of courfe be vertical, unlefs fome particular circumftance intervene.

The branches, which are at firf fuppofed to proceed. laterally out of the falk in the firlt embryo of the plant, though they fhould even come ont in a horizontal diredion, muft alfo raife themfelves upisards by the conflant direction of the nutritious juice, which at firlt fearce meets any refiftance in a tender fupple brancl? ; and afterwards, even though the branch grow more firm, it will act with the more advantage ; fince the branch, being become longer, furnifhes it with a longer arm or lever. The flender action of even a little drop becomes very confiderable by its continuity, and by the affifance of fuch circumftances. Hence may we account for that regular fituation and direction of the brauches, fince they all wake nearly the fame conftant angle of $45^{\circ}$ with the Item, and with one another.
M. Allruc accounts for the perpend cularity of the ftems, and their redrefling themfelves, thas: 1. He thinks the nutritious juice arifes from the circumference of the plant, and terminates in the pith: And, 2. That fluids, contained in tubes either parallel or oblique to the horizon, gravitatc on the lower part of the tubes, and not at all on the upper. Hence it follows, that, in a plant placed either obliquely or parallel to the horizon, the nutritious juice will act more on the lower part of the canals than on the upper ; and by this means they will infinuate more into the canals communicating therewith, and be collented more copioully therein: thus the farts on the lower fide will receive more accretion and be more nourifhed than thofe on the upper, the extremity of the plant will therefore be obliged to bend upwards.

This principle brings the feed into its due fituation at firft. In a bean planted upfide down, the plume and radicle may be feen with the naked cye fhooting at firf directly for about an inch; after which they begin to bend the one downward, and the other upward. The fame is the cafe in a heap of barley to be made into to malt, or in a quantity of acorns laid to fprout in a moift place, isc. Each grain of barley and each acorn has a different fituation; and yet every fprout tends directly upward, and every root downward, and the currity or bend they make is greater or lefs as the r fituation approaches more or lefs to the direction wherein no curvature at all would be neceffary. But two fuch oppofite motions cannot polibly arife without fupp fing fome difference between the two parts: the only one we know of is that the plume is fed by a juice imported to it by tubes parallel to its fides whereas the radicle imbibes its nourihment at every pore in its furface. When the plume therefore is either parallel or inclined to the harizon, the nutritions juice, feeding the lower paris more than the upper, will determinc its extremes to turn upward, for the reafons before given. On the contrary when the radicle is in the like fituation, the nutritious juice penetrating through the upper part more copioutly than through the under, there will be at greater accretion of the former than of the latter; and the radicle will therefore be bent downwards, and this mutual curvity of the plume and radicle muf continue till fuch time as their fides are nourithed alike, whicis cannot be till they are perpendicul.ar.

Of the Food of $P_{L}$ taqs. -This hath been fo fully difeuted
difuffed under the article Agriculturet, that little remains to be faid upon the fulject in this place. The method of making deghlogitticated or vital air de novo, is now fo much improved, that numberlefs expe. riments may be made with it both on animals and vegetables. It appears, indeed, that theefe two parts of the creation are a kind of connterbalance to one another; and the noxious parts or excrements of the one prove falutary food to the other. Thus, from the animal body continually pals of certain efluvia, which vitiate or phlogiffica'e the air. Nothing can be more prejudicial to animal life than an accumulation of thefe eflluviz: on the other hand, nothing is more favourable to vegetables than thofe excrementitious efluvia of animals; and accordingly they greedily abforb them from the earth, or from the air. With refpect to the excrementitious parts of living vegetablec, the cafe is reverfed. The pureft air is the common eflluvium which paffes off from vegetables; and this, however favourable to animal life, is by no means fo to vegetable; whence we have an additional proof of the doctrine concerning the food of plants delivered under the anticle Agriculture.

With regard to the effects of other kinds of air on vegetation, a difference of fome confequence took place between Dr Prieftey and Dr Percival. The former, in the firt valume of his Experiments and Obfervations on Air, had afferted that fixed air is fatal to vegetable as well as to animal life. This opinion, however, was oppofed by Dr Percival, and the contrary one adopted by Dr Hunter of York in the Georgical Eflays, vol. v. The experiments related by thefe two gentlemen would indeed have been decifive, had they been made with fuficient accuracy. That this was the cafe, however, Dr Prieftley denies; and in the 3 d volume of his Treatife on Air has fully detected the miftakes in Dr Percival's experiments; which proceeded in fact from his having ufed, not fised air, but common air mixed with a imall quantity of fixed air. His experiments, when repeated with the pureft fixed air, and in the moft careful manner, were always attended with the fame effect, namely, the killing of the plant.

It had alfo been afferted by Drs Percival and Hunter, that water impregnated with fixed air was more favourable to vegetation than fimple water. This opinion was likewife examined by Dr Priefley : however, his experiments were indecifive; but feem rather unfavourable to the ufe of fixed air than otherwife.

Another very remarkable fact with regard to the food of plants has been difcovered by Dr Priefley; namely, that fome of them, fuch as the willow, comfrey, and duck-weed, are nourifhed by inflammable air. The firt, he fays, flourifhes in this fpecies of air fo remarkably, that, "it may be faid to feed upon it with great avidity. This procefs terminates in the change of what remains of the inflammable air into phlogitticated air, and fometimes into a fpecies of air as good as common air, or even better, fo that it mult be the inflammable principle in the air that the plant takes, converting it, no doubt, into its proper nourifh. ment."

What the followers of Stahl call phlogiticated air and intlammable air, are fo clofely allied to each other, that it is no wonder they fould ferve promifcuoufly for the food of plants. The reafon why both are not agrecable to all kinds of plants, mont probably is the different
quantity of phloginic matter cortaired in them, and the different action of the latent fire they coniain: for all plants do not require an equal quanticy of nouiifhment; and fuch as requitc but little, will te deftroyed by having too much. The action of l.eat alfo is efientially neceflary to vegetation; and it is probable that very much of this principle is abforbed from the air by vegetables. But if the air by which plants are partly nourifhed contains too much of that principle, it is very probable that they may be deAroged from this caufe ats well as the other; and thus inflammable air, which contains a vaft quantity of that active principle, may deftroy fucla plants as grow in a dry foil, though it preferves tho:e which grow in a wet onc. Sec Vegetarion.

Diffemination of Plants. - So great are the prolific powers of the vagetable kingdon, that a fing!e plant almoft of any kind, if left to itfelf, would, in a hhort time, over-ran the whole world. Indeed, fuppofing the plant to have been only a fingle amnual, with two feeds, it would, in 20 years, produce more than a million of its own fpecies; what numbers then muf have been produced by a plant whofe feeds are fo numerous as many of thofe with which we are acquainted? See $N_{A T H R A L}$ Hijlory, fect. iii. p. 654, \&cc. In that part of our work we have given particular examples of the very prolific nature of plants, which we need not repeat here ; and we have made fome obfervations on the means by which they are carried to diftant places. This is a very curious matter of fact, and as fuch we thall now give a fuller account of it.
If nature had appointed no means for the fcattering of thefe numerous feeds, but allowed them to fall down in the place where they grew, the young vegetables mult of neceffity have choaked one another as they grew up, and not a fingle plant could have arrived at perfection. But fo many ways are there appointed for the diffemination of plants, that we fee they not only do not hinder each others growth, but a fingle plant will in a fhort time fpread through different countries. The molt evident means for this purpofe are,

1. The force of the air.-That the efficacy of this may be the greater, nature has raifed the feeds of vegetables upon italks, fo that the wind has thus an opportunity of acting upon them with the greater advantage. The feed capfules alfo open at the apex, left the ripe feeds fhould drop out without being widely difperfed by the wind. Others are furninhed with wings, and a pappous down, by which, after they come to maturity, they are carried up into the air, and have been known to fly the diftance of 50 miles: $13^{8}$ genera are found to have winged feeds.
2. In fome p.ants the feed-veffels open with violence when the feeds are ripe, and thus throw then to a confiderable diftance; and we have an enumeration of 50 genera whofe feeds are thus difperfed.
3. Other feeds are furniflied with hooks, by which, when ripe, they adhere to the coats of animals, and are carried by them to their lodging places. Limmaus reckons 50 genera armed in this manner.
4. Many feeds are difperfed by means of birds and other aninals; who pick up the berrics, and afterwards eject the feeds uninjured. Thus the for diffeminates the privet, and man many fpecies of fru:t. The plants found growing upon walls and houfes, on the tops of
high

## PLA [io P LA

Phote. high rocks, \&c. are moftly brought there by birds; and it is univerfally known, that by manuring a field with new dung, innumerable weeds will fpring up which did net exift there before : 193 fpecies are reckoned up which may be difeminated in this manmer.
5. The growth of other feeds is promoted by animals in a different way. While fome are eaten, others are foattered and trodden into the ground by them. The fquirrel gnaws the cones of the pine, and many of the feeds fall out. When the loxica eats off their bark, almolt his only food, many of their feeds are committed to the earth, or mixed in the morals with mofs, where he had retired. The glandularia, when the hides up her nuts, often forgets them, and they flrike root. The fame is obfervable of the walnut; mice collect and bury great quantities of them, and being afterwards killed by different animals, the nuts germinate.
6. We are attonifhed to find mofes, fungi, byflus, and mucor, growing everywhere; but it is for want of reflecting that their feeds are fo minute that they are almof invilible to the naked eye. They float in the air like atoms, and are dropped everywhere, but grow only in thofe places where there was no vegetation before; and bence we find the fame moffes in North America and in Europe.
7. Seeds are alfo difperfed by the ocean and by ri-

Amcen.
Academ. vers. "In Lapland (fays Limnæus), we fee the moft evident proofs how far rivers contribute to depolite the feeds of plants. I have feen Alpine plants growing upon their thores frequently 36 miles diftant from the Alps; for their feeds falling into the rivers, and being carried along and left by the ftream, take root there.We may gather likewile from many circumfances how much the fea furthers this bufinefs.-In Rollagia, the illand of Græfor, Celand, Gothland, and the fhures of Scania, there are many foreign and German plauts not yet naturalized in Swedeu. The centaury is a German plant, whofe feeds being carried by the wind into the fea, the waves landed this foreigner upon the coatts of Sweden. I was aftonifhed to fee the veronica maritima, a German plant, growing at Tornea, which hitherto had been found only in Grabea: the fea was the vehicle by which this plant was trandported thither from Germany; or polfibly it was brought from Germany to Giæfoca, and from thence to Tornea. Many have imagined, but erroneoully, that feed corrupts in water, and lofes its principle of vegetation. Water at the bottom of the fea is feldom warm enough to deftroy feeds; we have feen water cover the furface of a field for a whele wister, while the feed which it contained remained unhert, unlefs at the begimning of fpring the waters were let down fo low by drains, that the warmth of the fnnbeams reached to the bottom. Then the feeds germirate, but prefently become putrefcent; fo that for the reft of the year the earth remains naled and barren.

Rain and fhowers carry feeds into the cracks of the carth, freams, and rivers ; which laft, conveying them to a diftance from their native places, plant them in a foreign foil."
8. Lafly, fome feeds afift their projection to a diftance in a very furprifing manner. The crupina, a fpecies of centaury, has its feeds covered over with erect brittes, by whofe afliftance it creeps and moves about in fuch a manner, that it is by no means to be kept in the hand. If you confine one of them between the focking and the foot, it creeps out either at the fleeve or neck-banj, travelling over the whole body. If the bearded oat, after harvelt, be left with other grain in the barn, it extricates itfelf from the glume ; nor does it fop in its progrefs till it gets to the walls of the building. Hence, fays Linnxus, the Dalecarlian, after he has cut and carried it into the barn, in a few days tinds all the glumes cmipty, and the oats feparate from them; for erery oat las a piral arifa or beard annexed to it, which is contracted in wet, and extended in dry weather. When the fpiral is contracted, it drags the oat along with it : the arifta being bearded with minute hairs pointing downward, the graimeceflarily follows it; but when itexpands again, the oat does not gack to its former place, the roughnefs of the beard the contrary way preventing its return. If you take the feeds of equifetum, or fern, thefe being laid upon paper, and viewed in a microfope, will be feen to leap over any obftacle as if they had feet; by which they are feparated and difperfed one from ano. ther; fo that a perfon ignorant of this propetty we uld pronounce thefe feeds to be fo many mites or frnill infects.

We cannot finifh this article without remarking, that many ingenious men ( A believe that plants have a power of perception. Of this opinion we fhall now give an account from the fecond volume of the Manchefter Tranfactions, where we find fome fleculations on the perceptive power of vegctables by Dr. Percival, who attempts to thow, by the feveral analogies of organization, life, inftint, fpontaneity, and felf-motion, that piants, like aninals, are endued with the powers both of perception and enjoyment. The attempt is ing enious, and is ingenioully fupported, but in our opivion fails to convince. That there is an analrgy between animals and ve ${ }_{5}$ tables is certain ; but we cannot from thence conclude that they either perceive or enjoy. Botanifts have, it is t:ne, derived from anatomy and ployrolo.,y, almoft all the terms employed in the defeription of plants. But we cannot from thence conclude, that their organization, tho' it bears an analogy to that of animals, is the fign of a living primiph, if to this princifle we annex the idea of porception; yet fo fully is our author convinced of the truth of it, that he does not think it extravagant to fuppore, that, in iome future period, perceptivity may be difcovered to extend even bejond the limits now af figned to vegret, ble life- Corallines, madrepores, millepores, and ipunges, were formerly confidered as folfil bo-
dies:
(A) The ingenious Dr Bell held this opinion, as appears from the clofe of his Thefis de Plyniologiar Plandurun, which was publifled at Edinburgh, June 1777, and a trandlation of which by Dr Currie we find in the fecond volume of the Manchefter Tranfactions, where our readers will alfo find menoirs of its author. Dr Currie informs us, that Dr Hope, the late excellent profeffor of botany in Edinburgh, in his courfe of leftures, ufed to fpeak of Dr Bell with the higheit efteem; but did not approve of the idea which he entertained refpecting the feeling or perception of plants,

Flants, dies; but the experiments of Count Marfigli evinced, that they are endued with life, and led him to clais them with the maritime plants, And the obfervations of E1lis, Juflieu, and Peylonel, have fince raifed them to the rank of animals. The detetion of error, in long ctablifhed opinions concerning one branch of natural knowledge, jutifies the fufpicion of its exiftence in others, which are nearly allied to it. And it will appear from the profecution of our inquiry into the inftinets, fpontaneity, and felf-moving power of vegetables, that the fulpicion is not without foundation.

He then goes on to draw a comparifon between the inftincts of animals and thore of vegetables: the calf, as foon as it comes into the world, applies to the teats of the cow; and the duckling, though hatched under a hen, runs to the water.
"Inftincts analogous to thefe (fays our author), ope. rate with equal energy on the regetable tribe. A feed contains a germ, or plant in miniature, and a radicle, or little root, intended by nature to fupply it with nourifhment. If the feed be fown in an inverted pofition, ftill each part purfues its proper direction. The plumula turns upward, and the radicle ftrikes downward into the ground. A hop-plant, turning round a pole, follows the courfe of the fun, from fouth to weft, and foon dies, when forced into an oppolite line of motion: but remove the obftacle, and the plant will quickly return to its ordinary pofition. The brariches of a honey-fuckle fhoot out longitudinally, till they become unable to bear their own weight ; and then ftrengthen themfelves, by changing their form into a fpiral: when they meet with other living branches, of the fame kind, they coalefee, for mutual fupport, and one firal turns to the right and the other to the left ; thus feeking, by an inftinctive im. pulfe, fome body on which to climb, and increafing the probability of finding one by the diverfity of their courfe: for if the auxiliary branch be dead, the other uniformly winds itfelf round from the right to the left.
"Thefe examples of the inftinctive economy of vegetables have been purpofely taken from fubjects familiar to our daily obfervation. But the plants of warmer climates, were we fufficiently acquainted with them, would probably furnith better illuftrations of this acknowledged power of animality : and I faall briefly recite the hifto-
ry of a very curious exotic, which has been delivered to us from geod authonity ; and confirmed by the obfervations of Eeveral European botanifts."

The Doctor then goes on to give a defcription of the dionser mufcipula ( B ), for which fee vol. vi. p. 32. and concludes, that if he has furnifhed any prefumptive proof of the inltinctive power of vegetables, it will neceffarily follow that they are endued with fome degree of fpontaneity. More fully to evince this, however, the Doctor points out a few of thofe phenomena in the vege. table kingdom which feem to indicate fpontancity. "Several years ago (fays he), whiilt engaged in a courle cf experiments to afcertain the influence of fixed air on vegetation, the following fact repeatedly occurred to me. A fprig of mint, fufpended by the root, with the head downwards, in the middle glafs veffel of Dr Nooth's machine, continued to thrive vigoroufly, without any other pabulum than what was fupplied by the flream of mephitic gas to which it was expofed. In 24 hours the ftem formed into a curve, the head became ereet, and gradually afcended towards the mouth of the veffel ; thus producing, by fucceflive efforts, a new and unufual contiguration of its parts. Such exertions in the fprig of mint, torectifyits inverted pofition, and to removefrom a foreign to its uatural element, feems to evince evolition to avoid what wasevil, and to recover what hadbeen experienced to be good. If a plant, in a garden-pot, be placed in a room which has no light except from a hole in the wall, it will thoot towards the hole, pafs throngh it into the open air and then vegetate upwards in its proper direction. Lord Kames relates, that, " amongft the ruins of New Abbey, formerly a monattery in Galloway, there grows on the top of a wall a plane tree, 20 feet high. Straitened for nourifhment in that barren fituation, it feveral years ago directed rocts down the fide of the wall till they reached the ground ten feet below: and now the nourifhment it afforded to thefe roots, during the time of defcending, is amply repaid; having every year fince that time made vigorous thoots. From the top of the wall to the furface of the earth, thefe roots have not thrown out a fimple fibre, but are now united into a pretty thick hard root.
"The regular movements by which the fun-flower pre. fents its fplendid difk to the fun have been known to B 2 naturalifts,

Plans:
Plans:

Plentg. naturalits, and celebrated by pects, both of ancient and modern times. Ovid founds upon it a beatiful ltozy ; and Thomfon defcribes it as an attachment of love to the celeftial luminary.

- But one, the lofty f:llower of the fun, 'Sad when he fets, fhuts up her yellow leaves, - Drooping all night ; and when he warm returns, ' Points her enamour'd bofom to his ray,'

Summer, line 216.
Dr Percival nest touclies on motion ; he mentions co$\ddagger$ See Pen- rallines, feapens $\downarrow$, oyfters, ${ }^{\sigma} c$. as endued with the power natula, of of motion in a very fmall degree, and then he fpeaks in crea, Mytitas, \& e.
the fillowing manner. "Mr Miller (fars he), in his late account of the illand of Sumatra, mentions a fpe-
cies of coral, which the inhabitants have miltaken for a plant, and have denominated it lalan-cout, or fea-grals. It isfound in fhallow bays, where it appears like a fraight fick, but when touched withdraws itfelf into the fand. Now if felf-moving faculties like there indicate animality, can fuch a diltinction be denied to vegetables, polfeffed of them in an equal or fuperior degree? The water-lily, be the pond deep or flallow in which it grows, pufhes up its flower-ftems till they reach the open air, that the farina fecundans may perform without injury its preper office. About feven in the morning the Italk erects itfelf, and the llowers rife above the furface of the water: in this fate they continue till four in the afternoon, when the falk beonmes relaxed, and the fiowers fink and clofe. The motions of the fenfitive plant have been long noticed with admiration, as exhibiting the molt obvious figns of perceptivity. And if we admit fuch motions as criteria of a like power in other beings, to attribute them in this infance to mere mechanifm, actuated folely by external impulfe, is to deviate from the foundeft rule of fhilofophizing, which directs us not to multiply caufes when the effects appear to be the fame. Neither will the laws of electuicity better folve the phenomena of this animated vegetable: for its leaves are equally affected by the contadt of electric and non-electric bodies; fhow no change in their fenfibility whether the atmofphere be dry or moift; and infantly clofe when the vapour of volatile alkali or the fumes of burning fulphur are applied to them. The powers of chemical Atimuli to produce contrations in the fibres of this plant may perhaps lead fome philofophers to refer them to the vis infita, or irritability, which they affign to certain parts of organized matter, totally diftinct from, and independent of, any fentient energy. But the hypothefis is evidently a folecifm, and refutes itfelf. For the prefence of irritability can only be proved by the experience of irritations, and the idea of irritation involves in it that of feeling.
"But there is a fpecies of the order of decandrin,
which confantly and uniformly exerts a feif moving power, uninfluenced either by chemical Atimuli, or by any external impulie whatfoever. This curious Chrub, which was unknown to Linnxus, is a native of the Eaf Indies, but has been cultivated in feveral botanical garders here I had an opportunity of examining it in the collestion of the late Dr Brown. See Hedysarum.I cannot better comment on this wonderful degree of vegetahle anmation than in the wrods of Ciccro. Inaninum oft oanme quod pul/is agitalur exterm; quad autem fft animal, id motus cietur interiore ct fuo.
"I have thus attempted, with the Brevity prefcribed by the laws of this fuciety, to extend our views of ani* mated nature ; to gratify the mind with the contempldtion of multiplied accenions to the general aggregate of felicity; and to exalt our conceptions of the wifdom, power, and benificence of God. In an undertaking never yet accomplifhed, difappointment can be no difgrace: in one directed to fuch noble objects, the motives are a juftification, inde, endently of fuccefs. Truth, indeed, obliges me to acknowledre, that I review my fpeculations with much diffidence; and that I dare not prefume to expect they will produce any permanent conviction in others, becaule I experience an inftability of opinion in myfelf. For, to ufe the language of Tully, Nefcio guemodo, d:m lego, afentior; cum polia librum, affenfo omnis ilia elabitut.-But this fcepticim is perhaps to be afcribed to the influence of habitual preconceptions, rather than to a defiency of rcalonable proof. For befides the various arguments which have been advanced in favour of vegetable perceptivity, it may be further urged, that the hypothefis recommends itfelf by its confonance to thofe higher analogies of nature, which lead us to conclude, that the grestelt polfible fum of happinefs exifts in the univerfe. The bottom of the ocean is overfpread with plants of tic moft luxuriant magnitude. Immenfe regions of the earth are covered with perennial forefts. Nor are the Alps, or the Andes, deftitute of herbage, though buried in deeps of fnow. And can it te imagined that fuch profution of life finbfifs without the lealt fenfation or enjoyment? Let us rather, with humble reverence, fuppofe, that veretables participate, in fome low degree, of the common allotment of vitality ; and that nur great Creator hath apportioned good to all living things, ${ }^{6}$ in number, weight, and meafure." See Sensitire Plant, Mimosa, DioNas. Mufiipulu, Vegetable Motion, $\mathcal{O} c$.

To thefe ingenious and firited obfervations, we fuall fubjoin nothing of our own, but leave our reiders to deternine for themfelves (c). Speculations of this kind, wher carried on by fober men, will never be productive of bat cunfoquences; but by the fubtle fceptic, or the mote nnwary inquirer, they may be made the engine of very dangrerous eriors. By this we do not mean to infinuate
(c) In the 2 d volume of TranfuRions of the Linnaxan Society, we find Dr Percival's reafoning very ably combated, asfar ds he draws his confequences from the external motions of plants; where it is argued, that thefe motions, fhough in fome refpects fimilar to thofe of animals, can and ought to be explinen, without concluding that they are endowed either with perception or volition. Mr Townfon concindes hi paper in the fe woras: "When all is con'dered (fays he), I think we thall place this opinion amongt the many inspenious fights of the imagination, and fuberly foliow th: blind impulfe which leads us : armaliy to give fenfiti n and percep ivi y to animat, life, and to deny it to vegeables; and foftill fay with Aritotle, and our great matter Limnæus. Vegefabilia cref"unt É vivant; animalab irefont, viount, 于 fentiunt."

Method of Drying and Preferving Plants for Bola-nig.-Many methods have been devifed for the prefervation of plants : we fhall relate only thofe that have been found moll fuccersful.
Wither. Firt prepare a prels, which a workman will make ing's buta- by the fullowing directions. 'Take two planks of a nical Ar- wood not liable to warp. The planks mult be two rangement, ingches thack, 18 inches long, and 12 inches broad. Get
Introd. Introd. p. 48 . four male and four female fcrews, fuch as are common-
ly ufed for fecurine fith-windows. Let the four female ferews be let into the four comers of one of the plants, and correfponding holes made through the four corners of the sther plank for the male forews to pafs through, fo as to al.ow the two planks to be furewed tughty together. It will not be amils to face the bearing of the male ferews upon the wood with iron plates; and if the iron plates went acrofs from corver to corner of the wood, it would be a goo. f.cutity againf the warping.

Secondly, get half a dezen quires of large fofe fpongy paper (tiuch as the ftationers call liofoom bliting paper is the beit), and a few fleets of frong pafeboard.

The plants you wifh to preferve fhould be gathered in a dry day, after the fun hath exhaled the dew; taling particular care to colleet them in that Iate wherein their generic and fpecific claracters are mof confpicuous. Carry them home in a tin-box nine inches long, four inches and a half wide, and one inch and a lalf deep. Get the box made of the thinnelt tinned iron that can be procured; and let the lid open upon hinges. If any thing happens to prevent the immediate ufe of the fpecimens jou have collected, they will be kept frefh two or three days in this box much better than by putting them in water. When you are going to preferve them, fuffer them to lie upon a table until they becon limber; and then they fhould be laid upon a paiteboard, as much as foffible in their natural firm, but at the fame time with a particular view to their generic and fpec fic characters. Fir this purpofe it will be advifible to feparate one of the flowere, and to difplay the generic character. If the fecific charanter depends upon the flower or upen the root, a particnlar ditplay of that will be likewife necsfary. When the play is thus difpoled upun the parteboard, ce.ver it with eicht or ten layers of fpen y paper, and put it into the pr=fs. Exert only a fmall degree of preffure f r the firt two or three days; then examine it, unf, ld any unnatur. 1 plaits, rectify any miftakes, ind, after puiting frefl fater over it, ficew the prefs harder 1 la about three days more feparate the frant from the patteboard,

13 P P L A
$\mathrm{if}^{\circ}$ it is fumcientl; firm to allow of a change of place ; put it upon a frefh palteboard, and, covering it with frefl blollom-paper, let it remain in the prefs a few days longer. 'The pret's thould ftand is the fun-thine, or within the influence of a fire.

When it is p.rfect!y dry, the ufual method is to fafen it down, with patte or gum-water, on the righthand inner page of a fheet of large ftrong watingpaper. It requires fome dexterity to glue the plant neatly down, fo that none of the gum or palte may appear to dente the paper. Preis it gently again for a day or two, with a half fheet of blofiom-paper beiwixt the folds of the writing.paper. When it is quite dry, write upon the left-hand inner page of the paper the name of the plant ; the fpecific character; the place where, and the time when, it was found; and any other remarks you may think proper. Upon the back of the fame page, near the fold of the paper, write the name of the plant, and then place it in your cabinet. A fmall quantity of finely powdered arfenic, or corrofive fublimite, is ufually mised with the patte or gum-water, to prevert the devaftations of infedts; but the feeds of 隹aves-acre finely powdered will anfwer the fame purpofe, withont being liable to corrode or to change the colour of the more delicatc plants. Some people put the dried plants into the theets of writing paper, without faftening them down at all; and others only fatten them by means of imall flips of paper, pafted acrofs the ftem or branches. Where the fpecies of any genus are numerous, and the fpecimens are fmall, feveral of them may be put into one fheet of paper.

Another more expeditious method is to tale the plants out of the prefs after the firft or fecond day; let them iemain upon the pateboard; cove= them with five or fix leaves of blofforn paper, and iron them with a hot fmoothing iron until they are perfectly dry. It the iron is too hot, it will change the colours; but fume people, taught by long practice, will fucceed very hap. pily. This is quite the belt me:hod to treat the orchis and other flimy mucilagirous plants.

Another method is to take the plants when fiefl gathered, and, inftead of putting them into the prefs, in. mediately to faiten them down to the paper with Arong gum water: then dip a camel-hair pencil into fpirit-varhifh, and varnilh the whole forface of the plant two ov three times over. This method fuccecds very well with plants that are readily laid flat, and it preferves their colours better than any other. The fpirit varnifh is mad: thus. To a quart of highly ectified fpirit of wine put five ounces of gum fandarach; two onnces of maltich in drops; one ounce of pale gum elemi, and one ounce of oil of fpike-lavender. Let it ftand in a warm place, and thake it frequently to expedite the folution of the gums.

Where no better convenience can be had, the fpecimens may be difpofed fyftematically in a large folio book; but a vegetable cabinet is upon all acenunts mere eligible. In Plate CCCXCVII, there is a fection of a cabinet, in the true proportions it ought to be made, for containing a complete cullection of Pritifh plants. By the affiftance of this drawing, and the adjoining fcale, a workman will readily make one. The drawers muft have backs and fides, but no other front than a
fmall

$$
\Gamma \quad L A \quad 1 \neq 1 \quad \mathrm{P} \quad \mathrm{~A}
$$

finall ledge. Each drawer will be 14 inches wide, and 10 inches from the back to the front, after allowing half an inch for the thicknefs of the two dides, and a quatiter of an inch for the thicknefs of the back. The fides of the drawers, in the part next the front, mult be floped off in a ferpentine line, fomething like what the workmen call an ogee. The bottoms of the drawers mult be made to dlide in grooves cut in the uprights, fo that no face may be lof betwixt drawer and drawer. After allowing a quarter of an inch for the thicknefs of the bottom of each drawer, the clear perpendicular fpace in cach mutt be as in the following table.

- 1. Two tenths of an inch.

11. One inch and two tenths.
III. Four inches, andlix tenths.
IV. Two inches and threeecaths.
V. Seven inches and eight teaths
V'I. Two inches and twotenths.
Vill. Two tenths of an inch. VII. One inch and fonr-tenths.
IX. Two tenths of an inch.

- z . Two inchez and cighttenths
XI. One inch and two tenths.
XII. Three inches and five. tenths,
XIII. Two inches and fourtenths.
XIV. Thiree inches and eight tenths.
XV. Three inches and four tenths.
XVI. One inch and three tenths.
XVII. Two inches and eight tenths
XVIII. Six tenths of an inch.
XIX. Ten inches
XX. One inch and ninetenths.
XXI. Four inches and four tenths.
XXII, 'I wo inches and fixtenths.
XXIll. One iach and two. tenths.
XXIV. Seventeen inches.

This cabinet fhuts up with two doors in front; and the whole may ftand upon a bafe, containing a few drawers for the reception of duplicates and papers.

Foffl Plants. Many fecies of tender and herbaccous plants are found at this day, in great abundance, buried at confiderable depths in the earth, and converted, as it were, into the nature of the matter they lie among; fonill wood is often found very little altered, and often impregnated with fublances of almolt all the different foflil kinds, and lodged in all the feveral frata, fometimes firmly imbedded in hard matter; fometimes loofe: but this is by no means the cafe with ti.e tenderer and more delicate fubje?ts of the vegetable world. Thefe are ufually immerfed either in a blackifh flaty fubftance, found lying over the ftrata of coal, elfe in loofe nodules of ferruginous matter of a pebble-like form, and they are always altered into the nature of the fubfance they lie among: whit we meet with of thefe are principally of the fern kind; and what is very lingular, though a tery certain truth, is, that thefe are principally the ferns of American growth, not thofe of Europe. The inoft frequent foflil plants are the polypody, fpleenwort, ofmund, trichomanes, and the feveral larger and fmaller ferns; but befides thefe there are allo found picces of the equifetum or horfe-tail, and joints of the ftellated plant, as the clivers, madder, and the like; and thefe Have been too often miftaken for flowers; fometimes there are alfo found complete grafles, or parts of them, as allo reeds, and other watery plants; fometimes the ears of corn, and not unfrequently the twigs or bark, and impreffions of the bark, and fruit of the pine or fir kind, which have been, from their fcaly appearance, miftaken for the $\mathbb{f k i n s}$ of fifhes; and fometimes, but that very rarely, we meet with molfes and fea-plants.

Many of the ferns not unficquently found, are of
very fingular kinds, and fome fpecies yet unknown to us; and the leaves of lome appear fet at regular diftances, with round protuberances and cavities. The fones which contain thefe plants fplit readily, and are often found to contain, on one fide, the imprefion of the plant, and on the other the prominent plant itfelf: and, befide all that have been mentioned, there have been frequently fuppored to have been found with us ears of common wheat, and of the maize or Indian corn; the firlt being in reality no other than the common endmoft branches of the firs, and the other the thicker boughs of various fpecies of that and of the pine kind, with their leaves fallen off; fuch branches in fuch a ftate cannot but afford many irregular tubercles and papillæ, and, in fome fpecies, fuch as are more regularly difpofed.

Thefe are the kinds moft obvious in England ; and thefe are either immerfed in the flaty fone which contitutes whole ftrata, or in flatted nodules, ufually of about three inches broad, which readily fplit into two pieces on being ftruck.

They are moft common in Kent, on coal-pits near Newcaltle, and the foreft of Dean in Gloucelterfhire; but are more or lefs found about almoft all the coal-pits, and many of the iron mines. Though thefe feem the only fpecies of plants found there yet in Germany there are many others, and thofe found in different fubflances. A whitifh fone, a littie harder than chalk, frequently contains them: they are found alfo often in a grey flaty ftone of a firmer texture, not unfrequently in a blackifh one, and at times in many others. Nor are the bodies themfelves lefs various here than the matter in which they are contained: the leaves of trees are found in great abundance, among which thofe of the willow, poplar whitethorn, and pear trees, are the mof common; fmall branches of box, leaves of the olive-tree, and ftalks of garden thyme, are alfo found there; and fometimes ears of the various fpecies of corn, and the largeras well as the fmaller moffes in great abundance.

Thefe feem the tender vegetables, or herbaceous plants, certainly found thus immerfed in hard fone, and buried at great depths in the earth: others of many kinds there are alfo named by authors; but as in bodies fo imperfect errors are eafily fallen into, thefe feem all that can be afcertained beyond mere conjecture.

Plants, metbod of preferving them it their original frape and colour. Wafh a fufficient quantity of fine fand, fo as perfealy to feparate it from all other fubtances; dry it ; pafs it through a ficve to clear it from any grols paticles which would not rife in the walhing; take an earthen veflel of a proper fize and form, for every plant and flower which you intend to preferve; gather your plants and flowers when they are in a fate of perfection, and in dry weather, and always with a convenient portion of the ftalk: heat a little of the dry fand prepared as above, and lay it in the bottom of the veffel, fo as equally to cover it; lay the plant or flower upon it, fo as that no part of it may touch the fides of the veffel : fift or thake in more of the fame fand by little and little uponit, fo that the leavesmay be extended by degrees, and without injury, till the plant or flower is covered about two inches thick: put the velfel into a fove, or hothoufe, heated by little and little to to the 50 th degree ; let

Plant it ftand there a day or two, or perluaps more, according d to the thickrefs and fucculence of the flower or plant; Plantago. then gently flake the fand out upon a fheet of paper, and take out the plant, which you will find in all its beauty, the thape as elegant, and the colour as vivid as when it grew.

Some flowers require certain little operations to preferve the adherence of their petals, particularly the tulip; with refpect to which it is necelfary, befcre it is buried in the fand, to cut the triangular fruit which rifes in the middle of the flower; for the fetals will then remain more firmly attached to the ftalk.

A hortus ficcus prepared in this manner would be one of the moft beautiful and uleful curiolities that can be.

Moving Plant. See Hedysarum.
Sea Plants. See Sea Plants.
Senfitive Plant. See Minosa and Sensigive Plant.
Plast-Lice, Vine fretters, or Puctrons. See Aphis.
PLANTA, a flant. See Plant.
Plavis Fxmina, a female plant, is one which bears female flowers only. It is oppofed to a male plant, which bears only male flowers; and to an androgynous one, which bears flowers of both fexes. Female plants are produced from the fame feed with the male, and arrange themfelves under the clafs of dicecia in the fexual method.

PLANTAGENET, the furname of the kings of England from Henry II. to Richard III. inclufive. Antiquarians are much at a lofs to account for the origin of this name; and the beft derivation they can find for it is, that Fulk, the firft earl of Anjou of that name, being ftung with remorie for fome wicked action, went in pilgrimage to Jerufalem as a work of atonement; where, being foundly fcourged with broom twigs, which grew plentitully on the fpot, he ever after took the furname of Piantagenet or broomfalh, which was retained by his noble potterity.

PLANTAGO. PLANTAIN; a genus of the monosynia order, belonging to the tetrandria clafs of plants. To this genus Linnxus has joined the coronopus and pfrllium of Tournefort. The firit of thefe is called bariflorn, the latter fleawert. Of thefe there are feveral diftinct fpecies, and fome varieties; but as they are rarely cultivated in girdens, we fhall not enumerate them here, and fhall only mention fuch of them as grow naturally in Britain. Of the plantain there are the following forts: The common broad leaved plantain, called weylread; the ereat hoary plantain, or lambs-tongue; the narrow-leaved plantain, or ribwort: and the following varieties have alfo been found in England, which are accidental; the befom-plantain and rofe-plantain. The plantains grow naturally in paltures in moft parts of England, and are frequently very troublefome weeds. The common plantain anj libwort flantain are both ufed in medicine, and are to well known as to need no defcription. They are laid to be flightly aftringent; and the green leaves are commonly applied to freth wounds by the common penple.

Of the coronopus, or buckthorn plantain, there are two varieties growing in England, viz. the common buckfhorn, which grows plentifully on heaths everywhere ; and the narrow leaved Welch fort, which is found upon many of the Welch mountrins. The firft of thede was
formerly culivated as a falad herb in gardens, but has Plantion been long banithed from thence for its rank diagreeable Havour; it is fometimes ufed in medicine.-There has been one fpecies of plyllium or fleawort found growing naturally in Englind, which is ufed in medicine. It was found in the earth thrown out of the boitem of the canals which were dug for the Cheliea watorworks, where it grew in great plenty. The feeds of it mult h:ve been buried there fome ages; for no perfon reme bers any of the plants growing in that ncigh. bourhood before. The feeds of this fpecies are fometimes ufed, as they are imported from the fouth of France.

Plantain. See Plantagu.
Plantain-Trce. See Musa.
PLANTATION, in the Weft Indies, denotes a fpot of ground which a planicr, or perfon arrived in a new colony, pitches on to cultivate fir his own ufe, or is afigned for that purpofe. However, the term phane tation is often ufed in a term fyonymous with colony. See Colony.

PLANTERSHIP, in a general fenfe, the bufinefs of a plant r.

Plantership, in the Weft Indies, denctes the ma. na ement of a fugar plantation, including not only the cultivation of the cane, but the varicus frocefies for the extradion of the fugar, together with the making of fu-gar-fpirits. See Rum, Saccharum, and Sugar.

To iffect a defign fo comprehenfive, it is necelf.. 5 for a planter $t_{w}$ underfand every branch of the art precifely, and to ufe the utmof attention and caution both in the laying down and executing of his plans. It is therefcre the duty of a good planter to infpest every part of his plantation with his own ejes; to place his provifions, ftores, and utenfils, in regular order, and in fafe repofitories; that by preferving them in perfection, all kind; of wafte may be prevented.

But as negroes, cattle, mules, and horfes, are as is were the nerves of a fugar plantation, it is expedient to treat that fubject with fome accuracy.

Of Nerroes, Catile, \&c. 1 In the firft place, then, as it is the intereft of every planter to preferve his negroes in health and ftrength; fo every ate of cruelty is not lefs repugnant to the mafter's real profit, than it is contrary to the laws of humasity: and if a manager confiders his own eafe and his employel's intereft, he will treat all negroes under his care with due benevolence; for good difcipline is by no means inconfifent with humarity: on the contrary, it is evident from experience, that he who feeds his negroes well, proportions their labour to their age, fex, and frength, and treats them with kindnefs and good nature, will reap a much larger produf, and with infinitely more eafe and felf.fatisfaction, than the moft cruel talkmafter, who farves his negroes, or chaftifes them with undue feverity. Every planter then Martin on who wifhes to grow rich with eafe, mult be a good eco-Martin on nomift; muft feed his negroes with the moft wholefome hip. food, fufficient to preferve them in healtl and vigour. Common experience points ont the methods by whicha planter may preferve his people in health and ftrength. Some of his mof fruitful lan ' thould be allo:ted to each negro in proportion to his fam ly, and a fufficient portion of time allowed for the cu tivation of it; but becaufe fuch allotment cannot in long droughts produce enough for his comfortable fupport, it is the incumbert

Flanterfrip.
duty of a good planter to have always his fores well filled with Guinea corn, yams, or cddoes, befides pocatoes growing in regular fucceffion: for plenty begets cheerfuinefs of thear, as well as frength of body; by whiel more work is effected in a day by the fame hands than in a week when enervated by want and feverity. Scanty' meals may fuftain life; but it is evident, that more is requifite to enable a negro or any other perfon to go through the neceflary labours. He, therefore, who will rcap plentifuily, muft plant great aluadance of provifions as well as fugar-canes; and it is nature's economy to to fructify the foil by the growth of yams, plantains, and potatoes, as to yield better harvents of fugar, by that very means, than can be produced by many other arts of cultivaticu. Plantains are the principal fupport of all the negroes in Jamaica; and are alfo much cultivated, at great expence of manure, in Barbadoes; but ouglit not to be folely dependei upon in climates fulject to hurricanes. A celebrated planter and economift of the laft mentioned ifland, who raifed an immenfe fortune from very finall begimings only by planting, affirmed, that he fed contantly at lealt 300 negroes out of 12 acres of plantains. How that excellent produce cane to be fo long neglefted in fone of the iflands it is hard to guefs; but at prefent the negleot feems to be founded upon a vulgar error, that plantains cannot thrive il any other than low molt foils. In fuch places, do donbt, they flourifh moft luxuriantly; but yet they dhrive and bear fruit abundantly on mountains and in marfhes, and in the drielt black mould upon marle or rocks, and even in fharp gravelly foils, as may be evinced liy numberiefs inftances.

However plenty of wholefome food may be conducive to health, there are alfo other means, equally neceffary to ftrength and the longevity of negroes, well worth the planrer's attention: and thofe are, to choofe airy dry fituations for their houfes ; and to obferve frequently that they be kept clean, in good repair, and perfectly water-tight; for naltinefs, and the inclemencies of weather, generate the moft malignant difeafes. If thefe honfes are fituated alfo in regular order, and at due diftances, the fpaces may at once prevent general devafations by fire, and furnifh plenty of fruits and potherbs, to pleafe an unvitiated palate, and to purify the blood. Thus then ought every planter to treat his negroes with tendernefs and generofity, that they may be induced to love and obey him out of mere gratitude, and become real good beings by the imitation of his behaviour ; and therefore a grood planter, for his own eale and happinefs, will be careful of fetting a good esample.

Having thus hinted the duties of a planter to his negroes, let the next care be of cattle, mules, and horfes. The planters of Barbadoes (who are perhaps the molt frilful of all others, and exaet to a nicety in calculations of profit and lofs), are, with refpeif to their cattle, the moft remifs of any in all the inands; as if the carriage of canes to the mill, and of plantation-produce to the market, was not as effential as any other branch of planterShip. At Barbaboes, in particular, the care of thefe animals is of more importance; becaufe the foil, worn out by long culture, cannot yield any produce without plenty of dung. Some planters are neverthelefs fo ingenioufly thrifty, as to carry their canes upoa negroes beads; axting in that refpect diamstrically oppofite to
their own apparent intereft, which cannot be ferved more effcetually than by faving the labour of human hands, in all cafes where the labour of brutes can be fubfitu:ed; and for that end, no means of preferving thofe creatures in health and ftrength ouglit to be neglected.

The firt care therefore is to provide plenty and variety of food. In crop-time, profufion of cane-tops may be had for the labour of carriage ; but they will be more wholefome and nutritious if tedded like hay by the fun's heat, and fiwcated by laying them in heaps a few days before they are eaten. In this feafon of abundance, great ricks of cane-tops (the butt ends turned inwards) thould be made in the moft convenient corner of eack fiald, to fupply the want of pafturge and other food: and thefe are very wholefome if choppedinto imall parts, and mixed fometimes with common falt or fprinkled with melaffes mixed with water: but yet the cattle require change of food to preferve them in Arength ; fuclt as Guinea corn, and a variety of grafs, which every foil produces with a little care in moift weather; and indeed this variety is found neceflary in all climes.

But fince that variety is not to be had during thofe fevere droughts to which hot climates are liable, and much lefs in thofe fmall inands which cannot furnifh large tracts of meadow-lands for hay, the only refource is the fodder of cane tops or tedded Guinea-corn leaves; which arc very nutritious, and may be preferved in perfection for more than a whole year, provided the tops of Guinea-corn are well tedded for three o: four hot days as they lie fpread in the field; and then, being tied into bundles or fheaves, muft lie in the hot fun for three or four days more, when they may be fit to be put up into ricks. The beft metlod of making them is in an oblong figure, about 30 feet in length, and 16 or i8 feet wide ; feven feet bigh at the fides, and from thence floping like the roof of an houfe, the ridge of which muft be thatched very carefully; for the fides may be fecured from wet by placing the bundles with the butts upwards towards the ridge, in courfes, and lapping the upper over the lower courfe.

The beft method of forming thofe ricks is to place the firlt courfe of bundles all over the bafe ous way ; the fecond courfe reverfely; and fo alternately till the rick be finifhed.

When cattle are to be fed with this fodder, it mun be obferved to take down the bundles from the top, at the welt end of the rick, to the botrom; for all thefe ricks muft ftand eaft and weft lengthwife, as well to fecure them from being overturned by high winds, as for the convenience of preferving them from wet, which cannot te done when ricks are made round. By this hufbandry, an herd of cattle may be kept in Atrength, cither in fevere droughts, or in wet feafons when grafs is purgative; and thus the neceffity or expence of large paftures may be totally faved. The hay-knife ufed in England for cutting hay, anfwers for cutting ricks of tops.

The method of tedding Guinea-corn to make a kind of hay, will require a little explanation here. When Guinea corn is planted in May, and to be cut down in July, in order to bear feed that year, that cutting, tedded properly, will make an excellent hay, which cattle prefer to meadow-hay. In like mamer, after Guineacoru has done bearing feed, the after crop will furnith a

Planterhip.

## P I A

Pianter- great abundance of that lind of fodder which will fhip. keep well in ricks for two or three jears.

The next care of a planter is to provide fhade for his catle; either by trees whate they are fed in the heat of the day, if his foil requires not dung; or by build. ing a flat thade over the pen where cattle are confined for making it. That fuch thades are effentially necerfary to the well being of all animals in hot weather, is apparent to every common obferver, who cannot fail of fecing each creature forfuking the moft luxuriant paftures in the heat of the day for the fake of thade; thus convincing the owners, by intindive argument, that fhade is almof as neceflary to the well-being of the brute creatures as food. Yet, notwithtanding that demonfration from the unerring courfe of mature, throughout all the Britilh illands (except in a very few inttances) thefe poor creatures are expofed to the forching fun beams without mercy. Such inhuman neglect is not always fo much the effert of inattention as of a mitaken notion that flades are impedimental to the making of much dung; but a flat fhade, covered with cane-itath, may be fo made as to let rain pafs through it without admiffion of fun-beams. This will do for cattle; but mules, which are fpirited creatures, and work themfelves by draught into a foaming heat, fhou!d be putinto a warm it able, until quite cool : for turning them loofe to pafture when fo hot, is probably the caufe of their deftruction by the glanders.

If the care of providing fhade for brute creatures is fo much the duty and interelt of their owners, how much more is it agreeable to the laws of humanity to provide fhade for human creatures travelling upon the hiizh-roads in this hot climate? Nothing furely of fo much beauty cofts fo little expence as planting cocoanut or fpreading timber trees in avenucs along the highways, if each proprietor of the lands adjoining hath any tafte of elegance, or feeling for other men: but both thofe kinds of trees will yield alfo great profit to the proprietor, by furnifhing him with timber, when perhaps not otherwife to be had; or with a delicious milk, fitted by nature to cool the effervefcence of the blood in this hot region; and alfo to improve the firits made from fugar to the delicacy and foftnefs of arrack. Cocoannut and cabbage trees are both very beautiful and fhady, bearing round heads of great expanfion, upon natural trunks or pillars of elegant proportion, and of fuch an height as to furnifh a large fhade, with a free circulation of air equally refrefhing to man and beaft.

The common objection of injury to canes by the roots of fuch trees growing on their borders, may be eafily removed by digging a fmall trench between the canes and trees, whicli may intercept their roots, and oblige them to feek fultenance in the common road. Let it alfo he confidered, befides the benefits above fuggeited, that the planter will thus beaptify his eftate to the refemblance of a moit fumptuous garden. And probably that very beauty might not only render the illands more healthful to the inhabitants, by preferving Vol. XV.
them from fevers kindled by the burning fun-beam?, but alfo much more fruitful by makiag the wenther more feafonable: for as, by cutting down all its woods, :m lant country becomes more fubjeef to excenive droughts; fo, by replanting it in the manner abore defcribed, this inconvenicnce would probably bepreventad.
Let then the planter be liad not on! to his fellowcrcatures but merciful to his beafts; giving th. mplenty and variety of wholefome food, clear water, cocl hato and a clean bed, bleeding them after a long courfe ot hard labour, currying their lides from filth ard ticl:s ( $A$ ); affording them falt and other phytic when necelfary ; protecting them from the flaying ropelafnes of a crucl driver (who needs no other inftrument than a gnad): proportioning their labour to their Atergth; and by cvery art rendering their work as e:ry as poffible. The general management of planters is not, perhaps, miore difentive in any other refpect than in this: for, br pairing the cattle unequally, and by the drivers ill conduct in writhing to the right and left, the poor creatures are fatigued by much needlers labour. An horie ought therefore to be harnefied before them as a leader. This docile creature, by being led in a ftraight line, will foon learn to be an unerring guide, and the cattle will fol. low in the fame direction with united ferength, and confequently with more effoit and lefs fatigue to each individual.

The Portuguefe of Madeira, by their poverty and fcantinefs of pafture, breed the fmalleft kind of cattle; and yet one yoke of them will draw a much greater weight than a pair of the largeft Britifh oxen, folely by an equal exertion of their joint ftrength. That equality or evennefs of draught is preferved by boring gimblet holes through their horns, within two inches of the points, and running a thong of leather througb thofe holes, fo as to tie the horns of each pair at tix inches diftance from each other. By this ligature the pair of cattle are abfolutely hindered from turning different ways, and draw in an even direction with united force. Thus it appears evidently from reafon, as well as from experience, that the labour of the Britifh beafts mar, by a little contrivance, be rendered more eafy and effectual.

Of the culture of various Soits.] In the Britifh fugarcolonies there is as great a variety of foils as in any country of Europe; fome naturally very rich or fruitful, yielding a luxuriant product with little labour or culture. This fruitful foil is of three hinds; a lonfe hazel mould mised with fand, like that of St Chritopher's, and is the beft in the known world for producing fugar in great quantity, and of the beft quality. The brick mould of Jamaica is fomewhat of the fame nature, and next in value; and then the various mix. tures of mould and gravel, to be found in veins or plats over all the other inlands. When any of thefe fcils are exhaufed of their fertility by long and injudicious culture, they may be reftored by any kind of dung woll rotted; for thefe (B) warm foils canmot bear lot unrotten dung, without being laid fallow for a confideC able
(A) One pound of native fulphur, a quart of lamp-oil, and the like quantity of hog's lard, intimately-mixed and made into an ointment, is a cure for the mangc, lice, \&c.
(в) Thefe foils, which are naturally loofe and upon Marle, Mr Martin cails bot foils: and Licie, he fays, have

## P L A

Hanterfhip.
able time after it. Another improvement is by feafand or fea-weed; or by digging in the cane-trafl into fteep lands, and by letting it lie to rot for fome months. A third method is, by ploughing and laying it fallow ; and the fourth method (the belt of all), is by folding the fallows by fheep. But this can be practifed only where there are extenfive pallures; nor can the plough be employed where the foil abounds with large foones. In that cafe, however, the former method of digging in tralh will be nearly as effectual, though more expenfive, by hand-labour or hoe-ploughing.

The next beft foil for producing good fugar is a mould upon clay, which if thallow requires much culture and good labour, or its prodnce will be fmall in quantity, though of a frong grain and bright colour, fo as to yield mof profit to the refiner of any fugar, except that produced from an hazel or gravelly foil, as hefore-mentioned. All the black monld foils upon marle are generally fruitful, and will take any kind of dung; but yield not fo ftreng or large grained fugar. Marle, however of a white, yellow, or blue colour, or rich mould from wafhes, or afthes of every kind, are excellent for every ftrong foil, as the chief ingredient in the compoft of dung; either of them will do alone for fiff lands; but the jellow and chocolate marle are the moft foapy, and the richeft kind of manure (except fine mould) for all fiff lands. If thefe are well opened, pulverized by culture, and mixed with hot dung, or any kind of loofe earth or marle, they will produce as plentifully as lighter foils: and all kinds of clay-foils, except that of a white colour, have thefe two advantages above the fineft gravel foils, that they do not forch foon by dry weather, and never grow weary of the fame manure, as moft other foils do.

The extraordinary hand labour beflowed in making dung, may be faved by the art of caving, now in general ufe in England. Ten mules or horfes, and two light tumbrels with broad wheels, and ten able negroes, may, by the common ufe of fpa les, fhovels, and light mattocks, or grubbing hoes, make more dung than 60 able negroes can do in the prefent methods.

If marle lics upon rifing ground, or in hillocks, as it of en does, the pit is to be opened at the foot of the declivity; which being dug inwards, till the bank is three feet ligh, then it is to be caved thus. Dig an linllow fpace of 12 or 18 inches deep under the foot of the bank; then dig into each fide of it another perpendicular cut of the fame depth, and 18 inches wide from the top of the bank to the bottom: that being finifhed, mal:e a fmall trench a foot or two from the brink of the bank; pour into it water till full ; and when that is done, fill it again, till the water foaking downward makes the marle feparate and fall down all at once. This may be repeated till the pit niies to 50 feet high; and then many lumared of cart-loads of marle may be ther win dowa by four negroes in two hours; fiom whence it may be carted into cattle. pens or laid out upon lands, as occalimn requires. Five or fix negroes with fpales or thuvels will keep two or thiee tumbels em.
ployed, according to the diflance of cartage: and thus as much dung may be made by ten negro men as will dung richly at leatt 70 or 80 acres of land every year, and laid out alio with the affulance of cat le-carts: An improvement highly worth every planter's confideration, when negrnes and feeding them are fo expanfive; and this is no fpeculation, but has been confirmed by practice. In level lands, the fume operation may be as effectual, provided the mouth of the pit be opened by gradual defcent to any depth : but when marle is to be found on the fides of hills, the operation is lefs laborious for the horfes. But if the furface of the marle-pits (as it often happens) be covered with clay or lliff foil, fo that the water cann't quickly foak from the trench above ; in that cafe, pieces of hard wood, made like piles, four feet long, and four inches fquare, pointed at one end, and fecured at the , ther fquare head by an iron clamp, may be driven by heavy mauls into the trench, as fo many wedges, which will make the caved part tumble down: but a fkiful eye muft watch the laft operation, or the labourers may be buried or hurt.

But then clay-foils that are level, and fubject to bedrowned, or to retain water in ftagnated pools, can never be made fruitful by any kind of manure, withont being firt well drained: for water lying upon any foil will mott certainly transform it to a ftiff unfruitful clay; as appears evidently by the bogs of Ireland, the fens of Lincoln and Cambridgefhire, and even by the ponds of Barbadoes fituated in the deepeft and lighteft black mould; for that fine foil being wathed into thofe ponds, becomes the fiffeft black clay, not fit even for an ingredient in dung, until it has been laid dry, and expofed to the fin for a whole year: but when thefe bogs and fens are well drained, they become the moft fruitful foils. Natural clay the celebrated Boerlaave thinks the fatteft of all foils; but then it muft be opened by culture, marle, or fandy manures. It is hard to conjefture low the opinion prevailed in the Britilh plantations, that fundy gut-mould was moft unfit for clay-foils, as being the means of binding them to the compactnefs of brick; whereas it is proved, from long experience, to be one of the beft means of opening clay foils, and sendering them abundantly fruitful. Brick is made of clay alone; no fand being wied in it, farther than to fprinkle the board, on which it is noulded into fhape. From repeated experience it appears, that a mixture of fand in gut-mould is the beft of all manure for fiff and barrea clay lands; provided they be well drained, by throwing the whole fuil into round ridges of 12 feet wide, with furrows of three fect wide between each ridge. And this is done with little mure hand labour thin that of hoe-ploughing well in the common way. For if a piece of land be marked in lines at feven feet and a half diftance from each other, and the labourers are fet in to hoe-plough at the fecond line, hauling back each clod 12 inches; bulf the ridge, and near half the furrow, is made at the fame time: and thus a piece of land may be round-sidged, and the furrows all made at once, by the common operation of hoe-ploughing, provided the digger drives his hoe up to the eye at every Arokic. Heeploughing.
been murh ingred in fome of the iflands by dung latily made with marle: but if the fediment of lees were throw.a in:u thefe pens, after being turned over, it would mucle improve the dung.

## PI. A

ManterGuip.

## 19]

may be prefumed that the difufe of burning trath wis founded upon the miftaken notion of burn-baiting, which is turning up a thick fod of very dry, light, and fh.llow foils, and burning the whole fuperficies or flaple to afhcs. This prastice the writers upon hubandry condemn univerfally, and very jully : for though by this practice the land will produce two or three crops more plentifuly than ever, yet the foil is blown away by the wind, and the fubftratum being grenerally an hungry gravel or chalk, can uever be reflored to fertility by the common arts of hufbandry. But furely this his no refemblance to the fuperficial burning of the little trath we cau fpare from dung; and though this method of burn-baiting light and flallow foils be jufly condemned, yet the beft writers recommend that very practice in cold, moift, and heavy foils, as is obfervel above; and long experience juftifies it.

Deep mould upon clay or loam being fuljeer to the grub worm (c), will not take any kind of dung, till perfeety rotten, except that of the fheep-fold; which is the beft manure for all kinds of light foils, and is of all uthers the lealt expenfive, as not requiring hand-labour. But the ufe of the fo!d is impracticable in any ifland not abounding with large favannas or fheep pafures, as in Jamaica.

Thofe foils therefore which are fubject to the grub, and mult be fertilized by common dung, which is a proper nef for the mother-beetle to depofite its eggs, mult be well impregnated with the brine of diffolved falt, after the dung is firt cut up ; two large hog theads of falt will make brine enough for a dung-pen of 50 feet fquare.

This cure for the grub is a late difcovery; and which has been attended with fuccefs, fo tar as the experiment is made. But though it proves effectual to deftroy that pernicious infect in plant-canes, it probably will not be fufficient to fave rattoons, withont a new application of falt in powder ; becaufe the firft brine muf be wafhed away by the time when ratioons fpring up.

The planter who would fave his rattoons from the grub ought therefore to cut off the heads of his flools with tharp hoes three inches below the furface of the foil, and then frew an handful of falt round each ftool, and cover it up to a level with fine mould taken from the edges.

In foils where there is no grub, and the planter wifhes to have very good rattoons, let him, as foon as his canes are cut, draw all the trafl from the fools into the alternate fpaces, if planted in that manner ; or into the furrows, if his land be round-ridged; and then cut off the head of his ftools with harp hocs, as above directed. Experiance has fhown the advantige of this practice, and reafon demonftrates the great henefit of the rattoonfprouts rifing from three inches below the furface, inftead of fuperficial fhoots which come to nothing, and only flarve the ftrong fprouts. Befides, the fubs which are left upon the ftools after the canes are cut, canker; and rot the flools ; which is one reafon why good ratC 2
toons

Hinter-

## PLA

Henter toons are uncommon in foils long cultivated. Yet it is the opinion of fome, that by hoe-plourghing and even
dunging rattoons, the produce might be as good plantcanes, which would fave the labour of holing and planting fo often as planters commonly do.

Fallowing is of incredible advantage to every foil, not only by being divided into the minutelt parts, but allo by imbibing thofe vegetative powers with which the air is impregnated by the bountiful hand of Providence, whenever rain falls. What thofe powers are has been explained under the articles Agriculture and Plant; and experience evinces, that the tender vegetables of the earth are invigorated more by the fmalleft fhower of rain, than by all the water which human art can beftow. Let it therefore be a conltant maxim of the planter, never to plant his ground until the foil is well mellowed by fallowing, even though lie beftows upon it a due proportion of dung: we tay a due proportion ; for too much will furce up rank canes, which never yield good rugar; and though fome advantage may be reaped from the rattoons, yet it will be found by experience not to compenfate the lofs by the plants. In fony or fteep foils, where the plough cannot be ufed, or where a fufficient ftrength of cattle cannot be fupported for that purpofe, hand-labour or hoeploughing mult be fibftituted: but cven in that cafe, much labour may be faved by fereading the dung according to the Englih hubandy, and digging it into the foil. To evince this truth, let any planter compute his negroes labour of diftributing dung by bafkets, and by fpreading it with dung-forks; and then judge for limfelf by one fingle experiment which is the moft profitable.

But if fome planters are fo devoted to the old cuftom of diftributing dung by bankets inftead of wheel barrows in level ground, or hand-banows in uneven lund, by which three times the labour may be accomplifhed in the fame time and by the fame hands; let them at leaft fave much of their hand-labour, by the following method of laying out ding, before the diltribution by badkets.

In holing a piece of land, let a fpace be left after 80 holes from the firft interval, and then the like fpace after 80 holes throughout the whole plat, which fpaces mult run exactly parallel to the intervals on the iight and left of the holes. Into thefe faces the dung may be carted, even bcfore it be rotten ( $D$ ), at the mont leifure times, and covered with mould or come trafh, to prevent exhalation ; and in fuch quantity as will fuffice only to dung a row of 40 holes, from the point oppolite to each fide of it. In the intervals at each fide of the cane-piece, which are parallel to thofe faces, there muft be dung enough carted to mature a row of 4 c holes, and covered in like manner.

By thus placing the dung or gut-mould, it is evident
at the firl fight, that the farthelt diftance cannot be above 40 holes in diftributing the dung; and in cafe it be not fufficiently rotten for prefent ufe, it may be diftributed even in dry weather, and covered by the bank; which will both prevent its firit from exhalation, and occcafion it to rot fooner, which is no fmall advantage. Mreover, by being thus laid out at the moft leifure times, and covered with the banks, the dung will be more intimately mixed with the foil, and therefore continue to nourifh the plant for a longer time than if laid as ufual at the bottom of the holes. A farther advantage of thus diftributing the dung, and covering it, refults from the more expeditious planting the land after a fhort or fidden fhower : for the labour of covering the dung, and uncovering it when the land is planted, however it may appear in fpeculation, is in practice a trife; and befides all the other advantages arifing by the diftribution of dung from the faces above defcribed, this is not the lealt, that not a bunk is trodden under foot. But it is evident, that by diftributing the dung with bakets in the prefent method, the foil is much trampled under foot; and by that means, the very end of hoe-ploughing, or loofening the foil is mucl defeated. In like manner, by the prefent method of hoeploughing, the fame ill eff.es is prodnced; for as the negroes hoe-plough or dig the foil direetly forward, fo they mult neceffarily tread the ground as faft as they dig it: whereas by putting the labourers to dig fide. wite, no one puts a foot upon the foil after it is dug; and by lining the land before it is hoe-ploughed, each negroe may have an equal thare to dig. The only difficulty of hoe-ploughing fidewife is in firl fetting the negroes to that work ; but it may be done without lofs of time when working in a contiguous field. Whether hoe-ploughing bcfore or after the land be holed for canes is moft eligible, experience mult determine ; but certainly both opcrations will be mof effectual: and therefore it will be advifable (E), firft to plough the foil where the land will admit the plough; an 1 where it will not, to hoe-plough it with or wi hout dung, as requifite; then let it le fallow till perfectly mellowed; then lole and plant it ; and inllead of weeding in the ufual manner, let the weeds in all the \{paces be dug into the foil: but as this is not to be done fo well with the hoe, it is fubmi ted to future experience, whether the dexterom- u!e of failes, as in England, will not anfwer the purpole much better, and with equal difpatch. But whatever method is preferred, meft cortain it is, that by loolening the fol in all the faces between the young canes atter being come up, their fibres will more ealily expand on every fise, and acquire more nutritinn to invigorate their growth. But where the planter grudges this labon:, by thinking it needlefs in a rich lonfe fuit, he may difpatch more weeding-work by the Dutcli hoe than by any other; which being faftened upon
(D) In order to make dung rot the fooner, much labour is beftowed in digging and turning it over by hoes: but two-thinds of that labrur may be faved by the ufe of hay.knives; fix of which, ofed dex:eroufly, will cut up a pen in lefs time than 60 negroes can do by hoes: but liay-knives cannot be ufed where gritty mould is ufed in pers.
(E) Decp and loofe fills may be ploughed with a fmail firength of cattle or mules : but fiff lands in hot climates require more ftrength of cat:le than can of maintained in the fmall pallures of the planters; for if thofe Arong foils are either too wet or too dry (as is generally the cafc), ploughing is imprasticable.

## P L A

Manterfhip.
upon the end of a tick, is puthed forward uader the roots of the fmall weeds, in fuch a manner as to cut them up a little below the furface of the foil, and will do more execution at one fhove than can be done at three ftrokes of the common hoe: but there is yet ato. ther practice of the horfe-hoe plough, whereby all weeds grewing in rows between the beans and peafe, are extirpated with incredible eafe and expedition. It is a very fimple machine, drawn by one or two horfes, confifting of a pair of low wheels turning upon a common axis; from whence two fquare irons are let down at equal diftances, and triangular hoes made at the ends, the points of the triangles being placed furward, and fo fixed as to cut all weeds an inch below the furface, in the fame manner as the Dutch garden hoc above-mentioned. By this machine a man and a boy, with two horles or mules, will clear perfectly all the fpaces of a field of ten acres in two days, and may be of admirable ufe in all loofe and dry foils in the fugar-iflands: for while two horfes or mules draw in the fpace before each other, the wheels pafs on the outfide of each row of canes, without doing the lealt injury, while the plough-holder attends to his bufinefs. In ftiff forls which require draining, neither the horfe-hne plough nor the Dutch hoe can be proper ; or any other inftrument fo effequal as the fpade ufed in the manner above hinted where the ftaple is deep.

But where the ftaple of land is fhallow, care mult be taken not to dig much below it, acoording to the uriverfal opini $n$ rf all the beit writers fupported by the experience of 100 jears. Yet fime grod planters ate fallen into the contrary practice, and dig up Itiff clay tar below the Ataple This, Mr Mirtin fays, was done in his own lands, during his abfence, by injudicioufly ploughing below the ftaple; and fo injured the foil, that all the arts of cuiture cor many years hardly retrieved its former fertility. Indeed, where the ftaple is fhallow, upon a fat clay, the turning up a little of it at a time, from the britem of the cane-holes, and mixing it with sich hut dung, made of marle, or fandy mould, which may take off its cohefive quality, will in duc time, and by long fallow, convert it into good foil : but iiftiff cluy be turned up, withnut any fuch mixture, in large quan. tities, it will infallibly difappoint the operator's hopes: for though folid clay will moulder, by expofure, to a feeming tine earth, yet it will return to is primitive ftate very foon after being wet, and covered from the external air if not divided, as ahove fuggefted.

After all, the common horfe-hoeing plough drawn by two mules in a lice before each other, or the hand-hoe in common ufe, will anfwer the purpufe very well, where the lands are planted in Mr Tull's method; that is, where the fpaces are equal to the land planted in the following manner.

Suppofe fix feet planted in two rows of canes, and fix feet of land left as i fpace mplanted; and fo a whole piece of land, planted in alternate donble rows ( $F$ ), with equal faces, may be hoe-ploughed with eafe, as before hinted; and that any time during the growth of canes, when it is moft convenient to the planter, which is a

## 2 [ ] <br> 1 L A

confiderable ad:entage ; and yet it is the leaf of all at. tending this method of culture : for, lyy leaving the?c fpaces, the canes will have bo:h more ar and fua: by hoe ploughing them, the ruots of each doublo row will have large 100 m for expanfion, and confequently, by gaining more mutriment, will grow more luxuriantly : by thefe fiaces the canes may be cleaned from the blaft with much more eafe and convenience; and will ferve as proper beds to plant great corn, without the leaf injury to the canes; as well as to contain the trafh taken off the land, where by rotting, and being hoe ploughed into the foil, it will wonderfally enrich it, and will fit it to be planted immediately after the canes in the neighbouring double rows are cut down. Befides all thefe admirable advantages of planting the land in alternate double rows with equal faces, the canes, when at full age, may be eafily ftripped of their trafh, and by that means the juice rendered fo mature as to yield double the produce, and much better fugars than unfripped canes. This method of culture may be recommended for ail kinds of foil : for as by this practice the rank luxuriant canes will be more notured, fo the poor foils will be rendered more fruitful; and as the roots of the canes which expanded into thefe fpaces will be kept moif by being covered with rotien trath, fo they muft bear dry weather much longer in the burning foils. In thefe low lands which require draining by furrows, the alternate double rows and fpaces muft $b$ : made crofs the ridges; by which means thofe faces, being hoe-plonghed from the cen're to the fides, will be always preferved in a proper tate of roundnefs. By this method of planting, the canes may be fo well ripened as to yield double the quantity of fugar of canes planted in the clofe manner; which faves half the labour of cartage, half the time of grinding and boiling, and hali the fucl, befides yieiding finer fugar.

Yet, how well foever the method of planting in fingle or double alternate rows has fucceeded in the lonfe and ftiff foils, experience has fhown that it is a wrong prictice in fliff lands that a:e thrown into round or flat ridges : for thefe being molt apt to crack, the fun-beams penetrate fon to the cane roits, ftop their growth, and have an ill influence upon the fugar. It is therefore advifable to plant fuch lunds full, but in lar se holes, of 4 feet, by 5 feet towards the banks: after the plant-anes are cut, to dig out one and leave two rows ftanding, hoe-ploughing the faces afier turning all the tralh into furows till almoft rotten : for if the trad is dramm upon the Ane-ploughed fpaces, they will hardly ever monlder, at leaft not till the trafh is quite rotten. This is an infallible proof from experience of how little advantage trath is to the foil, unlefs it be in great droughts, to keep out the intenfe fun beams: for, in all other refpects, it prevents that joint operation of the fun and air in mouldering and frnctifying the foil, as has been proved by repeated experiments.

But in flat fiff foils that are properly drained by round-ridging, no culture prevents cracking fo effectually as hoe-ploughing into them a quantity of loole marle, of which that of a chocolate or of a yellow colour is beft;

Planter-beft ; and it will he fill much better, by lying upon the Ship, land, in fmall heaps, or in cane-holes, for fome time, to imbibe the vegetative powers of the air before it is intimately mixed with the foil.

As to the manner of planting cancs, the general practice of alowing four fect by five to an hole, and two frefh (c) plants, is found by common experience to beright and good in alternate rows. But the following precautions are neceflary to be obferved. Finf, let all the cane-rows run eaft and welt, that the trade wind may pafs freely through them ; becaufe air and funthine are as conducive to the growth and maturation of fugarcanes as of any other vegetable. Secondly let not any accellion of mould be drawn into hills romen the goung canes, except where water ftagnates ( H ) ; beculde the fibres which run hnrizontally and near the furface, are much broken and fpoiled by that practice. Thirdly, let the fugar-canes be cut at their full maturity ; which, in a dry loofe foil, is generally at the end of 14 or 15 months after being planted; but in cold clay-foils, not tili 16 or 17 months. Fourthly, as the cane-rows run caft and weft in as proper a direction as pofible for cartage to the fugar work, fo canes muft be cut the contraty way if the planter expents any great produce from his rattoons: for by begimning to cut canes at the part of his fiell moft remote fron the works, the carts cannot often pals over the fame tract, and confequently the cane (tools cannot be injured, more efpecially if he takes due care to cut the canes very clofe to their roots; for, by leaving a long ftub (which mult perifh) the caneftools are much injured. It may be objected to the practice of the cutting canes tranfverfely to the rows, that the negroes labour will not be fo equally divided: bitt let every man confider both fides of the queftion, and be determined by his own experience; and then he will be convinced, that it matters very little which way he cuts flraight ftanding canes; but in cales where the fugar caues lean, or are lodged by preceding high winds, it is a point of great importance to place the labourers fo as to cut the canes fift at the roots, and then, drawing them, cut off the tops: for thus by two Itrokes each cane will be cut; and twice the quantity cut in the fame time, and by the fame hands, more than by cutting in any other direction. In round-ridged land, it is proper to cut canes in the fame direction of the ridges throwing the tops and trafl into the furrows to render the carriage eafy and to preferve the ridges in their proper form.

It is almoft needlefs to fuggent the expediency of planning the cane-pieces of a plantation in exach fquares, fo that the interval may interiect at right angles; fince fuch regularity is not only more beatiful, more fafe in cafe of accidental fires, and a beter difpofition of the whole for dividing and planting one third or fourtls part of a plantation every year, but allo much eafier guarded by a few watchmen for one of thefe walking in a line
from eaft io welt, and the other from north to fouth, look through cvery avenue, where the muff fubtile thief cannot efcape the watchful eye. And if the intervals furrounding the boundary of a regular plantation be made 24 feet wide, the proprietor will receive ample recompenfe for fo much land, by the fecurity of his cancs from fires kindled in the neighbourliood, and by planting all that land in plantain-trees, which may at once yield food and frade to the watchmen, who by that means can have no excufe for abfence from their proper ftations. But as fuel grows very farce in molt of the fe inlands, it is alfo expedient to plant a logwood or flowerfence in all the boundaries of every plantation, whicls being cut every year, will furnill good flore of faggots. Logwood makes the ftrongeft and quickeft of all fences, and agrees with every foil : the cuttings make excellent oven-fuel.

So much for the general operations of planterfhip, according to the approved directions of Mr Martin. For the particular cultivation of the fugar-canes, the extraction of the fugar, and the ditillation of rum, fee the articles Saccharum, Sugar, and Rum.

PLANTIN (Chriftopher), a celebrated printer, was born near 'Pour's in 1533, and bred to an art which he carried to the ligheft degree of perfection. He went and fettled at Antwerp; and there erected a printingoffice, which was confidered not only as the chief ornament of the town, but as one of the molt extraordinary edifices in Europe. A great number of ancient authors were printed here; and thefe editions were valued not only for the beauty of the characters, but alfo for the correctnefs of the text, with regard to which Plantin was fo very nice, that he procured the moft learned men to be correctors of his prefs. He got immenfe riches by his profeffion; which, however, he did not hard up, but fpent like a gentleman. He died in 1598 , aged 65 years; and left a moft fumptuous and valuable library to his grandfon Balthafar.

PLANTING, in agriculture and gardening, is fet. ting a trec or plant, taken from its proper place, in a new ho'e or pit; throwing frefh earth over its root and filling up the hole to the level of the furface of the ground.

The firft thing in planting is to prepare the ground before the trees or plants are taken out of the earth, that they may remain out of the ground as fhort a time as pofible and the next is, to take up the trees or plants, in order to their being tranfplanted. In taking up the trees, carefully dig away the earth round the roots, fo as to come at their leveral parts to cut them off; for if they are torn out of the ground without care, the roots will be broken and bruifed, to the great injury of the trees. When you have taken them up, the next thing is to prepare thicm for planting by pruning the roots and heads. And firtt as to the roots; all the fmall fibres are to be cut off, as near to the place from whence they
(c) It is an odd fancy that flale plants grow beft, when both reafon and experience vouch that the moft fucculent plants are beft: one good plant in the centre of a large hole is fufficient when the land is full holed.
(н) The fagation of water in pools (ufual in fiff level lands) is the mof injurious circumfance attending it; for that ling duration, will convert the fined mould into diff clay. The proprietor of fuch a foil muft therefore grodge no labur to drain it well; and yet by fuch eafy gradation as to prevent the mould from being wafhed away by great floods, in caie the under ftratum be a loam.

## PLA

'lanting.
they are produced as may be, except they are to be replanted immedately after they are taken up. Then prune off all the brufed or broken roots, all uch as are irregular and crofs each other, and ail dowimight roots, efpecially in fruit-trees: fhorten the larger roots in proportion to the age, the Atrength, and nature of the thee; obferving that the walnut, mulberry, and fome other tender rooted kinds thould not be pruned fo clofe as the more hardy forts of fruit and forelt trees: in y ung fruit trees, fuch as pears, apples, plems, peaches, \&c. that are one year old from thi time of their budding or grafting, the roots may be left ouly about eight or nine inches long ; but in older trecs, they mult be left of a much greater length; but this is only to be underfood of the larger roots: for the fnall ones mult be chiefly cut quite out, or pruned very thort. The next thing is the pruning of their heads, which mult be differently performed in different trees; and the defign of the trees mult alfo be confidered. Thus, if they are defigned for walls or efpaliers, it is beft to plant them with the greateft part of their heads, which fhould remain on till they begin to floot in the fpring, when they mult be cut down to five or fix eyes, at the fame time t.aking care net to difturb the roots. But if the trees are de. figned for itandards, you fhould prune off all the fmall branches clofe to the place where they are produced, as alfo the irregular ones which crofs each other; and after having difplaced thefe branches, you fhould allo cut off all fuch parts of branches as have by any accident been broken or wounded; but by no means cut off the main leading fhoots which are neceffary to attract the fap from the root, and thereby promote the growth of the tree. Having thus prepared the trees $f_{i} r \operatorname{pl}$ lanting, you mule now proceed to place them in the earth : but firlt, if the trees have been long out of the ground, fo that the fibres of the roots are dried, place them eight or ten hours in water, before they are planted, with their heads erect and the roots only immerfed therein ; which will fivell the dried veffels of the roots, and prepare them to imbibe nourifhment from the earth. In planting them, great regard fhould be had to the nature of the foil: for if that be cold and moint, the trees fhould be planted very fhallow; and if it be a hard rock or gravel, it will be better to raife a hill of earth where each tree is to be planted, than to dig into the rock or gravel, and fill it up with earth, as it is too often practifed, by which means the trees are planted ass it were in a tub, and have but little room to extend their roots. The next thing to beobferved is, to place the trees in the hole in fuch a manner that the routs may be about the fame depth in the ground as before they were taken up; then break the earth fine with a fpade, and fcatter it into the hole, fo that it may fall in between every root, that there may be no hollownefs in the earth : then having filled up the hole, gently tread down the earti with your feet, but do not make it too hard; which is a great fault, efpecially if the ground be ftrong or wet. Having thus planted the trees, they fhould be fatened to fakes driven into the ground to prevent their being difplaced by the wind, and fome mulch laid upon the furface of the ground about their roots; as to fuch as are planted againft walls, their roots fhould be placed abont five or fix inches from the wall, to which their heads fhould be mailed to prevent their being blown up by the wind. The feafons for plauting are various, according to the diffe-

## $23]$ <br> P L A

rent forts of trees, or the foil in which they are planted. Manirg. For the trees whofe leaves fall off in winter, the beit time is the beginning of October, provided the foil he dry ; but if it be a very wet foil, it is better to defer it till the latter end of February, or the beginning of March : and for many kinds of evergreens, the beginning of April is by far the beft feafon; thnugh they may be fafely renoved at midfummer, provided they are not to be carried vory far; but fhould always make choice of a cloudy wet feafon.
In the fecond volume of the papers, \&c. of the Bath Society there is a letter on planting walte grounds. The gentleman who writes it informs us, that in the county of Norfolk, where he refides, there were about 60 or 70 years ago valt tracts of uncultivated ground, which were then thought tetally barren. "The weftern parts of it (fays he) abounded with fand of fo light a texture, that they were carried about by every wind; and in many places the fands were fo loofe that no grafs could grow upon them. Art and induftry, however have now fo altered the face of this once Arabian defert, that it wears a very different appearance. Moft of thefe tracts are either planted or rendered very guod corn-land and fheepwalks.
"Abont 30 years fince, the fides of inany of our little fand-hills were fown with the feeds of French furze, and when a wet feafon fullowed, they fucceeded very well, and grew fo falt, that once in three or four years they are cut for fuel, and fell at a good price at Thetford, Brandon, Harling, Swalfham, and places adjacent. This excited tome public fpirited gentiemen, among whom was the late Mr Buxton of Shadu ell-Lodge, near Thetford, to attempt the planting of Scotch and fpruce firs, and other hardy foreft-trees. At firit they found fome difliculty from the extreme loofenefs of the fand. But as there is in all this part of the country fine white and yellow m.rre, at about three feet depth below the fand, they very judicioully thought that incorporating it with the fand in the holes where their young trees were planted, would infure fuccefs; nor were they difappointed. The method fucceeded beyond expectation; the plantations throve exceedingly, and the roots foor reached below the fand, after which they were out of danger. This excited them to futher attempts.

On the fpots where they intended to raife new plantations from feeds and acorns, they laid on a thick coat of marle and clay, which after being rough fpread, and lying a winter in that fate, was made fire, and ploughed in juft before planting. By thefe means the foil became fixed, and in a little time covered with grafs and herbage; fo that there are now vait plantations of firs, oak, and foreft-trees, in the mof healthy and vigorous flate, where within my memory ten acres of land would not maintain a fingle theep three months.
"But the benefit of plantations, whether of fhrubs, copfe, or trees, is not confined to the immediate advan. tage, or even the future value of the wood. By anually fhed ling a great number of leaves, which the winds difperfe, and the rains wath into the foil, it is confiderably improved; and whenever fuch copfes have been ftubbed up, the ground (however unfruitful before planting) has thereby been fo enriched as to bear excellenit crops for many years, without the additimal he!p of manure. How much land-owners are interelted in planting wafte or barren foots I need not mention; and no-

Manting thing but a degree of indolenee or ignorance unpardonit.
"Nature has furnifhed us with plaints, trees, and fhrubs, adapted to almion cvery foil and fituation; and as the laws of vegetation are now much better underfood than formerly, it is a reproach to thofe whofe pradice dses not keep pace with their knowledge in making the beft ufe of her bounty. Let no man repine and fay the land is barren; for thofe fpots which appear to be fo, owe that appearance to human negligence. Induftry and art might foon render an eighth part of this kingdom nearly as valuable as the reft, which now remains in a ftate unprofitable to the owners, and difgraceful to the commurity."

Revorfe Planting, a method of planting in which the natural pofition of the plant or thoot is inverted; the branches being fet into the earth, and the root reared into the air. Dr Agricola mentions this monfrous method of pianting, which he found to faceced very well in moft or all forts of fruit-crees, timber-trees, \&-c. Bradley affirms, that he has feen a lime-tree ia Holland growing with its firt roots in the air, which had fhot out branches in great plenty, at the fame time that its firf branches produced roots and fed the tree. Mr Fairchild of Hoxton las practifed the fame with ms, and gives the following directions for performing it : Make choice of a young tree of one thoot, of alder, elm, willow, or any other tree that eafly takes root by haying; bend the fhoot gently down into the earth, and io let it remain until it has taken root. Then dig about the firt soot, and raife is gently out of the ground, till the ftem be nearly upright, and fake it up. Then prune the ronts, now erected in the air, from the bruifes and wounds they received in being dug up; ard anoint the proned parts with a compofition of two ounces of turpentine, four wunces of tallow, and four ounces of bees wax, melted together, and applied pretty warm. Afterwards prune off all the buds or thoots that are upon the ftem, and drefs the wounds with the fame compofition, to prevent any collateral fhootings, that might fpoil the beality of the fem,

PLANUDES, (Maximus), a Greek monk of Confantinople, towards the end of the Thth century, who publifled a collection of epigrams intitled Anthologia; a Greek tranfation of Ovid's Metamorphofes; a Life of $\mathbb{E}$ fop, which is rather a romance than a hififery ; and fome nther works, We know nothing more of him, than that he fuffered fome perfecution on account of his attarchment to the Latin church.

PLASHING of Hedges, is an operation thought by fome pertons in promote the growth and contiruance of old herges; but whether the fast be fo or not will admit of fome diipute. See Hedges, $n^{\circ}$ 29, 37, 2 ac .

It is performed in this manner: The old Aulss muit be cut off, $\& \times c$. wit). in two or three inches of the ground; and the beft andlongef of the middle.fized thoots mult be left to lay down. Some of the frongelt of thefe muft allo be left to anfiwer the purpofe of ftakes. Thefe are to be cut off to the height at which the hedge is intendel to be lelt; and they are to ftand at ten feet diftance onc from another ; when there are not proper thonts fir thefe at the due diffances, their places mult be fupplisd with common flakes of deal wood. The
hedge is to be firft thinned, by cutting away all but thofe fhoots which are intended to be ufed either as ftakes, or the uther work of the plafhing : the ditch is to be cleaned nut with the fpade; and it muft be now dug as at firf, with floping lides each way; and vhen there is any cavity on the bank on which the hedge grows, or the earth has been wafhed away from the rocts of the fhrubs, it is to be made grod by facing it, as they exprefs it, with the mould dug from the upper part of the ditch; all the reft of the earth dug out of the ditch is to be laid upon the top of the bank: and the owner fhould look carefully into it that this be done, for the workmen, to fpare themfel ves trouble, are apt to throw as much as they can upen the face of tle bank; which being by this means ove:loaded, is foon wathed off into the ditch again, and a very great part of the work undone; whereas what is laid on the top of the bank always remains there, and makes a good fence of an indifferent hedge.

Ia the plathing the quick, two extremes are to be avoided; thefe are, the laying it too low, and the laying it too thick. The latter makes the fap run all into the floots, and leaves the plathes without fufficient nourifhment; which, with the thicknefs of the hedge, finally kills them. The other extreme of laying them too high, is equally to be avoided; for this carries up all the nourifliment into the plafles, and fo makes the fhoots fmall and weak at the bottom, and confequently the hedge thin. This is a common error in the north of England. The belt hedges made any where in England are thofe in Herifordthire ; for they are plafhed in a middle way between the two extremes, and the cattle are by that prevented both from cropping the young fhoots, and from going through ; and a new and vigorous hedge foon forms itfelf.

When the fhoct is bent down that is intended to he plafhed, it mult be cut half way throngh with the bill: the cut muft be given floping, fomewhat downwards, and thin it is to be wound about the ftakes, and after this its fuperfluous branches are to be cut off as they frand out at the fides of the hedge. If for the firft year nr two, the field where a new hedge is made can be ploughed, it will thrive the better for it; but if the fubs are very old, it is beft to cut them quite down, and to fecure them with good de:td hedges on both fides, till the fhoots are grown up from them ftrong enough to plafh; and whercver void fpaces are feen, new fets are to be planted to fill them up. A new hedge raifed from fets in the common way, generally requires plafhing in about eight or nine years atter.

PLASSEY, is a grove near the city of Muxadab in India, famous for a battle fought between the Engliih under Lord Clive and the native Hindoos under the Nabob Surajah Dowlah. The Britifh army confifted of about 3200 men, of whom the Europeans did not exceed 900 ; while that of the Nabab confilited of 50,000 foot, and 18,000 horfe. Notwithflanding this great difproportion, however, Lord Clive effectually routed the Nabob and his forces, with the lofs of 3 Europeans and 26 Seapoys killed, and 5 Europeans and 40 Seapoys wounded. The Nabob's lofs was eftimated at about 200 men, betides oxen and elephants. See Clive.

PLASTER, or Emplaster, in pharmacy, an external application of a harder confiftence than an oint-

## I) L. A

Plaster, or Plaife, in building, a compofition of lime, fometimes wi h fand, \&c. to parget, or cover the muditics (f a building. See Paroering and Stucco.

PIASTER of Puris, a prenaration of feveral fpecies of gypfum dug near Mount Maite, a village in the ncighb. urhood of Paris; whence the name. See Alabastri, Gypsum, and Chemistry, no 635, \&.c.

The beft fort is hard, white, thining, and marbly; known by the name of plagler-fone or parget of Mount Mailre. It will neither give fire with deel, nor ferment with aquafortis: fut very freely and readily calcines in the firc inter a fine phafter, the ufe of which in building and cafting ftatucs is well known.

The nie hod of reprefenting a face truly in plafter of Paris is this: The perfon whofe figure is defigaed is laid on his back, with any convenient thing to keep off the hair. Into each inftril is ennveyed a conical $p$ iece of liiff paper, open at both ends, to allow of refiration. There tubes being anointed with oil, are fupported by the hand of an affiltant; then the face is lightly oiled over, and the eyes being kept thut, alabafter frefh calcined, and tempered to a thinifh cunfitence with water, is by fponnfuls nimbly thrown all nver the face, till it lies near the thicknefs of an inch. This matter grows fenfibly hot, and in about a quarter of an hour hardens into a kind of itony concretion; which being gently tiken (ff, reprefents, on its concave furface, the minuteft part of the original face. In this a head of good clay may be moulded, and therein the eyes ate to be opened, and other neceffary amendments made. This fecond face being anuinted with oil, a fecond mould of calcined alabatter is made, confifting of two parts joined lengthwife along the ridge of the nofe: and herein may be calt, with the fame matter, a face extremely like the criginal.

If finely powdered alabater, or plafter of Paris, be put into a baton over a fire, it will, when hot, affume the apparance of a fluid, by rolling in waves, gielding to the touch, Ateaming, \&cc. all which properties it again lofes on the departure of the heat; and being thrown upon paper, wiil not at all wet it, but immediately difcover it: clf to be as motionlefs as before it was fet over the fire; whereisy it appears, that a heap of fuch little bodics, as are neither fipherical nor otherwife regularly fhaped, nor fmail enough to be below the difcernment of the e.c. maly, without fufion, be made fluid, barely by a iufficently flrong and various agitation of the particics which compole it ; and moreover lofe its fluidity inumediaiely upon the ceflation thereof.

T'wo or three fpoontuls of burnt aiabafter, mixed up thin witin water, in a fhert time coagulates, at the bottom of a veffel full of water, into a hard lump, notwithflandirg the watcr that furrounds it. Artificers obferve, that the coagulating property of burnt alabater will be very much inspaired or lott, if the powder be kept too long, efpecinily if in the open air, before it is made ufe of; and wilicis it hath been nuce tempered with water, and fiffired io grow hisd, they camot, by any lurning or powdering of it again, make it ferviceable tor their rurpofes as betore.

Vol. XV.

This matter, when wrought into veffels, \&ce. is fill of fo loofe and fpongy a texturc, that the air has eafy pallige through it. Mr Boyle gives an account, among his experiments with the air-pump, of his preparing a tube of this plafter, clofed at one cid and npen at the other: and on applying the open end to the cement, as is ufually done with the rectiver:, it was found utterlyimpofible to exhault all the air out of it ; for frelh air from withont preffed in as faft as the other, or internal air, was cxhmutted, though the fides of the tube were of a confiderahle thicknefs. A tube of iron was then put on the engine ; fo that being filled with water, the tube of phater of Paris was covcred with it ; and on ufing the pump, it was inmediately feen, that the water palfed through into it as eatily as the air had donc, when that was the anmbient fuid. After this, trying it with Venice turpentine intead of water, the thing fucceeded very well; and the tube might be perfectly exhautted, and would remain in that flate feveral hours. After this, on pouring fome hot oil upon the turpentine, the carc was much altered; for the turpentine melting with this, that became a thinner fluid, and in this frate capable of paling like water into the pores of the plafter. On taking away the tube affer this, it was remarkable that the turpentine, which had pervaded and filled its pores, rendered it tranfparent, in the manner that water gives tranfparency to that fingular fone called oculus mundi. In this manncr, the weight of air, under proper management, will be capable of making feveral forts of glues penetrate plafter of Paris: and not only this, but baked earth, wood, and all other bodies, porous enough to admit water on this occation.
Plater of Paris is ufed as a manare in Pennfylvania: a letter from a gentleman in this country inferted in the 5 th volume of the Bath Society Papers, reprefents its utility and which we fhall infert here for the fatisfaction and information of our agricultural readers. "The beft kind is imported from hills in the vicinity of Paris: it is brought down the Seine, and csported from Havre de Grace. I am informed there are large beds of ir in the Bay of Fundy, fome of which I have leen nearly as good as that from France; neverthelefs leveral cargoes brought from thence to Philadel phia have been ufed without effect. It is probable this was taken from the top of the ground, and by the influence of the fun and atmofphere difijofferfed of the qualities neceffary for the purpofes of vegetation. The lumps compofed of flat fhining fipecula are preferred to thofe which are formed of round particles like fand: the fimple method of finding out the quality is to pulverize fome, and put it dry into an iron pot over the fire, when that which is good will foon boil, and great quantities of the fixed air efcape by ebullition. It is pulverifed by firt putting it in a fampingmill. The finer its pulverization the better, as it will thereby be more generally diffufed.
"It is beft to fow it in a wet day. The moft approved quantity for grafs is fix bufhels per acre. No art is required in fowing it more than making the diftribution as equal as poffible on the fward of grafs. It operatesaltogether as a top manure, ard therefore fhould not be put on in the fpring until the principal frofts are over and vegetation hath begun. The get:eral time for fowing with us is in April, May, June, July, Angult, and even as late as Scprember. Its effects will genc. D

Plafer rally appear in 10 or 15 days; after which the growth 1 of the grais will be fo great as to produce a large Plaftic. burden at the end of fix weeks afier fowing.
"It muft be fown on dry land, not fubject to be overflown. I have fown it on fand, loam, and clay, and it is difficult to fay on which it has beft anfwered, althongh the effeet is fooner vifible on fand. It has been ufed as a manure in this fate for upwards of twelve years. Its duration may, from the beft information I can collect, be eflimated from feven to twelve years; for, like other manure, its continuance very much depends on the nature of the foil on which it is placed.
"One of my neighbours fowed fome of his grafs ground fix years ago, another four years ago; a great part of my own farm was fown in May 1788. We regularly mow two crops, and pature in autumn ; no appearance of failure, the prefent crop being full as good as any preceding. I have this feafon mowed fifty acres of red clover, timothy-grafs, white clover, \&c. which was plaftered laft May, July, and September: many who faw the grafs eftimated the produce at two tons per acre, but I calculate the two crops at three tons. Several Itripes were left in the different fields without plafter; thefe were in a meafure unproductive, being fcarce worth mowing. In April 1788 , I covered a piece of grafs land upwards of two inches thick with barn manure ; in the fame worn-out field I fowed pla. fter, to contralt it with the dung. I mowed the dunged and plaftered land twice laft year and once this ; in every crop the platter has produced the moft. You will remember, in all experiments with clover, to mix about one-third timothy grafs feed; it is of great advantage in leiving as a fupport for the clover; it very much facilitates the curing of clover, and when cured is a fuperior fodder. The plafter operates equally as well on the other graffes as on clover. Its effect is faid to be good on wheat, if fown in the fpring ; but I cannot fay this from experience. On Indian corn I know its operation to be great; we ufe it at the rate of a tablejpoonful for a hill, put in immediately after dreffing.
"From fome accurate experiments laft year made and reported to our Agricultural Society, it appears that nine bufhels of additimal corn per acre were produccd by this method of ufing plafter."
plastering. Sce Pargetting.
PLASTIC, denotes a thing endowed with a formative power, or a faculty of forming or fafhioning a mafs of matter after the likenefs of a living being.

Ptastic.Nature, a certain power by which; as an inftrument, many philofophers, both ancient and modern, have fuppofed the great motions in the corporeal world, and the varinus proceffes of generation and corruption, to be perpetually carried on.

Among the philofophers of Greece, fuch a power was almoft univerfally admitted. It feems, indecd, to have been rejected only by the followers of Democritus and Epicurus, who talk as if they had thought gravity effential to matter, and the fortaitous mot:on of atoms, which they held to have been from eternity, the fource not only of all the regular motions in the univerfe, but alfo of the organization of all corporeal fyltems," and even of fenfation and intellegion, in brutes and in men. It is needlefs to fay, that thofe men, whatever they might profefs, were in reality atheifts ; and Democritus, it is univerfally known, arowed his atheifm. exiftence of a plaftic nature, confidered it not as an asent in the ftrict fenfe of the word, but merely as an inftrument in the hand of the Deity; though even among them there were fome who held no fuperior power, and were of courfe as grofs atheifts as Democritus himfelf. Such was Sirato of Lampfacus. This man was originally of the peripatetic fchool, over which he prefided many years, with no fmall degree of reputation for learning and eloquence. He was the firft and chief affertor of what has been termed Hylowoic atheifm; a fyftem which admits of no power fuperior to a certain nc. tural or plafic life, effential, ingenerable, and incorruptible, inherent in matter, but without fenfe and confcioufnefs. That fucls was his doctrine we learn from Cicero, who makes Yelleius the Epicurean fay, "Nec audiendus Sirato qui Pbyficus appclatur, qui omnem vim divinam in Natural fitam effe cenfet, quæ caufas gignendi, augendi, minuendive habeat, fed careat omnifenfu $\ddagger . "$ That Strato, in admitting this plaftic principle, differed widely from Democritus, is apparent from the following account of him by the fame author: "Strato Lampfacenus negat opera deorum fe uti ad fabricandum mundum, quæcunque fint docet omnia effe effecta natura, nec ut ille, qui afperis, et levibus, et hamatis uncinatifque corporibus concreta hæc elfe dicat, interjecto inani ; fomnia cenlet hxe effe Democriti, non docentis fed optantis $\oint . "$

That the rough and imooth, and hocked and crook. ed, atoms of Democritus, were indeed dreams and dotages, is a pofition which no man will controvert ; but furely Strato was himfelf as great a dreamer when he made fenfation and intelligence refult from a certain plaAtic or fpermatic life in matter, which is itfelf devoid of fenfe and confcioufnefs. It is, indeed, inconceivable, to ufe the emphatic language of Cudworth, "how any one in his lenles thould admit fuch a monltrous paradox as this, that every atom of dult has in itfelf as much wifdom as the gre:itelt politician and moft profound philofopher, and yet is neither confcious nor intelligent!" It is to be obferved of Strato likewife, that though he attributed a certain kind of life to matter, he by no means allowed of one common life as ruling over the whole material univerfe. He fuppofed the feveral parts of matter to have fo many feveral platic lives of their own, and feems $\ddagger$ to have attributed fomething to chance in the production and preiervation of the mundane fyftem.

In denying the exiftence of a God, perpetually directing his plattic principle, and in fuppofing as many of theie principles as there are atoms of matter, Strato deviated far fiom the coctrine of Ariftotle. The great founder of the peripatetic chool, as well as his apoltate difciple, taught that mundane things are not effected by fortuitons mechanifm, but by fuch a nature as atts regularly and artificially for ends; yet he never confiders this nature as the higheft principle, or fupreme Numen, but as fubordinate to a perfect mind or intellect; and he exprefsly affirms, that " mind, together with nature, formed or fafhioned this univerfe." He evidently confiders mind as the principal and intelligent agent, and nature as the fubfervient and executive inflrument. Indeed, we are Arongly inclined to adopt the opinion of the learned Motheim, who thinks that by nature Arifotle meant nothing more than that tepuorns $\downarrow$ uxixn, or animal beat, to which he attributes immortality, and of which he exprefsly fays $\ddagger$ that all things are full. Plantic. this as it may, he always joins God and nature together, and affirms that they do nothing in vain. The fame doarine was taught before him by llato, who affirms that " nature, together with reafon, and according to it, orders all things." It mult not, however, be concealed, that Plato feems to have attributed intelligence to the principle by which he fuppofed the world to be animated; for Chalcidius, commenting on the \# feet 53 . Timæus $\ddagger$, thus expreffes himfelf: "Hxc eft illa rationabilis anima mundi, qux gemina juxta meliorem naturam veneratione tutelam prabet inferioribus, divinis difpofitionibus obfequens, providentiam nativis impertiens, æeterno:um fimilitudine propter cognationem beata."-
\|De Dor- Apuleius, too, teils us\|," "Illam caieftem animam, fonmate Pla- tem anirrarum omnium, optimam virtutem efle genetritonis.
cem, fubferviri etiam Fabricatori Deo, et prafto effe ad onmia inventa ejus." Plato pronourciat.

This doEtrine of Plato has been adopted by many moderns of great eminence both for genius and for learning. The celebrated Berkeley bihop of Cloyne, after giving the view of Plato's anima nuindi, whicls the reader will find in our article Motiov, $\mathrm{n}^{\circ}$ 10, thus recommends the fudy of this philofoply*: "If that philofopher himfelf was not read only, but nudied alfo with care, and made his own interpreter, I believe the prejudice that now lies againft him thould foon wear off, or be even converted into high efteem, for thofe exaltted notions, and fine hints, that fparkle and fline throughout his writings; which feem to contain not only the mofl valuable learning of Athens and Greece, but alfo a treafure of the moft remote traditions and early fcience of the eaft." Cudworth, and the learned author of Ancient Metaphyfics, are likewife ftrenuous advocates for the Arifotelian doctrine of a plafic nature diffufed through, the material. world; (fee Metaphysics, $\mathrm{n}^{\circ} 200,201,202$.) : and a notion very fimilar has lately occurred to a writer who does not appear to have borrowed it either from the Lyceum or the Academy.

This writer is Mr - Young, of whofe afive fubfance, and its agency in moving bodies, fome account has been given elfewhere, (fee Мотion). As a mere unconfcious agent, immatcrial, and, as he expreffes himfelf, innmental, it bears a ftriking refemblance to the plaflic nature or vegetable life of Cudworth: but the author holds it to be not only the principle of motion, but alfo the bafis or fubfiratum of matter itfelf; in the production of which, by certain motions, it may be faid to be more ftrietly plaffic than the bylarchical principle, or vis genirrix, of any other philofopher with whofe writings we have any acquaintance. Though this opinion be fingular, yet as its author is cvidently a man who thinks for himfelf, unawed by the authority of ce'cbrated names, and as one great part of the utility of fuch works as ours confifts in their ferving as iudexes to fcience and literature, we thall lay before our readers a fhort abftract of the reafonings by which Mr Young endeavours to fupport his hypothelis, and we fhall take the liberty of remarking upon thofe reafonings as we proceed.

The author, after a fhort introduction, cnters upon his work $\ddagger$, in a chapter entitled, Analyfis of Matter in geon the neral. In that chapter there is little novelty. He treats, powers as others have done, of primary and fecondary qualities, and me- and adheres too clufely to the language of Locke, when chanifm of nature.
he fays, that " the nature of bodies fignifies the aggre. grate of all thofe id uts with which they furnilh us, and ly which they are made known." To fay the beft of it, this fentence is inaccuratcly expreffed. An aggregate of ideas may be secationed by the impulfe of hodies on the organs of fenfe, but the effect of impulfe cannot be that which impels. We fhould not have made this remark, which may perhaps be deemed captious, were we not purfuaded that the vague and inaccurate ufe of terms is the fource of thofe mitakes into which, we caninot help thinking, that the very ingenious author has fometimes fallcn, Having juftly obferved, that we know nothing directly of bodies but their qualities, he proceeds to invefligate the nature of folidity,
"Solidity (he fays) is the quality of body which primcipally requires our notice. It is that which fills extenfion, and which refifts other folids, occupying the place wnich it occupies; thus making extenfion and figure real, and different from mere fpace and vacuity. If the fecondary qualities of bodies, or their powers, varioufly to affect our femfes, depend on their primary qualities, it is chiefly on this of folidity; which is therefore the moft important of the primary qualities, and that in which the cflence of body is by fome conceived to confifl. This idea of folidity has been judged to be incapable of any analy fis; but it appears evident to me (continues our author), that the idea of folidity may be refolved into another idea, which is that of the power of refilting within the extenfion of body. Hence it becomes unneceffary, and even inadmifible, to fuppofe that folidity in the body is at all a patternor archetype of our fenfation."

That folidity in the body, and we know ncthing of folidity any where elfe, is no pattern of any fenfation of ours, is indeed moft true, as we have fhown at large in another place, (fee Metaphysics, $n^{\circ} 44$ and i7t): but to reconcile this with what our author afferts immediately afterwards, that "folidity is no more in bodies than colours and flavours are, and that it is equally with them a forfation and an idea," would be a tafk to which our ingennity is by no means equal. He aflirms, indeed, that folidity, as it is faid to be in bodies, is utterly incomprelienfible; that we can perfectly cemprehend it as a fenfation in ourfelves, but that in bodies nothing more is required than a power of active refiftance to make upon our fenfes thofe impreflions from which we infer the reality of primary and fecondary qualities. This power of refiftance, whether it ought to be called adive or paffive, we apprehend to be that which all other philofophers have meant by the word folidity; and though Locke, who ufes the words idea and notion indifcriminately, often talks of the idea of folidity, we believe our author to be the firt of human beings who has thought of treating folidity as a fenfation in the mind.

Though it is wrong to innovate in language, whea writing on fubjects which require much attention, we mult, however, acknowledge it to be unworthy of inquircrs after truth to difpute about the proper or improper ufe of terms, fo long as the meaning of him who employs them can be eafily difcovered. We fhall, therefure, follow our author in his endeavours to afcertain what this power of refiftance is which is commonly known by the name of folidity. All power he juflly holds to be active; and having, by an argument (A) of which we do

D 2 not
" (A) we can only conceive of folidity as being a refiftance of the parts of any body, to a power which endea-

## P L A

 not perceive the force, attempted to prove that it is by an inward powit, and not by its inertia, that one body prevents another from occupying the fame place with itfelf, he naturally enough infers matter to be effentially active. "But the activity of matter is to be confilered in a certain limited fenfe, and its inertnefs is to be regarded in another limited fenfe; fo that thefe are compatible within their refpective limits. The adivity of body may be confidered as belonging to the parts of a compound; its inertia as the ineriia formed of thofe parts. The attions of the parts are everywhere oppofed to each other, and equal ; and hence refults the inactivity of the whole."Sozidity alone of the primary qualities being pofitive, and peculiar to bodies, and our author having refolved this into action or rower, it follows, by his analyfis, that the essence of body is reduced to power likewife. But, as he properly obferves, power is an idea of reflestion, not acquired by the fenfes, but fug. gefted by thought. Hence our knowledge of real exiftence in body mult be fuch as is figgetted to us by our thoughts exercifed about our fenfations. "We are capable of acting and producing changes in appearances; and this faculty, which we experience to exift in ourfelves, we call power. We arc confcious of the exertion of our own power; and therefore, when we fee action or change happen without any exertion of ours, we refer this to other powers without us, and neceffarily conclude the POWER to exit where the change begins or the action is exerted. This power, then, referred to bodies, mult exit in them, or it can cxit no where."

In two chapters, which might eafily have been com. preffed into one not fo long as the fhortelt of them, our author analyzes atoms or the primary particles of matter, and Arenuoufly oppofes their impenetrability. He allows that there are atoms of matter not divifible byany known force ; but as thefe, however fmall, nuft fill be conceived as having extenfion, each of them mun be compofed of parts held together by the fame power which binds together many atoms in the fame body. This power, indeed, he acknowledges to operate much more forcibly when it cements the parts of a primary atom than when it makes many atoms cohere in one mafs; but fill it operates in the fame manner : and as the ideal
analytis may be carried on ad infinitum, the only pofitive idea which is fuggefted by atoms, or the parts of atoms, is the idea of a refilling power. That this power of refifance, which conftitutes what is vulgarly called the folidity of bodics, may not be abfolutely impenetrable, he' attempts to prove, by fhowing that refiltance does in fast take place in cafes where impenetrability, and even folidity, are not fuppofed by any man.
" Let us endeavaur (lays he) to bring togetlier two like poles of a magnet, and we fhall experience a refiltance to their approximation. Why, then, may not a piece of iron, which between our fingers refilts their coming together, refift by an efficacy perfectly fimilar, tho' more ftrongly exerted? If magnetifm were to as upon our bodics as upon iron, we thould feel it ; or were magnets endowed with fenfation, they would feel that which refifts their nearer approach. The refifing extenfion between the two magnets is permeable to all the rays of light, and reflecting none is therefore unfeen; but it is eafy to conceive that the fame power which refints the approach of the iron might refilt and reflect fome rays of light. We thould then have a vifible object interpofed between the two magnets, as we have before fuppofed it might be a tangible one. It is likewife eafy to conccive that which is tangible and vifible fo applied to our organs of talting, of fnelling, and of hearing, as to excite ideas of flavours, odours, and founds. Thus we fee that an action, in which no fuppofition of folidity or impenetrability is involved, may be conceived to affume all the qualities of matter, by only fuppofing a familiar effect extended in its operation."

This reafoning is exceedingly ingenious, though perlaps not original ; but what is of more importance, it does not approach fo near to demonfration as the author feems to imaginc. If magnets operate by means of a fluid iffuing from them (fee Magnetism, chap. 3.), thofe who hold the folidity or impenctrability of matter will maintain, that each at $m$ of the magnetic fluid is folid and impenetrable. That we do not fee nor feel thefe atoms, will be confidered as no argument that they do not exift for we do not fee, nor in a clofe room feel, the atoms of the furrounding atmofphere; which yet Mr Young will acknowledge to have a real exiftence, and to be capable of operating upon our fenfes of hearing and fonelling. Let us, however, luppofe, that by this
reafoning
vours to fesarale them, or to bring them nearer together. Now, that which refits any power, and prevents its effed, is alfo a power. By refiftance, I mean here an adive refiftance, fuch as an arimal can cmploy againt an animal. If a horfe pulls againft a load, he draws it along; but if he draws againft another horie, he is put to a fand, and his endeavour is defeated. When any endeavour to change the fituation of the parts of any folid is in like manner prevented from taking effen, and the parts retain their fituation, the fituation las plain!y been prefu ved by an active refiftance or power, equivalent to that which was fruitefly exerted on them."

Such is cur author's reafoning to prove that matter is cffentially active, and that from this activity refults our notion of its folidity: but does he not here crnfound folidity with hardnefs, and impenetrability with coherion? He certainly docs; for suater is as folid, in the poper fenfe of the word, as adamant, and the particles of air as the particles of iron. The parts of water are, indeed, feparated with eafe, and thofe of adamant with difficulty; but it is not becaufe the latter have more folidity than the former, but becaufe the power of conelion, whatever it may be, operates upon them with greater force. Solidity is an attribute of a whole; hardncfs and foftnefs refults from the cohelime of parts. We do not at all perceive the propriety of the limile of the horfe pulling a load, and aften wards pulling againh another horfe. Is it becaufe both horfes are alive that one of them cannot prevail againtt the other, and becaufe the load is inartive that cither of them may drag along a mafs of iron of haif a tun weight? If fo, double or triple the mafs, and a very ftange phenomenon will be the refult; for we fhall have an active whole compounded of two or three inactive parts, even theugh thofe parts fhould not be in contact!

Platic. reafoning he has eftablifhed the non-exiftence of cvery thing in the primary atoms of matter but active powers of teliftance, and let us fee how he conceives the actions of thefe powers to conflitute what gives us the notion of inert and folid body; for that we have fuch a notion cannot be denied.

To act he allows to be an attribute, and jufly obferves, that we cannot conceive an attribute to exilt without a fubflance. "But (fays he) we have traced all phenomena to action as to a generic iden, comprehending urder it all forms of matter and motion as fpecies of that genus. By this analyfis, that complex idear we have ufually denominated'matter, and confidered as the fubftance or fubftratum to which motion appertained as an attribute, is foun to change its character, and to be itfelf an attribute of a fubfance effentially active, of which one $m$ dification of montion produces matter and another generates motion." The action of this fubflance Mr Young determines to be motion (fee Motion, $n^{\circ}$ 16.) ; and he proceeds to inquire by what kind of motion it produces matter, or inert and refifting atoms.
"Whatever portion of the active substance is given to form an atom, the following things are neceffary to be united in fuch potion of alive fubftance: $1 / f$, It muft in fome refpect continually move; for otherwife it would lofe its nature, and ceafe to be active. 2 dly , It muft alfo in fome other refpect be at reft, for otherwife it would not form an adive atom. 3 dly , It mut preferve unity within itfelf." The author's proof of the firft of thele pofitions we have given elfewhere. The fecond he holds to be felf-evident ; and the third he thinks eftablifhed by the following reafoning: "Solidity is the refult of thofe actions among the parts of any whole, whereby the unity of the whole is preferved within itfelf. Several uncohering things may be united by an external bond: this does not conftitute thefe one folid; it may be one bundle: but if feveral things cohere, and have a unity preferved within themfelves, they become one folid. An atom is the leaft and moft fimple folid."

Having thus proved the neccfity of thefe three requifites to the formation of an atom, he ohferves, that "the two firt can nnly be united in a rotation of the portion of active fubltance about a center or axis at reft. By fuch a motion, allibe parts fucceffively occupy different places in the orbit of rotation, and therefore move; the centre round which they revolve being at reft, the swlole portion is alfo at reft; and thus the purtion is at once moving and quiefcent, as is required. The fame kind of motion will alfo fulfil the terms of the third requfite; fora fubflance having a revrlving motion around its own centre, preferves its unity by reafon of all the parts preferving the fame relation to the centre: and further, a motion of the aktive fubftancc about a centre or axis will be an ativity in the fame oroit, which will act upon and refift whatever thall interfere to oppofe its activity, or deftroy the unity of the fphere, by diverting the courfe of the revolving motions. The aftivity or motion of a portion of active substance about a centre will, therefore, give folidity to fuch portion ; for it wiil give it unity and refiftance, and in a manner tie together all the parts, forming them into one mafs about their c smmon contre: for they $m$ ve or are active not towards the ecntre, in which cafe they would be loft in son-exten-
fion; nor from the centre, where they would difipate in Plaftic. boundlefs fpace; but alout the centrc, preferving the fime limits of extenfion : and being in this way active, they in this way refift any orler activity oppofed to them, that is, they refit any action which tends to pene. trate or divide this fphere of revolving activity. Therefore, fince any portion of attive fubtance docs, by revol. ving about a centre, become an united, reffiting, and quiefent whole, the fmalleft portions of the Active substance which have fuch motions will become atoms, or make the finalleft portions of matter."

Having thus thown to his own fatisfaction how atoms of matter are formed, he next explains what at firft he confeffes may have appeared a paradox, "how the active substance, retaining its own nature and effential properties, continuing immatcrial, unfolid, and active, puts on at the fame time the form of matter, and becomes material, folid, and inert. A fphere of revolving adive fubfance, as it revolves continually abont a contre, and as parts of the fubftance, are confidered as fueceffively pafling through every point in the orbit; confidered thus in its parts, and in its motions, it is active sue. stance, immaterial, and unfolid; but the whole fphere, confidered unitically, collectively, and as quiefcent, is in this point of view a folid atom, material, and inert."

Such is the active fubfance of Mr Young, and fuch his theory of the formation of matter. That he has not with fervility copied from the ancients, every reader of his book, who is not an abfolute ftranger to Greek and Roman literature, will readily acknowledge; and yet if his theory be well founded, he has difcovered a mid. dle fubfance between mind and matter, more properly plafic than Ariftotie or Plato, Cudworth or Berkeley, ever coneeived. But truth compels us to add, that to us his theory appears to labour under infuperable objec. tions, That there may be in the univerfe a fubfance effentially active, and at the fame time not intelligent, is a propofition which we are by no means inclined to controvert. Various phenomena, both in vegetable and animal life, lead us to fufpect that there is fuch a fuofance; but it does not follow that we are inclined to adopt our author's doetrine refpecting the formation of matter. He conceives his proof, indeed, to be " in its nature not at a!! imperfect, or to fall flort of demonItration; and if any one refure it, he thinks it will be neceflary for him to thow, cither that the exp'anation offered is not fufficient, or that fome other explanation will ferve equally well."

To thow that the exl, anation offered is not fufficient, will nor, we apprehend, be a very arduous tafk; but we have no inclination to attempt ourfelves another explanation, becaufe we belicve that of the formation of ma:ter no other account can be given than that which refolves it into the fat of the Creator. That it cannot be formed by the motion of an immaterial fubftance in the manner which our author lias very clearly deferibed, feems to be a trnth fo evident as not to admit of proof; for if motion be, as he defincs it, a change of place, every thing that is mored muft have the quality of extenfion. But all the parts of this adive fubltance whiolt are given to form an atom, move round a centre, and are exprefsly faid to occupy fucceffively differert fiaces in the orbit of rotation. Every one of theie parts, therefore, is an extendcd being : and fince, aecorcing to ore authos.
author, folidity is nothing but an akive pozver of refilance, and the parts of this afive fubtance, in their rotation round their centre, ad upon and refif whatever interferes to oppofe their adivity, it follows that each of thefe parts is likewife a folidbeing. But, in the opinion of Mr Young himfelf, and of all mankiad, whatever is extended and folid is material. This theory, therefore, exhibits a procefs in which atoms are formed of a fubfance, which, though it is faid to be ative, inmaterial, and uniolid, appears, when narrowly intpected, to be nothing elfe than a collection of thofe very atoms of which the author pretends to explain the formation. Mr Young, who examines and very freely cenfures fome of the doctrises of Newton and others, is too much a man of fcience to be offended at us for ftating objections to a theory which is quite new, to a transformation which he himfelf acknowledges may to many " appear not only problematical and dificult to conceive, but wholly impollible, and implying contradictions abfolutely and for ever irreconcileable." Whether this be a jult character of it our readers mut determine ; but if we did not believe the author to be a man of ingenuity, we fhould not lave introduced him or his work to their acquaintance.

PLastic Art, the art of reprefenting all forts of figures by the means of moulds. This term is derived from the Greek word riasix:", which fignifies the "art of forming, modelling, or calting, in a mould." A monld in general is a body that is made hollow for that purpofe. The artift makes ufe of them to form figures in bronze, lead, gold, filver, or any other metal or fufible fubftance. The monld is made of clay, ftuecu, or other compofition, and is hollowed into the form of the figure that is to be produced; they then apply the jet, which is a fort of funnel, through whieh the metal is poured that is to form the figures, and that is called running the metal into the mould.

It is in this manner, but with much practice and attention, that the artift forms, 1. Equeitrian and pedeftrian ftatues of every kind; 2. Groups; 3. Pedeftals; 4. Bafs-reliefs; 5. Medallions; 6. Cannons, mortars, and other pieces of artillery; 7. Ornaments of architecture, as capitals, bafes, \&c.; 8 Various forts of furniture, as luitres, branches, \&c. in every kind of metal : and in the fame manner figures are catt in fucco, platter, or any other fuffble matter. See P $\operatorname{lASTER}$ of Paris.

Wax bsing a fubftance that $i_{s}$ very eafily put in fufion, platic makes mucla ne of it. There are impreffions which are highly pleafing in colcured wax, of medallions, baifo and alto relievos, ad of detached figures; which, however, are fomewhat brittle. But this matter has been carried too far: they have not only formed mou'ds to reprefint the likenefs and the bult of a living perion, by applying the platter to the face itfelf, and afte: wards cifting molted wax into the mould : but they have alro painted that wasen bult with the natural colours of the face, and have then applied glafs eyes and natural hair; to which they have joined aftuffed body and limbs, with hands of wax; and have, laftly, drefled their figure in a real habit; and by the fe means have produ. ced an object the moft thocking and deteftable that it is polfible to conceive. It is not it fatue, a buft, a natural reicmblance that hley form; but a dead body, a lifelel's countenuce, a mere carcaie. The ftiff air, the inflexible muicies, he laggard eves of glafs, all contribute to
produce an objeft that is hideous and difgultiful to every man of talte. Figures like theefe offend by affording too exact an imitation of nature. In no one of the polite arts ought imitation ever to approach fo near the truth as to be taken for nature herfelf. Illufion muft have its bounds; without which it becomes ridiculous.

There is another invention tar more ingenious and pleafing, whiel: is that wherein M. Lippat, antiquary and artift at Drefden has fo much excelled. He has found the means of refembling, by indefatigable labour, great expence, and infinite tafte, that immenfe number of ftones, engraved and in camaieu, which are to be feen in the moft celebrated cabinets. He has made choice of thofe that are the moft beautiful; and, with a pafte of his own invention, he takes from thefe fones an impreffion that is furprifingly accurate, and which afterwards become as marble: thefe impreflions he calls pafi. He then gives them a proper colour, and inclofes each with a gold rim ; and, by ranging them in a judicious order forms of them an admirable fyftem; They are fixed on palteboards, which form fo many drawers, and are then inelofed in cafes, which reprefent folio volumes, and have titles wrote on their backs; fo that thefe fictitious books may conveniently occupy a place in a library. Nothing can be more ingenious than this invention ; and, by means of it, perions of moderate fortune are enabled to make a complete collection of all antiquity has left that is excellent if this kind; and the copies are very little inferior to the originals.

There is alfo another method of taking the impreffions of camaieus, medals, and coins, which is as follows: They wafh or properly clean the piece whofe imp:eflion is to be taken, and furround it with a border of wax. They then diffolve ifinglafs in water, and make a decoction of it, mixing with it fome vermilion, to give it an agreeable red colour. They pour this pafte, when hot, on the Itone or medal, to the thicknefs of about the tenth part of an inch ; they then leave it expofed to the fun, in a place free from dut. After a few days this pafte becomes hard, and offers to the eye the moft admirable and faithful reprefentation of the medal that it is poltible to conceive : they are then carefully placed in drawers; and thoufands of thofe impreflions, which comprehend many ages, may be included in a fmall compafs.

The proficients in plaftics have likewife invented the art of calting in a mould papier maché or difolved paper, and forming it into figures in imitation of fculpture, of ornaments and decorations for ceilings, fur niture, \&c. and which they afterwards paint or gild. Tinere are, however, fome inconveniences attending this art; as, for example, the imperfections in the moulds, which render the contours of the figures inelegant, and give them a heavy air : thefe ornaments, moreover, are not fo durable as thofe of bronze or wood, feeing that in a few years they are preyed on by the worm.

The figures that are given to porcelain, Delft ware, \&c. belong alfo to platics; for they are formed by moulds, as well as by the art of the feulptor and turner; and by all thefe arts united are made vafes of every kind, figures, groups, and other defigns, either for ule or nrnament.

From this general article the reader is referred to Foundery, Cast, Glazing, Porcelain, PapierMachí, Pottery, Delft W'are.

PLATA,

## PLA [ $3^{1}$ ] PLA

PLATA, the name of a very great river of South America, running through the province of Paraguay ; whence the whole country is fometimes called Plata; though this name is ufually befowed only upon a part of Paraguay. In the latter fenfe it comprelends all that country bounded on the eaft and fouth-ealt by the Atlantic Ocean ; on the fouth, by Terra Magellinica ; on the weft by Tucuman; and on the north, by the provinces of Paraguay Proper and Parana. The great river La Plata, from which the country has its name, was firlt difcovered in 1515, by Juan Diaz de Solis; but denominated La Plata by Sebaftian Gabato, from the great quantity of the precious metals he procured from the adjacent inhabitants, imagining it was the produce of the country, though in fact they brought it from Peru.

The country lics between $32^{\circ}$ and $37^{\circ}$ of fouth la. titude. The climate is pleafant and heaithy. Their winter is in May, June, and July, when the nights are indeed very cold, but the days moderately warm; the froft is neither violent nor lafting, and the fnows are very inconfiderable.

The country confifts mofly of plains of a valt extent, and exceeding rich foil, producing all forts of European and American fruits, wheat, maize, cotton, fugar, honey, \&c. and abnunding with fuch excellent pattures, that the bealts brought hither from Spain are multiplied to fuch a degree, that they are all in common, no man claiming any property in them, but every man takes what he hath occafion for. The number of black cattle, efpecially, is fo prodigions, that many thoufands of them are killed merely for their hides, every time the fhips go for Spain, and their carcafes left to be devoured by wild beafts and birds of prey, which are alfo very numerous. Sometimes, when they cannot vend their lides, they will kill them for their tongues; and thofe who care not to be at the trouble to fetch them from the plains, may buy them for a trifle. There is a curious account in Lord Anfn's voyage of the manner of hunting them on horfeback; and of catcling and killing them, by throwing a noofe on their horas at full gallop, the horfes being trained to the fport. Horfes are no lefs numerous, and in common lite the other cattle; fo that a man may have as many as he pleafes for the catching; and of thofe that are already broke, one may buy fome of the beft, and of the true Spanifh breed, for a piece-of cight per head. Wild-fowl alfo is in great plenty here ; partridges in particular are more numerous, and as large and tame as our hens, fo that one may kill them with a ftick. Their wheat makes the fineft and whiteft of bread; and, in a word, they feem to want for nothing here, efpecially the natives, but falt and fuel. The former the Spaniards have brought to them from other parts; and the latter they fupply themfelves with, by planting valt numbers of almond, peach, and other trees, which require no other trouble than putting the kernels into the ground, and by the next year, we are told, they begin to bear fruit. The return for European commodities is fo great here, that it almoft exceeds belief; an ordinary two-penny knife fetching a crown, and a gun of the value of 10 or 13 faillings 20 or 30 crowns, and fo of the reft.

The river Plata rifes in Peru, and receives a great many others in its courfe; the chief of which is the Paraguay. The water of it is faid to be very clear and
fweet, and to petrify wood; and contains fuch plenty and variety of fifh, that the pcople catch great quantities of them without any other inftrument than their hands. It runs moftly to the fouth and foutl-eaft; and is navigable the greater part of its courfe by the largeft veffels, and full of delighltful intands. All along its banks are feen the mof beatutiful birds of all kinds; but it fometimes overflows the adjacent country to a great extent, and is infefted by ferpents of a prodigious bignefs. From its jumtion with the Paraguay to its mouth is above 200 leagues. We may form fome judgement of its largenefs by the width of its mouth, which is faid to be about 70 leagues. Defore it falls i:tto the Paraguay it is called Panama. Sec Panama.

PLATAR (anc. geoz.), a very ftrong town of Bootia, in its fituation cxpofed to the north wind (Theophrattus) ; burnt to the ground by Xerxes (Herodotus, Jultinus) ; mentioned much in the courfe of the Perfian war: Famous for the defeat of Mardonius, the Perfian general; and for the moft fignal vidory of the Lacedemonians and other Greeks under Paufanias the Lacedemonian, and Arinides an Athenian general (Nepos, Diodorus, Plutarch) ; in memory of which the Greeks erected a temple to Jupiter Eleutherius, and inftituted games which they called Eleutheria; and there they thow the tombs of thofe who fell in that battle (Strabo). It food at the foot of mount Cithæron, between that and '「hebes to the north, on the road to Athens and Megara, and on the confines of Attica and Megaris. Now in ruins.
PLATALEA, the Spoonbill, in ornithology, a genus belonging to the order of grallæ. The beak is plain, and dilates towards the point into an orbicular plain, and dilates towards the point into an orbicular Plate
form; the feet have three toes, and are half palmated. cccxcyis. There are three fpecies diftinguilhed by their colour: and of thefe fpecies there are three varieties; two of which is called the rwhite fpecies, and one of the rofeate.

1. The white fpecies, whirh Linnxus calls platalia leucorodia, is about the fize of a heron, but fomewhat fhorter in the neck and legs. The bill is more than half a foot long, and, like that of the relt of the genus, is fhaped like a fpoon: the colour of the bill is very various, being in fume birds black, in others brown, and fometimes fpotted; from the bafe to two-thirds of its length ficveral indentations crofs it, the rifing parts of which are of a dark colour : the tongue is fhort and heart-fhaped: the irides are grey: the fin of the lore round the eyes and of the throat is bare and black: the plumage is entirely white, though there have been fpecimens where the quills were tipped with black: the legs are generally either black or of a greyifh brown colour; between the toes there is a membrane connected to the outer one as far as the fecond, and to the inner as far as the firf joint.
"This bird (fays Mr Latham) is found in various parts of the old concinent, and from the Ferro ifles near Iceland to the Cape of Good Hope. It frequents the neighbourhood of the fea; and has been met with on the coafts of France : at Sevenhuys, near Leyden, once in great plenty, annually brceding in a wood there. The neft is placed on high trees near the fea-fide. The femalc lays three or four white eggs, powdered with a few pale red fpots, and of the fize of thofe of an hen. Theyare very noify during bree ding-time, like our rooks; are feldom found high up the rivers, chiefly frequenting

Platixe,
$\underbrace{\text { Platalea, }}$

Platalea, the mouths of them. Their food is fifh, which they are Platanus. faid not unfrequently to take from other birds, in the
mannor of the bald eagle; alfo mulcles and other thellfifh being found in greatelt numbers where thefeare plenty; and they will alfo devour frors and frakes, and even grafs and weeds, which grow in the wateri, as well as the roots of reeds. They are migratory, retiring to the warmer parts as the winter approaches, and are rarely feen in England. Their flefl is faid to lave the fly wour of a goofe, and is caten by fome, and the young birds have been thought grood food. By many authors they are called pelizans."

The two varieties of this feccies are equal in fize to the rofate fpecies. The bill of the firft is reddilh; the plumage moitly white; the feathers of the wings partly white and partly black, and the legs reddifh. The plumage of the other is entirely white, not excepting even the quills. It has a creat of feathers whofe webs are very looie, and feparated from one another; the bill is of a rufous grey colour, having red cdges, and the legs are of a dull pale red. They both inhabit the Pbilip. pine illands.
2. The rofeate fpecies, or platalea saja, is but a little lefs than the white. The bill is marked all round with a furrow parallel to the edge, and is of a gregifh white colour, fo tranfparent as to thow the ramification of the blood-reffels belonging to it: the forehead is of a whitith colour between the bill, and eyes, and throat: the plumage is a fine rofecolour, deepeft on the wings: the legs are grey; the claws hackifh; and the toes have membranes as in the latt fpecies. The variety of this fpecies is entirely of a beautiful jed, colour, having a collar of black at the lower part of the neck; the irides are red. Mr Latham imagines it is the rofeate in full plumage. It is faid to be of a blackifh chefnut the firft year; becomes rofe-coloured the fecond, and of a deep fearlet the third. It lives on fmall fifh.
3. The dwarf fpecies, or flatalea pigmea, is about the fize of a fparrow. The bill is black, longer than the head, flat at the end, and nearly of a rhemboidal form; the angles and top of the upper mandible are White; the tongue is finooth; the body is brown above and white beneath; the quills have white flafts; the tail is rounded, hort, and of a brownilh white colour; the feet have four coes, are cloven, and the claws are pointed. It inhabits Surinam and Guian:.

PLATANUS, the Plane-rafe; a genus of the polyandria orcer, belonging to the moncecia clafs of plants.

Species. 1. The orientain, oriental or caftern planetree, rifes with a very ftraight fmooth buanching fem to a great height. It has pamated leaves, fix or eight inches long and as much hioad, divided isto five large fegments, having the fide ones cut into two finaller, green above, and pale undernath; and long pendulous pedunculi, cach futaining feveral round heads of clofefitting very fmall flowers; fucceeded by numerous downy feads, coliecteat into rund, rough, hard balls. It is a native of Afia and many parts of the eafl, and grows in great plenty in the Levant. 2 . The oecidentalis, occiJental, or weftern plane-tree, rifes with a fraight fmooth flem, to a grcat leight, branching widely round: it has lobatedleaves, feven or eight inches long, and from nine or ten to twelve or fourteen broad, divided into three large lobes; and ve:y fmall flowew, collected into round
heads, fucceeded by round rough balls of feed. It is a native of Virginia and other parts of North America; where it attains an enormous fize, and is remarkable for having its fem all of an equal girt for a confiderable length: we have an aecount of fome trees being eight or nine yards in circunderence, and which, when felled, afforded 20 loads $f$ wood. The varieties of the etwo fpecies are the Spanifh or middle plane-tree, having remark:bly large leaves of three or five narrower fegments ; and the maple leaved plane-tree, having frnaller leaves, fomewhat lobated into five legnaents, relemuling the maple-tree leaf.

All thete e!egant trees are of bardy temperature, fo as to profper here in any common foil and expofure in our open plantations, \&ec. and are fome of the moft defirable trees of the deciduous tribe. They were in fingular efteem amnng the ancients of the ealt, for their extracrdinary beauty, and the del:ghtful hade they afforded by their noble follaye. The leaves commonly expand in May, and fall off early in autumn; and the flowers appear in fpring, a little before the leaves, being fucceeded by feeds, which in fine feafors frequently ripen in September. Thefe fine tiees are fingularly fitted for all ornamental plantations. Their fraight growth, regular branching heads, and the lofty fature they attain, logether with the extraordinary bread th $0 \frac{1}{s}$ their luxuriant leaves, render them extremely defirable furniture to adorn avenues, lawns, parks, and woods; fome difpofed in sanges, fome as lingle ltandards, others in clumps, fome in groves, \&c. They are moft excellent for ihade ; for it is obfervable, that no tree is better calculated to defend us from the heat in fummer, by its noble fpreading foliage, and to admit the fun's rays more freely in winter, on account of the diftance of its branches, which is always in proportion to the fize of the leaves. They may alfo be employed in the collection of forelt-trees, in woods, to grow up to timber, in which cafe they will alfo prove advantageous in time. In thort, thete noble trees claim the efteem of every one concerned in plantations of every kind; but more par. ticularly in extenfive ones, where they may be fo varicuny difpofed as to have a charming effeet.

The propagation of thefe trees is by feed, layers, and cuttings. The feeds frequently ripen in thefe parts, and are alfo procured from other countrics, and may be obtained of the nurferymen or feedfmen. The beft fealon for fowing them is antumn, if they can be then poffibly procured. Choofe a fumewhat thady moint foil; and having dug the ground, nnd raked it fine, form it into four feet wide becis, and either featter the feeds evenly on the furface and rake them in, or previnully with the back of a rake tum the earth off the furface near half an inch deep into the alleys; then fow the feed, and directly, with the rake turmed the proper way, draw the carth evenly over the feeds, and trim the fur. face fnooth: many of the plants will rife in fpring, and probably many not till the jpring following. When they are one or two years old, plant them out in nurfery rows, two or threc feet aiunder, and about half that difance in the lines; here to remain till of a proper lize for final traniplantation. 'The incthod of propagation by layers is very commonly pradifed in the nurferies, in defanl: of feed, and by which they nonf readily grow; for which parpofe, fome flout plants for fools mult be planted, which in a year after muft be headed down

Tluartin: / :

## PLA

 ground, convenient for laying; which, in the autumn alter they are produced, lay by for flit-laying; and by autumn after, they will be well rooted, and form plants two or three feet high, fo may be feparated, and planted in nurtery rows like the ieerlings. All the forts will tale tolerably by cutting off the itrong young thoots; but the platurs occidentalis more freely than the oriental kind. Autumn is the beit faton: as foon as the leaf falls, choofe frong young fhoots, and plant them in a moift foil; many of them will grow, and make tolerabic plants by next autumn. It fould be remarked, that, in order to continue the diftinction of the varieties more effectually, they thould be propagated either by layers or cuttings: for when railed from feed, thofe of the refpetive fpecies generally vary.PLATBAND, in gardening, a border or bed of flowers, along a wall, or the fide of a parterre, frequently edged with box, \&c.

Platband of a door or window, is ufed for the lin. tel, where that is made fuuare, or not much marked.

PLATE, a term which denotes a piece of wrought filver, fuch as the flatlow veifel off which meat is eaten. It is likewif: ufed by Britilh fportfmen to exprefs the reward given to the belt horle at their races.

The winning a plate is not the work of a few days s Dic- to the owner of the horle ; but great care and preparation is to be made for it, if there is any great dependence on the fuccefs. A month is the lealt time that can be allowed to draw the horfe's body clear, and to refise his wind to that degree of perfection that is attain able by art.

It is frilt noceflary to take an exaft view of his body, whether he be low or high in flefh; and it is alfo necelfary to confider whether he be dull and heavy, or britk and lively when abroad. If he appear dull and heavy, and there is reafon to fuppofe it is owing to too hard riding, or, as the jockcys exprefs it, to fome greafe that has been diffulved in hunting, and has not been removed by fcouring, then the proper remedy is half an ounce of diapente given in a pint of good fack; this will at once remove the caufe, and revive the creature's fpirits. After this, for the firlt week of the month, he is to be fed with oats, bread, and fplit beans; giving him fometimes the one and fometimes the other as he likes beft; and always leaving fome in the locker, that he may feed at leifure when he is left alone. When the groom returns at the feeding-time, whatever is left of this muft be removed, and frefh given; by this means the creature will foon become high-pirited, wanton, and full of play. Every day he mult be rode out an airing, and every other day it will be proper to give him a little more exercife; but not fo much as to make him fweat too much. The beans and oats in this cafe are to be put into a bag, and beaten till the hulls are all off, and then winnowed clean; and the bread, inftead of being chipped in the comnon way, is to have the cruft clean cut off. If the horle be in good fleth and firits when taken up for its month's preparation, the diapente mult be omitted; and the chief bufinefs will be to give him good food, and fo much exercife as will keep him in wind, without overfweating him or tiring lis fpirits. When he takes larger exercifes afterwards, towards the end of the month, it will be proper to have fome horfes in the place to run againt him. This will put him upon lis mettle, and the beating them will give him
fpirits. This, however, is to be cautioully oblerved, that he has not a bloody heat given him for ten days or

Fiaplatis, a fortnight before the plate is to be run for ; and that: the laft heat that is given him the day before the race, mult be in his clothes: this will make him rua w th greatly more vigour, when Aripped for the race, and feeling the cold wind on every gart.

In the fecond week, the horfe fhould have the fame food and more exercife. In the laft fortnight he inut have dried oats that have been hulled hy beating. After this they are to be netted in a quantity of whites of eggs beaten up, and then laid out in the fun to dry ; and when as dry as before, the horfe is to have ther. This fort of food is very light of digeftion, and very good for the creature's wind. The beans in this time thould be given more fparingly, and the bread hould be nade of three parts wheat and one part bcans. If he flould become coftive under this courfe, he mut then lave fome ale and whites of eggs beaten $t$ gether; this will cool him, and keep his body moift.

It the laft week the math is to be omitted, and bar-ley-water given him in its place, every day, till the day before the race: he floould have his fill of hay; then he muft have it given him more fparingly, that he may have time to digeft it; and in the morning of the race day he mutt have a toaft or two of white bread foaked in fack, and the fame juft before lie is let out to the field. This is an excellent method, becaufe the two extremes of fullnefs and fafting are at this time to be equally avoided; the one hurting his wind, the other occafioning faintnefs that may make him lofe. After he has had his food, the litter is to be fhook up, and the fable kept quiet, that he may be dilturbed by nothing till he is taken out to run.
PLATFORM, in the military art, an elevation of earth, on which cannon is placed to fire on the enemy ; fuch are the mounts in the middle of curtins. On the ramparts there is always a platform, where the cannon are mounted. It is made by the lieaping up of earth on the rampart, or by an arrangement of madriers, rifing infenfibly for the cannon to roll on, either in a cafemate or on attack in the outworks. All practitioners are as greed, that no thot can be depended on, unlefs the piece can be placed on a folid platiform; for if the platform flakes with the firt impulfe of the powder, the piect: molt likewife flake, which will alter its direction, and render the flot nncertain.

Platform, in architecture, is a row of beams which fiupport the timber-work of a roof, and lie on the top of a wall where the entablature ought to be raifed.

This term is alfo uted for a kind of terrace or broad fmooth open walk at the top of a building, from whence a fair profect may be taken of the adjacent country. Hence an edifice is faid to be covered with a platorm, when it is flat at top and has no ridge. Moft of the oriental buildings are thus covered, as were all thofe of the ancients.

Platform, or Oriop, in a man of war, a place on the lower deck, abaft the main-maft, between it and the cockpit, and round about the maincapitan, where provifion is made for the wounded men in time of action.

PLATINA is a metallic fubtance lately difeovered. The name, which has an allufion to its colour, is a diminutive of plata, and fignifies "little filver." Fram its rreat fpecific gravity, and other refemblances which

## PLA [ 34$]$ P A

Matina. it has to gold, it has been called or llane, or white gold; from its refractory nature, diabolus wztallorum; from fome doubts entertained of its character as a metal, juan blanco, white jack, white rogue, or white mock metal. It las alfo received the appellation of the eighth metal; and, probably from fome diftrict which affords it, has gotten the name of platina del Pinto.

The firt in Europe who mentioned it by its prefent name was Don Antonio Ulloa, a Spanifi mathematician, who in 1735 accompanied the French academicians that were fent by their fovereign to determine the figure of the earth by meafuring a degree of the meridian in Peru. In the relation of his voyage, which was publifhed at Madrid in 1748 , he fays, that the golden mines in the territory of Choco had been abandoned on account of platina; which he reprefents as a hard tane not eafily broken by a blow on the anvil, which could not be fubdued by calcination, and from which the gold could not be extracted without mich labour, much expence, and great difficulty.

The particular places of Choco where it is found are Novita and Citara; but in what quantity it is there to be met with is not afcertained. The miners, difeovering at an early period that it was a metal, had begun to employ it in adulterating their gold; and the court of Spain, it is faid, dreading the confequences, took mealures not only to prevent its exportation, but partly to conceal the knowledge of it from the world. It is reported in the Chemical Annals for July 1792, that when the gold is brought from Choco to be coined in the two mints of Santa-fe, in that of Bogota and Popayan, the gold undergoes a new examination, the platina that remains is carefully feparated, and being given to officers appointed by the king, they, as foon as a certain quantity is colle?ed, cazry it away, and before witnefes throw it into the river Bogoto, at two leagues diftance from Santa-fe, cr into the Cauca, about one league diftant from Popayan.

In the Phyfical Journals for November 1785 we are told, that the primitive mines which produced it have not yet been difcovered in any part of the globe, and that thofe which furnifh it at prefent are of the fecondary kind, being Itrata of loofe eat th wafhed down from the ligher grounds. In thefe frata the particles are reported to be from the lize of a millet feed to that of a pea. The author of the account fays, that he had fome pieces which weighed from 15 to 20 grains; and adds, that on trying fome of them between feel-rullers, in the prefence of Meffrs. Darcet and Tillet at Paris, they were perfectly laminated. He fays alfo, that a native piece of platina was found nearly of a fquare figure, and almolt as large as a pigeon's egg, which was depofited in the Royal Socicty of Bicay. M. de Buffon, however, fays eaprefsly, that "a purfon of credit had aflured him that platina is fometimes found in large mafles; and that he had feen a limp of it weighing no lefs than 20 lib. which had not been me'ted, but taken in that Rate out of the mine." As to the fmall particles, they are of a whiter erlour than iron, with a fmooth -furface. 'Their figure is generally of an oblong fomm, very flat, rounded in the edge, and has been afenibed to the hammening of the mills in which the gold is analgamated.

The heterogeneous fubfances with wisch the platina is "enerally mined arefat cles of grld, grains of quartz
or cryftal, fome fand of a brownifh hue, and fome duft of a dark colour obedient to the magnet, and which feems to be fragments of other irregular dark-coloured particles, which refemble pieces of emery or loaditone. Dr Ingenhoufz, however, fays, that every particle even of fome tine platina which he examined obejed the nagnet more or lefs, excepting fome that were tranfpatent and fony; and that thefe were all magnets in themfelves, or that eacla of thefe particles had two poles, which he could change at pleafure by magnetic bars. In ahont 72 pounds weight of platina which was brought from Spanifh America, M. Magellan found not only a large quantity of ferruginous fand, but many pieces of vegetable ftalks, a number of feeds, and fome very fmall red cryftals like rubies. Thefe eryftals being fent to $M$. Achard of Berlin, he tried them as far as their minutenefs and fmall quantity would permit, and at laft concluded that they really were rubies. As for the mercurial globules which are fometimes intermixed with the particles of platina, they are entirely foreign to its mines. They are now generally thought to be part of the mercury that has been employed in amalgamation ; and which could not be brought from a place lefs diftant than Guancavelica, about 900 miles from the province of Choco where the platina is found.

This metal, though not under its prefent name, which was firlt mentioned by Don Ulloa, has perhaps been known in Europe fince 1741. At that period Charles Wood found in Jamaica fome platian which was broughe from Carthagena. He even made fome chemical trials of it. Among others, he attempted to cupel it; and obferves, in the account which he gave of it in 1749 , that the Spaniards had a method of cafting it into different forts of toys, which are common enough in the Spanifh Weft Indies. It was probably, too, imported into Spain fooin after its difcovery in America. It is faid that Rudenfchoel carried fome of it from Spain to Stockholm in 1745 ; and the firft important fet of ex. periments that appeared on the fuoject we:e thofe of Scheffer, one of the members of the Swedifh Acadeny. They were publifhed in 1752; and gave this infurmation, that platina is eafily lulible wih arfenic, but when alone remains unchanged by the moft violent heat of the furnace. Two years after Dr Lewis publifhed fome papers concerning this metal in the Royal Philofophical Tranfactions of London. This eminent chemift, in the courfe of his experiments, had examined it both in the dry and the wet way; difeovered a number of its relat:ve affinities; mixed it in different proportions with different metals; and had fufed it with arienic, though he did not afterwards attempt to feparate them.

In 1757 Margraaf publified ieveral very interefting obfervations about the methed of feparating it from the iron which always accomponies it.

In 1758 and 1763 Miacquer and Beammé made upon See Choit a confiderable number of experiments together, and miftry, formed of it at latt a concave nitror.

And it was in 1780 that the fournazes de Plyygue gave an account of the labours of Bergman on the fame tinbject.

The platina of which the toys were made in the Spanifh Weft Indies was found by Dr Lewis to be always $\mathrm{Ib} . \mathrm{n}^{\circ}{ }^{133}$ mixed with fome other metals. What thefe particular - ${ }^{1347 \text { ? }}$ mixtures were is not well known; but many of the al. lays formed by 10. Lewis himfelf have promifed to be

## PLA

both ornamental and ufeful. He found that platina, which is $\frac{2}{3}$ of the whole mats, will render gold no paler than a guinea, which contains only $T_{T}^{\prime}$ of filver. He found that copper was much improved by allaying it with platina in certain proportions ; and that equal parts of platina and brafs formed a compound not fubject to tarnifh, and which might be emplojed with great advantage for the ipeculums of teletcopes.
Belides allaying it with the different metals, it was an object cqually interefting to the chemifts and fociety that platina flould be obtained pure and unmixed; and that means fhould be contrived to render it fuffible, malleable, and ductile. We are now to fee what the chemifts have done to accomplifl thefe ends. They readily fiw that it would be neceffary, in the firft place, to bring it to a fate of ultimate divifion, and that this fhould be tried in one or other of thefe two ways; by difolving it in acids, or by fufing it along with fome other metal ; for by itfelf it had hitherto proved abfolutely unfufible, except when expofed to the focus of a large barning glafs, or the kindled Atream of dephlogifticated or vital air. Among the methods which they employed to feparate it from gold, the principal were the following : The firf was by uniting the mixture of platiua and gold with mercury, and grinding the amalgam for a confiderable time with water in which procefs the platina was gradually thrown out, and the gold retained by the quickfilver. Another method was by mixing a few drops of a folution of platina with above a hundrad times the quantity of a folution of gold, and gradually adding a pure fixed alkaline falt as long as it occafioned any effervefcence or precipitation. The remaining liquor in this cafe was fo yellow, that it has been judged the platina would difcover itfelf, though its proportion had been lefs than a thoufandth part of that of gold. A third mode of feparating platina and gold was that of precipitation, by means of mineral fixed alkali; for when this alkali is mixed with a folution of gold containing platina, the gold alone is precipitated, and all the platina remains diffolved. Another method was by precipitation of the platina with fal ammoniac. For this purpofe to a folution of the metal in aqua regia a fmall quantity of the folution of fal ammoniac in water was addel; and if the gold contained any platina, the liquor inftantly grew turbid, and a fine yellow or reddifh precipitate quickly fell to the bottom; if the gold was pure, no precipitation or change of tranfparency enfued. The fifth method of feparation was by means of inflammable liquors. The compound to be examined was diffolved in aqua regia: the folution mingled with twice its quantity or more of rectified fpirit of wine, and the misture fiffered to fand for fome days in a glafs llightly covered, the gold rofe to the furface, leaving the platina diffolved. Otherwife, to the folution of the metal in aqua regia about half its quantity of any colourlefs effential oil was added : the two were fhaken well together, and fuffered to reft; upon which the oil rofe immediately to the furface, carrying the gold with it, and leaving the platina diffolved in the acid underit. Or, the gold was taken up ftill more readily and more perfectly by ether, or the etherial ipirit of wine. But, after all, the moft effectual and advantageous method of feparating platina from gold was founded on a property which gold has, and not platina, of being capable of precipitation from aqua
regia by martial vitriol; and upon a property o.lich platina has, and not ichat, of being capable of peecipitation from aqua regia by fal ammoniac. When therefore we would difcorer if gold be allayed with plation, let it be diflolved in aquat regia; and to this fnlution, which will contain beth metals, let firme fal ammoniae diffolved in water te added; upon which the platina will be precipitated in form of a brich-coloured fediment. If, on the other lide, we would know if platinz contain any gold, let this platina be difiolved in a pua regia, and to the folution add a foluticn of martial vitriol in water ; upon which the liquor wiil become turbid, and the gold will form a precipitate which may be eafly feparated by decanting and filtating the liquor. This property which platina poflefies of being frecipitated by martial vitriol was fift difcovered by MI. Sheffer.
With refpeet to the iron contained among the platina, M. de Buffon feparated, by means of a magnet, fix parts out of feven of a parcel of platina. He diftinguifhed two different matters in platina; of which one was. black, friable, and attractable by magnets; and the other confifted of larger grains, was of a livid white or yellowifh colour, much lefs attractable, and was extenfible. Between thefe two different maters were many intermediate particles, fome partaking more of the former and fome of the latter. He thought that the black matter was chiefly iron; and fays, that he had obferved a fimilar black powder in many ores of iron.
M. Morveau found, that a Prufian blue could be obtained from the black part of the platina; by pouring upon it fpirit of nitre, and afterwards adding to the folution diluted fome phlogifticated alkali; and that the particles of platina which could not be attracted by magnets, did not by this method fhow any fign of their containing iron.

But the moft important difeovery concerning the feparation of platina from other metals was a method of melting it, by which it became a perfect metal, malleable, and denfer than gold. It was in 1773 and 1774 that M. de Lifle effected this, by difolving crude platina in aqua regia, precipitating it from the acid menfrume by fal ammoniac, and by fufing this precipitate, without addition, in a double crucible, expofed to the intente heat of a for ge-fire excited by double bellows. M. Morveau has repeated the experiment, and $f$ und that he could melt the precipitate with feveral fluxes; he found likewife that by means of white glafs, borax, and charcoal, he could meit even crude platina, and could allay together platina and feel in various proportions.
M. de Sickengen was the inventor of another method: he diffolved his platina in aqua regia, and precipitated the iron by the pruffiate of potafs. In evaporating this liquor he obtained fmall oftaedral cryftals of the colous: of rubies; which, being expofed to a frong he.tt, yielded a metal which bore eafily the ftroke of the hammer, which could be readily drawn into wire, and was extremely malleable.

In attempting to refine platina by the diy way, capellation was a method to which the chemifts early hai recourfe ; but, notwithtanding their utmof endeavours, it has not been attended with all the fuccefs which could have been wifhed. It was found that the forification proceeded as well at the bcginining of the operation, as when gold and filver are cupelled: but the cupellation

afterwards became more and more difficult ; becaufe, as the quantity of lead diminifhed, the matter became lefs and lefs fufible, and at laft ceafed to be fluid, notwithftanding the molt violent heat; and alfo becaufe, when the quantity of platina was greater than that of the lead, this latter metal was protected, and not converted into litharge. Hence the regulus obtained was always darkcolourcd, rough, adhering to the cupel, brittle, and weighing more than the platina orizinally employed, from the lead which remained united with it. Meff. Macquer and Beaume appear neverthelefs to have carriel, this experiment further: they kept the matter expofed to a violent fire during a longer time; that is, about 50 hours fucceffively: and therefore, although their platina was tarnifhed and rough on its furface, it was internally white and Ihining, cafily feparable from the cupel, and a little diminifhed in weight; a certain proof that no lead remained in it. This platina was alfo ductile, and capable of extenfion under the hammer.

Cupellation, therefore, though not the beft, is at leaft a certain method of applying platina to ufe, and of forming it into utenfils.

What has been thought a preferable method, is firft to fufe the platina with arfenic, and afterwards diffipate this laft metal by a flrong heat : by this means Achard and Rochon were able to obtain a pure platina; of which the former made fome frall crucibles, and the latter, by allaying it with copper and tin, fome large mirrors for reflecting telefcopes.

Jeanety of Paris has gone fill farther: befides fnuffboxes, watch chains, and a coffec-pot of platina prepased by this artift, the world has feen a lens weighing fix pounds, a ball weighing nine, and two bars ig feet long, and weighing no lefs than 11 pounds each. This gentleman has the merit of being the firf who wrought this metal in the great way. The method he employed was far from being new; it had been fuggefted by Scheffer, by Willis, by Margraaf, and was afterwards practifed by Achard, Morveau, and a great many others, but who always prepared it in very fmall quantities. In the Chemical Annals for July 1792, the following account of it is given by himelf.

The platina is firft pounded in water to difengage it from the ferruginous and other heterogeneous particles that are mixed with it. "This being done, I take (fays he) one pound and a half of plativa, two pounds of white arfenic in powder, and one pound of purificd pot 4 fh . I mix the wholc: I put a crucible in the fire capable of contaiuing about 20 pounds; when my fur nace and crucible are well-heated, I throw into the crucible one third of the nixture, and apply a good heat; I then add a fecond quantity and a third, and fo on, always taking care at every time to mix the whole with a rod of phatina. I give now a confiderable force to the fire; and when I am certain that the whole is completely in a fate of fulion, I withdraw my crucible and leave it to cool. Atter breaking it I find a button that is well formed and attrdetable by the magnet. I bruife this button into fmall pieces, and fufe it a fcon 1 time in the fame manner: if this lecond fufin, which it generally ic, be not fufficient to effeet the epparation of the iron from the platina, I fufe it a third time; but if I be sbliged to do it a third time, I alway put two buttons together, to five at once a crucible and chatcoal.

This firl oferation being finihed, I take a cruc:ble
with a flat bottom and of a circumference to give to the button about three inches and a quarter in diameter. I make this crucible red hot, and throw into it one pound and a half of the platina which has been already fufed with the arfenic after it was broken into fmall pieces; to this I add a quantity of arfenic of the fame weight, and about half a pound of refined potafh. I give to the fire a confiderable fore; and when I am cottain that the whole is completely in a flate of fufion, I withdraw my crucible and leave it to cool, taking care always to place it horizontally, that the button may be of an equal thicknefs. After breaking the crucible, I find a button clear and fonorous, and weighing commonly about 1 pound and in cunces. I have remarked, that in proportion to the quantity of arfenic combined with the platina, the purification always fucceds with the more or lefs promptnefs and eafe; and the greater the proportion fo much the better. In this flate I put my button into a furnace under a mufflle, which ought not to be higher than the edge of the binton lying on its flat fide, andinclining a little to the walls of the muflle. In this manner I place three buttons on each fide of the muffe, and apply fire to my furnace, that the mufle may be equally heated throughout: as foon as the buttons begin to evaporate I fhut the doors of my furnace, that the heat may be kept up to the fame degree; this ought always to be carefully attended to even to the end of the operation, for even a temporary excefs of heat might fpoil the whole of my paft operations and render them abertive. I canfe my buttons to volatilize during fix hours, always taking care to change their fituation, that every part may receive an equal portion of heat: I then put them in common oil, and for at like time keep them in a fire fufficient to difinpate the oil in fmoke, I continue this opcration as long as the button emits vapours; and when the evaporation has ceafed I pufh the fire as far as it will go by means of the oil. Thefe arfenical vapours have abright flining metallic appearance, which I never can obt. in any other way, and without which I have never been able to render platina perfectly malleable.
"If thefe Iteps which are here pointed out be properly followed, the operation lafts only eight days. My buttons are then thrown into the nitrous acid, and afterwards boiled in dillilled water, till no part of the acid remains with them: I now heap them together one above another, apply the frongeit poffible heat, and beat them with a hammer, taking always care at the firft heat to make them red hot in the cricible, that no foreign bodies may mix with them, as before this compreflion they are only fo many fpongy maffes. I afterwards heat them in a naked flate (les chouffe à nud); and bringing them to a fquare form, I hammer them on all fides for a lhorter or longer time according to their bulk."

Such is the procefs obferved by Jeanety in fufing platina; but he thinks that the working of this metal is fufceptible of aill greater improvement. In 1788 it . was accordingly propofed by fome of the French chemifts to fufe platina by mixing it with charcoal and ph Sphoric glafs, ard afterwards to expufe the phofphure of platina to a heat fulficient to volatilice and difipate the plerf horus. 'This method fucreeded remarkably well with M. Pchle:ier ; but, belides being tedinus, it is difficult to feparate the laft porions of the phofphorus; and as thefe operations are always coftly, there are few: artilis.

## P L A

Matina, antifts who are willing to undertake them. M. de Plating. Morveau has alio fufed platina with his vitreous flux, made of pounded glafs, borax, and chatco:11: and Beau. me has advifed to fure it with a fliglit addition of lead, bifmuth, antimony, or arfenic, and by keeping the alloy in the fire a long time to dillipate the metals which have facilitated the fufion. Platina may likewile be fufed with a metal fuluble in an acid : the mixture being pulverized the alloyed metal may be diffolved, and the powder of platina may then be fured with the flux of De Morve:u ; or, infead of ufing a foluble metal, a calcinable metal may be employed, and heated as be$\dagger$ Chaptal. fore $\dagger$.

The colour of platina, when properly refined, is fomething between that of iron and filver; it has no freell, and is the heavief body yet known in nature. According to Mr Kirwan its fpecific gravity is to that of water as 23 to 1. It may likewife be faid to be the moft durable of all the metals: it is harder than iron; it undergoes no alteration in the air, and fire alone does not even appear to pof. fefs the power of clanging it; for which reafin it forms the beft of all crucibles that have yet been invented. It refifts the action of acids, alkalis, and fulphurs: it may be rolled into plates as fine as leaves of gold which are ufed in gilding; it is likewife extremely ductile : and Dr Withering tells us, that a wire of platina is Itronger than a wire of gold or of filver of the fame thicknefs; it is preferable to gold by the property which it has of foldering or welding without misture ; and it unites, fays Chaptal, two qualities never before found in one and the fame fubfance. When formed into a mirror, it reflects but one image, at the fame time that it is as un. changeable as a mirror of glafs.

As thofe motives which at firlt prepoffeffed the court of Spain againt this metal no longer exif, it is to be hoped that the decree which was paffed againt it will foon be revoked, and that the Spanifh monarch will neither defpife fonich a treafure as his mines of platina, nor refufe to the world the numerous advantages that may be derived from a fubflance that promifes to be of fo much importance in commerce and the arts.

PLATING is the art of covering bafcr metals with a thin plate of filver either for ufe or for ornament. It is faid to have been invented by a fpur-maker, not for fhow but for real utility. Till then the more elegant fpurs in common ufe were made of folid filver, and from the flexibility of that metal they were liable to be bent into inconvenient forms by the flighteft accident. To remedy this defect, a workman at Birmingham contri. ved to make the branches of a pair of fpurshollow, and to fill that hollow with a flender rod of feel or iron. Finding this a great improvement and being defirous to add cheapneis to utility, he continued to make the hollow larger, and of comirle the iron thicker and thicker, till at leaft he difcovered the means of coating an iron fpur with filver in fuch a manner as to make it equally elegant with thrfe which were made wholly of that metal. The invention was quickly applied to other purpofes; and ti) numberlefs utentils which were formerly made of brafs or iron are now given the frengih of thefe metals, and the elegance of filver, for a fraall additional expence.

The filver plate is generally made to adhere to the bater metal by me:ns of folder; which is of two kinds, the foft and the hard, or the tin and fiver folders. The
former of thefe confifts of tin alone, the latter ge- Plating. nerally of threc parts of filver and one of brafs. When a buckle, for inltance, is to be plated by means of the foft folder, the ring, before it is bent, is firt timed, and then the filver-plate is gently hammered upon it, the hammer employed being always covered with a piece of cloth. The filver now forins, as it were, it mould to the ring, and whatever of it is not intended to be ufed is cut off. This mould is faftened to the ring of the buckle by two or three cramps of fmall iron. wire; after which the buckle, with the plated lide undermoft, is laid upon a plate of iron fuficiently hot to malt the tin, but not the filver. The buck'e is thea coveted with powdered refin or anoined with turpentine; and left there fhould be a deficiency of tin, a fmall portion of rolled tin is likewife melted on it. The buckle is now taken off with a tongs, and commonly laid on a bed of fand, where the plate and the ring, while the folder is yet in a fate of fufion, are more clofely compreffed by a fmart ftroke with a black of wood. The buckle is afterwards bent and finifhed.

Sometimes the melte? tin is poured into the filver mould, which has been previoufly rubbed over with fome flux. The buckle ring is then put among the melted tin, and the pla:ing finifhed. This is called by the workmen filling up.

When the hard folder is employed the procefs is in many refpects different. Before the plate is fited to the iron or other metal, it is rubbed over with a folution of borax. Stripes of filver are placed along the joinings of the plate; and intead of two or three cramps, as in the former cafe, the whole is wrapped round with frall wire ; the folder and joinings are again. rubbed with the borax, and the whole put into a charcoal fire till the folder be in fution. When taken out the wire is inftantly removed, the plate is cleaned by the application of fome acid, and afterwards made fimooth by the Ittokes of a hammer.

Metal plating is when a bar of filver and copper are taken of at leait one equal fide. The equal fides are made fmooth, and the two bars fantened together by wire wrapped round them. Thefe hars are then fweated in a chancoal fire; and after fweating, they adhere as clofely together as if they were foldered. Afier this they are flattened into a plate between two rollers, when the copper appears on une fide and the filver on the other. This fort of plate is named plated metal.

French plating is when filver-leaf is burnified on a piece of metal in a certain degree of heat.

When filver is dillolyed in aquafortis, and precipitated upon another metal, the procefs is called filvering. See Soldering.

PLATO, an illufrious philofopleer of antiquity, was by defcent an Athenian, though the place of his birth was the Ifland of Egina. His lineage through his father is traced back to Codrus the laft king of Athen:s, and through his mother to Solon the celebrated legifators. The time of his birth is commenly placed in the beginning of the 88th Olympiad; but Dr Enfield thinks it may be more accurately fixed in the third year of the 87th Olympiad, or 430 years before the Chtitian era. He gave eany indications of an extenfive and original genius, and had all cducation fuitable to his high rank, being infructed in the rudiments of letters by the grammarian D.onyfuls, and trained in athletic exercifes by Arifa

## PLA

 PLAArifo of Argos. He applied with great diligence to the Atudy of the arts of painting and poetry; and nade fuch proficiency in the latter, as to produce an epic poem, which, apon comparing it with the poems of Homer, he committed to the flames. At the age of 20 he compofed a dramatic piece; but after he had given it to the performers, happening to attend upon a diffourfe of Socrates, he was fo captivated by his eloquence, that he reclainted his tragedy without fuffering it to be acted, renourced the mufes, burnt all his poems, and applied himfelf wholly to the ftudy of wifdom.

It is thought that Plato's firft mafters in philofophy were Cratylus and Hermogenes, who taught the fy fems of Heraclitus and Parmenides; but when he was 20 years old, he attached himfelf wholly to Socrates, with whom he ecmained eight years in the relation of a fcholar. During this period, he frequently difpleafed his compaFions, and fometimes even his matter, by grafting upon the Socratic fyltem opinions which were taken from fome other Rock. It was the practice of the fcholars of Socrates to commit to writing the fubftance of their matter's difcourfes. Plato wreie them in the form of dialognes ; but with fo great additions of his own, that Socrates, hearing him recite his Lylis, cried out, "O Hercules ! how many things does this young man feign of me!"

Plato, however, retained the warmel attachment to his mafter. When that great and good man was fummoned before the fenate, his illuffrious fcholar undertook to plead his caufe, and begun a fpeech in his defence; but the partiality and violence of the judges would not pernit him to proceed. After the condemnation, ha prefented his mafter with money fufficient to redeem his life ; which, however, Socrates refufed to acsept. During his imprifonment, Plato attended him, and was prefent at a converfation which he held with his friends concerning the immortality of the foul; the fubtance of which he afterwards committed to writing in ghe beaviful dialogue intitled Pbedo, not, however, without interweaving his own opinions and language.

The philofophers who were at Athens were foalarmed at the death of Socrates, that moft of them fled from the city to avoid the injuatice and cruelty of the government. Phato whofe grief upon this occation is faid by Plutarch to have been exceffive, retired to Megara; whe:e he was friendly entertained by Euclid, who had been one of Socratcs's firit fcholars, till the form was over. Afterwards he determined to travel in purfuit of knowledge; and from Miegarn he went to Italy, where he conferred with Eurytus, Philolans, and Archytas. Thefe were the mont celebrated of the followers of $\mathrm{P}^{\prime} \mathrm{y}$ thageras, whofe dothine was then become famerris in Greece; and from thefe the Pythagoreans have affirm. ed that he hated all his natural philofophy. He dived into the moit profound and myiterious fecrets of the Pythagoric docirines; and perceiving other knowledge to be conncted with them, he went to Cyrene, where he learned geometry of Thendorns the mathematician. From thence he paffed into Egypt, to acquaint himelf with the thenlogy of their prictis, to ftudy more nicely the proportions of geometry, and to inftruet himfelf in aftromnnical obfervations; and having taken a full furvey of all the country, he fettled for fome time in the province of Sais, lenming of the wife men there, what they leed concerning the univerfe, whether it had a be-
ginning, whether it moved wholly or in part, \&c.; and Paufanias afirms, that he learned from thefe the immortality, and alfo the tranfmigration of fouls. Some of the fathers will have it, that he had communication with the books of Mofes, and that he ftudied under a learned Jew of Heliopolis; but there is nothing that can be called evidence for thefe afiertions. St Auftin once believed that Plato had fome conference with Jeremiah; but afterwards difcovered, that that prophet mul have been dead at leaft 60 years befcre Platn's voyage to E sspt.

Plato's curiolity nats not yet fatistied. He travelled into Perfia to confuit the magi about the religion of that country : and he defigned to have penetrated even to the Indies, and to have learned of the Lrachmans their manners and cuntoms; but the wars in Afia hindered him.
" He then returned into Italy, to the Pythagorean fchool at Tarentum, where he endeavoured to improve his own fyitent, by incorporating with it the doarine of Pythagoras, as it was then taught by Archytas, Timxus, and others. And afterwards, when he vifited Sicily, he retained fuch an attachment to the Italic fchool, that, through the bounty of Dionyfiue, he purchafed at a valt price feveral books which contained ile doctrine of 3ythagoras, from Philohas, one of his followers.
" Returning home richly fored wih knowledge of vizrious kinds, Plato fettled in Athens, and executed the defign, which he had doubtlefs long had in contemplation, of forming a new fchool for the inftruction of youth in the principles of philofophy. The place which he raade choice of for this purpofe was a public grove, called the Actadeny, from Hecademus, who left it to the citizens for the purpofe of gymnaftic excrcifes. Adorned wit Aatues, temples, and fepulchres, planted with lofty plane-trees, and interfected by a gentle ftream, it afforded a delighttul retrcat for philofophy and the mufes. Of this retreat Horace fpeaks :

## Atque inter Sylvas Academi quarere verum, <br> "'Midn Academic sroves to fearch for truth."

Within this inclofure he poffeffed, as a part of his humble patrimony, purchafed it the price of three thoufand drachmas, a fmall g:arden, in which he opened a fchool for the reception of thofe who might be inclined to attend his inftructions. How much Plato valued mathematical fudies, and how necelfary a preparation he thought them for higher fpeculations, appcars from the inicription which he placed over the deor of his fchool:
 qtiainted with geonsetry enter here."
"This new fchool foon became famous, and its mafter was ranked among the moft eminent philofophers. His travels into diflant countries, where lcarning and wifdom flourifhed, gave him celebrity among his brethren of the Socratic feet. None of thefe had ventured to infitute a fehool in Athens except Ariftippus; and he had confined his infruations aimot entircly to ethical fubje?s, and had brought himfelf into fome difcredit by the freedom of his manners. Plato alone vemained to inherit the patrimony of public efteenı which Socrates had left his difciples ; and he poffeffed talents and learning adequate to his defiga of extending the fudy of philofoply leyond the limits within which it had been in-

## P L A

his pupil from the general depravity.
Nor did Dion that young men erowded to his fch ool from every quarter, but that people of the firlt diftinction in every department frequented the academy. Even females, difguifed in mens clothes, often attended his lectures. Among the illuftrious names which apparar in the catalogue of his followers are Dion the Syracufan prince, .and the orators Hyperides, Lycurgus, Demollhenes, and Ifocrates.
"Greatnefs was never yet exempted from envy. The ditinguifhed reputation of Plato brought uponlim the hatred of his former companions in the fchool of Socrates, and they loaded him with detraction and obloquy. It can only be afcribed to mutual jealoufy, that Xenophon and he, though they relate the difcourfes of their common mafter, fudioufly avoid mentioning one another. Diogenes the Cynic ridiculed Plato's doctrine of ideas and other abftract fpeculations. In the midft of thefe private cenfures, however, the public fame of Plato daily increafed; and feveral fates, among which were the Arcadians and Thebans, fent ambaffadors with earneft requefts that he would come over, not only to inftruet the young men in philofophy, but alfo to prefcribe them laws of government. The Cyrenians, Syracufians, Cretans, and Eleans, fent alfo to him: he did not go to any of them, but gave laws and rules of governing to all. He lived fingle, yet foberly and chaftly. He was a man of great virtues, and exceedingly affable; cf which we need no greater proof, than his civil manner of converfing with the philofophers of his own times, when pride and envy were at their height. His behaviour to Diogenes is always mentioned in his hiftory. The Cynic was vaftly offended, it feems, at the politenefs and fine tafte of Plato, and ufed to catch all opportusities of fnarling at him. He dined one day at his table with other company, and, trampling upon the tapeftry with his dirty feet, uttered this brutifh farcaim, "I trample upon the pride of Plato;" to which Plato wifely reparteed, "With greater pride."

The fame of Plato drew difciples to him from all parts; among whom were Speufippus an Athenian, his lifter's fon, whom he appointed his fucceflor in the academy and the great Arifotle.

The admiration of this illuftrious man was not confined to the brealts of a few philofophers. He was in high efteem with feveral princes, particularly Archelaus king of Macedon, and Dionyfius tyrant of Sicily. At three different periods he vilited the court of the latter prince, and made feveral bold but unficcefsful attempts to fuldue his haughty and tyrannical fipirit. A brief relation of the particulars of thefe vifits to Sicily may ferve to caft fome light upon the charafter of our philofopher ; and we flatll give it in the words of Dr Enfield, from whofe clegant hitlory of philofophy we have extracted by much the mof valuable parts of this article.
"The profeffed object of Ylato's firt vifit to Sicily, which happened in the 40 th jear of his age, during the reign of the elder Dionfius the fon of Hermocrates, was, to take a furvey of the ifland, and particularly to colerve the wonders of Mount Atna. Whill he was reldent at Syracufe, he was employed in the inftruation of Dion, the king's brother-in-law, who polieffed excellent abilities, thongh hitherto, reftrained by the terrors of a tyrannical government, and relaved by the luxuries of licentious court. Difgulted by the debauched manners of the Syracufans, he endeavoured to refue
difappoint his preceptor's expetations. No foner had he received a tafte of that phillofophy which leads to virtue, then he wa fired with an ardent love of wifdom. Entertaining an hape that philofophy might produce the fame effee upon D:onyfus, he took great pains to procure an intervicw between Plato and the tyrant. In the courfe of the conference, whilf Plato was difcourfing on the fecurity and happinefs of virtue, and the miferies attending injurtice and opprefion, Diony fuus, perceiving that the philofopher's difcourfe was levelled :againf the rices and cruelties of his reign, difmiffed him with high difpleafure from his prefence, and conceivel a defigu againt his life. It was not without great difficulty that Plato, by the affilance of Dion, made his efcape. A vefiel which had brought over Pollis, a delegate from Sparta, was fortunately at that time returning to Greece. Dion engaged Pollis to take the charge of the philofopher, and land him fafely in his native country; hat Dionyfins difeovered the defign, and obtained a promife from Pollis, that he would cither put him to dcath or fell him as a flave upon the paffaga. Pollis according. ly fold him in the ifland of Agiala; the inlabitants of which were then at war with the Athenians. Plato could not long remain unnoticed : Anicerris, a Cyrenaic philofopher, who happened to be at that time in the ifland, difcovered the ftranger, and thought himfelf happy in an opportunity of fhowing his refpeet for fo illurtrious a philofopher: he purchajed his ireedom for 30 minx, or 84 l . bos. Sterling moner, and fent him home to Athens. Repayment being afterwards offered to Anicerris by liato's relations, be refufed the money, faying, with that generons fpirit which true philofophy always infpires, that he faw no re.lfon why the elations of Plato fhould engrofs to themfelves the honour of fer. ving him."

After a fhort interval, Dionyfius repented of his illplaced refentment, and wrote to l'hato, earnefly requefting him to repair his credit by returning to Syracufe; to which Plato gave this high-fpirited anfwer, that phi: lofophy would not allow him leifire to think of D:onyflus. He was, however, prevailed upon by his filiend Dion to accept of the tyrant's invitation to return to Syracufe, and take upon him the education of Dionyfus the younger, who was heir apparent to the monarchy. He was received by Dionyfius the reigning fovereign with every poffible appearance of relpect; but after feeing his friend banithed, and being himfelf kept as a prifoner at large in the palace, he was by the tyrant fent back into his own country, with a promife that both le and Dion fhould be recalled at the end of the war in which the Sicilians were then engaged. This promife was not fulfilled. The tyrant wifhed for the return of Plato; but could not rejolve to recal Dion. At laft, however, having prcbably promifed that the phiofopher fhould meet his friend at the count of Syracufe, he prevailed upon Plato to vifit that capital at third time. When he arrived, the king met him in a magnificent chariot, and conduted him to his palace. The Sicilians too rejoiced in his return; for they hoped that the wifdom of Plato would at length triumph over the tyranaical fpirit of the prince. Dionyfius feemed wholly civelled of his former iefentments, liflened with apparent pleafure to the philofopher's doctrins, and among otwer exprefions of regard, preented him with eighty talents

## PLA [40 1 PLA

of gold. In the midit of a numerous train of philofophers, Plato now poffeffed the chief influence and authority in the court of Syracufe. Whilf Ariftippus was enjoying limfelf in fplendid luxury; whilf Diogenes was freely indulging his acrimonious humour; and whilit Efchines was gratifying his thirft after riches;Plato fupported the credit of philofophy with an air of dignity, which lisis friends regarded as an indication of fuperior widdon, but which his enemies imputed to pride. After all, it was not in the power of Plato to prevail upon Dionyfius to adopt his fyltem of policy, or to recal Dion from his exile. Mutual diftuft, after a fhort interval, arofe between the tyrant and the philofopher ; each fulpcoted the other of evil defigns, and each endeavoured to conceal his fuppicion under the difguife of refpect. Dionyfius attempted to impofe upon Plato by condefeending attentions, and Plato to deceive Dionyfius by an appearance of confidence. At length, the philofopher became fo much diffatisfied with his fituation, that he earneftly requefted permiflion to return to Creece, which was at laft granted him, and he was fent home loaded with rich prefents. On his way to $A$ thens pafling through Elis during the celcbration of the Olympic games, he was prefent at this general affembly of the Greeks, and engaged univerfal attention.

From this narrative it appears, that if Plato vifited the courts of princes, it was chiefly from the hope of feeng his ideal plan of a republic realized; and that his talents and attainments rather qualified him to fhine in the academy than in the council or the fenate.

Plato, now reftored to his country and his fchool, devoted himfelf to fcience, and fpent the laft years of a long life in the inltruction of youth. Having enjoyed the advantage of an athletic conftitution, and lived all his days temperately, he arrived at the Sift, or according to fome writers the 79 th, year of his age, and died, through the mere decay of nature, in the firft year of the hundred and eighth Olympiad. He paffed his whole life in a Rate of celibacy, and therefore left no natural heirs, but transferred his effects by will to his friend Adiamantus. The grove and garden, which had been the feene of his philufophical labours, at laft afforded him a fepulchre. Statues and altars were erected to his memory ; the day of his birth long continued to be cclebrated as a fenival by his followers; and his portrait is to this day preferved in gems: but the mof lafting monuments of his genius are his writings, which have been tranfmitied, without material injury, to the prefent times.

The character of this philofopher has always been high. Defides the advantages of a noble birth, he had a large and comprehenfive underfanding, a valt fund of wit and good talle, great evennefs and fiveencefs of temper, all cultivated and refined by education and travel ; to that it is no wonder if he was honoured by his comntymen, efcemed by frangers, and adore by his fcholars. The ancients thought more highly of Plato than of all their philofopbers : they always called him the DiFine Phato; and they feemed refolved that his defeent flould be more than lumzan. "There are (fays Apuleius) who aftert l'lato to have fprung from a mucre fublime conception; and that this mother Perictione, who was at very beautiful woman, was impregnated by Apollo in the lhane of a fpectre." Platarch, Suidas,
and others, affirm this to have been the common report at Athens. When he was an infant, his father Arifo went to Hymettus, with his wife and child, to facrifice to the mufes; and while they were bufied in the divine sites a fwarm of bees came and diftilled their honey upon his lips. This, lays Tully, was confidered as a prefage of his futurc eloquence. Apuleius relates that Socrates, the niglit before Plato was recommended to him, dreamed that a young fwan fled from Cupid's altar in the academy, and fettled in his lap; thence foared to heaven, and delighted the gods with its mufic: and when Arito the next day preiented Plato to him, "Fiends (fays Socrates), this is the fwan of Cupid's academy." The Greeks loved fables : they how however in the prefent cafe, what exceeding refpect was paid to the memory of Plato. Tully perfectly adured him; tells us, how he was junly called by Panæius the divine, the zoof wife, the mol fucred, the Homer of philufophers; intitled him to Atticus, Deus slle nofer: thinks, that if Jupiter h.d fpoken Greek, he would have fpoken in Plato's language; and made him fo implicitly his guide in wifdom and philofophy, as to declare that he had rather err with Plato than be right with any one elfe. But, panegyric afide, Plato was certainly a very wonderful man, of a large and comprehenfive mind, an imagination infinitely fertile, and of a moft flowing and copious eloquence. Neverthelets, the ftrength and heat of fancy prevailing in his compofition over judgment, he was too apt to foar beyond the limits of earthly things, to range in the imaginary regions of general and abitracted ideas; and on which account, thongh there is always a greatnefs and lublimity in his manner, he did not philofophize fo much according to truth and nature as Arithotle, though Cicero did not feruple to give him the preference.

The writings of Plato are all in the way of dialogue; where he feems to deliver nothing from himfelf, but every thing as the fentiments and opinions of others, of Socrates chiefly, of Timæus, \&c. He does not mention himfelf any where, except once in his Phædo, and another time in his Apology for Socrates. His fyle, as Ariftotle obferved, is betwixt profe and verfe : on which account, fome have not ferupled to rank him with the pocts. There is a better reafon for fo doing than the elevation and grandeur of his Ityle: his matter is oftentimes the offspring of imagination, inftead of doctrines or truths deduced from nature. The firft edition of Plato's works in Greek was put ont by Aldus at Ve. nice in 1513 ; but a I,atin verfon of him by Marfilius Ficinus had been printed there in 1491. They wete reprinted torether at Lyons in 1588 , and at Francfort in 1602. The famous printer Henry Stephens, in 1578 , gave a mof beautiful and correct edition of Plato's works at Paris, with a new Latin verfion by Serranus, in three volumes folio; and this defervedly paffes for the belt edition of Plato: yet Serranus's verfion is very exceptionable, and in many refpects, if not in all, inferio: to that of Ficinus.

PLATONIC, fomething that relates to Plato, his fchool-philofophy, opinions, or the like. Thus, Platonic love denotes a pure fpiritual affection, for which Plato was a great advocate, fubfining between the different fexes, abfrated fromiall carnal appetites, and rcgarding no other object but the mind and its beauties;

## P L $\wedge$

Matnnic, Iatonifin. or it is even a fincere difinterefted friendinip fubfiting
between perfons of the fame fex, aboltracted from any felfifh views, and regarding no other object than the perfon, if any juch love or friendihip las aught of a foundation in nature.
 time determined by tlee revolution of the equino:scs, or the fpace wherein the ftars, and conflellations return to their former places in refpet of the equinoxes. The Platonic year, according to Tycho Brahc, is 25816, according to Ricciolus 25920, and according to Caffini 24800 years.

This period once accomplifhed, it was an opinion arnong the ancients that the world was to begin anew, and the fame feries of things to turn over again.

PLATONISM, the plilofophy of Plato, which was divided into three branches, theology, phy/ics, and mathematics. Under theo!og was comprehended metaphyfics and cthics, or that which in modern language is called moral philofophy. Plato wrote likewife on diafefies, but witly fuch inferiority to his pupil Ariftotle, that his trorks in tlat department of fcience are feldom mentioned.

The ancient philofophers almays began their theolngical fyltems wi:h fome difquifition on the nature of the gods, ard the formation of the world; and it was a tundamental doctrine with them, that from wölhing nothing em proced. We are not to fuppofe that this general axiom implied nothing more than that for every effect there muft be a caufe; for this is a propolition which no man will controvert who underfands the terms in which it is expreffed: but the ancients believed that a proper creation is impoffible even to Omnipotence, and that to the production of any thing a material is not leis becefory ithan an efficient caufe, (fee Metaphysics, $\pi^{9} 264,304$.) Thiat with refpen to this important queftion, Plato agreed with his predeceffors and contemporaries, appears evident to us from the whole tenor of his Timaus. We agree with Dr Enfield ${ }^{\xi}$ in thinking, that in this dialogne which comprehends his whole doctrine on the fubject of the formation of the univerfe, matter is fo manifeftly fpoken of as eternaily co-exifting with God that this part of his doctrine could not have been miftaken by fo many learned and able triters, had they not been feduced by the defire of eftablifhing a coincidence of doctrine between the writings of Plato and Mofes. It is certain that neither Cicero $\ddagger$, nor Apuleius $\|$, nor Alcinous $\dagger$, nor even the later commentator Chalcidius, underfood their mater in any other fenfe than as admitting two primary and incorruptible principles, God and matter; to which we Thall afterwards fee reafon to add a third, namely ideas. The paffages quoted by thofe who maintain the contraty opinion are by no means fufficient for their parpofe. Plato, it is true, in his Timxus, calls God the parent of the univerfe, and in his Sophita fpeaks of him as "forming animate and inanimate beings, which did not before exift:" but thefe expreffions do not neceffirily imply that this offfpring of Deity was produced from nothing, or that no prior matter exifted from which thefe new beings were formed. 'Through the whole dialogue of the 'limaus, Plato fappofes two eternal and independent caufes of all things; one, that by which all things are made, which is God; the other, that from which all things are made, which is matter, He diftinguifhes between God;

Voz. XV.
matter, and the univerfe, and fuppofes the Architect of Hatomitit. the world to have formed it out of a mais of precxillent matrer. Mattcr, according to Platn, is an eternal and infinite principle. His doetrine on this leat 1 is thas cr. plained by Cicero". "Matter, from which all things " Ac Qu. are produced and formed, is a fubltance wichout form or 1 1.c. §. quality, but capable of recciving all forms, and tadergoing every kind of change; in which, howeter, it never fuffers annihilation, but merely it folution of its parts, which are in their rature infinitely divifible, athe move in portions of face which arc alfo infinitely divifible. When that principle which we call quality is moved, and acts upon matter, it undergoes an entli* change, and thofe forms arc produced, fremi which atifes the diverffied and coherent fyftem of the univerfe. ${ }^{\text {to }}$ This dostrine llato unfolds at large in his Timetis, and particularly infifts upon the notion, that matter las originally no form, but is capable of receiving any. If: calls it the mother and receptacle of forms, by the union of which; with matter the univerfe becomes petceptible to the fenfes; and maintains, that the vifible world owes its forms to the energy of the divine intellectual nature.

Our author is fupported in drawing this inference by the teftimony of Dlogenes, Laertias, who furely uridetfood the larguage and dogmas of Plato better than the mof accomplithed modern fcholar cari pretend to do; yet a learned writer $\ddagger$ has lately expreffed great furprifé $\ddagger$ Dr Ogllthat any one foould confider matter as hating bent, in Plato's opinion, uncreated ; and he holdly affirms, that Laertius, inftead of afferting that fpitit and mattef were the pínciples of all things, ought to have faid that God alonc, in Plato's eftimation, was their original.To prove this, he gives from the Timxus a quotation, in which the founder of the Acaderry declates that God framed heaven and earth, and the inferior delties; and that as he fafbioned, fo he pervades all nature. He obferves, that Cicero denominates the god of Plato the mather, and the god of Ariftotle only the gowernor, of the world. And, to fatisfy thofe who may demand a partictulat proof of Pldto's having taught a real creation, le affirms that his writings abcund with declarations on the fubject, of which the meaning cannot be mifapprehended. "W With Theology this purpofe (fays he) Plato denominates at one time the of Plato.
 rep, the productions of the efficient Deity, and at others enters more particularly into the queftion. Thus, he obsferves, that many perfons are ignotant of the nature and power of mind or intellect, " as having exifted at the beginning antecedent to all bodies.' Of this mind he ols. ferves that it is without exception חaitat aperburatt, of all things the mof ancient; and he fubjoins, in order to remore all doulst of his purpofe, that it is alfo ApX**Thrios, the caufe or pristiple of motion"

With all poftible relpect for Dr Ogilvie, of whole piety and erudition we are thoroughly continced, we mult take the liberty to fay, that to us the declarations of Plato on this fubject appear much lefs precife and explicit than they appcar to him; and that the inference which he would draw from the suords of Ciceto feems now to flow neceftarily from the fempe of thofe words. That Plato believed God to have framed the heaven and the earth, and to have fofbioned all hature, is a polition which, as far as we know, has never been controverted; but between framing or fofbioning the chaos or inn ricont, and calling the univerfe intoexitence from nom-
F. $\quad$ entity,

Matonifm. entity, there is an infinite and an obvious difference. The ditinction made by Cicero between the God of Plato and the God of Ariftotle is a jult diftinction, but it will not bear the fuperftructure which the learned Dofor builds upon it. Ariftotle maintained the eternity of the world in its prefent form. Plato certainly taught that the firt matter was in time reduced from a chantic fate into form by the power of the Deminrgus; but we have feen nothing in his writings which explicitly declares his belief that the fofl matler was itielf created.

The learned Cudworth, who wifhed like Dr Ogilvie, to find a coincidence of doettine between the theolngy of Plato and that of the Gofpel, thained all his factil. ties to prove that his favourite philofopher taught a proper creation; but he laboured in vain. He gives a number of quotations in fupport of his pofition; of which we thall here infert only tiele two upon which Dr Ogilvie feems to lay the greatelf ftrefs. Plato, fays the author of the futellectual Syitem, calls the one

 sarth, and heuven, and the gods, and doth all things loih in heaven, and hell, and under the earth. And, again, " he by whofe efficiency the things of the world (iotspor ezepero, тperepov ouz orta) ewere aflerseards made quben they
"Sophifia, were not before*." Both Cudworth and Ogilvie think p.168. this latt fentence an explicit declaration of Plato's belief in the creative power of God: but that they are miftaken has been evinced by Mofheim with a force of argument which will admit of no reply. In that part of the Sophiff from which the quotation is taken, Plato confiders the durapur тountixny, of which he is treating, as belonging both to God and to man; and he defines it in general to be "a certain power which is the caufe that things may alterwards be which were not before.". Cudworth wilhes to confine this definition to the divine power; aid adds from himfelf to the text which he quotes the following words, which are not in Plato, or from an antecedent non-existence brought forth into bEING! That the incomparable author intended to deceive his reader, we are lar from imagining: his zeel for Platonifm had deceived himelf. Plato's definition
+Mo!ch. comprchends the duen:y mornvixnt tas well of man as of
ed. Cud. God; and therefore cannot infer a creative power any Syft. Intel where, unlefs the father of the academy was fo very cap. 4.
523.0. 1 I.
abfurd as to fuppofe human artilts the creators of thofe machines which they have invented and made! Molleim thinks that Cudworth was mifled by tuo implictt a confidence in Ficinus; and it is not imp fiole that Dr Ogilvie may have been fwayed by the authority, great indeed, of the author of the Inteilectual Syfem.
That intellect evifted antecedent to all bodics is indeed a Platonic dogna, from which Dr Ogilvie, after Culworth, wilhes to infer that the doetrine of the crea.
tion was taught in the academy ; but Dr Ogilvie knows Plataifur and no man knew better than Cudworth, that Plato, with every other Greek philofopher, diftinguifhed between body and matter ; and that though he held the priority of intellect to the former, it by no means follows that he believed it to have exifted antecedent to the latter. That he believed mind, or rather foul (for he diftinguiftes between the two), to be the caufe or principle of motion cannot be denied; but we are not therefore authorifed to conclude that he likewife believed it to be the caufe of the exiftence of matter. That he believed mind to be the moft ancient of all things, taking the word things in the moft abfolute fenfe, cannot be true, fince by Dr Ogilvie's own acknowledgment he held the exiftence and eternity of ideas, not to add that he believed $\pi s \in y$ or $\tau^{\prime} \alpha z^{\circ} \alpha$ or-the firlt hypoftafis in his trinity, to be fuperior to mind and prior to it though not in time, yet in the order of nature. When therefore he calls mind the molt ancient of all things, he muft be fuppofed to mean only that it is more ancient, than all bodies and inferior fouls. It is no reflection on the character of Plato that he could not, by the efforts of his own reafon, acquire any notion of a proper creation; fince we, whol ave the advantage of his writings, and of writings infinitely more valuable, to inftruct us, find it extremely difficult, if not impoflible, to conieive how any thing can begin to be. We believe the fact on the authority of revelation; but fhould certainly have never agitated luch a queftion, had it not been Itated to us by writers infpired with celeftial wildom.

In the Platonic cofmogeny we cannot therefore doubt but that the etsmity of the ixn rifurn was taken for granted. Whether it was an eternal and neceffary ema. nation trom an eternal mind, is not perhaps quite fu evident, theugh our own opinion is, that it was believed to befelf-exiftent. But be this as it may, which is not worth drfuting, one thing iscestaiu, that Plato did not believe it to have a fingle form or quality which it did not receive either from the Demiurgus or the Pfyche -the fecond or third perfon of his irinity. Except Aritotle, all the Greek philofephers, who ware not materiabits, held nearly the fame npininas refpecting the origin of the world; fo that in examining their fyltems we flall be greatly milled if we underfand the terms incorpireal and inmaterial as at all fynonymous. It was alfo a dofrine of Plato, that there is in matter a neceffaty but blind and refractory force; and that hence arifes a pre penfity in matter to diforder and deformity, which is the caute of all the imperfection which appears in the works of God. and the origin of evil. On this Inbject Piato wites with wonderful obfcurity : but, as far as we are able to trace his conceptions, he appears to h.ive thought, that ma:ter, from its nature, refilts the will of the Supreme Artificer, fo that he camot perfcely execute his deligus; and that this is the caufe of
(A) Moncim affirms that this quotation is nowhere to be found in the writings of Plato. He therefore at frit fulpeeted that the learned author, in looking haltily over Piato's soth book De Legibus, had transferred to God what is there faid of the anima numdi, leading by its own motions every thing in the heaven, the tarth, and the fea, and that he had added fomething of his own. He dropped that cphinion, however, when he foutal llate, in the ro:h louk of his Republic, declaring it to be as "eafy for God to produce the fun moen and ftars, and earth, \&c. fr m himfelf, as it is for us to produce the image of ourfelves, and whatever clfe we pleafe, only by interpoling a looking-5...fs." In all this power, howiver, there is nothing fimilar to that of creation.

Platonifn. the mixture of good and cvil which is found in the material wo:ld.

Plato, howcver, was no materialift. He tanght, that there is an intelligent caule, which is the origin of all fpiritual being, and the former of the material world. The nature of this great being he pronounced it difficult to difcover, and when difonvered impofible to divulge. The cxiftence of God he inferred from the marks of in--telligence, whish appear in the form and arrangement of bodies in the vifible world: and from the unity of the material fyltem he concluded, that the mind by which it was formed mult be one. God, according to Plato, is the fupreme intelligence, incorporcal, without begimning, end, or change, and capable of being perceived only by the mind. He certainly diltinguifhed the Deity notonly from body, and whitever has corporeal qualities, but from matter itfelf, from which all things are made. He alfo afcribed to him all thole qualities which modern philofophers afcribe to immaterial fubflance; and conceived him to be in his nature fimple, uncircumficribed in fpace, the author of all regulated motion, and, in fine, poffeffed of intelligence in the highelt perfection.

His motions of God are indeed cxccedingly refined, and fuch as it is difficuit to fuppofe that he could ever have acquired but fiom fome obfore remains of primeval tradition, oleaned perhaps from the prielts of Egypt or from the plilofophers of the Eaft. In the Divine Nature he certainly believed that there are two, and probably that therc are three, hypoflafes, whom he called to cv and to $\varepsilon^{\prime \prime}$, vous and $\ddagger \cup x^{\%}$. The firit be confidered as felf-exitent, and elevated far above all mind and all knowledge; calling him, by way of eminence, the biing, or the one. The only attribute which he acknowledged in this perfon was goodnefs; and therefore he frequently Ityles him the ro zatov-the good, or effential soodnefs. The fecond he confidered as mind, the wifflom or reafon of the firit, and the maker of the world; and therefore he ftyles him vous, noyos, and onproupzos. The third he always fpeaks of as the foul of the world; and hence calls him qux", or quxy tou xospou. He taught that the fecond is a neceflary emanation from the firft, and the third from the fecond, or perhaps from the firft and fecond.

Some have indeed pretended, that the Trinity, which is commonly called Plalonic, was a fiction of the later Platonits, unknown to the founder of the fchool; but any perfon who thall take the trouble to fudy the writings of Flato, will find abundant evidence that he really afferted a triad of divine hypoftales, all concerned in the formation and government of the world, Thus in his roth book of Laws where he undertakes to prove the exiftence of a Deity in oppofition to atheifts, he afcends no higher in the demonitration than to the fexa or mundane foul, which he held to be the iminediate and proper caufe of all the motion that is in the world. But in other parts of his writings he frequently afferts, as fiuperior to the felf-moving principle, an immoveable vous or intellect, which was properly the demiurgas or framer of the world; and above this bypolafis one moft
fimple and abcolutely perfect being, who is confidered in Platonifu. his Theotry as wjotros, the origina! deity, in contradiItinction from the others, who are only $\theta$ so: $s x$ Esov. Thefe doctrines are to be gathered from his works at large, particularly from the Tima:us, Pbilebur, Sophifta, and $E$ pinomis: but there is a paffige in his feenond epiatle to Dinnylius, apparently written in anfwer to a letter in which that monarch had required him to give a more explicit account tham he had formorly done of the nature of God, in which the dotrine of a Trinity feems to be direnly afferted. "After having faid that he meant to wrap up his meaning in fuch obfctrity, as that an adept oniy fhould fully comprehend it, he adds expreftions to the following impart: 'The Lord of Nature is furrounded on all fides by his works: whatever is, exits by his poraifion: ho is the fountain and fource of excellence: aromd the fecond perfon are placed things of the fecond order; and around the thind thofe of the third degree ( B ." Of this obfcure paffige a very fatisfactory explanation is given in Dr Ogilvie's Theology of Plato, to which the narrow limits prefcribed to fuch articles as this compel us to refer the reader. We thall only fay, that the account which we have given of the Platonic Trinity is ably fupported by the Doctor.

In treating of the eternal emanation of the fecond and third Hypoltafes from the firt, the philofophers of the academy compare them to light and heat proceeding from the fun. Plato himfelf, as quoted by Dr Cudworth, illuftrates his doctrine by the fame comparifon. For " ${ }_{\varepsilon \pi} \pi^{\prime} \alpha \gamma \times \theta c y$, or the firt hypotafis, is in the intellec. tual world the fame (he fays) to intellect and intelligibles that the fun is in the corporeal world to vifion and vifibles; for as the fun is not vifion itfelf but the caulc of vifion, and as that light by which we fee is not the fun but only a thing like the fun; fo neither is the Supreme or Highef Good properly knowledge, but the caufe of knowledge; nor is intellect, confidered as fuch, the bett and moft perfent being, but only a being having the form of perfection." Again, "as the fun caufes other things not only to become vifible but alfo to be generated; fo the Supreme Good gives to things not only their capability of being known, but allo their very effences by which they fubfift; for this fountain of the Deity, this highelt good, is not itfelf properly effence, but above effence, trinfcending it in refpeet both of dignity and of power."

The refemblance which this trinity of Plato bears to that revealed in the gofpel mult be obferved by every attentive reader; but the two doftrines are likewife in fome refpects exceedingly difimilar. The third hypoItafis in the Platonic fyftem appears in no point of vier co-ordinate with the firft or fecond. Indeed the firft is elevated far above the feond, and the third funk fill farther beneath it, being confidered as a mere foul immerfed in matter, and forming with the corporeal world, to which it is united, one compound animal. Nay, it does not appear perfecily clear, that Plato confidered his $\psi^{u} \chi^{y}$ rou rospos as a pure fpirit, or as having fubfilted from eternity as a diftinct Hyprfafis. "This governing ipirit, of whom the earth, properly fo called, is the $\mathrm{F}_{2}$

## PLA [ 44 ] P A

Hatonifm. body, conGlted, aecording to our author's philofophy, of the fame and the other; theat is, of the firit matter, and of pure intelligence, framed to actuate the machinery of nature. The Supreme Being placed hin in the middle of the earth ; which, in the wivid idea of Plato, feemed itfelf to live, in confequence of an influence that was felt in every part of it. From this feat his power is reprefented as being extended on all fides to the utmoft limit of the heayens; conferring life, and preferving harmony in the various and complicated parts of the univerfe. Upon this being God is faid to have looked with peculiar complacency after having formed him as an image of himfelf, and to have given beauty and perfect proportion to the manfion which he was deftined to occupy. According to the doctrine of Ti. maus, the Supreme being ftuck out from this original mind innumerable firits of infcrior order, endowed with principles of realon; and he committed to divinities of fecondary ra:ik the tafl of invelting thefe in material forms, and of difperfing them as inhabitants of the fun, moon, and other celeftial bodies. He taught alfo that
 $\mu 3:$, as to the fource from which it originally came."

Such is the third peaton of the Platonic triad, as we find his nature and attributes very accurately ftated by Dr Orilvie; and the Chrifian philofopleer, who has no particular fyftem to fupport, will not require another proof that the triad of Plato differs exceedingly from the Trinity of the Scriptures. Indeed the third hypoftalis in this triad has fo much the appearance of all that the ancients could mean by that which we eall a creature, that the learned Cudworth, who mifh. ed, it is dificult to conceive for what reafon, to find the fublimelt myftery of the Chriftian faith explicitly taught in the writings of a pagan philofopher, was forced to fuppofe that Plato held a double tex or foul, ne equosuev incorforated with the material world, and the other exepsogucy or fupramundane, which is not the ful but the governor of the univerfe. We call this a mere hypothelis; for though the author difplays valt eandifion, and adduces many quotations in which this double plyche is plainly mentioned, yet all thofe quotations ane taken from Platonilts who lived after the prepagation of the goffel, and whe, calling themfelves eicledics, freely flole from every feet fuch dogmas as they could ircorpor:tte with their own fyltem, and then attributed thofe dogmas to their maller. In the writings of Plato himfelf, there is not fomuch as an allufion to this fupramum-

We have faid that the Demiurgus $\$ 7$ as the maker of Hatasifis, the world from the firf matter which had exilted from ctenity; but in Plato's cofnogony there is another principle more myfterious, if polfible, than any thing which we have yet mentioned. This is his intellecqual fyftem of ideas, which it is not eafy to colled from his writings, whether he confidered as independint exitencesp or only as archetypal forms, which had fublified from eternity in the dozos or divine intellet. On this fubject he writes with fuch exceeding obfanity, that rnen of the firft enimence, both among the ancients and the moderns, have differed ahout his real meaning. Some have duppofed, that by ideas he meant real beings fubfifting from eternity, independent of all minds, and feparate from all matter; and that of thefe ideas he conceived fome to be living and others to be without life. In this manner his doctrine is interpreted by Tertiliun * among the ancients, and by the celebrated Bruck- Lib. de ertamong the moderns; and not by them only, but Anima. by many others equally learned, candid and acute. Cud- $f$ Hiftor. worth, on the other hand, with his amotator Mofheim, Doctrm. de contend, that by his ideal world Plato meant nothing more than that there exifted from eternity in the $x$ oyos or mind of God a notion or conception of every thing which was in time to be made. This is certainly much more probable in itfelf, than that a man ofenlarged undertanding fhould have fuppofed that there are fomewhere in extramundane fpace rẹal living incorporeal beings eaxing and drinking, which are the icieas of all the asimals which ever have been or ever will be eating and drinking in this world. Yet Mofheim candidly acknowledges, that if the controverfy wete to be decided by the votes of the learned, he is doubtful whether it would be given for or againft him; and Cudworth, though he pleads the caufe of his mater with much in genuity, owns, that on this fubject his language cannot be vindicated. $\Gamma$, is indeed is meft true; fo: Plato contends, that his ideas are not only the objefis of fcience, but alfo the proper or phyfieal caufes of all things here below; that the ida of frmilitnde is the caufe of the refenblance betreen two slobes; and the ider of diffimilitude the cant that a giobe does not refemble a pyramid: he likewife ealls them ouvoas, effences or fubfiances, and many of his followers have pronounced them to be animals.

Theefe wonderful expreflions incline us to adopt with fome helitation the opinion tated by Dr Enfeld. This hiftorian of philofophy having obferved, that fome of the admirers of Plato contend, that by ideas exi?ing in the 1 e fon of God, nothing more is meant than concep. lions formed in the Divine mind, enntroverts this opinion with much effeet. "By ideas, Plato (fays he) appears to have meant fomething much more myfterious; namely, pattems or archeiypes fubfilting by themfe!ves, as real beings, evocs ofre in the Divine reafon, as in their original and eternal region, and illuing thence to give form to fenfible things, and to become objects of contemplation and fience to rational beings. It is the
 fon of God, comprehends exemplars of all things, and that this reafon is one of the primaty caufes of things. Plutarch fays, that Plato fuppofes three principles, God, Matter, and Idea. Juêin Martyr, Pfeudo.Origen, and others, allert the fame thing.
"That this is the true Platonic doctrine of ideas will

## I Li A

onify. appear probable, if we attend to cie manoer in which Plato framed his fy tem of opinions concerning the arigin of things. 'Having been from his youth (fays Ariftotle) converfant with Cratrlas, a difciplc of Heraclitus, and inftructed in the doatrine of that fehool, that all fenfible things are sariable, and csmot be proper objects of fcience, he reafomably concludgd, that if there be any fuch thing as feienec, there muft exif, befides fenfible objects, certain permanent natures, perceptible only by the intellect.' Such natures, divine in their origin, and cternal and immutable in their exilence, be admitted into his iyftem, and called them ideaf. Vifible things were regarded by Plato as fleeting flades, and ideas as the ouly permanent fubitances. Thefe he conccived to be the proper objects of fciesce to a mind raifed by divine contemplation above the perpectually yarying feenes of the matcrial world."

It was a fundamental doetrine in the fyfem of Plato, that the Deity formed the material world after a perfect r:odal, confinting of thofe ideas which had eternally fub. fifted in his own reafon; and yet, with forme appearance of concradiction, he calls this model "filf. exiftent, indivitible, and eternally gen rated." Nay, he talks of it as being intelligent as well as eternal, and wholly different from the tranfcripts, which are fubjected to our infpection. There is fo much myftery, confufion, and apparent abfirdity, in the whole of this fyftem, as it has come duwn to us, that we mult fup. pofe the friends of Plato to have been intrulted with a liey to his eloteric doftrines, which has long been lof, othervife it would he difficule to conceive how that philofopher coruld have had fo many admirers.

With almoft every ancient theif of Greece the founder of the academy believed in an order of baings called danyons, which were fuperior to the fouls of men, and flruck of by the Demiurgus from the foul of the world. Of there the reader will find fome account elfewhere: (See Diemon and Polythersm). We mention them at prefent becaufe they make in important appearance in Plato's fyftem of phyfics, which was built upon them and upon the doctrine which has been fated conserning God, matter, and ideas. He taught, that the vifible world was formed by the Supreme Architca, uaiting eternal and immutable ideas to the firft matter; that the univerfe is one animated being ${ }^{\text {the }}$, including wihin its. limits all animated natures; that in the formation of the vifible and tangible world, fire and eart's were firit formed, and were afterwards united by mezns of air and water; hat from perfect parts one periect whole was produced, of a fyherical figure, ais moft beatutiful in itfelf, and belt fujted to contain all other fuycres $\dagger$; that the elementary parts of the world are of regular geometrical forms, the particles of eath being cubical, thofe of fire pyramidical, thofe of air in the form of an odohedron, and thofe of water in that of a:a icolchedrou; that thefe are adjufed in number, meafu $e$, and power, in perfect conformity to the genmetrical laws of proportion; that the foul which pervades this fphere is the caufe of its revolution round this centre; and, laftly, that the world will remain for ever, bet that by the asium of its alumating princinte, it accomplifhes cerrain periods, within which every thing returns to its ancient phace and itate. This periodical revolution of nature is called the Platonic or great year. See the preceding article.

The metaphyfical doofrines of Plato, which treat of लlaturifus. the human foul, ard the principles of his fy: fem of ethicg, have been detailed in miher articles (See Meta. puxsies, Part III. clap. iv.; and Mozal Philojpphy, n9 6.): but it is worthy of obfervation in this place. that prepuratory to the fudy of all philofoplyy, liz required frem his difciples a knowledge of the elements of mathematics. In lis Repulblic, he makes Glaucus, one of the fueakers, iecommend then for their afefulnefis in hurazn life. "Arithmetic for accounts and difribn: tions; geometry for er.campments and menfurations; mufic for folcmn feftivals in honour of the gods; and altronomy for agriculture, for navigation, and the like. Socrates, on his part, deries nat the truhh of all this, but Atill infinuates that they were capable of anfwering an end more fublime. 'You are pleafart (fuys he) in your feeming to fear the multitude, left you fhould be thought to enjoin certaia fiences that are ufelefs. 'Tis indeed no contemptible matter, though a dificult one, to believe, that through thefe particular fciences the foul has an organ purified and enl ghtened, which is deftrcyed and blinded by fudies of other kinds; an organ better worth faving than a thoufind eyes, inafmuch as fruth becomes vifible through this aions."
"Concerning policy, Plato has written st large in his Republic and in his Dialogue on Laws. He was fo much enampured with his own conceptions on this fubject, that it was chiefly the hope of having an opportunity to realife his plan of a republic which induced him to vifit the court of Dionyfus. But they who are converfant with mankind, and capable of calmly inveftigation the fprings of human ations, will cafily perceive that his projests were shimerical, and could onily have originated in a mind replete with philof phical enthafiatm. Of this niothing can be a clearer proof than the defign of admitting in his republic a community of women, in order to give reafon an entire controul over defire. The main objest of his political inflitutions appears to bave been, the fubjigations of the paflions and appstites by means of the abifruct contemplation of ideac. A fyftem of policy, raifed upon fuch fanciful grounds, camot merit a more diflina confideration."

Such is gemuine Platonim as it was taught in the old academy by the founder of the fchool and his immediate followers; but when Arcefilius was placed at the head of the academics, great innovations were intenduced both into their doftimes and in to their mode of teaching (See Arcesilaus). This man was therc.ore confidered as the frunder of what was aftewwards called the middla academy. Being a profelied fecptic, he carried his maxim of uncertainty to fuch a height, as to alarm the general body of philofophers, offead the governors of the Rate, and bring juft oudurn upon the very name of the academy. At length, Cariecdes, one of the difciples of this fohool, eelinquithing fome of the more obnosious tenets of Arcefliaus, founded what has been called the mav academy with very litele improvenent on the jrinciples of the middle. See Cirniades.

Under one cr ather of thefe inms illatuniful found its way into the Roman republic. Cicero was a Flatoritt, and one of the g eiteft umaments of the tcho:l. A fchool of Platonilts was likewife found dia Alezandria in the fecond century of the Chriftian cra; but theur dofrines differed in many particulars from thofe target

## P L A <br> [ $4^{6}$ ]

Platus II whe three academies. incy profelied to teoth from every fchoul. They endeavoured to bend fome of the principles of Plato into a conformity with the doctrines of the gofpel; and they incorporated with the whole many of the maxims of Arifotle and Zeno, and not a few of the fiftions of the ealt. Their fyftem whis therefore extrencly haterogeneous, and feldom fo rational as that of the philofopher after whofe name they were called, and of whofe deftines we have given fo copious a detail. Sec Ammonius, Ecclectics, and Plotinus.

PLAUTUS (Marcus Accius), a comie writer of ancient Rome, born at Umbria, a province of Italy: His proper name was Murcus Accius, and he is fuppofed to have acquired the furname of Plaulus from having fplay leet. His parentage appears to have been mean; fo that fome liave thought he was the fon of a flave. Aulus Gellius fuys tirat Plautus was diftinguifhed for his poctry on the theatre, and Cato for his eloquence in the Forum, at the fame time; and obfives elfewhere from Varro, that he was fo well paid firr his plays as to doulle his ftock in trading, in which he loft all he gained by the intifes. He is faid to have been reduced to work at a mill for his fubliftence; but Varro adds, that his wit wats his beft fupport, as he compored three of his plays during this drri. Igery. He died in the firlt year of the elder Cato's cenforlhip, about the year of Rome 569 , and 184 13. C. We have 20 of his plays extant, though not all of them entire. Five of them, eomedies, have been elegantly tranflated into Englih by Mr B. Thornton, and publifhed in 2 vols 3vn, 1767.

PLAYS. Sce PLAY-house.
PLAY-house. See Theatre, Amphitheatre, \&c. The molt ancient Englifh play-houfes wore the Curtain in Shoreditch and the Theatre. In the time of Shakefpeire, who commenced a dramatic writer in 1592, there was no lefs than ten theatres open. Four of thefe were private houfes, viz. that in Blackfiars, the Cockpit or Phocnix in Drury-Lane, a theatre in Whitefriars, and one in Salifbury court. The other fix were called public thearres, viz. the Clobe, the Swan, the Rofe, and the Hope, on the Bank-fide; the Red Bull, at the upper end of St John's freet, and the Fortune in White-crofs Street. The two lat were ehiefly frequented by citizens. Mr Malone gives us a pretty copious account of thefe phiy houfes, in a fupplement to his latt edition of Shatlefpeare, which we thall here isfert.
" Moft, if not all (fays he) of Slakefpeare's plays were performed eilher at the Clobe crat the Thearre in Blackfiniars. It appears that they bo: 1 t belonged to the fume company of comedians, viz. lixi majefly's fervants, which title they allumed, after a licence had been granted to then by King James in 1603 , having belore that time been called the fervanar of the lord chamberlain.
"The theatre in Blackfiiars was a private houf; but the peculiar and diflinguifhing marks of a private play heule it is not eafy to afcertain. It was very fimall, and plays were there ufually repref:nted by cundie light. Tlic Globe, fituated on the forthern fide of the river Thames, was a hexagonal building, partly open to the weather, partly covercd with roeds. It was a public
theatre, and of confiderable fize, and there they always liay hou ated by day-light. On the roof of the Globe, and the other publie theatres, a pole was erected, to which a flag was affixed. Thefe flags were probibly dipplayed only during the hours of exhibition, and it fhould feem from a paflage in one of the old comedies tbat they were taken down during Lent, in which feafonno plays were prelented. The Globe, though hexagonal at the outide, was probably a rotunda within, and perhaps had its name from its circular form. It might, however, have been denominated only from its fign, which was a figure of Hercules fupporting the Globe. This theatre was burnt down in 1613 , but it was rebuilt in the folIowing year, and decorated wich more ornament than had been originally beftowed upon it. The exhibitions at the Clobe feem to have been calculated chiefly for the lower clafs of people; thofe at Blackfriars for a more feledt and judicious audience.
" A writer informs us, that one of thefe theatres was a winter and the other a fummer houfe. As the Globe was partly expofed to the weather, and they acted there ufually by day-light, it was probably the fummer theatre. The exhibitions here feem to lave been more frequent than at Blackfriars, at leatt till the year 1604 or 1505 , when the Bank-fide appears to have become lefs falionable and lefs frequented than it formerly had been. Many of our ancient dramatic pieces ware performed in the yard; of carriers inns; in which, in the beginning of Queen Elizabeth's reign, the comedians, who then firft united themfelves in companies, erected an occafional ftage. The form of thefe temporary play-houfes feems to be preferved in nur modern theatre. The galleries are in both ranged over each ather on three fides of the building. The finall rooms under the loweft of thefe galleries anfwer to our prefent boxes; and it is obfervable that thefe, even in theatres which were built in a fubfequent period exprefsly for dramatic exhibitions, ftill retained their old name, and are frequently called rooms by our ancient writers. The yard bears a fufficient refemblance to the pit, as at pre. lent in ufe. We may fuppofe the fage to have been raifed in this area, on the fourth fide, with its back to the gateway of the inn, at which the money for admiffion was taken. Hence, in the middle of the Globe, and I fuppofe of the other public theatres, in the time of Shakefpeare, there was an open yard or area, where the common people ftood to fee the exhibition; from which circumflance they are called by our author groundlings, and by Ben Johnfon ' the underftanding gentlemen of the ground.'
"In the ancient play-houfes there appcars to have been a private box, of which it is not eafy to afcertain the fituation. It feems to have been placed at the fide of the ftage towards the rear, and to have been at a lower price: in this fome people fat, either from eco. nomy or fingularity. The galleries, or fcaffolds as they are fometimes called, and that part of the houfe whrich in private theatres was named the pit, feem to have been at the fame price ; and probably in houfes of reputation, fuch as the Globe, and that in Blackfriars, the price of admiffion into thofe parts of the theatre was 6 d . while in fome meaner play-houfes it was only 1 d . in others only 2 d . The price of admifion into the beft rooms or boxes was, I believe, in our author's time, Is.; though
$\gamma$-houfe afterwards it appears to have rifen to 2 s . and half a crown.
"From feveral paffages in our old plays, we learn, that fpectators were admitted on the flage, and that the critics and wits of the time ufually fat there. Some were placed on the ground; others fat on ftools; of which the price was either 6 d . or is. according, I fuppofe, to the commodioufiefs of the fituation; and they were attended by pages, who furnifhed them with pipes and tobacco, which was fmoaked here as well as in other parts of the houfe; yet it fhould feem that per fons were fiufered to fit on the fage only in the private playhoufes, fuch as Blackfiiars, \&c. where the audience was more felect, and of a higher clafs; and that in the Globe and other public theatres no dich licence was permitted.
" The itage was ftrewed with rufhes, which, as we learn from Hentzner and Caius de Ephemera, was, in the time of Shakefpeare, the ufial covering of foors in England. The curtain which hangs in the front of the prefent thage, drawn up by lines and pulleys, though not a modern invention, for it was ufed by Inigo Jones in the mafques at court, was jet an apparatus to which the fimple mechanifm of our ancient theatres had not arrived, for in them the curtains opened in the midd:e, and were drawn backwards and forwards on an iron rod. In fome play houfes they were woollen, in other made of filk.- Towards the rear of the tlage there appears to have been a bal:ony, the platform of which was probably e1 ht or ten feet from the ground. I fuppole it to have been fupported by pillars. From hence, in many of our old plays, part of the dial gue was (poken; and in the front of this balcony curtains likewife were hung.
"A doubt has been entertained whether in our ancient theatres there were fide and other feenes. The queftion is involved in fo much obfcurity, that it is very difticult to form any decided opinion upon it. It is certain, that in the year 1605 Inigo Jones exlibited an entertainment at Oxford, in which moveable feenes were ufed ; but he appears oo have introduced teveral pieces of machinery in the mafques atccurt, with which undoubtedly the public theatres were unacquainted. A paflage which has been produced from one of the old comedies, proves, it maut be owned, that even theie were furnithed with fome pieces of machinery, which were :1fed when it was requifite to exhibit the defcent of fome god or faint; but from all the contemporary accounts. I am inclined to believe that the mechanitn of our ancient ftage feldom went beyond a painted char or a trap door, and that fex, if any of them, had any moveable feenes. When king Henry VIII. is to be difcovered by the dukes of Suffolk and Norfolk, reading in his ttudy, the fecnical direction in the firft folio, 1623 , (which was printed apparently from payhoufe copies), is, 'the king draws the curtain, (i. e. draws it open), and ti:s reading penfively;' for, befides the principal curtains that hung in the front of the flage, they uted others as fubllitutes for fcenes. If a bed-chamber is to be exhibited, ro change of feene is mentioned; but the property-man is fimply ordered to thruf forth a bed. When the fab'e requirts the Roman caritol to be exhibited, we find two officers enter, 'to lay cuifhions, as it were, in the capitol,' \&cc. On the whln'e, it appears, that our ancient theatres, in gencral, wereonly furnifhed with curtains, and a fingle feene compofed of tapeftry, which weretor retimes, perhaps, ornamensed with pitures; and fome faffages in vur old dramas incline one to think,
that when
with black.
"In the early part, at leaft, of our author's $\ddagger$ acquain- $\ddagger$ Stak . tance with the theatr=, the want of feenery fecms to have fyeare. been fupplied by the fimple expedicnt of writing the names of the different places where the ficene was laid in the progrefs of the play, which were difpofed in fuch a manner as to be vifible to the amaience. The invention of trap-dcors, however, appears not to be modern ; for in an old morality, intit'? ${ }^{\text {a }}$ All for AToney, we find a marginal direction which implies that they were very early in ufe. The covering, or internal roof of the ftage, was anciently termed the heavens. It was probably painted of a fky-blue colnur, or perlaps pieces of drapery tinged with blue were fu'ponded acrofs the ftage to reprefent the heavens.
"It is probable that the faxge was formerly lighted by two large branches, of a form fimilar to thofe now hung in churches. They gave place in a fubfequent period to fmall circular wooden frames, furnifhed with candles, eight of which were hung on the fage, four at either fide, and thefe within a few years were wholly removed by Mr Garrick, who, on his return from France, firt intrcuuced the prefent commodious me:hod of illuminating the ftage by lights not virible to the audience. Many of the companies of players were formerly fo thin, that one perfon played two or three parts; and a battle on which the fate of an empire was fuppofed to depend was decided by half a dozen combatants. It appears th have been a common practice in their mock engagements to difcharge imali pieces of ordnance on the flate. Before the ex! ibition began, three flourifhes or pieces of mufic were played, or, in the ancient language, there were three foundings. Mufic was likewife played between the afts. The inltruments chiefly ufed were trumpets, cornets, and hauboys. The band, which did not confit of more than five or fix pertormers, fat in an upper balcony, over what is now called the flage-box.
"The perion who fpoke the prologue was uthered in by trumpets, and ufually wore a long black velvet cloak, which, I luppofe, was confidered as beft fuited to a fup. plicatory addrefs. Of this cultom, whatever might have been its origin, fome traces remained till very lately, a black coat having been, if I miftake not, within thefe few years, the conftant Aage habilimerit of our modern prologue-fpeakers. The drefs of the ancient prologuefpeaker is thill retained in the play that is exbibited in Hamle tbefore the king and court of Denmark The pe:formersof male chinracters generally wore perivigs, which in the age of Shakefpeare were not in common ufe. It appears, from a paffage in Putter han's Ar! of Engli/h Poefy, 1589 , that vizards were on fome occations ufed by the actors of thofe cinys; and it nay be inferred, frum a fcene in one of our athor's comelies, that they were fometimes worn in his time by the who performed female characters ; but this I imagine was very rare. Some of the female part of the audience likewite appeared in maks. The flage.drefies, it is reatomable to tippofe, were much more coflly at fome theatres than at others; yet the wardrobe of even the king's fervants at the Globe and Blackfriars, was, we find, but feantily furnithed ; and our author's dramas derised very litule aid from the fplend r of exlibition.
"It is well known, that in the tine of Sha' effere and for many years afterwards, temale chaincters were

## Y L. A

rlay hurfe. reprefented by boys or young men. Sir William $\mathrm{D}^{\prime} \mathrm{A}$ ve. nant, in imitation of the foreign theatres, firl introduced females in the feene, and Mrs Betterton is faid to have been the firlt woman that afpeared on the Englifh ftage. Andrew Pennycuicke played the part of Matilda in a tragedy of Davenpo:t's, in 1655 ; and Mr Kymafon acted feveral lemale parts after the Relloration. Downes, a contemporaty of his, alures us, 'that being then very young he made a conimplete ftage beauty, performing his parts io well, particularly Arlhiope and Aglaura, that it has fince been difputable among the judicious whether any woman that ficceeded him touched the audience fo fenfibly as he.'
" Both the prompter, or book-holder, as he was fometimes called, and :lic property-man, appear to have been regular appendages of our ancieut theatrc3. No writer that Ihave inet with intimates, that in the time of Shake fpearc it was cuftomary to exhibir morethan afingle dramatic piece on one day. The Yorkfire tragedy, or All's Ore, indced, appeats to have been one of four pieces that were reprefinted on the fame day; and Fletcher his alfo a piece called Four, thays in On' ; but probably thefe were cither exhibited on fome particulat occation, or were ineffectual efforts to introduce a new fiecics of an fement; for we do not find any other initlances of the fame kind. Had any fhorter pieees been exthibited after the principal performance, foine of them probably would have becu printed : but there are none catant of an earlier date than the time of the Reforation. The practice, therefore, of exhibiting two dramas fucceffively in the fame evening, twe may be affured was not eftablifhed before that period. But though the andiences in the time of our anthor were not gratified by the reprefentation of more than onc drama in the fame dar, the entertainment was diverfified, and the populace diverted, by vaulting, tumbling, flight of hand, and morris dancing, a mixture nct much more heterogeneous than that with which we are daily prefented, a tragedy and a farce.
"The amufements of our anceftors, betore the commencement of the play, werc of various kinds, fuch as reading, playing at cards, drinking ale, or fmoaking tobaeco. It was a common practice to carry table-books to the theatrc, and either ficm curiofity or enmity to the author, or fome other motive, to write down paffages of the play that was reprefented : and there is reafon to believe that the imperfert and mutilited eopies of fome of Shakefpear's dramas, which are jet cxtant, were taken down in fhort-h:and during the exhibition. At the end of the piece, the aetors, in noblemen's houfes and in taverns, where plays were frequently performed, prayed for the heallh and profperity of their patrons; and in the public theatres for the hing and queen. This prayer fometimes maide part of the epilogue. Hence, probably, as Mir Steevens has obierved, the addition of $V_{\text {rvan! }} r$ rex "t regina to the modern flay-bills.
". Plays, in the time of our authot, began at one o'clock in the afternonn ; and the cxhibition was ufually finith. cd in two hours. Even in 1667 they commenced at three. When Gofion wrote his School of Alve in 1579, it feems the dramatic entertainments were ufually exhibited on Sundiys. Afterwaids they were performed on that and other days indifriminately. It appears from a contemporary writer, that exhib:ting plays on Sunday bad not been aboliflhed in the third year of king Chatles I.
" The modes of conveyance to the thearr, anciertly
as at prefent, feem to have been various; fome going in Haythoel coaches, others on horicback, and many by water.To the Globe play-houfe the company probably were conveyed by water; to that in Blackfriars the gentry went cither in coaches or on horfback, and the common people on foot. In an epigram to Sir John Davis, the pratice of riding to the theatre is ridiculed as a piece of affectation or vanity, and therefore we may prefume it was not very general.
" The long and whimlical titles that are prefixed to the quarto copies of our author's plays, I fuppofe to have been trinferibed from the play-bills of the time. A contemporary writer has preferved fomething like a play-bill of thofe days, which feems to corroborate this obfervation; for if it were divefted of rhime, it would bear no very diftant refemblance to the title pages that fland befere fome of our auther"s dramas:
"__Prithse, what's the play?
" (The firf I vifited this twelvemonth day)
"They fay-" A new invented play of Purle,
"That jeoparded his neck to Iteal a girl
"Of twelve; and lying faft impounded for't.
"Has hither fent his bearde to aft his part ;
"Againft all thofe in open malice bent,
" That would not freely to the theft confent:
" Feigns all to's wifh, and in the epllogue
"Gocs out applauded for a famous-rogue."
"-Now hang me if I did not look at firft
"For fome fuch tuuff, by the fond people's thruft."
" It is uncertain at what time the ufage of giving atsthors a benefit on the third day of the exhibition of their pieces commenced. Mr Oldys, in one of his manferipts, intimates that dramatic poets had anciently their benefit on the firlt day that a new play was teprefented; a regulation which would have been very favourable to fome of the ephemeral productions of modern times. But for this there is not, I believe, any fufficient authority. From D'Avenant, indeed, ire learn, that in the latier part of the reign of queen Elizabeth, the poet had his benefit on the fecond day. As it was a general practice in the time of Shakefpeare to fell the copy of the play to the theatre, I imagine in fuch cafés an author derived no other advantage from his piece that what arofe from the fale of it. Sometimes, however, he found it more beneficial to retain the copyright in his own hamds; and when he did fo, I fuppofe he had a beenefit. It is certain that the giving authors the profit of the third exhibition of their play, which feems to have been the ufual mode during almoft the whole of the laft century, was an eftablifhed cuftom in the year 1612; for Decker, in the prologue to one of lis comedics printed in that year, fieaks of the poet's third day. The unfortunate Otway had no more than one berefit on the production of a new play; and this too, it fems, he was fometimes forced to mortgage before the piece was aeted. Southerne was the firit dramatic writer who obtained the emoluments arifing from two reprefentations; and to Farquhar, in the year 1700, the benefit of a third was granted. When an author fold his piece to the fharers or proprietors of a theatre, it remained for feveral years unpublifhed; but when that was not the cafe, he ptinted it for fale, to which many feem to have been induced, from an apprehenfion that at imperfee copy might be iffued from the pre's with-

## PLE

-houfe out their confent. The cuftomary price of the copy of Plea. a play in the time of Shakefpeare appears to have been twenty nobles, or fix pounds thirteen flillings and fourpence. The play when printed was fold for fixpence ; and the whal prefent from a patron in return for a dedication was forty fhillings. On the firt day of exhibiting a new play the prices of admitlion appear to have been railed; and this feems to have been occafionally practiced on the bencfit-nimhts of authors to the end of the laft century. The cuftom of paifing a final confure on plays at their firt exlibition is as ancient as the time of our author; for no lefs than three plays of his rival Ben Jonfon appear to liave leen damned; and Fletcher's Faithful Shepherdefs, and The Fnight of the Burning Pefle, written by him and Beaumont, underwent the fame fate.
"It is not eafy ts afcertian what were the emoluments of a fuccefsful actor in the time of Shakefpeare. They bad not then annual benefits as at prefent. The performets at each theatre feem to have fhared the pro. fits ariting either from each day's exhibition or from the whole ieafon among them. From Ben Johnfon's Petafter we learn, that one of either the performers or prop ietors had feven fhares and a half; but of what integral fum is not mentioned. From the prices of ad. miffion into our ancient theatres, which have been already inentioned, I imaginc the utmof that the fharers of the Globe play-houfe could have received on any one day was about L. 35 . So lately as the year $\mathbf{1 6 8 5}$, Shadwell received by his third day on the reprefentation of the Squire of Alfatia, L.I30; which Downes the prompter fays was the greateft receipt that had been ever taken at Dury-Line play-houie at fingle prices. It appears from the MSS. of Lord St inhope, treafurer of the chambers to King James 1. that the cuftomary fum pilid to John Heminge and his company for the performance of a play at court was twenty nobles, or fix pounds thirteen hillings and four-pence. And Ed. ward Alleyn mentions in his Diary, that he rnce had fo flender an audience in his theatre called the Fortune, that the whole receipts of the houfe amounted to no more than three pounds and fome odd fhillings.
"Thus fcanty and meagre were the apparatus and accommodations of nur ancient theatres, on which thofe dramas were firt exhibited, that have fince engaged the attention of fo many learned men, and delightcel fo many thoufand fpectators. Yet even then, we are told by a writer of that age, ' that drantatic poefy was fo lively exprefled :and reprefented on the public ftages and theatres of this city, as Rome in the age of her pomp, and glory rever saw it better performed; in refpect of the aetion and art. not of the coft and fumptuoufinefs."

PLEA, in law, is what either party alleges for himfulf in court, in a canfe there depending; and in a more reftrained fenfe, it is the defendant's anfiver to the plaintiff's declaration.

Pleas are utually divided into thofe of the crown and common pleas. Pleas of the crown are all fuits in the king's name, or in the name of the attorney-general in behalf of the king, for offences commitred againft his crown and dinity, and aganf hie jeice; as treafon, murder, fulony, \&cc. See Arritonment.

Common pleas are fuch fuits as are carried on between common perfons in civil cafes. Thefe pleas are Vol. XV.
of two forts; dilatory pleas, and pleas to the adion. Dilatory pleas are fuch as tend merely to delay or put off the fu:t, by queftioning the propriety of the remed 5 , rather than ly denying the injury: pleas to the action are fuch as difpute the very caufe of fuit.

1. Dilutory pleas are, to to the jurifdiation of the court: allesing, that it nught not to hold plea of this injury, it arifing in Wales or beyond fea; or becaufe the land in queliion is of ancient demefne, and ought only to he demanded in the lord's covrt, \&e. 2. To the difability of the plaintiff, by reafon whereof he is incapab.e to commence or continue the fuit; as, that he is an alien encmy, nutlawed, excommunicated, attainted of treafon or feiony, under a pramunire, not in rerum natura (being only a fictitious perfon), an infant, a ferme covert, or a monk rrofefled. 3. In abatement: which abatement is either of the writ, or the count, for fome defeet in one of then; as by mifnaming the defcadant, which is called a mifromer; giving him a wrong addition as efquire inftead of knicht; or other want of form in any material sefpect. Or, it may be that the plaintiff is dead; for the death of either party is at once an abatement of the fuit.
Thefe pleas to the jurifdiction, to the difability, or in abatement, were formerly very often ufed as mere dilatory pleas, without any foundation in truth, and calculated only for delay; but now by ftat. $4 \& 5$ Ann. c. 16 . mo dilatory plea is to be admitted without affidavit made of the truth therenf, or fome probable matter fhown to the court to induce them to believe it truc. And with refpect to the pleas themfelves, it is a rule that no exception fhall be admitted againft a declaration or writ, unlefs the defendant will in the fame plea give the plaintiff a better; that is, fhow him how it might be amended, that there may not be two objections upon the fame account.
All pleas to the jurifdiction conclude to the cognizance of the court; praving " judgment whether the court will have farther cognizance of the fuit." Pleas to the difability conclude to the perfon; by praying "judgment, if the faid A the plaintiff ought to be anv fwered:" And pleas in abatement (when the fuit is by original) conclude to the writ, or declaration; by praying "judgment of the writ, or declaration, and that the fame may be quafhed," cafitur, made voil, or abated: but if the ation be by bill, the plea mult pray " judgement of the bill," and not of the declaration; the bill being here the original, and the declaration only a copy of the bill.
When thefe dilatory pleas are allowed, the caure is either difmiffed from that jurifdiction, or the plaintiff is flayed till his difability be removed; or he is obliged to fue out a new writ, by leave obtained from the court, or to amend and new-frame his declaration. But when, on the other hand, they are over-muled as frivolous, the defendant has judgment of refponzzat oufer, or to anfiver over in fome better manner. It is then incumbent on him to plead.
2. A plea to the ation; that is, to anfwer to the merits of the complaint. This is done by confefing or denying it.
A confeffion of the whole compiaint is not very ufual: for then the defendant would probably end the mattet fooner, or not plead at all, but fuffer judgment to go G

## PLE

by defarit. Yet fometimes, after tender and refufal of a debt, if the creditor haraffes his debtor with an astion, it then becomes neceffary for the defendant to acknowledge the debt, and plead the tender; adding, that he has always been ready, tout temps prifl and is fill ready, uncore pres, to difcharge it: for a tender by the debtor and refufal by the creditor will in all cafes difcharge the cofts, but not the debtitfelf; though in fome particular cafes the creditor will totally lofe his money. But frequently the defendant confelles one part of the complaint (by a cognovit actionem in refpeft thereof), and traverfes or denies the reft; in order to avoid the expence of carrying that part to a formal trial, which he has no ground to litigate. A fpecies of this fort of cenfeftion is the payment of money into court: which is for the moft part neceflary upon pleading a tender, and is itfelf a kind of tender to the plaintiff; by paying into the hands of the proper officers of the court as much as the defendant acknowledges to be due, together with the cofts hitherto incurred, in order to prevent the expence of any farther proceedings. This may be done upon what is called a motion ; which is an occafional application to the court by the parties or their counfle, in order to obtain fome rule or order of courb, which becones neceflary in the progrefs of a caufe; and it is ufually grounded upon an affidavit (the perfect tenfe of the verb affido), being a voluntary oath before fome judge or officer of the court, to evince the truth of certain facts, upon which the motion is grounded: though no fuch affidavit is neceffary for payment of money into court. If, after the money is paid in, the plaintiff proceeds in his fuit, it is at his own peril : for if he does not prove more due than is fo paid into court, he fhall be nonfuited and pay the defendant's cofts; but he flall ftill have the money fo paid in, for that the defendant has acknowledged to be his duc. To this head may alfo be referred the prasice of what is called a fet off; whereby the defendant acknowledges the juftice of the plaintiff's demand on the one hand, but on the other, fets upa demand of his own, to counterbalance that of the plaintiff, either in the whole or in fart ; as, if the plaintiff fues for ten pounds due on a note of hand, the defendant may fet off nine pounds due to hinfelf for merchandize fold to the plaintiff; and, in cafe he pleads fuch fet-off, mutt pay the remaining ba. larce into court.

Pleas that totally deny the caufe of complaint are either the general iffue, or a fpecial plea in bar.

1. The general ifice or general plea, is what traverfes, thwarts, and denies at once, the whole declaration, without offering any fpecial matter whercby to evade it. As in trefpafs either vi et armis, or on the cafe, " noin culpalitis, not guilty;" in debt upon contrast, " nibil dccbit, he owes nothing;" in debt on bond, "non of forium, it is not his deed;" on an affump/fit, "non cflumpfit, he made no fuch promife." Or in seal ations, "nul lout, no wrong done ; nul diffejifu, no diffeifin;" and in a writ of right, the mi.e or iflue is, that " the tenant has more right to hold than the demandant has to demand." Thefe pleas are called the genernl ifuc, becaufe, by importing an abfolute and general derial of what is alleged in the declaration, they amount at once to an :Thue : by which we mean a faat affirmed on one fide and dusied on the other.
2. Special pleas in bar of the plaintiff's demands are sery various, according to the circumtances of the de-
fendant's cafe. As, in real actions, a general releafe or a fine; both of which may deftroy and bar the plaintiff's title. Or, in perfonal actions, an accord, arbitra. tion, conditions performed, nonage of the defendant, or fome other fact which precludes the plaintiff from his action. A jufification is likewife a fpecial plea in bar; as in actions of aftault and battery, fon affoult demefne, that it was the plaintiff's own original affitult ; in trefpais, that the defendant dit the thing complained of in right of fome office which warranted him fo to do; or, in an action of flander, that the plaintiff is really as bad a man as the defend?nt faid he was.

Alfo a man may plead the flatutes of limitation in bar; or the time limited by certain acts of parliament, beyond which no plaintiff can lay his caufe of ation. This, by the ftatute of 32 Hen. VIII. c. 2. in a writ of right is 60 years: in aflifes, writs of entry, or other poffeffory actions real, of the feifin of one's anceftors in lands; and either of their feifin, or one's own, in rents, fuits, and fervices, 50 years: and in atctions real for lands grounded upon one's own feifin or poffeffion, fuch poffenion muft have been within 30 years. By ftatute I Mar. ft. 2. c. 5 . this limitation does not extend to any fuit for avowfons. But by the flatute 21 Jac. I. c. 2. a time of limitation was extended to the cafe of the king : viz. 60 years precedent to 19th Feb. 1623: but, this becoming incffectual by cflux of time, the fame date of limitation was fixed by ftatute 9 Geo. III, c. 16 . to commence and be reckoned backwards, from the time of bringing any fuit or other procefs to recover the thing in queftion; fo that a poffeftion for 60 years is now a bar even againft the prerogative, in derogation of the ancient maxim, Nulhom tempus occurrit regi. By another ftatute, 21 Jac. I. c. 16.20 years is the time of limitation in any writ of formedon: and, by a confe. quence, 20 years is alfo the limitation in every action of ejectment ; for no ejectment can be brought, unlefs where the leffor of the plaintiff is intitled to enter on the lands, and by the fatute 21 Jac. I. c. 16 . no entry can be made by any man, unlefs within 20 years after his light thall accrue. Alfo all actions of trefpais (quarc claufun fresit, or otherwife), detinne, trover, replevin, account, and cafe (except upon accounts betiveen merchants), debt on fimple contract, or for arrears of rent, are limited by the flatute laft mentioned to fix ycars after the caufe of action commenced : and actions of aftault, menace, battery, mayhem, and imprifonment, muft be brought within four years, and actions for words two years, after the injury committed. And by the fatute 31 Eliz. c. 5. all fuits, indietments, and informations, upon any penal flatutes, where any forfeiture is to the crown, fhall be fied within two years, and where the furfciture is to a fubject, within one year, after the offence commitied, unlefs where any other time is fpecially limited by the ftatute. Lafly, by fatute 10 W . III. c. 14. no writ of error, fire facias, or other fuit, flall be brought to reverfe any judgment, fine, or recovery, for crror, unlefs it be profecuted within 20 ycars. The ufe of thefe ftatutes of limitation is to preferve the peace of the kingdom, and to prevent thofe innumerable perjuries which might enfue if a man were allowed to bring an action for any injury committed at any diftance of time. Upon both thefe accounts the law therefore holds, that interef ripublicae ut fit finis litizm: and upon the dame principle the Athenian laws in general pro-Libitedi

## PLE <br> 51 ] PLE

 Sibited all adions where the injury was committed five years before the complaint was made. If therefore, in any fuit, the injury, ur caule of action, happened earlicr th:in the period exprefsly limited by law, the delendant may plead the fatutes of limitations in bar: as upon an aftumn $f_{i}$, or promife to ply money to the platutiff, the d.fendant may plead, Non affumpfinfra fex annos, He made no fuch promife within fix years; which is an affectual bar to the complaint.An efloppel is likewife a fpecial plea in bar; which happens where a man hath done fome ant, or exccuted fome deed, which ellops or precludes him from averring any thing to the contrary. As if a tenant for years (who hath no (reehold) levies a fine to another perfon. Though this is void as to flrangers, yet it thall work as an eftoppel to the cognizor ; for, if he afterwards brings an action to recover thefe lands, and his fine is pleaded agraint him, be fhatl thereby be eftopped from faying, that he had no freehold at the time, and therefore was incapable of levying it.

The conditions and qualities of a plea (which, as well as the doctrine of eiloppels, will alio hold equally, mutatis mutandis, with regard to other parts of pleading), are, 1. That it be fingle and containing only one matter ; for duplicity begets confution. But by ftatute 4 and 5 Ann. c. 16 a man, with leave of the court, may plead two or more dittinct matters or fingle pleas; as in an action of aftault and battery, thefe three, Not guilty, fon afluitt dimefne, and the itatute of limitations. 2. That it be direct and pofitive, and not argumentative. 3. That it have convenient certainty of time, place, and perfons. 4. That it anfwer the plaintiff's allegations in every material point. 5. That it be fo pleaded as to be capable of trial.

Special pleas are ufually in the affirmative, fometimes in the negative, but they always adrance fome new fact not mentioned in the declaration; and then they mult be averred to be true in the common form:-" And this he is ready to verify." -This is not neceffary in pleas of the general ifiue, thofe always containing a total denial of the facts before advanced by the other party, and therefore putting him upon the proof of them. See Pleadings.

PLEA to Indiament, the defenfive matter alleged by a comment. criminal on his indietment: (fee Arraignment) This is either, 1. A plea to the jurifdition; 2. A demurrer; 3. A plea in abatement; 4. A fpecial plea in bar; or, 5. The general iffue.
I. A plea to the jurifdition, is where an indictment is taken before a court that hath no cognizance of the offence; as if a man be indieted for a rape at the fheliff's tourn, or for treafon at the quarter-feflions: in thefe or fimilar cafes, he may except to the jurifdiction of the court, without anfwering at all to the crime alleged.

Il. A densurrer to the indictment, is incident to criminal cafes, as well as civil, when the fact as alleged is allowed to be true, but the prifoner joins iflue upon fome point of law in the indietment by which he infifts, that the fact, as flated, is no felony, treaion, or whatever the crime is alleged to be. Thus, for intancs, if a man be indicted for felonioully tealing a greyhound; which is an animal in which no valuable property can be had, and therefore it is not felony, but only a civil trefpal's to fteal it; in this cafe the party indicted may dernur to the indictment; denying it to be felony, tho ${ }^{\prime}$
he contelfes the act of taking it. Some have held, that if, on demurser, the point of law be adjudged againit the prifoner, he thall have judgment and execlition, as it convicted by verdict. But this is denied by others, who hold, that in fuch cafe he thatl be diredted and received to plead the general illue, Not guilty, af:er a de. murrer determined againt him. Which appears the more reafonable, becaufe it is clear, that if the prifoner frecly difcovers the fact in court, and refers it to the opinion of the court whether it be felony or no; and upon the fact thus thown, it appears to be felony, the court will not record the confefion, but adnit him afterwards ty plead not guilty. And this feems to be a cafe of the lume nature, being for the molt part a mif. titie in point of law, and in the conduct of his pleading; and, though a main by mifpleading may in fome calés lofe his property, yet the law will not fuffer him by fuch niceties to lofe his life. However, upon this doubt, demurress to indictmente are feldom ufed: fince the fame advantages may be taken upon a plea of not guilty ; or afterwards, in arref of judgment, when the verdict has eftablimed the fact.
III. A plea in abatement is principally for a mifnomer, a wrong name, or a falle addition to the prifoner. As, if James Allen, gentleman, is indiced by the name of Foln Allen, efquire, he may plead that he has the name of Fames, and not of Joln ; and that he is a gentleman. and not an efquire. And, if either fact is found by a jury, then the indifment fhall be abated, as writs or declarations may be in cisil actions. But, in the end, there is little advantage accruing to the prifoner by means of thefe dilatory pleas; becaufe, if the exception be allowed, a new bill of indictment may be framed, according to what the prifoner in his plea avers to be his true name and addition. For it is a rule, upon all pleas in abatement, that he who takes advantage of a Haw, muft at the fame time fhow how it may be amended. Let us therefore next confider a more fubftantial kind of plea, riz.
IV. Special pleas in bar ; which go to the merits of the indiotment, and give a reafon why the prifoner ought not to anfwer it at all, nor put himfelf upon his trial for the crime alleged. Thefe are of four kinds : a former acquittal, a former conviction, a former attainder, or a pardon. There are many other pleas which may be pleaded in bar of an appeal: but thefe are applicable ts both appeals and indictinents.

1. Firt, the plea of autirfoits acquit, or a former acquittal, is grounded on this univerfal maxim of the common law of England, that no man is to be brought into jeopardy of his life, nore than once, for the fame of fence. And hence it is allowed as a confequence, that when a man is once fairly found not guilty upon any indistment, or other profecution, before any court haring competent jurifdiction of the offence, he may plead fuch acquittal in bar of any fubfequent accufation for the fame crime.
2. Secondly, the plea of auterfoits conviat, or a former convistion for the fame identical crime, though no judgment was ever given, or perhaps will be (being fufpended by the benefit of clergy or other caufes), is a good plea in bar to an indietment. And this depends upon the fame principle as the former, that no man ought to be twice brought in danger of his life for one and the fame crime,

## PLE [ 52$] \quad$ PLE

lica.
3. Thirdly, the plea of auterfoits attaint, or a former attainder, is a good plea in bar, whether it be for the fame or any other felony. For wherever a man is attainted of felony by judgment of death either upon a verdict or confefion, by outlawry, or heretofore by abjuration, and whether upon an appeal or an indiament; he may plead fuch attainder in bar to any fublequent indictment or appeal, for the fame or for any other felony. And this becaufe, gencrally, fuch proceeding on a fecond profecution cannot be to any purpofe; for the prioner is dead in law by the fir! atrainder, his blood is already corrupted, and he hath forfeited all that he had: fo that it is abturd and fuperfluous to endeavour to attaint him a fecond time. Though to this general rule, as to all others, there are fome exceptions; wherein, ceffante ratione, ceffat ot iffal l :
4. Laftly, a pardon may be pleaded in bar; as at once deftroying the end and purpoie of the indiement, by remitting that punifhment, which the prefecution is cal. culated to inflic. There is one advantage that attends pleading a pardon in bar, or an arreft of judgment, before fentence is palt ; which gives it by much the preference to pleading it after f.ntence or attainder. 'This is, that by flopping the judgment it fops the attainder, and prevents the corruption of the blood: which, when once corrupted by attainder, cannot afterwards be reftored otherwife than by att of parliament.
V. The geveral ifue, or plea of not guilty, upon which plea alone the prifoner can receive his tinal judgment of death. In cafe of an indiftment of felony or treafon, there can be no fpecial juffification put in by way of plea. As, on an indictment for murder, a man cannot plead that it was in his own defence againit a robber on the highway, or a burglar; but he muft plead the general iffue, Not guilty, and give this fpecial matter in evidence. For (befides that thefe pleas do in effect amount to the general iffue; fince, if true, the prifoner is moft clearly not guilty) as the facts in treafon are faid to be done proditore et contra liganlia fue delitum; and, in felony, that the killing was done felonice; the fe charges, of a traiterous or felonious intent, are the points and very giff of the indictment, and muft be anfwered dircolly by the general negative, Not guilty; and the jury upon the evidence will take notice of any defenfive matter, and give their verdif accordingly as effectually as if it were or could be fipecially pleaded. So that this is, upon all accounts, the moft advantageous plea for the prifoner.

When the prifoner hath thus pleaded not guilty, non cu'pabilis, or nient culpable: which was formerly ufed to be abbreviated upon the minutes, thus, Non (or nient) cal. the clerk of the affize, or clerk of arraigns, on be. half of the crown replies, that the prifoner is guilty, and that he is ready to prove him fo. This is done by two monofyllables in the tame frisit of abbreviation, cal. prit.: whith lignifies firf that the prifoner is guilty, (cul. culpuble, or culpalilis); and then that the Ling is ready to
prove him fo, (prit, preflo fum, or paratus, verifiuture). By this replication the king and the prifoner are therefore at iflue: for when the parties come to a fast which is affirmed on one fide and denied on the other, then they are faid to be at iffue in point of fact: which is evidently the cafe here, in the plea of non cul. by the prifoner; and the replication of cul. by the clerk.

How the courts came in exprefs a matter of this importance in fo odd and obfcure a manner, can hardly be pronounced with certainty. It may perhaps, however, be accounted for by fuppofing, that theje were at firft fhort notes, to help the memory of the clerk, and remind him what he was to reply; or elfe it was the fhort method of taking down in court, upon the minutes, the replication and averment; cul. prit: which afterwards the ignorance of lucceeding clerks adopted for the very words to be by them fpoken (a).

But however it may have arifen, the joining of iffue feems to be clearly the meaning of this obicure expreffion; which has puzzled our moft ingenious etymolugiits, and is commonly undertond as if the clerk of the arraigns, immediately on plea pleaded, had fixed an opprobrious name on the prifoner, by alking him, "culprit, how wilt thou be tried?" for immediately upon iflue joined it is inquired of the prifoner, by what trial he will make his innocence appear. This form has at prefent reference to appeals and approvements only, wherein the appellee has his choice, eicher to try the accufation by Battle or by Jury. But upon indiftments, fince the abolition of Ordeal, there can be no other trial but by jury, per pais, or by the country: and therefore, if the prifoner refufes to put himfelf upon the inqueft in the ufual form, that is, to anfiwer that he will be tried by God and the country, if a commoner; and, if a peer, by God and his pcers ; the indistment, if in treafon, is taken pro confeffo; and the prifoner, in cafes of felony, is judged to Itand mute, and, if he perfeveres in his obftinacy, flall now be convifted of the felony.

When the prifoner has thus put himfelf upon his trial the clerk anfivers in the humane language of the law, which always hopes that the party's innocence rather than his guilt may appear, "God itnd thee a good deliverance." And then they proceed, as foon as conveniently may be, to the trial. See the article 'Trial.

PLEADINGS, in law, are the mutual altercations between the plaintiff and defendant, (fee Suit, Writ, and Process). They form the third part or fage of a fact; and at prefent are fet down and delivered into the proper olfice in writing, though formerly they were ufually put in by their council ore teuns, or viva voce, in court, and then minuted down by the chief clerks or protlienotaries; whence, in our old law-French, the pleadings are frequently denominated the parol.

The firft of thele is the declaration, narratio, or count, anciently called the tale; in which the plaintiff fets forth his caufe of complaint at length: being indecd only an amplification
(A) Of this ignorance we may fee daily infances, in the abufe of two legal terms of ancient French : one, the prologue to all proclamaticns, "Oyez, or Hear ye," which is generally pronounced, molt unmeaningly, "O yes: the other, a more pardonable miftake, viz. when a jury are all fivorn, the officer bids the crier number them, for which the word in law French is "Contez;" but we now hear it pronounced in very good Englifh, "Count thefe."

## PLE. [ 53 ] PLE

leadiags, amplification or expofition of the oricinal writ upon which his ation is founded, with the additional circumfances of tume and place, when and where, the injury $w \%$ committed.

In local actions, where poffeffion of land is to be recovered, or damages for an a tutual trefiple, or for wate, \&c. affesting 1 ind, the plaintiff muft lay his declaration, or declare his injury to have happened in the very county and place that it really did happen; but in tranfitory actions, for injuries that might have happened any where, as delt, detinue, flander, and the like, the plaintiff may dechare in what county he pleafes, and then the trial mult be in that ceunty in which the declaration is laid. Thouch, if the defendant will make affidavit that the caule of action, if any, arofe not in that but another county, the court will direct a clange of the cenue or vifnc (that is, the viciniz or neighbourhood in whilh the injury is declared to be done), and wili oblige the plaintiff to declare in the proper county. For the fatute 6 Ric. II. c. 2. having ordered all writs to be laid in their proper counties, this, as the judges conceived, impowered them to change the venus, if required, and not to infilt rigidly on abating the writ: which pradtice began in the reign of James I. And this power is diferetionally exerciled, fo as not to caude but prevent a defert of juttice. Therefore the court will not change the venue to any of the four northern counties previous to the fpring circuit; becaufe there the affifes are holden only once a-year, at the time of fummer circuit. And it will fometimes remove the rienue from the proper jurifdiction (efpecially of the narrow and limited kind), upon a fuggeltion, duly fupported, that a fair and impartial trial cannot be had therein.

It is generally ufual, in actions upon the cafe, to fet forth feveral cafes, by cifferent counts in the fame declaration; fo that if the plaintiff fails in the proof of one, he may fucceed in another. As in an attion on the cafe upon an assumpsir for goods fold and delivered, the plaintiff ufually counts or declares, firt, upon a fettled and agreed price between him and the defendant; as, that they bargained for 201 .: and left he fhould fail in the proof of this, he counts likevife upon a quantunz valibant; that the defendant bought other goods, and agreed to pay him fo much as they were reafonally woith: and then avers that they were worth other 20l. and fo on in three or four different thapes; and at laft concludes with declaring, that the defendant had refufed to fulfil any of thefe agreements, whereby he is endamaged to fuch a value. And if he proves the cafe laicl in any one of his counts, though he fails in the relt, be thall recover proportionable damages, This declaration always concludes with thefe words, "and thereupon he brings fuit," \&c. inde producit jellam, Ejc. By which words, fuit or feda (a fequendo), were anciently underflood the witneflies or folfowers of the plaintif. For in former times, the law would not put the defendant to the trouble of anfiwering the charge till the plaintiff had niade out at leaft a probable cafe. But the actual production of the finit, jeca, or followers, is now antiquated, and hath been totally difuted, at leaf ever firce the reign of Edward III. though the form of it ftill continues.
At the end of the declaration arc added alfo the
plaintif's common pledges of profecution, John Doe lleadings. and Richard Roe; which, as we cliewhare obicrve, (fee Writ), are now mere names of form; though formerly they were of ufe to anfwer to the king for the amercement of the phintiff, in cale he were nonfuited, barred of his astion, or had a verdict and judgment arraint him. For if the plaintif neglefs to deliver it declaration for two terms a'ter the deich dant appears, or is guilty of other delays or defau!ts a rainlt the rules of law in any librequaent farge of the acti $n$, he is a juedred not to follow or purfue his remedy as he ought to do ; and thereupon a monfuit, or man $p$ ojequitur, is critere 3 . and he is faid to be honn prof'd. And for thers deferting his complaint, after miking a falfe claim or complaint (profalfo clamore fio), he fhall not only pay cons to the defendant, but is liable to be amerced to the kiig. A retraxit differs from a nonfuit, in that the ons is negative and the other politive: the nonfuit is adefult and neglect of the plaintiff, and thercfore l:e is allowed $t$, begin his fuit again upon payment of coft; but a reiraxit is an open and voluntary renuncintion of his fuit in court; and by this he for ever lofes lins aftion. A difcontinuance is fomewhat fimilar to a nonftit ; for when a plaintiff leaves a chafin in the proccedings of his cutfe, as by not continuing the proceff regularly from day to day, and time to time, as he ought to do, the fivit is difcontinued, and the defendant is $n$ ) longer boun. 10 attend; but the plaintiff mult begin again, by fuing vet a now original, ulually paying colts to his antargonit.

When the plaintiff hath fated his cafe in the decl.1ration, it is incumbent on the defenlant, within a reafonable time, to make his defence, and to put in a plea; or elfe the plaintiff will at once recover judgment by default or nizil dizit, of the defendant.

Defence, in its true legal fenfe, fignifies not a juftification, protection, or guard, which is now its popalar fignitication; but merely an oppofing or denial (from the French verb defendre) of the truth or validity of the complaint. It is the contefatio l'tis of the civilians: : general affertion that the plaintifi hath no ground of action; which alfertion is afterwards extended and maintained in his plea.

Betore defence made, if at all, cognizance of the fuit muft be claimed or demanded; whea any perfon or body-corporate hath the franchile, not only of holding pleas within a particular limited juridiction, but alio of the cognizance of pleas; and that either without any words exclufive of other courts, whith intitles the lord of the franchife, whenever any fuit that belongs to his jurifdistion is commenced in the courts at WeftminAter, to demand the engnizance thereof; or with fueh exclufive words, which alfo inticle the defendant to plead to the jurifdiction of the court. Upon this claim of cognizance, if allowed, all proceedings thall ceafe in tha fuperior court, and the plaintiff is left at liberty to purlu: his remedy in the feecial juriflistion. As when a fcholar or 0 her privileged perfon of the univerfitics of Oxford or Cambridge is impleaded in the courts at Weftminter, for any caufe of ation whatfoever, unlefs upon a queftion of freehold. In thefe cafe, by the charter of thufe learned bodies, confirmed by att of parliament, the chancellor, or vice-chancellor, may put in a claim of cognizance; which, if made in due time and form, and with due proof of the facts alleged is regu-

## PLE

Fleadings. larly allowed by the courts. It muft be demanded before full defence is made or imparlance prayed; for thefe are a fubmifion to the jurifdistion of the fuperior court, and the delay is a lacbes in the lord of the franchife; and it will not be allowed if it occations a failure of juflice, or if an adion be brought againft the perfon himfelf who clains the franchife, untefs he hath alfo a power in fuch cafe of making another judge.

After defence made, the defendant mult put in his plea. But before he defends, if the fuit is commenced by capias or latiat, without any fpecial orisinal, he is intitied to demand one imparlance, or lisentia loquendi; and may, before he pleads, have more granted by confent of the court, to fee if he can end the matter amicably without farther fuit, by talking with the plaintiff: a grafice which is fuppofed to have arifen from a principle of religion, in obsuience to that precept of the gofpel, " agree with thine adverfary quickly, whilft thou art in the rway with him." And it may be obferved, that this $\mathrm{g}\ulcorner$ fpel-precept has a plain reference to the Roman law of the twelve tables, which expreffly direfted the plaintilf and defendant to make up the matier while they were in the way, or going $t$ the prator;-in via, rem uti pacent orato. There are alfo many other previous Iteps which mary be taken by ad defendent before he puts in his plea. He may, in real astions, demand a viers of the thing in quellion, in order to alcertain its indentity and other circumftances. He may crive oyer of the writ, or of the bond, or other fpecialty upon which the action is brought ; that is, to hear it read to him ; the generality of defendants in the times of ancient fimplicity being fuppofed incapable to read it themfelves: whereupon the whole is entered verbatim upon the record; and the defendant may take advantage of any condition, or other part of it, not ftated in the plaintiff's declaration. In real actions alfo the tenant may pray in aid, or call for the affiftance of another, to help him to plead, becaufe of the feeblenefs or imbecility of his own eftate. Thus a tenant for life may pray in aid of him that hath the inheritance in remainder or reverion; and an incumbent may pray in aid of the patron and ordinary; that is, that they thall be joined in the action, and help to defend the citle. $I^{\top}$ oucber alfo is the calling in of fome perfon to anfwer the action, that hath warrmied the title to the tenant or defendant. This we fill make ufe of in the form of common recoveries, which are grounded on a writ of entry; is fpecies of astion that relies chiefy on the weaknefs of the temant's tifle, who therefore vouches monther perfon to warrant it. If the vouchec appears, he is made defendant inflend of the voucher; but if he afterwards makes default, recovery thatl be had againt the original defendint; and he flall iccover an equivalent in value araintt the deficient vouchee. In anizes, indeed, where the pincipal quellion is, whether the demandant or his anceltors were or wete not in poifetlion till the oufter happoned, and the title of the tenant is little (if at all) difcuffed, there no voucher is allowed; but the tenant may bring a wit of coarrantion tharte againf the warrantor, to compel him to athil him with a good ple:t or defence, or elfe to render damages and the value of the land, if recovered againt the tenant. In many real actions alfo, brought by or againt an infant unjer the are of 21 years, and alfio in actions of debt brought againt him, as heir to any decenfed
anceftor, either patty may fuggen the nonage of the Pleadirgi. infant, and pray that the proceedings may be deferred till his full age, or in our legal phase, that the infant may have his age, and that the parol may demur, that is, that the pleadings may be ttaid; and then they fhall not proceed till his full age, uniefs it be apparent that he cannot be prejudiced thereby. But hy the flatutes of Wefm. I. 3. Edw. I. c. $4^{6}$. and of Glocefter, 6 Edw: I.c. 2. in writs of entry fur diffeifin in fome particular cafes, and in aftions aunceAtrel brought by an infant, the parol thall toot demar; otherwife he might be deforced of his whole property, and even want a maintenance, till he came of age. So likewife in a writ of dower the heir fhall not have his alge; for it is neceffary that the widow's claim be immediately determined, elfe the may want a prefent fubfittence. Nor flall an infant patron have it in a quare impeclit, fince the law holds it neceffary and expedient that the church be immediately filled.

When thefe proceedings are over, the defendant mull then put in his excufe or plea. See Plea.

It is a rule in pleading, that 110 man be allowed to plead fpecially fuch a plea as amounts only to the general iffue, or a total denial of the charge; but in fuch calfe he thall be driven to plead the generdl iflue in terms, whereby the whole quetion is referred to a jury. But if the defendant, in an affize or astion of tref $f_{\text {afs }}$, be defirous to refer the validity of his title to the court rather than the jury, he may fate his title fpecially; and at the fame time give colour to the plaintiff, or fuppofe him to have an appearance or colour of title, bad indeed in point of law, but of which the jury are not competent judges. As if his own true title is, that he claims by feoffment with livery from $A$, by force of which he entered on the lands in queftion, he camot plead this by itfelf, as it amounts to no more than the general iftue, nul tort, nul difeifin, in afize, or not guilty in an alion of trefpafs. But he may allege this §pecially, provided he goes farther, and fays, that the plaintiff claiming by colour of a prior deed of feoffment, without livery, entered; upon whom he entered; and may then refer himfelf to the judgment of the court which of thefe two tilles is the beft in point of law.
Whan the plea of the defendint is thus put in, if it docs not amount to an iffue or tetal contradiction of the declaraiiin, but only evades it, the plaintiff may plead again, and reply to the defendant's plea: Either traverfing it, that is, totally denying it; as if, on an astion of delat upon bond, the defendant pleads folvit ad Hom, that he paid the money when due; here the phantiff in his replication may totaliy traverfe this plea, by clenying thate the defendant paid it: Or lie may allege ncw matter in contradiation to the defendant's plea: as when the detendant pleads no award made, the plaintiff may reply, and fet forth an actual award, and aflign a breach: Or the replication m y confefs and avoid the plea, by fome new matter or difinction, confiftent with the plaintifes former declaration; as in an action for trefjarfing upon land whereof the plaintiff is feized, if the defendant fhows a titie to the land by defeent, and that therefore he had a right to enter, and gives colour to the plaintiff, the plaintiff may either traverfe and totally deny the fact of the defcent; or he may confefs and avoid it, by replying, that true it is that fuch de-

## P L A

eadings. fcent happened, but that fince the defeent the defendant himfelf demifed the lands to the plaintiff for term of life. To the replication the defendant may rejoin, or put in an anfwer called a rejoinder. The plaintiff may anfwer the rejoinder by a fur reoindir; upon which the defendant may rebut, and the plaintiff anfwer him by a fur-rebutter. Which pleas, replications, rejoinders, furrejoinders, rebutters, and fur-rebutters, anfiwer to the exccptio, replicatio, diuplicalio, triplicatio, and quadruplicatio, of the Roman laws.

The whole of this procefs is denominated the plea\% ing; in the feveral fages of which it mult be carefully obferved, not to deparior vary from the title or defence which the party laas once infilted on. For this (which is called a departure in pleading) might occafion endlefs altercation. Therefore the rephcation mult fupport the declaration, and therrejoinder mult fupport the plea, without departing out of $i t$. As in the cafe of pleading no award made in confequence of a bond of arbitration, to which the plaintiff replies, fetting forh an aifual award; now the defendant cannot rejoin that he hath performed this award, for fuch rejoinder would be an entire departure from his original plea, which alleged that no fuch award was made : therefore he has now no other choice, but to traverfe the fact of the replieation, or elfe to demur upon the law of it.

Again, all duplicity in pleading muft be avoided. Every plea mull be fimple, entire, connected, and confined to one fingle point: it muft never be entangled with a variety of diftinct independent anfwers to the fame matter; which mull require as many different replies, and introduce a multitude of iflues upon one and the fame difpute. For this would often embarrafs the jury, and fometimes the court itfelf, and at all events would greatly enhance the expence of the parties. Yet it frequently is expedient to plead in fuch a manner as to avoid any implied admifion of a fact, which cannct with propriety or fafety be pofitively affirmed or denied. And this may be done by what is called a proteftation; whereby the party interpofes an oblique allegation or denial of fome fact, protefting (by the gerund, protefando) that fuch a matter does or does not exitt ; and at the fame time avoiding a direct affirmation or denial. Sir Edward Coke hath defined a proteltation (in the pithy dialect of that age) to be, "an exclufion of a conclufion." For the ufe of it is, to five the party from being concluded with refpest to fome fast or circumfance which cannot be directly affirmed or denied without falling into duplisity of pleading; and which yet, if he did not thus enter his protef, he might be deemed to have tacitly waved or admitted. Thus, while tenure in villainage fubfifted, if a villain had brought an astion againft his lord, and the lord was inclined to try the merits of the demand, and at the fame time to prevent any conclufion againft himfelf that he had waved his figniory; he could not in this cafe both plead affirmatively that the plaintiff was his vilain, and alfo tale iffiue upon the demand; for then his plea would have been double, as the former alone would have been a good bar to the adion: but he might have alleged the viliainage of the plaintiff by way of proteltation, and then have denied the demand. By this means the future vaf. falage of the plaintiff was faved to the defend.int, in cafe the iflue was found in his (the defendant's) favour; for the proieftation prevented that conclufion which would
otherwife have refulted from the rell of his defence, Pleadings that ho had enfranchifed the plaintiff, fince no vi lain could maintain a civil action againt his lord. So alio if a defendant, by way of inducement to the point of his defence, alleges (among other matters) a particular mode of fifin or tenure which the platintif is unwilling to admit, and yet detires to take illue on the principat point of the delenes, he munt deny the feim or tenure by way of proteftation, and then triverfe the defenfive matter. So, lafly, if an award be fet $f$ rth by the plaintif, and he can afign a breach ia one part of it (viz. the non-payment of a fum of money), and yet is afraid to admit the performance of the reft of the award, or to aver in general a non-performance of any purt of it, lef fomething fhould appear to have been performed; he may fave to himfelf any advantage he might hereafter make of the general non-performance, by alleging that by proteftation, he can plead only the non-payment of the money.

In any ftage of the pleadings, when either fide advances or affirms any new matter, he uftally (as was faid) avers it to be true; " and this he is ready to verify." On the other hand, when either fide traverles or denies the facts pleaded by his antagonilt, he ulually tenders an iflue, as it is called; the lmguage of which is different according to the party by whom it is tendered; for if the traverfe or denial comes from the dufendant, the iffue is tendered in this manner, "And of this he puts himfelf upon the country," thereby fubmitting himfelf to the judgment of his peers: but if the traverfe lies upon the plantiff, he tenders the ifue or prays the judgment of the peers againtt the defendant in another form ; thus, " and this he prays may be inquired of by the country."

But if either fide (as, for inftance, the defendant) pleads a fpecial negatire plea, not traverfing or denying any thing that was before alleged, but difclofng fome new negative matter; as where the fuit is on a bond conditioned to peıform an award, and the defendant ple:ads, negatively, that no award was made; he tenders no iflue upon this plea, becaufe it does not yet appear whether the fact will be difputel, the plaintiff not having yet afferted the exiltence of any award: but when the plantiff replies, and fets forth an actual fpecific award, if then the defendant traverfes the replication, and denies the making of any fuch award, he then, and not before, tenders an iffue to the plaintiff. For when in the coure of prading they come to a point which is affirmed on one fide and denied on the other, they are then faid to be at iffue; all their debates being at laft contracted into a fingle point, which mult now be determined either ia favour of the plaintiff or of the defendimt. Sce Issue.

PLEASiNG, art of. See Politeness.
PLEASURE is a word fo univerfally underflond as to need no explanation. Lexicographers, however, who mult attempt to explain every word, call it " the gratification of the mind or fenfes." It is direstly oppofite to Pain, and conflitutes the whole of pontive happinefs as that does of mifery.

The Author of Nature has furnihed us with many perdic Mepleafures, as well as made as liable to many pains; and thorlique, we are fufceptible of boill in fome degiee as foon as we logique, have life and are endowed with the faculty of fenfation. Metaphy. A French writer, in a work* which onse railed high figue, it

## PIE

Pleafure. expefations, contends, that a child in the womb of its mother feels neither pleafure nor pain. "Thefe fenfations (fays he) are not innate; they have their origin from without: :trid it is at the moment of our birth that the foul reccives the fil ft impreflions; imprefions fight and fupericial at the beginning, but which by time and repated acts leave deeper traces in the fonforium, and hecome more cxtenfive and more laft ing. It is when the child fends forth its firit crics thant fenfibility or the faculty of fenfation is produced, which in a flort time gathe:s ftrength al:d lathility by the impreflion of exterior objects. Pledfure and pain not being innate, and being only acauired i:a the fame manner as the qualities which we cerive from initruation, education, and fociety, it follows that we learn to fuffer and enjoy as we learn any other feience."

This is ftange reafoning and frange language. That ferfations are not innate is univerfilly acknowledged; but it does not therefore follow that the foul receives its firlt impreflions and firft fenfations at the moment of birth. The cliid has life, the power of locomotion, and the fenfe of touch, long b fore it is bo:n ; and cvery mother will tell this philofopher, that an infant unborn exhibits fympeons both of pain and of pleafure. That many of our organs of fenfe are improved by ufe is incontrovertible; but it is fo fat from being truc that our fenfible pleafures become more exquifite by being often repeated, that the direat contrary is experienced of far the greater part of them; and though external objeats, by making repeated inpprefions on the fenfes, certain!y leave deeper traces on the memory than an object once perccived can do, it by no ineans follows that thefe impreflions become the more delightful the more familiar that they are to us. That we learn to fuffer and enjoy as we learn any other fcience, is a moit extravagant paradox ; for it is felf-evident that we cannot live without being capable in fome degree both of fuffering and enjoyment, though a man may certainly live to old age in profound ignorance of all the iciences.

The fime writer affures us, indeed, that fenfation is not neceffary to human life. "Philofophers (fays he) make mention of a man who had loft every kind of feeling in every member of his body: he was pinched or pricked to no purpote. Meanwhile this man made ufe of all his members; he walked without pain, he drank, ate, and flept, without perceiving that he did fo. Senfible neither to pleafure nor pain, he.was a true natural machine."

To the tale of thefe anonymous philofinphers our author gives implicit credit, whill he favours us at the fame intlant with the following argumentation, which completely proves its falfehood. "It is tuue that fendation is a reative quality, fufeep ible of increafe and diminution; that it is not necelfiry to exiftence; and that one might live without it: but in this caff he would live as an automaton, without feeling peafure or pain; and he would polfefs neither idea, nor reflection, nor defire, nor pafion, nor will, nor fentiment; his exiftence would be merely pafive, he would live without knowing it, and die without apprelsenfion.".

But if this man of the philofophers, whom our authar calls an autionn for, and a true natural michine, liad meither ida, nor defire, nor paffon, nor ruil, nor fentimint
(and without Cenfation he certairly could have none of Pleafure. them), what induced hin! to woik, eat, or drink, or to cenfe from any of thefe operations after they were ac. cidentally begun : The inftaices of the automata which played on the flute and at chefs are not to the purrofe for which they are adduced; for there is no parallel between them and this natural machine, unlefs the philofophers wound !lp their man to eat, drink, walk, or fit, as Vacanfon and Kempeler wound up their auto mata to play or ceafe from playing on the German flute and at chefs. See Androides.

Our author having for a while fported with thefe harmlefs paradoxes. proceeds to put the credulity of his reader to the teft with others of a very contrary tendcacy. He inflitutes an inquiry concerning the fuperiority, in number and degree, of the pleafures enjoyed by the different orders of men in fociety; and labours, not indeed by argument, lut by loofe declamation, to propagate the belief that h.ippinefs is very uncqually diftributed. The pleafures of the rich, he fays, mult be more numerous and exquilite than thofe of the poor; the nobleman muf have more enjoymerits than the plebeian of equal wealth; and the kint, according to him, mult be the happicfl of ail men. He owns, indeed, that although " birth, rank, honours, and dirnity, add to h.appinefs, a man is not to be confidered as miferable becaufe he is born in the lower conditions of life. A man may be happy as a mechanic, a merchant, or a labnurer, provided he enters into the fpirit of his profeffion, and has not imbibed by a mifplaced education tliofe fentiments which rake his condition infupportab'e. Happinefs is of eafy acquilition in the middling flations of life; and though perhaps we are unable to know or to rite exanlly the plesfure which arifes from contentment and mediocrity, yet lappinefs being a kind of aggrcgate of delights, of riches, and of advantages more or list great, every perfon muft have a fh ire of it; the divifion is not exactly mide, but all other things equal, there will be more in the elevated than in the inferior conditions of fociety; the enjoyment will be more felt, the means of enjoying more multiplied, and the pleafures more varied. Birth, rank, fortune. talents, wit, genius, and virtue, are then the great fources of happinefs: th fe idvantages are fir coniderable, that we fee men contented with any one of them, but their union forms fupreme felicity.
"There is fo valt a diference, fiys Voltaire, between a man who has made his fottune and one who las to make it, that they are fearecly to be confidered as creatures of the fance kine. The fame thing may be fid of birth, the greateft of atl advantages in a large fociety ; of rank, of honours, and of great abilities. How frcat a difierence is made between a perion of high birth and a tradefman; between a Newton or Defcartes and a fimple mathematician? Ten thouland foldiers are killai on the field of battle, and it is fcarcely mentimed; but if the general falls, and efpecially if he be a man of courage and abilities, the court and city are filled with the news of his death, and the monraing is unice fill.
" Freleric the Great, the late king of Prufia, fele in a more lively manner than perhaps any other man the wilue of great talents. I would willingly renounce, find he to Voltaire, every thing which is an object of delire and ambition to man; but I am certain is I were

## 1 L E

Pleafure, not a priace I Chould be nothing. Your merit alone would gain you the efteem, and envy, and admiration of the world; but to fecure refpect for me, titles, and armies, and revenues, are abfolutely neccfiary."

For what purpofe this account of human happinefs was publifhed, it becomes not us to fay. Its obvious tendency is to make the lower orders of fociety difeontented with their fate, and envious of their fuperiors; and it is not unreafonable to fuppofe, that it contributed in fome degree to excite the ignorant part of the author's countrymen to the commifion of thofe atrocities of which they have fince been guilty. That fuch was his intention, the following extratt will not permit us to believe; for though in it the author attempts to fupport the fame falle theory of human happinefs, he mentions virtuous kings with the refpect becoming a loyal fubject of the unfortunate Louis, whofe character he feems to have intentionally drawn, and whofe death by the authority of a favage faction he has in effeet foretold.
"Happinefs, in a ftate of fociety, takes the mont variable forms: it it a Proteus fufceptible of every kind of metamorphofis: it is different in different men, in different ages, and in different conditions, \&c. The pleafures of youth are very different from thofe of oid age : what affords enjoyment to a mechanic would be fupreme mifery to a nobleman; and the amufements of the country would appear infipid in the capital. Is there then nothing fixed with regard to happinefs? Is it of all things the moft variable and the molt arbitrary? Or, in judging of it, it is impofiible to find a fandard by which we can determine the limits of the greatef good to which man can arrive in the prefent fate? It is evident that men form the fame ideas of the beautiful and fublime in nature, and of right and wrong in morality, provided they have arrived at that degree of improvement and civilization of which human nature is fufceptible; and that different opinions on thefe fubjects depend on different degrees of culture, of education, and of improvement. The fame thing may be advanced with regard to happinefs: all men, if equal with refpect to their organs, would form the very fame ideas on this fubject if they reached the degree of improvement of which we are prefently fpeaking; and in fan, do we not fee in the great circles at Rome, at Vienna, at London, and Paris, that thofe who are called people of fafion, who have received the fame education, have nearly the fame talte, the fame defires, and the fame firit for enjoyment? there is doubtlefs a certain degree of happinefs to be enioyed in every condition of life; but as there are fome conditions preferable to others, fo are there degrees of happinefs greater and lefs; and if we were to form an idea of the greateft poffible in the prefent Rate, it perhaps wouid be that of a fovereign, matter of a great empire, enjoying good health and a moderate fpirit; endowed with piety and virtue, whofe whole life vas employed in acts of juftice and mercy, and who governed by fixed and immoveable laws. Such a king is the image of the divinity on earth, and he matt be the idol of a wife people. His whole life fhould prefent a picture of the molt:luguft felicity. A1though fuch fovereigns are rare, yet we are not without examples of them. Ancient hiftory affords us Titus and Marcus Aurelius; and the prefent age can boalt of piety Vol. XV.

## PLE

and munificence in the character of fome of its kings. This fate of the greatef happinefs to which man can reach not being ideal, it will ferve as a fandard of comparifon by which happinefs and mifery can be eftimated in all civilized countries. He is as bappy as a king, is a proverbial expreffion, bccaufe we believe with juflice that royalty is the extreme limit of the greateft enjoyments; and in fact, happinefs being the wor': of man, that condition which comprchends all the degrecs of power and of glory, which is the fource of honour and of dignity, and which fuppofes in the perfon invelted with it all means of enjoyment either for himfelf or others, leaves nothing on this carth to which any reafonable man would give the preference.
"We can find alfo in this high rank the extreme of the greateft cvils to which the condition of nature is expofed. A king condemned to death, and perifhing on a fcaffold, by the authority of a faction, while at the fame time he had endeavoured by every means in his power to fromote the general happinefs of his fubjeets, is the moit terrible and Atriking example of human mifery; for if it be true that a crown is the greateft of all bleftings, then the lofs of it, and at the fame time the lofs of life by an ignominious and unjuft fentence, are of all calamities the moft dreadful.
"It is alfo in the courts of kings that we find the mof amiable and perfect characters; and it is there where true grandour, true politenefs, the beft tone of manners, the moft amiable graces, and the moft eminent virtues, are completely eftablifhed. It is in courts that men feem to have acquired their greateft improvement: Whofnever has feen a court, fass La Bruyere, has feen the world in the moft beautiful, the moft enchanting, and attractive colours. The prejudices of mankind in behalf of the great are fo exceffive, that if they inclined to be good they would be almoft the objects of adoration."

In this paffage there are doubtlefs many juit obfervations; but there is at leaft an equal number of others both falfe and dangerous. That a crown is the greateft of eartlly bleffings, and that it is in the courts of kings that we met with the mof amiable and perfect characters, are poffitions which a true philofopher will not admit but with great limitations. The falfehood of the author's general theory refpecting the unequal diftribution of happinefs in fociety, we need not waft time in expofing. It is fufficiently expofed in other articles of this work, and in one of them by a writer of a very fuperior order. (Sec Happiness; and Moral Philofophy, Part II. chap. ii.) He enters upon other fpeculations refpecting the pleafures and pains of avages, which are ingenious and worthy of attention; but before we proceed to notice them, it will be proper to confider the connection which fubfifts between pleafure and pain.
" That the ceffation of pain is accompanied by pleafure, is a fact (fays a philofopher of the firt rank $\dagger$ ) $\dagger$ Dr $\mathrm{S}_{\mathrm{sjer}}$ which has been repeatedly obferved, but perhaps not fuficiently accounted for. Let us fuppofe a perfon in a ftate of indifference as to heat. Upon coming near a fire, he will experience at firt an agreeable warmth, i. e. picafure. If the bcat be increafed, this tate of pleafure will, after a time, be converted into"one of pain, from the incteafed astion upon the nerves and
brain

Pleafure. brain, the undoutted organs of all bodily fenfations. Let the heat now be gradually withdrawn, the nervous fyftem muft acquire again, during this iemoval, the flate of agreeable warmth or pleafure ; and after paf. fing through that tate it will arrive at indifference. From this fact then we may conclude, that a flate of pleafure may be pathed on till it is converted into one of pain; and, on the other hand, that an action which produces pain will, if it go off gradually, induce at a certain period of its decreare a ftate of pleafure. The fame reafoning which has thus been applied to the body may be extended alfo to the mind. Total languor of mind is not to pleafant as a certain degree of action or emotion; and emotions pleafant at one period may be increafed till they become painful at another; whilit painful emotions, as they gradually expire, will at a certain period of their decreafe, induce a fate of pleafure. Hence then we are able to explain why pleafure fhould arife in all cafes from the gradual celfation of any action or emotion which produces pain."

The fame author maintains, that from the mere removal of pain, whether by degrees or inftantancoufly, we always experience pleafure; and if the pain removed was exquifite, uhat he maintains is certainly true. To account for this phenomenon, he lays down the following law of nature, which experience abundantly confirms, viz. "that the temporary withdrawing of any action from the body or mind invariably renders them more fufceptible of that action when again produced." Thus, after long falting, the body is more fufceptible of the efferts of food than if the Itomach had been lately fatisfied ; the action of frong liquors is found to be greatcr on thofe who ufe them feldom than on fuch as are in the habit of drinking them. Thus, too, with refpect to the mind; if a perion be deprived for a time of his friend's fociety, or of a favourite amufement, the next vifit of his friend, or the next renewal of his amulement, is attended with much more pleafure than if they had never been withheld from him.
"To apply this law to the cafe of a perfon fuddenly selieved from acute pain. While he labours with fuch pain, his mind is fo cotally occupied by it, that he is unable to attend to his cuftomary purfuits or amufements. He becomes therefore fo much more fufcoptibie of their action, that when they are again prefented to him he is raifed above his ufual indifference to pofitive pleafure. But all pains do not proceed from in exccifs of action. Many of them arife from reducing the body or the mind to a ttate below indifference. Thus, if a perfon have juft fufficient warmth in his body to Leep him barely at eafc win a fate of indifference, by withdrawing this heat a itate of uneafinefs or pain is produced; aind if in a calm flate of mind ore be made acquainted with a melancholy event, his quiet is interrupted, and he finks below indifference into a painful fate of mind. If now, without communicating any now fonice of pofitive pleafure, we remove in the former cale the cold, and in the latter the grief, the perfons from whom they are removed will experience rcal pleature. Thus, then, whether painarifes from excefs or deficiency of attion, the gradnal or the fadden removal of it mult be in all cales artended with pleafure $\ddagger$."
account of the pleafures and pains of lavages. "Every age (fays he) has its different pleafures; but if we were to imagine that thofe of childhood are equal to thote of confirmed age, we hould be much miftaken in our eftimation of happinefs. The pleafures of philofophy, either natural or moral, are not unfolded to the inf.nt ? the molt perfect mufic is a vain noife; the moft carquifite perfumes and difhes highly reafoned oftend his young organs inftead ot affording delight; his touch is imperfect ; forty days elaple before the child gives any fign of laughter or of weeping ; his cries and groans before that period are not accompanied with tears; his countenance expreffes no paffion ; the parts of his face bear no relation to the fentiments of the foul, and are moreover without confiftency. Children are but little affected with cold; whether it be that they feel lefs, or that the interior heat is greater than in adults. In them all the impreflions of pleafure and pain are tranfitory ; their memory has fcarcely begun to unfold its powers; they enjoy nothing but the prefent moment; they weep, laugh, and give tones of fatisfaction without confcioufnefs, or at lealt without reflection; their joy is confined to the indulgence of their little whims, and conftraint is the greateft of their misfotunes; few things amufe, and notling fati fies them. In this happy condition of early infancy nature is at the whole expence of happinefs; and the only point is not to contradict her. That defires have children? Give them liberty in all their movements, and they have a plenitude of exiftence, an abundance of that kind of happinefs which is confined in fome fort to all the objects which furround them : but if all beings were happy on the fame conditions, fociety would be at no expence in procuring the happinefs of the different individuals who compofe it. Senfation is the foundation of reflection; it is the principal attribute of the foul; it is by this that man is elevated to fublime fpeculations, and fecures his dominion over nature and himfelf. This quality is not ftationary, but fufceptible, like all other relative qualities, of increafe and decay, of different degrees of ftrength and intenfenefs: it is different in different men; and in the fame man it increafes from infancy to youth, from youth to confirmed manhood: at this period it fops, and gradually declines as we proceed to old age and to fecond childilhncfs. Confidered phyfically, it varies according to age, con!titution, climate, and food; confidered in a moral point of view, it takes its different appearances from individual education, and from the habits of fociety; for man in a late of nature and fociety, with regard to fenfation and the unfolding of his posers, may be confidered as two diftinct beings: and if one were to make a calculation of pleafure in the courde of human life, a man of fortune and capacity enjoys more than ten thomand favages.
"Pleafure and pain being relative qualities, they may be almoft amililated in the moment of vehement palfion. In the heat of battle, for example, ardent and animated firits have not felt the pain of their wounds; and minds frongly penctrated with fentiments of religion, enthufafm, and humanity, have fupported the moft cruel lorments with courage and fortitude. The fentibility of fome perfons is 10 exquifitely alive, that one can farchly approach them without throwing them into convultions. Many difeafes thow the effect of fenfibility pulued to an extrome; fuch as hyiteric affections. cestain

## PLE

certain kinds of maduefs and fome of thofe which proceed from poifon, and from the bite or fting of centain animals, as the viper and the tarantula. Excellive joy or grief, fear and terror, have been known to deftroy all icnfation, and occafion death (A)"

Having made thefe preliminary obfervations on pleafare and plain in infancy, and as they are increafed or diminithed by education, and the different condit ons of body and mind, our author proceeds to confider the capability of lavages to feel pleafure and pain. "By favages he underitands all the tribes of men who live by hunting and fithing, and on thofe things which the earth yields without cultivation. Thofe tribes who pulfefs herds of cattle, and who derive their fubfiftence from fuch poffeffions, are not to be confidered as favages, as they have fome idea of property. Some favages are naturally compaffionate and humane, others are cruel and fanguinary. Although the phyfical conftitution of man be every where the fame, yet the varicties of climate, the abundance or fcarcity of natural productions, have a powerful influence to determine the inclinations. Even the fiercenefs of the tyger is foftened under a mild fly ; now nature forms the manners of favages juft as fociety and civil inftitutions form the manners of civilized life. In the one cafe climate and food produce almoft the whole effect ; in the other they have fcarcely any intluence. The habits of focietv every moment contend with nature, and they are almoft always victorious. The favage devotes himfelf to the dominion of his paftions; the civilized man is employed in reftraining, in diretting, and in modifying them : fo much influence have government, laws, fociety, and the fear of cenfure and punifhment, over his foul.
"It is not to be doubted that favages are fufceptible both of pleafure and pain ; but are the impreflions made on their organs as fenfible, or do they feel pain in the fame degree with the inhabitants of a civilized country ?
" Their enjoyments are folimited, that if we confine ourfelves to truth, a few lines will be fufficient to defcribe them: our attention muft therefore be confined to pain, becaufe the manner in which they fupport misfortune, and even torture, prefents us with a view of character unequalled in the hiftory of civilized nations. It is not uncommon in civilized countries to fee men braving death, meeting it with cheerfulnefs, and even not uttering complaints under the torture ; but they do not infult the executioners of public vengeance, and defy pain in order to augment their torments; and thofe who are condemned by the laws fuffer the punifhment with different degrees of fortitude. On thofe mournful occafions, the common ranks, of mankind in general die with lefs firmnefs; thole, on the other hand, who have
received edacation, and who, by a train of unfortunate cvents are brought to the fcallold, whether it be the fear of being reproached with cowardice, or the confideration that the flroke is inevitable, fuch men difcover the expiring fighs of ielf love even in their laft muments ; and thofe efpecially of high rank, from their mamers and fentiments, are expected to meet death with magnanimity: but an Anerican davage in the moment of punifhment appears to le more than human ; he is a hero of the firt order who braves his tormentors, who provokes them to employ all their art, and who confiders as his chief glory to bear the greateit degree of pain without thrinking (See America, $n^{6}$ 14, 27, 28, 29). Therecital of their tortures would appear exaggerated, if it were not attefted by the beft authonity, and if the favage nations among whom thofe cuftoms are eftablifhed were not fufficiently known; but the excefs of the cruelty is not fo aftonifhing as the courage of the victim. The European expofed to fufferings of the fame dreadful nature would rend heaven and earth with his piercing cries and horrible groans; the reward of martyrdom, the profeet of eternal life, could alone give him fortitude to endure fuch torments; but the favage is not animated with this exalted hope. What fupports him then in fcenes of fo exquifite fufiering? The feeling of hame, the fear of bringing reproach on his trite, and giving a ftain to his fellows never to be wiped away, are the only fentiments which influence the mind of a favage, and which always, prefent to his imagination, animat: him, fupport him, and lend him fpirit and refolution. At the fame time, however powerful thofe motives may be, they would not be alone fufficient, if the favage felt pain in the fame degree with the European. Sentibility as we have already obferved, is increafed by ectusation: it is influenced by fociety, manners, laws, and govern. ment ; climate and food work it into a hundred different thapes; and all the phyfical and moral caufes centribute to increafe and diminifh it. The habitual exiftence of a favage would be a ftate of fuffering to an inhabitant of Europe. Yru muft cut the flefh of the one and tear it away with your nails, before you can make him feel in an equal degree to a fcratch or prick of a needle in the other. The favage, doubtlefs, fuffers under torture, but he fuffers mu:h lefs than an European in the fame circumftances: the realon is obvious; the air which the favares breathe is loaded with fog and moift vapours ; their rivers not being confined by high banks, are by the winds as well as in floods fpread over the level fields, and depolite on them a putrid and pernicious flime; the trees fqueezed one upon another, in that rude uncultivated country ferve rather as a covering to the earth than an ornament. Inftead of thofe fref and delicious Shades, thofe openings in the woods, and walks crofling

H 2
(A) There are inftances of perfons who have died at the noife of thunder without being touched. A man frighted with the fall of a gallery in which he happened to be, was immediately feized with the black jaundice. M. le Cat mentions a young perfon on whom the infolence of another made fuch an impreffion, that his countenance became at firt yellow, and then chagged into black, in fuch a manner that in lefs than eight days he appeared to wear a makk of black velvet: he continued in this ftate for four months without any other fymptom of bad health or any pain. A failor was fo terrified in a ftorm, that his face fweated blood, which like ordinary fweat returned as it was wiped off. Stahl, whofe teftimony cannot be called in queftion, cites a fimilar cafe of a girl who had bee. fightened with foldiers. The excefs of fear, according to many phy: ficians, produces madness, and epileply.
jeakure. each other in all directions, which delight the traveller in the fine forefts of France and Germany ; thofe in America ferve only to intercept the rays of the fun, and to prevent the benign influence of his beams. The favage participates of this cold humidity ; his blond has little heat, his humours are grofs, and his conflitution phlegmatic. To the powerful influence of climate, it is neceffary to join the labits of his life. Obliged to traverfe valt deferts for fubliftence, his body is accuftomed to fatigue; food not nourifhing, and at the fame time in no great plenty, blunts his feelings; and all the hardfhips of the fivage ftate give a rigidity to his members which makes him almoft incapable of fuffering. The favage in this flate of nature may be compared to the water-women and Areet-porters, who, though they poffers neither great vigour nor ftrength, arc capable of performing daily, and without complaint, that kind of labour which to a man in a different condition of life would be a painful and grievous burden. Feeling, in lefs perfection with the favage, by the effects of clinate and food, and the habits of his life, is fill farther reftrained by moral confiderations. The European is lefs a man of nature than of fociety : moral reftraints are powerful with him ; while over the American they have fcarcely any influence. This latter then is in a double condition of imperfection with regard to us; his fenfes are blunted, and his moral powers are not difclofed. Now, pleafure and pain depending on the perfection of the fenfes and the unfolding of the intellectual faculties, it camnot be doubted, that in enjoyments of any kind favages experience lefs pleafure, and in their fuffering lefs pain, than Europeans in the fame circumftances. And in fact, the farages of America poffers a very feeble conflitution. They are agile without being frong; and this agility depends more on their habits than on the perfection of their members: they owe it to the neceflity of hunting; and they are moreover fo weak, that they were unable to bear the toil which their firft oppreffors impofed on them. Hence a race of men in all refpects fo imperfect could not endure torment under which the moft robuft European would fink, if the pain which they feel were really as great as it appears to be. Feeling is then, and muft neceflarily be, lefs in the favage condition; for this faculty difclofing itfelf by the exerciee of all the plyffical and moral qualities, muft be lefs as they arc lefs exercifed. Every thing thows the imperlection of this precious cuality, this fource of all our affections, in the American favages.
" All the improvements in Europe have had a tendency to unfold fenfibility: the air is purified that we mnay breathe more freely; the moraffes are drained, the rivers are regulated in their courfes, the food is nourithing, and the houfes commodions. With the favages, on the contrary, every thing tends to curb it; they take Heafure even in hardening the organs of the body, in accuftoming therafelves to bear by degrees the moft acute pain without complaining. Boys and girls among
the favages amufe themfelves wish tying thcir naked arms together, and laying a kindled coal between them, to try which of them can longeft fuffer the heat; and the warriors who afpire to the honour of being chief, undergo a courre of fuffering which exceeds the idea of torture inflited on the greateft criminals in Europe."
Thefe oblervations on the pleafures and pains of favages appear to be well-founded, and, as the attentive reader will perceive, are perfectly agreeable to the theory of Dr Sayers. If indeed that theory be juft, as we believe it to be, it will follow, that the few pleafures of fenfe which the American enjoys, he ought to enjoy more completely than any European, becaufe to him they recur but feldom. This may very poffibly be the cafe; and certainly would be fo, were not his fibres, by climate and the habits of his life, rendered more rigid than thofe of the civilized part of the inhabitants of Europe. But if we agree with our autior § in what he § Encych fays of the pains and pleafures of favages, we cannot ad- pedie Mc mit, without many exceptions, his theory of the enjoy- Lhodique ments of children. It is fo far from being true, that metaphy few things amufe, and that nothing fatisfies them, that fique, et the direct contrary mult have been obferved by every Morale, man attentive to the operations of the infant mind, tom, 40 which is amufed with every thing new, and often completely fatisfied with the mereft trifle. The pleafures of philofophy are not indeed unfolded to the infant; but it by no means follows that he does notenjoy his rattle and his drum as much as the philofopher enjoys his telefcope and air-pump; and if there be any truth in the fcience of phytiognomy, the happiness of the former is much more pure and exquifite than that of the latter. That the molt perfect mufic is vain noife to an infant, is far from being felf-evident, unlefs the author confines the fate of infancy to a very few months; and we are not difpofed to believe, without better proof than we have yet received, that the relifh of exquifite perfumes and highly-feafoned difhes adds much to the fum of human felicity.

But however much we difapprove of many of thefe refiections, the following we cordially adopt as our own. "If we compare (fays our author) the pleafures of fenfe with thofe which are purely intellectual, we fhall find that the latter are infinitely fuperior to the former, as they may be enjoyed at all times and in every fituation of life. What are the pleafures of the table, fays Cicero, of gaming, and of women, compared with the delights of fludy? This tafte increafes with age, and no happinefs is equal to it. Without knowledge and Hudy, fays Cato, life is almoft the image of death (b). The pleafures of the foul are fuch, that it is frequent enough to fee men preferve their gaiety daring their whole life, notwithttanding a weak, difeafed, and debilitated body. Scaron, who lived in the laft century, was an example of this. Balzac, fpeaking of him, fays, that Prometheus, Herculcs, and Philoctetes, in profame, and Job in facred, hiltory, faid many great things while
(в) "Savages, barbarians, and peafants, enjoy little happinefs except that of fenfation. The happinefs of a civilized and well-informed man confifts of fenfations, of ideas, and of a great number of affinities, altogether unknown to them. He not only enjoys the prefent, but the paif and the future. He recals the agreeable idea of pleafures which he has tafted. It is great happinefs, fays an ancient, to have the recollection of good actions, of an upright intention, and of promifes which we have kept.".

## PLE

leafures
they were afflicted with violent pain, but Scaron alone faid pleafant things. I have feen, continues he, in many places of ancient hittory, conftancy, and modefty, and wifdom, and eloquence, accompanying affiction, hut he is the only initance wherein I have feen pleafantry.
"'There are men whofe underfandings are conftantly on the ftretch, and by this very means they are improved; but if the body were as contantly employed in the purfuit of fenfual gratification, the conftitution would foon be deftroyed. The more we employ the mind we are capable of the greater exertion; but the more we employ the body we require the greater repofe. There are befides but fome parts of the body capable of enjoying pleafure; every part of it can experience pain. A toothach occafions more fuffering than the moft confiderable of our pleafures can procure of enjoyment. Great pain may continue for any length of time; exceffive pleafures are almoft momentary. Pleafure carried to an extreme becomes painful; but pain, either by augreenting or diminifhing it, never becomes agreeable. For the moment, the pleafures of the fenfes are perhaps more fatisfactory; but in point of duration thofe of the heart and mind are infinitely preferable. All the fentiments of tendernefs, of friendifip, of gratitude, and of generofity, are faurces of enjoyment for man in a ftate of civilization. The damned are exceedingly unlappy, faid St Catherine de Sienna, if they are incapable of loving or being beloved.
"Pleafure, continued for a great length of time, produces languor and fatigue, and excites fleep; the continuation of pain is productive of none of thefe effects. Many fiufer pain for eight days and even a month without interruption; an equal duration of exceffive pleafure would occafion death.
"Time is a mere relative idea with regard to pleafure and pain; it appears long when we luffer, and fhort when we enjoy. If thare exifted no regular and .uniform movement in nature, we would not be able frem our fenfations alone to meafure time with any degree of exainefs, for pain lengthens and pleafure abridges it. From the languor of unoccupied time has "arifen the proverberpreffive of our defire to $k i l l$ it. It is a melancholy reflection, and at the fame time true, that there is no enjoyment which can tffectually fecure us from pain for the remainder of our lives; while there are examples of evils which hold men in confant forrow and pain during their whole exifence. Such then is the in!perfection of the one and the power of the other.
" Pleafure and pain arc the fources of morality ; an antion is jult or unjut, good or otherwife, only as its natural tendency is to produce fuffering or enjoyment to mankind. No crime could be committed againft a being altogether infenfible, nor could any good be herowed on it. Unlefs he were endowed with the defire of pleafure and the apprehenfion of pain, man, like an autornaton, would act from necefity, without choice and without determination.
"All our paffions are the developement of fenfibility. If we were not pofefied of feeling, we fhould be deftitute of paffions ; and as fenfibility is augmented by civilization, the paffions are multiplied'; more'active and vigorous in an extenfive and civilized empire than in a frall ftate; more in the latter than among barbarous nations; and more in thefe laft than among favages (See

Passion). There are more paffions in France and England than in all the nations of Europe; becaufe every thing which ferves to excite and fofter them is always in thofe countries in the greatef fate of fermentation. The mind is active; the ideas great, extenfive, arid multiplied. And is it not the foul, the mind, and heart, which are the focus of all the paffions :"

But wherever the paffions ate multiplied, the fources of pleafure and pain are multiplied with them. This being the cafe, it is impoffible to prefcribe a fixed and general rule of happinefs fuited to every individual. There are objects of pleafure with regard to which all men of a certain education are agrecd; but there are perhaps many more, owing to the variety "-mpers and education, about which they differ. Ifery man forms ideas of cnjoyment relative to his character ; and what pleafcs one may be utterly detefted by another. In proportion as a nation is civilized and extenfive, thofe differences are remarkable. Savages, who are not acquainted with all the variety of pleafures of civilized nations, amufe themfelves with very few objects. Owing to the want of civilization, they have fearcely any choice in the objects of tafte. They have few pafions; we have many. But even in civilized nations plcafnre is infinitely varied in its modification and forms. Thofe differences arife from manners, from governments, from political and religious cufoms, and chiefly from education. Meanwhile, however different and variable the ideas of pleafure may be among nations and individuals, it fill remains a fact, that a certain number of perfons in all civilized itates, whether diftinguifhed by birth, or rnak, or fortune, or talents, as they have nearly the fame education fo they form nearly the fame ideas of happinefs: but to poffers it, a man muft give his chief application to the ftate of his mind ; and notwithftanding all his efforts it is of uncertain duration. Happinel's is the funhline of life: we enjoy it frequently at great intervals; and it is therefore neceflary to know how to ufe it. All the productions of art perifh; the largelt fortunes are diffipated ; rank, honour, and dignity pafs away like a fleeting fhadow; the memory is impaired; all the taculties of the fonl are extinguifhed; the body finks under the infirmities of old age; and fcarcely has one reached the boundaries of happinefs marked out by his imagination, when he muft give place to another, and renounce all his pleafures, all his hopes, all his illufions; the fugitive images of which had given happinefs to the mind.

There are pleafures, however, on which the mind may fecurely reft, which elevate man above himfelf, dignify his nature, fix his attention on fpiritual things, and render him worthy of the care of Providence. Thefe are to be found in true religion; which procures for thofe who practife its duties inexpreffible bappinefs in a better country, and is in this world the fupport of the weak, and the fiveet confolation of the unfortunate.

PLEBEIAN, any perfon of the rank of the common people. It is chiefly ufed in fpeaking of the ancient Romans, who were divided into fenators, patricians, and plebeians. The diltinction was made by Romulus the founder of the city; who confined all dignities, civil, military, and facerdotal, to the rank of patricians. But to prevent the feditions which fuch a diftinction might produce through the pride of the higher order and the envy of the lower, he endeavoured to engage

Tleafure, leheian.

## PLE F 621 PLE

Pletran- them to nac an ther by reciprocal ties and obligations. thus Every plebeian was allowed to choofe, out of the body II Pleiades. of the patticians, a protecor, who thould be obliged to afift him with his intereft and fubstance, and to def nd
him from eppreflion 'Thefe protectors were called patrons; the protected, clients. It was the duty of the patron to draw up the contracts of the clients, to extricate them out of their difficulties and perplexit es, and to guard their ignorance againt the artfulnefs of the cratty. On the other hand, if the patron was poor, his clients were obliged to enntribute to the portions of his daughters, the payment of his debts, and the ranfom of him and his children if they happened to be taken in war. The client and patron could neither accufe nor bear witnefs againft each other; and if either of them was convicted of having violated this law, the crime was equal to that of treafon, and any one might with impunity flay the offender as a vietim devoted to Plutn and the infernal gods. Fer more than 600 years we find no diffenfions nor jealoufies between the patrons and their clients; not even in the times of the republic, when the people frequently mutinied againft the great and powerful.

PLECTRANTHUS, in botany: A genus of the gymmofpermia order, belonging to the didynamia clafs of plants; and in the natural method ranking under the 42 d order, Verticillate. The calyx is monophyllous, thort, and bilabiated; the upper lip of which is large, oval, and bent upwards; the inferior lip is quadrifid, and divided into two lacinix: the corolla is monopetalous, ringent, and turned back; the labix look different ways, and from the bafe of the tube there is a nectarium like a fpur: the filaments are in a declining fitua. tion, with fimple antherx : the ftylus filiform ; the figma bifid. It has four feeds covered only by the calyx, There are two fpecies, viz. I. The Fruticofus, a native of the Cape of Good Hope; 2. Pungatus, a native of Africa. The firit flowers from June to September, the latter from January to May.

PLEDGE (Plegius), in common law, a furety or gage, either real or perfonal, which the plaintiff or demandant is to find for his profecuting the fuit.

The word is fometimes alfo ufed for $F_{\text {RaNK }}$ Pledge, which fee.

To Plenge, in drinking, denotes to warrant, or be furety to one, that he fhall receive no harm while he is taking his draught. The phrafe is referred by our antiquaries to the practice of the Danes, heretofore in England, who frequently ufed to fab or cut the throats of the natives while they were drinking.

Placges of Goods for money. See Pawn.
PLEDGERY, or Pleggery, in law, furetifhip, or an undertaking or anfwering for another.

PLEDGET', Bolster, or Comprefs, in furgery, a kind of flat tent laid over a wound, to imbibe the fuperflunus humnurs, and to kcep it clean.

PLEIADES, in fabulous hiftory, the feven daughters of Atlas king of Mauritania and Pleione, were thus called from their mother. They were Maia, Electra, Taygete, Afterope, Merope, Halcyone, and Celœno; and were alfo called Allantides, from their father Atlas. Thefe princeffes were carrizd off by Bufiris king of Egypt; but Hercules having conquered him, delivered then to their father; yet they afterwards fuffered a new perfecution fiom Orion, who purfued them five years,
till Jove, being prevailed on by their prayers, took them up iuto the heavens, where they form the confellation which bears their name.

Pleiades, in aftronomy, an affemblage of feven ftars, in the neck of the conftellation Taurus.

They are thus called from the Greek $\pi \lambda_{6} \omega$, navigare, "to fail;" as being terrible to mariners, by reafon of the rains and forms that frequently rife with them. The Latins called them vergilice, from vir, " pring;" becaufe of their riling about the time of the vernal equinox. The largett is of the third magnitude, and, is called lucide pleiadum.

PLENARY, fomething complete or full. Thus we fay the pupe grants plenary indulgences; $i$. $e$. full and entire remidions of the penalties due to all fins. See Indulgences.

PLENIPOTENTIARY, a perion vefted with full power to do any thing, See Ambassador.

PLENITUDE, the quality of a thing that is full, or that fills another. In medicine, it chiefly denotes a redundancy of bloot and humours.

PLENUM, in phylics, denotes, according to the Cartefians, that flate of things wherein every part of fpace is fuppofed to be full of matter, in oppofition to a Vacuum, which is a fpace fuppofed devoid of all matter.

PLENUS rlos, a full Hower; a term expreflive of the higheft degree of luxuriance in flowers. See Botany, p. $428,2 \mathrm{~d}$ columin. Such flowers, although the moft delightful to the eye, are both vegetable monfters, and, according to the fexualifts, vegetable eunuchs; the unnatural increafe of the petals conftituting the firlt; the confequent exclufion of the flamina or male organs, the latter. The following are well known examples of flowers with more petals than one; ranunculus, anemone. marh-marygold, columbine, fennel-fower, poppy, peony, pink, gilliflower, campion, vifoous campion, lily, crown imperial, tulip, narciffus, rocket, mallow, Syrian mallow, apple, pear, peach, cherry, almond, myrtle, rofe, and ftrawberry.
Flowers with one petal are not fo fubject to fullnefs. The following, howerer, are infances: polianthus, hyacinth, primrofe, crocus, meadow-faffron, and thorn-apple, tho Kramer has afferted that a full flower with one petal is a contradiction in terms. In flowers with one petal, the mode of luxuriance, or impletion, is by a multiplication of the divifions of the limb or upper part; in flowers with more petals than one, by a multiplication of the petals or neftarium.

To take a few examples. Columbine is rendered full in three different ways: 1. By the multiplication of its petals, and total exclufion of the nectaria; 2 By the multiplication of the netaria, and exclufion of the petals; or, 3. By lisch an increafe cf the nedaria only as does not exclude the petals, between each of which are interjected three nectaria, placed one within another. Again, fennel-flower is rendered full by an increafe of the nectaria only; narciflus, either by a multiplication of its cup and petals, or of its cup only ; lark-fpur cammonly by an increafe of the petals and exclufion of the fpur, which is its nectarium. In fuponaria concava anglia, the impletion is attended with the fingular effect of incorporating the petals, and reducing their number from five to one; and in gelder-rofe, the luxuriance is effected by an increafe both in magnitude and number

## PL L

of the circumfcrence or margin of the head of flowers, in the plain, wheel-fhaped, barren florets; and an cxclufion of all the bell-haped hermaphrodite florets of the centre or difk.
Hitherto we have treated of plenitude in fimple flowers only: the infance juit now adduced feens to connect the different modes of impletion in them and compound flowers. Before procceding farther, however, it will not be improper to premife, that as a fimple laxuriant flower is frequently, by beginners, mifaken for a compound flower in a natural fate, fuch flowers may always be diftinguifhed with certainty by this rule: That in fimple flowers, however luxuriant, there is but one piftillum or female organ; whereas in compound flowers, each floret, or partial flower, is furnifhed with its own proper piffillum. Thus in hawk-weed, a compound flower, each flat or tongue-fhaped floret in the aggregate has its five itamina and naked fied, which laft is in effect its piftillum; whereas, in a luxuriant lychnis, which is a limple flower, there is found only one piltillum or female organ common to the whole.

In a compound radiated flower, which genet ally confifts of plain florets in the margin or radius, and tubular or hollow florets in the centre or difc; plenitude is effected either by an increafe of the florets in the margin, and a total exclufion of thofe in the dife; which mode of luxuriance is termed impletion by the radius, and refembles what happens in the gelder-rofe: or by an elongation of the hollow florets in the centre, and a lefs profound divifion of their brims; which is terined inmpletion by the difc. In the firft mode of luxuriance, the florets in the centre, which are always hermaphrodite or male, are entirely excluded; and in their place fuc. ceed florets fimilar in fex to thofe of the radius. Now, as the florets in the margin of a radiated compound flower are found to be always either female, that is, furnifhed with the pitillum only; or neuter, that is, furnifhed with neither ftamina nor piftillum; it is evident, that a radiated compound flower, filied by the radius, will either be entirely female, as in feverfew, daify, and African marigold; or entirely neuter, as in funflower, marigoid, and centaury : hence it will always be eafy to diftinguilh fuch a luxuriant flower from a compound flower with plain florets in a natural Itate; as thefe flowers are all hermaphrodite, that is, furnifhed with both ftamina and piftillum. Thus the full fowers of African marigold have each foret furnifhed with the pintilum or female organ only: the natural flowers of dandelion, which, like the former, is compofed of plain tlorets, are furnifhed with both famina and pifillum.

In the fecond mode of luxuriance, termed implition by the dif., the florets in the margin fometimes remain unchanged: but moft commonly adopt the figure of thofe in the centre, without, however, fuffering any alteration in point of fex; fo that confufion is lefs to be apprehended from this mode of luxuriance than from the former ; bffides, the length to which the florets in the centre rum out is of ittelf a fufficient diflinction, and adapted to excite at once an idea of luxuriance. Daify, feverfew, and Affican marigold, exhibit inftances of this as well as of the former mode of impletion.

In luxuriani compound flowers with plain',forets, the femiffof culof of Tournefort, the figma or fummit of the Atyle in each floret is lengthened, and the feed buds are enlarged and diverge ; by which characters fuch flowers

## 63 PLE

may always be difinguifted from flowers of the fame kind in a natural Atate. Scorzonera, nipple-wort, and goat's beard, furnifh frequent inftances of the plenitude alluded to.

Laftly, the impletion of compound flowers wiht the bular or hollow florets, the fif fuulofi of Tournefort, feems to obferve the fame rules as that of radiated flowers juft delivered. In everlafting-flower, the xerantbemum of Linnæus, the impletion is fingular, being effested by the enlargement and expanfion of the inward chaffy fcales of the calyx. Thefe fcales, which become coloured, are greatly augmented in length, fo as to overtop the florets, which are farce larger than thofe ef the fame flower in a natural ftate. The florets too in the anargin, which in the natural flower are female, become, by lusuriance, barren; that is, are deprived of the pintillum ; the ftyle, which was very fhort, fpreads, and is of the length of the chaffy fcales; and its fummits, formerly two in number, are metamorphofed into one.

Full flowers are more cafly referred to their refpective genera in methods founded upon the calyx, as the flowercup generally remains unaffected by this higheft degree of luxuriance

PLEONASM, a figure in rhetoric, whereby we ufe words feemingly fuperfluous, in order to exprefs a thought with the greater energy; fuch as, "I faw it with my own eyes," \&c. See Oratory, $n^{\circ} 67$.

PLESCOW, a town of Ruffia, capital of a duchy of the fame name, with an archbinhop's fee, and a ftrong cafle. It is a large place, and divided into four parts, eact of which is furrounded with walls. It is feated on the river Muldow, where it falls into the lake Plefcow, So miles fouth of Narva, and 150 fouth by weft of Pe terfburg. E. Lon. 27. 52. N. Lat. 57. 58.
rlescow, a duchy in Ruffia, between the duchies of Novogorod, Lithuania, Livonia, and Ingria.
PLESSIS-Les-tours, a royal palace of France, within half a league of Tours. It was built by Louis XI. and in it he died in the year 1483 . It is fituated in a plain furrounded by woods, at a fmall difance from the Loire. The building is yet handfome, though built of brick, and converted to purpofes of commerce.

PLETHORA, in medicine from $\pi$ nnsor, " plenitude." A plethora is when the velfels are too much loaded with fuids. The plethora may be fanguine or ferons. In the firlt there is too much craffamentum in the blood, in the latter too litule. In the fanguine plethora, there is danger of a fever, inflammation, apoplexy, rupture of the blood.veffels, obfructed fecretions, \&cc. : in the ferous, of a dropiy, isc. A rarefaction of the blood produces all the effeets of a plethora; it may accompany a plethora, and fhould be difinguifhed therefrom. Mr Bromineld obferves, that a fanguine plethora may thus be known to be prefent by the pulie. An artery overchanged with blood is as incapable of producing a frong full pulfe, as one that contains a deficient quantity; in both cafes there will be a low and wealpulfe. To diftinguifh rightly, the pulfe mult not be felt with one or two fingers on the carpal artery; but if three or four fingers cover a coniderable length of the artery, and we prefs hard for fome time on it, and then fuddenly raife all theie fingers except that which is nearen to the patient's hand, the influx of the blood, if there is a ple:hora, will be fo rapid as to raife the other finger, and mate us fenfible of the fulnefs. The
fanguine plethora is relieved by bleeding; the ferous by purging, diuretics, and fweating. See Medicine, no 100.

PLEURA, in anatsmy, a thin membrane covering the infide of the thorax. See Anatomy, $n^{\circ} 113$. PLEURITIS, or Pleurisy. See Medicine, n? 185.

PLEURONECTES, in ichtlyology, a genus belonging to the order of thoracici. Both eyes are on the fame fide of the head; there are from four to five rays in the gill-membrane; the body is compreffed; the one fide refembling the back, the other the belly. There are 17 fpecies; the moft remarkable are,
I. The hypoglofius, or holibut. This is the larget of the genus: fome have been taken in European feas weighing from 100 to 300 pounds; but much larger are found in thofe of Newfoundland, Greenland, and Iceland, where they are taken with a hook and line in very deep water. They are part of the food of the Greenlinders, who cut them into large flips, and dry them in the fun. They are common in the London markets, where they are expofed to fale cut into large pieces. They arc very coarfe eating, excepting the part which adheres to the fide fins, which is extremely fat and delicious, but furfeiting. They are the moft voracious of all flat fih. There have been intances of their fwallow: ing the lead weight at the end of a line, with which the feamen were founding the bottom from on board a fhip. The holibut, in refpect to its length, is the narroweft of any of this genus except the lole. It is perfeatly fmooth, and free from pines either above or below. The colour of the upper part is dulky; beneath, of a pure white. We do not count the rays of the fins in this genus; not only becaufe they are fo numerous, but becaufe nature hath given to each fpecies characters, indeoendent of theferays, fufficient to diftinguifh them by. Thefe flat fifh fivim fidewife; for which reafon Linnæus hath ityled them pleuronedes.
2. The plateffa, or plaife, are very common on moft of the Eagifill coalts, and fometimes taken of the weight of 15 pounds; but they feldom reach that fize, one of eight or nine pounds being reckoned a large fifl. The beet and largeft are taken off Rye on the coalt of Surficx, and alfo off the Dutch coafts. They fpawn in the beginning of February. They are very flat, and much more fquare than the preceding. Behind the left eye is a row of fix tubercles, that reaches to the commencement of the lateral line. The upper part of the body and fins are of a clear brown, marked with large bright orange-coloured fpots: the belly is white.
3. The flefus, or flounder, inhabits every part of the Mritifh fea and even frequents the rivers at a great ditance from the falt waters; and for this reafon fome wriers call it the pafer furviatilis. It never grows large in the rivers, but is reckoned fweeter than thofe that live in the fea. It is inferior in fize to the plaife, feldom or never weighing more than fix pounds. It may very cafily be diftinguilhed from the plaire, or any other fifh of this genus, by a row of harp fmall fipines that fur. round its upper fides, and are placed jult at the junstion of the fins with the body. Another row marks the fide-line, and runs half way down the back. The colour of the upper pare of the body is a pale brown, fonetimes marked with a few obfure fpots of dirty yellow; the belly is white.
4. The limanda, or dab, is found with the other fpecies, but is lefs common. It is in beft feafon during February, March, and April; they fpawn in May and June, and become flabby and watery the reft of fummer. They are fuperior in quality to the plaire and flounder, but far inferior in fize. It is generally of an uniform brown colour on the upper fide, though fometimes clouded with a darker. The fcales are frall and rough, which is a claraderer of this fecies. The lateral line is extremely incurvated at the beginning, then goes quite fraight to the tail. The lower part of the body is white.
5. The folea, or fole, is found on all the Englifh coafts; but thofe on the weftern fhores are much fuperior in fize to thore on the north. On the former they are fometimes taken of the weight of fix or feven pounds, but towards Scarborough they rarely exceed one pound; if they reach two, it is extremely uncormmon. They are ufually taken in the trawl-net: they keep much at the bottom, and feed on fmall hell-fifh. It is of a form much more narrow and oblong than any other of the genus. The irides are yellow; the pupils of a bright fapphirine colour : the fcales are fmall, and very rough : the upper part of the body is of a deep brown; the tip of one of the pettoral fins black; the under part of the body white ; the lateral line is fraight; the tail rounded at the end. It is a fing of a very delicate flavour ; but the fmall foles are in this refpect much fuperior to large ones. By the ancient laws of the Cinque Ports, no one was to take foles from the if of Novermber to the 15 th of March; neither was any body to fifh from fun fetting to fun-riiing, that the filh might enjoy their night-food. The chief filhery for them is at Brixham in Torbay.
6. The maximus, or tuibot, grows to very large fize : Mr Pennant has feen them of 23 pounds weight, but has heard of fome that weighed 30 . The turbot is of a remarkable fquare forn: : the colour of the upper part of the body is cinereous, marked with numbers of black fpots of different fizes: the belly is white ; the fkin is wirhont fcales, but greatly wrinkled ,and mixed with fmall fhort fpines, difperfed without any order.-Thefe fifh are taken chiefly off the north coalt of England, and others off the Dutch coaft. See Turbot Fisherr.
PLEURS, a town in France, which was buried under a mountain in the year 1618. See our. article Moun rain, P. 430 . Of this fatal circumftance, Bifhop Burnet, in his Travels, p. 96. gives the following account. "Having mentioned (fays the Bifhop) fome falls of $^{2}$ mountains in thefe parts (viz. near the Alps), I cannot pafs by the extraordinary fate of the town of Pleurs, about a league from Chavernes to the north. The town was half the bigners of Chavennes, but much more nobly built ; for, befides the great palace of the Francken, that cof fome millions, there were many other palaces built by rich facors both of Milan anal the otlier parts of Italy, who, liking the fituation and air, as well as the freedom of the government, gave themfelves all the indulgences that a valt wealth could farnith. By one of the palaces that was a liette diftant from the town, and was noi nverwhelmed widh it, one may judge of the reft. It was an out houfe of the family of the Francken, and yet it may compare with many palaces in Italy. The voluptuoufnefs of this place be-

## P L I

came very crying; and Madam de Salis told me that the heard her mother often relate fome palfages of a Proteftant minifler's fermons that preached in a little church there who warncd them ofeen of the terrible judgments of God which ware hanging over their heads, and which he believed would fuddenly break out upon them.
"On the $25^{\text {th }}$ of Augult 1628 , an inhabitant came and $t$ ld them to be gone, for he faw the mountains cleaving ; but he was lauglied at for his pains. He had a daughter whom he pertuaded to leave all and go with him; but when the was fafe out of town, the called to mind that the had not locked the door of a room in which fhe had fome things of value, and fo fhe went back to do that, and was buried with the reft; for at the hour of fupper the hill fell down, and buried the town and all the inhabitants, to the number of $\mathbf{2 2 0 0}$, fo that not one perfon efcaped. The tall of the mountains did fo fill the channel of the river, that the firft news thofe of Chavennes had of it was by the failing of their river; for three or four hours there came not a drop of water, but the river wrought for itfelf a new conre, and returned to them.
" I could hear no particular character of the man who efcaped (continues the. Bifhop) ; fo I muft leave the fecret reafon of fo fingular a prefervation to the great difcovery, at the laft day, of thofe fteps of Divine Providence that are now fo uraccountable. Some of the fanily of the Francken got fome miners to work under ground, to find out the wealth that was buried in their houfe: for, befides their plate and furniture, there was a great deal of calh and many jewels in the houfe. The miners pretended they could find nothing; but they went to their country of Tirol, and built fine houfes, and a great wealth appeared, of which no other vifible account could be given but this, that they had found fome of that trealure."

PLEXUS, among anatomifts, a bundle of fmall veffels interwoven, in the form of net-work: thus a congeries of veffels within the brain is called plexus charoides, reicularis, or retiformis. See Anatomy, $n^{\circ}$ 136.

A plexus of nerves is an union of two or more nerves, forming a fort of ganglion or knot.

PLICA polonica, or plaited bair, is a difeafe peculiar to Poland; whence the name. See Medicine, $n^{\circ}$ 335. Mr Coxe, who gives a fhort account of it, attempts likewife to give the phyfical caufes of it. Many caufes of this kind, he tells us, have been fuppofed to concur in aendering the plica more frequent in thofe regions than in other parts. It would be an endlefs work to enumerate the various conjectures with which each perfon has fupported his favourite hypothefis.The moit probable are thofe afligned by Dr Vicat: The finf caufe is the nature of the Pulifh air, which is rendered infalubriousby numerous woods and moraffes, and occafionally derives an uncommon keennefs even in the midf of fummer from the pofition of the Carpathian mountains; for the fouthern and fouth-eafterly winds, which ufually convey warmth in other regions, are in this chilled in their paffage over their fnowy fummits. The fecond is, unwholefome water; for although Poland is not deficient in good fprings, yet the common penple ufually drink that which is neareft at hand, taken indifcriminately from rivers, lakes, and even ftagVol. XV.
nant pools. The third caufe is the grofs inattention of the matives to cleanlinefs; for experience fhows, that thofe who are not ne ligent in their perfons and habitations, ate lefs liable to be afficted with the plica than others who are deficient in that particular. Thus perfons of higher rank are lefs fubject to this diforder than thofe of inferior ftations; the inhabitants of large towns than thofe of fmall villages; the free peafants than thofe in an abfolute flate of valfalage; the natives of Puland Proper than thofe of Lithuania. Whatever we may determine as to the polfibility that all or any of thefe caufes, by themfelves, or in conjunction with others, nriginally produced the diforder ; we may venture to affert, that they all, and particularly the latt, allift its propagation, inflame its fymptoms, and protract its cure.

In a word, the plica polonica appears to be a contagious diftemper; which, like the leprofy, ftill prevails among a people ignorant in medicine, and mattentive to check its progrefs, but is rarely known in thofe countries where proper precautions are taken to prevent its fpreading.

PLIMPTON, a town of Devonfhire, in England, with a market on Saturdays. It is feated on a branch of the river Plime, and hard once a caftle, now in ruins. It fends tw ) members to parliament ; is feven miles E. of Plyn outh, and 218 W . by S. of London. W. Long. 4. o. N. Lat. 50. 32.

PLINIA, in hotany; a genus of plants of the polyandria monogynia clafs, defcribed by Plumier and Linnæus. The empalcment is divided into five feg. ments ; the flower confifts of five petals; the Itamina are numerous filaments, flender, and as long as the flower ; the antheræ are fmall, and fo is the germen of the piftil; the fyle is fubulated, and of the length of the famina; the Rigma is fimple; the fruit is a large glubofe berry, of a friated or fulcated furface, containing on ly one cell, in which is a very large, fmooth, and globofe feed. There is only one fpecies.

PLINTH, orle, or Orlo, in architecture, a flat fquare member, in the form of a brick. It is ufed as the foundation of columns, being that flat fquare table under the monlding of the bafe and pedeltal at the bottom of the whole order. It feems to have been originally intended to keep the bottom of the original wooden pillars from rotting. Vitruvius alfo calls the Turcan abacus plinth.

PLinth of a Statue, \&c. is a bafe, either flat, round, or fquare, that ferves to fupport it.

PLINTH of a Wall , denotes two or three rows of bricks advancing out from a wall; or, in general, any flat high moulding, that ferves in a front-wall to mark the floors, to fuftain the caves of a wall, or the larmier of a chimney.

PLINY the Elder, or Cacilius Plinius S.cundus, one of the moft learned men of ancient Rome, was defcended from an illuftrious family, and born at Versua. He bore arms in a diftinguithed poit; was one of the college of Augurs ; became intendant of Spain ; and was employed in feveral important affairs by Vefpafian and Titus, who honoured him with their efteem. The eruption of Mount Vefuvius, which happened in the year 79 , proved fatal to him. His nephew, Pliny the Younger, relates the circumftances of that dreadful eruption, and the death of his uncle, in a letter to Ta-
rimpton-
II
Pliny.

## P I I

citus. Pliny the Ahler wrote a Natural Hifory in 37 books, which is nill extant, and has had many editions; the moft eftecmed of which is that of Father Hardonin, printed at Paris in 1723, in two volumes folio.
$P_{\text {IINY }}$ the Youngcr, nephew of the former, was born in the ninth year of Ncro, and the 62d of Chrilt, at Novocomum, a town upon the lake Latius, near which he had feveral beautiful villas. Cxcilius was the mame of his father, and Plinius Secundus that of his mother's brother, who adopted him. He brought into the world with him fine parts and an elegant tafte, which he did not fail to cultivate early ; for as he tells us himfelf, he wrote a Greek tragedy at 14 years of age. He loft his father when he was young; and had the famous Virginiue for his tutor or guardian, whom he has fet in a glorious light. He frequented the fchools of the rhetoricians, and heard Quintilian; for whom he ever after entertained fo high an efteem, that he befowed a confiderable portion upon his daughter at her marriage. He was in his 18 th year when his uncle died; and it was then that he began to plead in the forum, which was the ufual road to dignities. About a year after, he affumed the military character, and went into Syria with the commiffion of tribune ; but this did not fuit his tatte any more than it had done Tully's; and therefore we find him returning after a campaign or two. He tells us, that in his paffare homewards he was detained by contrary winds at the ifland Icaria, and how he employed himfelf in making verfes: he enlarges in the fame place upon his poctical exercitations; yet poetry was not the flining part of his character any more than it had been of 'Tully's.

Upon his return from Syria, he married a wife, and fettled at Rome: it was in the reign of Domitian. During this moft perilous time, he continued to plead in the forum, where he was diftinguifhed not more by his uncommon abilities and eloquence, than by his great refolution and courage, which enabled him to fpeak boldly, when fearcely one elfe durft fpeak at all. On thefe accounts he was often fingled out by the fenate to defend the plundered provinces againt their oppreffive governors, and to manage other caufes of a like importarit and dancerous nature. One of thefe was for the province of Beotica, in their profecution of Babius Malfa; in which he acquired fo general an applaufe, that the emperor Nerva, then a private man, and in banifhment at Tarentum, wrote to him a letter, in which be congratulated not only Pliny, but the age which had produced an example fo much in the firit of the ansients. Pliny relates this affair in a latter to Cornelius Tacitus; and he was fo pleafed with it himfelf, that he could not help intreating this friend to record it in his hiltory. He intreats him, however, with infinitely more modefts than Telly had intreated Lucceius upon the fame occafion: and though he might imitate Cicero in the requeft, as he profeffes to have conftantly fet that great man before him for a model, yet he took care not to tranfgrefs the bounds of decency in his manner of making it. He obtained the offices of queftor, and tribune, and luckily went unhurt through the reign of Domitian : there is, however, reafon to fuppofe, it that emperor had not died juft as he did, that Pliny would have fhared the fate of many other great men; for he tells us himfelf, that his name was afterwards found in

Domitian's tablets, among the number of thofe who were deflined to deftruction.

He lof his wife in the beginning of Nerva's reign, and foon after married his beloved Calphurnia, of whom we read fo much in his Epifles. He had not, however, any children by any of his wives: and hence we find him thanking Trajan for the jus triunn liberorum, which he afterwards obtaincd of that emperor for his friend Suctonius Tranquillus. He hints alfo, in his letter of thanks to Trajan, that he had been twice married in the reign of Domitian. He was promoted to the confulate by Trajan in the year 100, where he was 38 years of age ; and in this office pronounced that famous panegyric, which has ever fince been admired, as well for the copioufnefs of the topics as the elegance of addrefs. Then he was elected augur, and afterwards made proconful of Bithynia; whence he wrote to Trajan that curious letter concerning the primitive Chriftians; which, with Trajan's refcript, is happily extant among his Epifles. Pliny's letter, as Mr Melmoth obferves in a note upon the paffage, is efteemed as almoft the only genuine monument of ecclefiaftical antiquity relating to the times immediately fucceeding the apofles, it being written at molt not above 40 years after the death of St Paul. It was preferved by the Chriftians themfelves, as a clear and unfufpicious evidence of the purity of their doctrines, and is frequently appealed to by the early writers of the church againt the calumnies of their adverfaries. It is not known what became of Pliny after his return from Bithynia; whether he lived at Rome, or what time he fpent at his country-houfes. Antiquity is alfo filent as to the time of his death : but it is conjestured that he died either a little before or foon after that excellent prince, his admired Trajan ; that is, about the year of Chriftinf.

Pliny was one of the greateft wits, and one of the worthieft men, among the ancients. He had fine parts, which he cultivated to the utmof; and he accomplifhed himfelf with all the various kinds of knowledge which could ferve to make him either ufeful or agrecable. He wrote and publifhed a great number of things; but nothing has efcaped the wreck of time except the books of Letters, and the panegyric upon Trajan. This has ever been confidered as a mafterpiece; and if he has, as fome think, almoft exhaulted all the ideas of perfection in a prince, and gone perhaps a little beyond the truth, yet it is allowed that no panegyrift was ever poffeffed of a finer fubject, and on which he might better indulge in all the flow of eloquence, without incurring the fufpicion of flattery and lies. His letters feem to have been intended for the public ; and in them he may be confidered as writing his own memoirs. Every epifle is a kind of hiftorical Thetch, wherein we have a view of him in fome ftriking attitude, either of active or contemplative life. In them are preferved anecdotes of many eminent perfons, whofe works are come down to us, as Suetonius, Silius Italicus, Martial, Tacitus, and Quintilian ; and ef curious things, which throw great light upon the hiRory of thofe times. They are written with great politenefs and fpirit; and if they abound too much in turn and metaphor, we muft impute it to that degeneracy of tafte which was then accompanying the degene. rate manners of Rome. Pliny, however, feems to have preferved

## PLO

preferved himfelf in this latter refpeet from the general contagion: whatever the manners of the Romans were, his were pure and incorrupt. His writings breathe a fpirit of tranfcendent goodnefs and humanity: his ouly imperfection is, he was too defirous that the public and pofterity fhould know how humane and good he was. We have two elegant Englifh tranflations of his Epirtles; the one by Mr Melmoth, and the other by Lord Orrery.
PLOCAMA, in botany; a genus of the monogynia order, belonging to the pentandria clafs of plants. The calyx is quinquedentate; the fruit a berry and trilocular, with folitary feeds. Of this there is only one fpecies, viz. the perdula, a native of the Canaries.

## ploce. See Oratory, p. 433.

PLOCKSKO, a town of Poland, and capital of a palatinate of the fame name, with a cafle and a bifaop's fee. The churches are very magnificent; and it is built upon a hill, whence there is a fine profpect every way, near the river Vitula. It is 25 miles fouth-eaft of Uladiflaw, and 65 weft of Warfaw. E. Long. :9.29. N. Lat. 52.46.

Plocksko, a palatinate of Poland, bounded on the north by Regal Pruffia, on the eaft by the palatinate of Mazovia, on the fouth by the Viftula, and on the weft by the palatinate of Inovladiflaw. The capital town is of the fame name.

PLOEN is a town of Germany, in the circle of Lower Saxony, and capital of Holltein. It fands on the banks of a lake of the fame name, and gave title to a duke, till by the death of the laft duke Charles without male iffue it efcheated to the king of Denmark in 1761 . The ducal palace, rifing in the midft of the town, on an elevated fpot of ground, and overlooking the lake, is a very pitturefque object. The town flands 22 miles north-welt of Lubeck, and 10 fouth-ealt of Kiell. E. Long. 1c. 30. N. Lat. 54. 11.

PLOMO, in metallurgy, is a name given by the Spaniards, who have the eare of the filver-mines, to the filver ore, when found adhering to the furface of fones, and when it incrufts their cracks and cavities like fmall and loofe grains of gun-powder. Though thefe grains be few in number, and the reft of the fone have no fillver in it, yet they are always very happy when they find it, as it is a certain token that there is a rich vein fomewhere in the neighbourhood. And if in digging forwards they fill meet wich thefe grains, or the plomo in greater quantity, it is a certain fign that they are getting more and more near the good vein.

PLOT' (Dr Robert), a learned antiquarian and philofopher, was born at Sutton barn, in the parilh of Borden in Lient, in the year 1641, and ftudied in Magda-len-hall, and afterwards in Univerfity-college, Oxford. In 1682 he was elected fecretary of the Royal Society, and publifhed the Philofophical Tranfactions from $n^{\circ}{ }_{1}+3$ to $n^{8} 166$ inclufive. The next year Elias Afhmole, Efq; appointed him firt kceper of his mufeum, and about the fame time the vice-chancellor nominated him firft profeifor of chemiftry in the univerfity of Oxford. In 1687 he was made fecretary to the Earl Marihal, and the following year received the title of Hifloriggrapher to King James II. In 1690 he refigned his profeflorfhip of chemiftry and likewife his place of keeper of the mufeum, to which te prefented a very large collection of natural curiofities; which were thofe he had defcribed
in his hifories Oxfordfhire and Staffordhire: the former pablifhed at Oxford in 1677, folio, and reprinted with additions and corrections in 1705 ; and the latter was printed in the fame fize in 1696. In January 1694-5, Henry Howard, Earl Marhal, nominated him Mobray-herald extraordinary ; two days after which he was conftituted regiter of the court of honour ; and, on the 3 oth of April 1696 , he died of the tone at his houfe in Borden.

As Dr Plot delighted in natural hiftory, the above works were defigned as effays towards a Natural Hiftory of England; and he had actually formed a defign of travelling through England and Wales for that purpofe. He accordingly drew up a plan of his fcheme in a letter to the learned Bifhop Fell, which is inferted at the end of the fecond volume of Leland's Itinerary, of the edition of 1744. Amongft fcveral MSS. which he left behind him were large materials for the "Natural Hinory of Kent, Middlefex, and the city of London." Befides the above works, he publifhed De origine fontium tentamen fhilofophicum, 8vo, and nine papers in the Philofophical Tranfactions.

Plor, in dramatic poetry, is fometimes ufed for the fable of a tragedy or comedy ; but more properly for the knot or intrigue, which makes the embarras of any picce. See Poetry.
Plor, in furveying, the plan or draught of any field, farm, or manor, furyeyed with an inftrument, and laid down in the proper figure and dimenfions.
PLOTINUS, a Platonic philofopher in the third century. He was born at Lycopolis, a city of Egypt. in 204; and began very early to thow a great fingularity both in his talte and manners : for at eight years of age, when he went to fchool, he ufed to run to his nurfe, and uncover her breaft to fuck; and would have continued that practice longer, if he had not been difcouraged by her. At 28 years of age he had a frong defire to ftudy philofophy, on which occafion he was recommended to the mof famous profeffors of Alexandria. He was not fatisfied with their lequres; but, upon hearing thofe of Ammonius, he confeffed that this was the man he wanted. He Audied for 11 years un:der that excellent mafter, and then went to hear the Perfian and Indian philofophers: for in 243, when the emperor Gordianus intended to wage war againft the Perfians, he followed the Roman army, but probably repented of it; for it was with difficulty he could fave his life by flight, after the emperor had been flain. He was then 39 ; and the year following he went to Rome, and read philofophical lectures in that city ; but avoided following the example of Erennius and Origen, his fellow-pupils, who, having promifed with him not to reveal fome hidden and excellent doetrines they had received from Ammonius, had neverthelefs forfeited their word. Plotinus continued ten years in Rome, without writing any thing; but, in his 50 th year, Porphyry became his fcholar; who, being of an exquifitely fine genius, was not fatisfied with fuperficial anfwers, but required to have all difficulties thoroughly explained; and therefore Plotinus, to treat things with greater accuracy, was obliged to write more books. He had before written 21 broks and during the fix years of Porphyry's ftay with him he wrote 24 , and 9 after Porphyry's leaving Rome, in all 54. The Romans had a high veneration for him ; and he paffed for a man of fuch judg.

## PLO

Hotinns. ment and virtue, that many perfons of both fexes, when they found themfelves dying, intrufted him, as a kind of guardian angel, with the care of their eftates and children. He was the arbiter of numberlefs laws-fuits; and conftanly behaved with fuch humanity and rectitude of mind, that he did not create himfelt one enemy during the 26 years he refided in Rome. He, however, did not meet with the fame jultice from all of his osn profeffion; for Olympias a philofopher of Alexandria, being envious of his glory, ufed his utmolt endeavours, though in vain, to ruin him. The emperor Gallienus, and the emprefs Salonina, had a very high regard for him; and, had it not been for the oppofition of fome jealous courtiers, they would have had the city of Campania rebuilt, and given to him with the territory belonging to it, to eftablifh a colony of philofophers, and to have it governed by the ideal laws of Plato's commonwealth. He laboured under various diforders during the laf year of his life, which obliged him to leave Rome, when he was carried to Campania to the heirs of one of his friends, who furnifhed him with every thing neceffary; and he died there in the year 270, at the age of 66 , and in the nobleft manner that an heathen philofepher could do, thefe being his words as he breathed his laft : "I am labouring with all my might to return the divine fart of me to that Divine Whole which fills the univerfe."
We have already remarked that the ideas of Plotinus were fingular and extraordinary ; and we fhall now fhow that they were fo. He was athamed of being lodged in a body, for which reafon he did not care to tell the place of his birth or family. The contempt he had for all earthly things, was the reafon why he would not permit his picture to be drawn : and when his diciple A melins was urgent with him upon this head, "Is it not enough (faid he) to drag after us, whitherfoever we go, that image in which nature has thut us up? Do you think that we fhould likewife tranfmit to future ages an image of that image, as a fight worthy of their attention?"' From the fame principle, he refufed to attend to his health; for he never made ufe of prefervatives or baths, and did not even eat the fefh of tame animals. He eat but little, and abftained very often from bread; which joined to his intenfe meditation, kept him very much from fleeping. In fhort, he thought the body altogether below his notice ; and had fo little refpect for it, that he conlidered it as a prifon, from which it would be his fupreme happinefs to be freed. When A melius, atter his death inquired about the flate of his foul of the oracle of Apollo, he was tuld, "that it was gone to the affembly of the bleffed, where clarity, joy, and a love of the union with God prevail:" and the reafon given for it, as telated by Porphyry, is, " that Plotinus had been peaceatle, gracions, and vigilant ; that he had perpetually clevated his fpotiefs fouito God; that he had loved God with his whole heart ; that he hal difengaged himfelf, to the utmolt of his abilities, from this wretched life; that, e'evating himfelf with all the powers of his loul, and by the feveral gradations tanght by Plato, towards that Supreme Being which fills the univerfe he had been enlightered by him; hadenjoyed the vifion of him without the help or interp fition of ideas; had, in hort, been often united to him." This is the account of Porfhy:y, who tells us alfo, that he himfelf had onece been favoured with the vifion. To this account, however,
we need fcarcely add, that little credit is due $:$ it agrees pretty much with modern enthufiafm and the reveries of Behmenifts. Plotinus had alfo his familiar fpirit, as well as Socrates: but, according to Porphyry, it was not one of thofe called demons, but of the order of thofe who are called gods ; fo that he was under the protection of a genius fuperior to that of other men. The fuperiority of his genius puffed him up not a little: for when Amelius defired him to fhare in the facrifices, which he ufed to offer up on folemn feltivals, "It is their bulinefs (replied Plotinus) to come to me, mot mine to go to them :" " which lofty anfwer (fays Porphyry) no one could guefs the reafon of, or dared to alk."

Porphyry put the 54 books of Plotinus in order, and divided them into fix enneafes. The greater part of them turn on the moft high flown ideas in metaphyfics; and this philofopher feems, in certain points, not to differ much from Spinoza. He wrote two books to prove, that " all being is one and the fame;" which is the very doetrine of Spinoza. He inquires, in another book," "Whether there are many fouls, or only one ?" His manner of compofing partook of the fingulatity of his nature : he never read over his compofitions after he had written them; he wrote a bad hand, and was not exact in his orthography: he food in need, therefore, of a faithful friend to revife and correct his writings; and he chofe Porphyry for this purpofe before Amelius, who had, however, been his dilciple 24 years, and was very much eftemed by him. Some have accufed Plotinus of plagiarifm, with regard to Numenius; a flander which Amelius refuted. Longinus was once much prejudiced againft our great philofopher, and wrote againt his Treatife of Ideas, and againft Porphyry's anfiver in defence of that treatife. He afterwards conceived a high efteem for him; fought induftrioully for all his books; and, in order to have them very correct, defired l'orphyry to lend him his copy; but at the fame time wrote to him in the following manner: "I always obferved to you, when we were together, when we were at a diftance from one another, as well as when you lived at Tyre, that I did not comprehend many of the fubjects treated of by Plotinus; but that I was extremely fond of his manner of writing, the variety of his knowledge, and the order and difpofition of his queftions, which are altogether philof phincal." "This fingle patlage (fuys liayle) thow's the cxalted gennius, the exquifite difer nment, and judicious penetration of Longinus. It cannot be denied, that moft fubjeats which this philofopher examines are incomprehenfible, neverthelefs, we difoover in his works a very elevated, fruitful and capacious genius, and a clofe way of reafoning. Had Louginus been an injudicious critic, had he not paflefied an exalted and beautiful genins, he would not have been fo fenfible of Plotinus's obfcurity : for no perfons complain lefs of the obfeurity of a book, than thofe whofe thnughts are confufed and undertanding is thallow." Marifius Ficinus, at the requelt of Cofmo de Medicis, made a Latin verfion of the works of Plotinus, with a fummary and analy fis of each book; which was printed at Batil, firft by itfelf, in 1559, and afterwards with the Greck in 1580 , folio. His life was written by Porphyry, the molt illuftrinus of his difciples.

PLOTUS, or Darter, in ornithology, a genus of birds

## PLO

## PLO

birds belonging to the order palmipedes. The bill is long and fharp-pointed; the noftrils are merely a long fit placed near the bafe; the face and chin are bare of feathers; the neck is very long; and the legs are fhort. They have four toes webbed together. There are three fpecies of this genus, and three varieties of the fecond of thefe.
r. The plotus anhinga, or white-bellied darter, is not quite fo big as a mallard; but its length from the point of the bill to the end of the tail is 10 inches. The bill, which is three inches long, is ftraight and pointed : the colour is greyilh, with a yellowith bate: the irides are of a gold colour: the head is fmall: che neck long and flender: the upper part of the back and fcapulars are of a dufky black colour: the middle of the feathers are dafhed with white: the lower part of the back, \&c. are of a fine black colour: the under parts from the breafts are filvery white: the fmaller wing coverts, and thofe in the middle, are dufky black; the larger ones are fpotted with white, and the outer ones are plain black: the tail feathers are 12 in number, broad, long, and gloffy black: the legs and toes are of a yellowifh grey. This fpecies is an inhabitant of Brafil, and is exceedingly expert and cunning in catching fifh. Like the corvorant, it builds nefts on trees, and roofs in them at night. It is fcarcely ever feen on the ground, being always on the higheft branches of trees on the water, or fuch as grow in the moilt favannas or river fides. When at reft, it generally fits with the neck drawn in between the fhoulders like the heron. The fleth is in general very fat; but has an oily, rank, and difagreeable talte like that of a gull.
2. The anhinga of Cayenne, or black-bellied anhinga, is as large as a common duck, with a very long neck, and a long fharp-pointed ftraight bill. The upper part of the bill is of a pale blue, and the lower is reddill): the eyes are very piercing: the head, neck, and upper part of the breaft are light brown: both fides of the head, and the upper part of the neck, are marked with a broad white line: the back, fcapulars, and wing coverts, are marked with black and white fripes lengthwife in equal portions: the quill feathers, the belly, thighs, and tail, are of a deep black colour; the tail is very long and flender: the legs and feet are of a pale green colour; and the four tues, like thofe of the corvorant, are united by webs. This fpecies is found in the iflands of Ceylen and Java. They generally tit on the fhrubs that hang over the water; and, when they fhoot out their long flender necks, are often taken for ferpents at firlt fight.

Mr Latham defcribes three varicties of this fpecies, which are all equal in fize to the common birds of the fpecies. The firlt and the fuend variety, which lalt Mr Latham callo the black darter, inhabit Cayenne; and third, or rufous darter, inhablits Africa, particularly. Senegal, where it is calied kandar.
3. The Surinam darter is about 13 inches long, being about the fize of a teal. The bill is of a pale colums, and about 1 's inch in length: the irides are red: the crown of the head is black, and the feathers behind form a fort of crelt: the neck, as in the other fpecies, is long and fender: the cheeks are of a bright bay colour: from the corner of eacheye there comos a line of white: the fides and back part of the neck are marked with longitudinal lines of black and white: the
wings are black, and the tail is durky brown: it is alfo tipped with white and flaped like a wedge: the breaft and belly are white: the legs fhort, but very ftrong, and of a pale dulky colour: the four toes are joined by a membranc, and barred with black. This fpecies inhabits Surinam, frequenting the fides of rivers and creeks, where it feeds on fmall fifh and infects, efpe. cially on flies, which it catcles with great dexterity. When drmefticated, which ofien happens, the inlabitants call it the funn bird. Authors have differed exceedingly concerning the genus to which this feecies belongs, fince it is found to differ from the others in fome pretty effential charadters: it agrees, however, in fo many, and thofe the mof effential, as fufficiently to excufe thofe naturalifts who clafs it with the plotus genus. See Latham's Synoffis of Birds, vol. iii. part 2. p. 627.

PLOUGH, in agriculture: A machine for turning The plough up the foil by the action of cattle, contrived to fave the time, labour, and experce, which, without this intrument, mult have bcen employed in digring the ground, and fitting it for rece:ving all forts of feed. See Agrsculture, no 83-95.
Amidft all the varieties which can occur in the manner of ploughing the ground, arifing from difference of foil, local habits, and other caufes, there is fill a famenefs in the tafk which gives a certain unifurmity to the chief parts of the infrument, and flould therefore furnifh principles for its conftruction. There is not, perhaps, any invention of man that more highly merits our utmott endeavours to bring it to perfection; but it has been too much neglected by thore perfons who ftudy machines, and has been confidered as a rude tool, unworthy of their attention. Any thing appears to them fufficient for the clumfy tafk of turning up the ground; and they cannot imagine that there can be any nicet $\boldsymbol{y}$ in a bufinefs which is fuccefifully performed by the ignorant peafant. Others acknowledge the value of the machine, and the difficulty of the fubject; but they think that difficulty infuperable, becaufe the operation is fo complicated, and the refiltances to be overcome fo uncertain, or fo little underfood, that we cannot difcover any unequivocal principle, and mult look for improvement onily from experience or chance.
But there opinions are ill founded. The difficulty is indeed great, and it is neither from the ignorant farmer nor thic rude artitt that we can expect improvement. It requires the ferious confideration of the moft accomplithed mechanic ; but from him we may exper improvement. We have many data: we know pretty and maty ditinetly what preparation will fit the ground for being peime the proper receptacle for the feed, and for fupporting and nourifhing the plants; and though it is, perhaps, impolible to bring it into this ftate by the operation of any inltrument of the plough kind, we know that fome ploughs prodigiounly excel others in reducing the fiff ground to that uniform crumbling flate in which it can be left by the fpade. The imperfections of their performance, or what yet remains to be done to bring the groma into this itate, is diftincly underfood. It feems, then, a determinate problem (to ufe the language of mathematicians), becaufe the operation depends on the invariable laws of mechanical nature.

It will therefore be very proper, under this article, The tans it to afcertain, if polible, what a piougla in general ought prfermas. to be, by deicribing diftinetly its talk. This will furs-

$\qquad$

$\qquad$ proce.

## Y L O

Mough. ly point out a general form, the chief features of which muit be found under every variety that can arife from particular circumftances.

The plough performs its tafk, not by dizging, but by being pulled along. We do not aim at immcdiately reducing the ground to that friable and uniform flate into which we can bring it by the fpade; but we wifh to bring it into fuch a flate that the ordinary operations of the feafon will complete the tall.

For this purpofe, a flice or fod mult be cut off from the firm land. This mult be floved to one fide, that the plough and the ploughman may proceed in their labour; and the fod mult be turned over, fo that the grafs and fubble may be buried and rot, and that frefh fnil may be brought to the furface; and all mult be left in fuch a loofe and open condition, that it may quickly crumble down by the influence of the weather, without baking intolumps, or retaining water. The firf office is performed by the coulter, whicl makes a perpendicular cut in the ground. The point of the fock follows this, and its edge gets under the fod, and lifts it up. While lifting it up, it alfo heels it over, away from the firm land. The mould-board comes laft, and pufhes it afide, and gradually turns it over as far as is required.

Plate scexcvir,
$\stackrel{5}{5}$
General the plough

The general form of the body of a plough is that of a wedge or very blunt cliffel, AFEDBC , (fig. i.), having the lower corner D of its edge conliderably more advanced than the upper corner B; the edge BD and the whole back AFDB is in the fame perpendicular plane ; the bottom FDB approaches to a triangular form, acute at $D$, and fquare at $F$; the furface BCED is of a complicated flape, generally hollow, becaufe the angle ABC is always greater than FDE: this confequence will be eafily feen by the mathematician. The back is ufually called the land side by the ploughmen, and the bafe FDE is called the sole, and FE the Heel, and BCED the mould-board. Laftly, the angle AFE is generally fquare, or a right angle, fo that the fole has level both as to length and breadth.

By comparing this form with attention, the reader will perceive, that if this wedge is pulled or pulhed along in the direction FD, keeping the edge BD always in the perpendicular cut which has been previoufly made by the coulter, the point D will both raife the earth and fhove it to one fide and twift it over; and, when the point has advanced from F to D , the fod, which formerly refted on the triangle DFE, will be forced up along the furface BCED, the line DF rifing into the polition $\mathrm{D} f$, and the line EF into the pofition $\mathrm{E} f$.Had the bottom of this furrow been covered with a bit of cloth, this cloth would be lying on the mould-board, in the pofition $\mathrm{D} f \mathrm{E}$ : the flice thus deranged from its former fituation, will have a fhape fomething like that reprefented in fig. 2.

In as much as the wedge raifes the earth, the earth prefies down the wedge; and as the wedge pufhes the earth to the right hand, the earth preffes the wedge to the left; and in this manner the plough is ferongly preffed, both to the bottom of the furrow by its fole, and alfo to the firm land by its back or land-fide. In flort, it is Arongly fqueczed into the angle formed along the line FD (fig. i.) by the perpendicular plane $a b \mathrm{DF}$ and the horizontal plane FDE; and in this mamer the furrow becomes a firm groove, directing the motion of the plough, and giving it a refifting fupport, by which it
can perform all parts of its tafk. We beg our readers to keep this circumftance conftantly in mind. It evidently fuggefts a fundamental maxim in the confruction, $A$ funda. namely, to make the land-fide of the plough an exact mental plane, and to make the fole, if not plane, at leaft maxim in Atraight from point to heel. Any projection would the contear up the fupporting planes, deftroy the directing offa ploug groove, and expend force in doing michief.
This wedge is feldom made of one piece. To give it the neceffary width for removing the earth would require a huge block of timber. It is therefore ufually framed of feveral pieces, which we fhall only mention in order to have the language of the art. Fig. 3. reprefents the land-fide of a plough, fuch as are made by James Small at Rofebank, near Foord, Mid Lothian, Scotland. The bafe of it CM, is a piece of hard wood, pointed before at C to receive a hollow floeing of iron CO , called the Sock, and tapering a little towards the hinder end, M, called the Heel. This piece is called The feve the Head of the plough. Into its fore part, jult be- ral parts hind the fock, is mortifed a tloping poft, AL, called the ploug the Sheath, the front of which is worked fharp, forming the edge of the wedge. Nearer the heel there is mortifed another piece, PQ, floping far back, called the Stilt, ferving for a nandle to the ploughman. The upper end of the fleath is mortifed into the long Beam RH, which projects forward, almoft horizontally, and is mortifed behind into the filt. To the fore end of the beam are the cattle attached. The whole of this fide of the wedge is fafhioned into oue plain furface, and the intervals between the picces are filled up with boards, and commonly covered with iron plates. The Coulter, WFe, is firmly fixed by its fhank, $W$, into the beam, rakes forward at an angle of $45^{\circ}$ with the horizon, and has its point $E$ about fix inches beforethe point of the fock. It is brought into the fame vertical plane with the land-fide of the plough, by giving it a knee outward immediately below the beam, and then knecing it again downward. It is further fupported on this fide by an iron fay FH, which turns on a pin at F , paffes through an eye-bolt I on the fide of the beam, and has a nut ferewed on it immediately above. When ferewed to its proper flope it is firmly wedged behind and before the flank.-Fig. $3 . \mathrm{N}^{\circ} .2$. reprefents the fame plough viewed from above. ST is the right hand or fimall filt fixed to the infide of the mould-board LV.
Fig. 4. reprefents the bottom of the wedge. CM is the head, covered at the point by the feck. Juft behind the fock there is mortifed into the fide of the head a fmaller piece DE, called the wret, making an angle of $16^{\circ}$ with the land-fide of the head, and its outfide edge is in the fame Atraight line with the fide of the fock. From the point to the heel of the head is about 33 inches, and the extreme breadth of the heel is about inine. The fide of the wedge, called the furtow fide, is formed by the mould-board, which is either made of a block or plank of wood, or of a thick iron plate.

The fock drawn in this figure is called a Spear Sock, sors and is chiefly ufed in coarfe or kony ground, which requires great force to break it up. Another form of the fock is reprefented in the next figure $4 . \mathrm{N}^{\circ} 2$. This is called a Feather Sock, and has a cutting edge CF on its furrow fide, extending back about ten inches, and to the right liand or furrow fide about fix. The

## $\mathrm{PLO} \quad\left[\begin{array}{ll} & 71\end{array}\right] \quad \mathrm{P}, \mathrm{O}$

 ufe of this is to cut the fod below, and detach it from the ground, as the coulter detaches ic from the un. ploughed land. This is of great ufe when the ground is bound together by knotted roots, but it is evident that it cannot be ufed to advantage in very ftony ground. In general the feather fock is only fit for ground which has been under tolerable culture ; but it greatly facilitates the labour of feparating the fod. It may reafonably be alked, why the feather is not much broader, fo as to cut the whole breadth of the furrow? This is fometimes done. But we muft recollect that the fod is not only to be pulhed afide, but alfo to be turned over. If it were completely detached by the feather, and chanced at any time to break on the back of the fock, it would only be pufhed afide; but by leaving a little of the fod uncut, it is held faft below while it is fhoved afide above, which cannot fail to twift it round. As the wreft advances, it eafily deftroys the remaining connection, which in general is very flight and crumbling.The breadth of the fole at the heel determines the width of the furrow. Nine inches will give enough of room for a horfe or man to walk in. A greater breadth is of no ufe, and it expends force in pufhing the earth afide. It is a miftake to fuppofe that a broad fole gives more room for the turned flice to fand on; for whatever is the breadth of the furrow, the fucceflive flices will be left at their former diftances, becaufe each is fhoved atide to the fame diltance. When the breadth of a flice exceeds its depth, and it is turned on its fide, it will now fland on a narrow bafe, but higher than before, and therefore will ftand loofer, which the farmers defire. But in this cafe it generally falls on its bark before it has been far enough removed, and is then pufhed afide, and left with the graffy fide down, which is nut approved of. On the other hand, when the depth confiderably exceeds the breadth, the fods, now turned on their fides, mult be fqueezed home to the ploughed land, which breaks them and toffes them up, making rough work. In wet cley foil, this is alro apt to knead them together. On the whole, it is belt to have the breadth and deptl nearly equal. But all this is workmanhip, and has no dependance on the width of the fole behind.

We have already faid that the fole is generally level from right to left at the heel. This was not the cafe formerly, but the wreft was confiderably raifed behind. It refulted from this form, that the furrow was always fhallower on the right fide, or there was left a low ridge of unttirred earth between the furrows. This circumftance alone was a bad practice ; for one great aim of ploughing is the renewal of a fuperficial foil. In this way of ribbing the furrows, the fod tumbles over as foon as it is pufhed to the top of the rib on the right of the rut made by the plough; the firmelt parts of it fall undermoft, and the rell crumbles above it, making the work appear neat ; whereas it is extremely unequal, and what moft needs the infuence of the weather to crumble it down is fheltered from it. Add to thefe circumftances, that the hollow is a receptacle for water, with a furface which can retain it, having been confolidated.
by the preflure of the plough. Fior all thofe reafons, therefore, it feems advifable to form the furrow with a flat or level bottom, and therefore to keep the heel of the wreft as low as the heel of the head. For the fame reaton it is proper to hold the plough with the landfide perpendicular, and not to heel it over that fide, as is frequently done, producing the fame ribbed furrow as an ill-formed fole.

There is great variety of opinions about the length Length of of the plough. If confidered merely as a pointed in- thepluagh ftrument, or even as a cutting infrument acting obliquely on a given length of fod, there can be no doubt but that it will be more powerful as it is longer : that is, it will require lefs force to pull it through the ground. But it muft it alfo thove the earth afide, and if we double its length we caufe it to act on twice as much earth at once; for when the plough has entered as far as the heel, the whole furrow fide is acting together in pulhing the earth to the fide. Now it is found that the force neceffary for pufhing a mais of earth horizontally along the rough ground is nearly cqual to its weight. It would feem, therefore, that nothing is to be gained by making the bafe of the plough of a great length, except a greater facility in making the firf penetration, and this is chiefly performed by the coulter and fock; and a great length renders the plough heavy and cumberfome; and by caufing it to aft long on the fod, tends to knead and cake.it.

Nothing very precife can be offered on this fubject. Some fenfible advantage is derived by making the plough taper, efpecially forward, where it acts as a boring and cutting inftrument; and for this purpofe it is convenient to give the coulter a flope of 45 degrees. (This has Slope of alfo che advantage of throwing up the fones and roots, the coulter. which it would otherwife drive before it through the and of the firm ground.) And for the lame reafon the edge of feather. the feather has a great flope, it being ten inches long and only fix inches broad. But if we purfue this ad. vantage too far we expofe ourfelves to another rifk. It is fometimes neceffary to heel over the plough to the right in order to get over fome obftruction. In doing this, the coulter is neceffarily raifed for a moment, and theflanting cut now made by the feather becomes the directing groove for the plough. When the feather has a very long flope, this groove has force enough to guide the whole plough; and it is almolt impoffible for the ploughman to prevent it from running out of the ground to the land-fide (A). The feather, therefore, thould not exceed 10 or 12 inches in length.

But to return to the length of the plough, from which this obfervation has diverted us a little, we muft add that a long plough has a great advantage in the fteadinefs of its motion, having a much more extenfive fupport both on the land-fide and below, and being therefore lefs affected by its inequalities. Accordingly they are now made confiderably longer than formerly; and 33 inches has been affumed as a proportion to 9 inches of breadth, in conformity to the moft approved ploughs now in ufe,

We come now to treat of the mould-board. This Themouldis board,
(A) This is offen felt with the excellent plough defcribed by Mr Arbuthnot of Surry in the Tranfantions of the Soci ety for the Encouragement of Arts, \&c. London.

## PLO

is the mof delicate part of the plough, and is to be feen in the greatelt vaniety in the works of different arifls, each of whom las a notrum of great value in his own noinion. It is here indeed that the chief refiftances are exerted and mut be overcome ; and a judicious furm of this part of the pough may diminith them coniderably, "hile it perforns the work in the belt manner. Withunt pretending to lay that the different reliftances are fufceptible of an accurate determination, we can fill draw fulficient information from palpable rules of mechanics to dired us to what would be nearly the bel poffible form for a mould-board. The tafk to be performed is to raite, pulhafide, and turn over to a certain degree, a flice already cut off from the firm ground. As we camot provide for every inequality of the colefion or tenacity of the earih, our fafeft way is to confider it as uniform : the weight of it is always fo. As we cannot provide for every proportion between the tenacity and the weight, we mult take an average or medium proportion which is not tar from that of equality. Conceiving the fice at firft as only tenacious, and without weight, it is an cafy problem to determine the form which thall give it the istended twill and removal with the fralleft force. In like m.mner we can proceed with a flice that las weight without tematity. It is equally eafy to combine both in any prepertions; and it is ealieft of all to make this combreation on the fuppofition of equality of weight and cohefinn. Supponng the flice like a brick, we know that it requires the greatelt force to begin to raife it on one edge, and that the frain becomes lefs as it rifes, till its centre of gravity is perpendicularly above the fupporting angle. It requires no force to raife it further ; for on pulling it beyond this pofition, it would fall over of itfelf, unlefs withheld by the tenacity of what is not yet raifed. But on confidering the form or plan of the fock, we find that while the weight of the fod refifts moft frongly, there is lefs of it in this fituation aftually rifing, and this nearly in the fame proportion with the labour of raifing it ; and we fee that after the fod has attained that polition in which it is ready to fall over, it has reached the wider part of the wreft, and is now puthed afide, which requires nearly the fame force as to raife it : and this continues to the end of the operation.

When we take all thefe circumftances into confideration, it appears probable, that the compund refillance does not change much from firft to lall. If this be really the cafe, it is an undoubted maxim that the whole operation fhould proceed equably: if it dues not, there mult he fome part of the fod that makes a refiftance greater than the medium; and as the refiltances in all this clafs of motions increafe nearly as the fquares of the velocities with which they are overcome, it is demonftrable that we fhall lofe power if we render them is unequal.
How to be Hence we deduce this maxim, That as the ploughs adperformed. vances through iqual fpaces, the twift and the lateral fliding of the fol fiould increafe by equal degrees. And this determines à priori the form of the monld-board. This priaciple occurred to Mr Janes Small a ploúghmaker in Berwick:hire, and he publified a treatife on the fubject in $\mathbf{1 7 8 4 .}_{4}$. He has givenf feveral methonds for conftrusing mould-boards, which he fuppofes are in confurmity to his principle; but being merely a country artift, and unacquainted with fcience, his rules do not
produce mould-boards having this property of equable operation, altho' they do not deviate far from it. His bork is a very ufeful and inttructive performance, and le= vel to the capacity of thole for whore it is intended; and we have here availed ourfelves of the author's mformation on many points.

The high character which Small's ploughs lave maintained for 25 years is a ftrong argument for the truth of the maxim. We thall therelore give fuch inftructions as will enable any intelligent workman to conltruct fuch a mould-board without any rifk of failure; and if future theory or experience th uld difcover any error in the principles from which this maxim is deduced, by fhowing that either the weight, the tenacity, or the lateral refillance, is exerted according to a different law from whit las been allumed, the directions to be given are of fuch a nature that they adapt themelves with precifion to thefe changes of principle, and will ftill produce a perfect and efficacions plough. Our readers will readily acknowledge that this is gaining a great point ; becaufe at prefent the inftrument is conftruged very much at random, and by a guefs of the eye.
I.et us now return to the wedge formerly made ufe of for ilhiftrating the action of the plough. Suppofe it placed in a furrow already ploughed, and that the fpace before the line FE ( 6 g .1 .), which is fquare from the line of motion FD, is cuvered with a piece of cloth or carpet, and that the point of the wedge enters upon it at F , and advances to D . It will evidetitly raife the cloth, which will now eover the fide of the wedge, forming the triangle $f \mathrm{DE}$. The line $f \mathrm{D}$ is what formerly lay in the angle along the line FD, and $f \mathrm{E}$ formerly lay on FE. It is this line FE therefore that we are to raife, fhove afide, and twit round, by equal degrees, while the plough advances through equal faces.

Now, if the length DF of the plough-wedge, reckoned from the point of the fock to the heel, be 33 inches, and the breadth FE behind be 9 inches, the angle DEF or DE $f$ will be nearly $74^{\circ}$. The conftruction of the furrow fide of the plough is therefore reduced to this very fimple problem, "'To make the angle $\mathrm{DE} f$ turn equably round the axis DE , while the anguhar point $E$ advances equably from $D$ to $E$."

This will be done by means of the following very fimple tool or infrument. Let IHFK (fig. 5.) be a piece of hard wood, fuch as oak, a foot long, three inches broad, and an inch thick. Plant on this another piece BHFC of the fame breadth, fuur inches long, and half an inch thick. This will leave beyond it a flat 8 inches long. We fhall call this the flock of the inftrument. Let ABC be a piece of clean oak half an inch thick, 20 inches long, and three inches broad at the end BC. Let this be fafhioned like the ftile of a fun-dial, having its angle $\mathrm{ABC} 74^{\circ}$. Let it have a part BCE fquare, to the extent of four inches from $C$, and the reft EA worked into the form of a ftraight flender rod. Let EFG be a femicircle of clean plane-tree or of metal four inches radius: fatten this by fmall forews to the fquare part of the tile CE, fo that its centre may be at C. Let this femicircle be divided into 180 degrees, and numbered from Galong the arch GFE, fo that $0^{\circ}$ may be at $G$, and $180^{\circ}$ at E. Let this Aile and $f$ emicircle turn round the line BC by means of fmall hinges. This inftrument may be called the mould-board, gage, or protractor. When the ftile is folded down on the

## PLO

Rock SIIK, the roint $G$ will be at $F$; and when it is rained up to any angle, the degrees will be pointed out on the femicircle by the ltraight edge CF.

Nothitg can be more obviou; than the manner of employing this influment if once we have determined the moft proper pofition for the fod when the work is completed. Now it feems to be the opinion of t!e moft intelligent farmers, that the beft pofition of the fod is that reprefented in fig. 6.

Fig. 6. reprefents a fection of the ground and the the working parts of the plotigh, as viewed by a perfon fanding ftraight before it. ABDC is the umploughed ground, and IV $B$ the coulter, knced in Small's manner. FGKB is the fection of the plough (or rather of the whole fpace through which the plough has paffed, fort no part of the plough has this fexion). HOFE is the feation of a lice, pullied afide and turned over;, fo as to lean on the next. HE is that fide of the filice which formerly lay on KB. EF is the fide cut of by the coulter; and FO is the upper or graffy fide. The lower corners are fuppofed to be a little bruifed inwards, as munf gencrally happen.
The fod is pufhed 9 inches to the right hand, and it leans with its graffy fide on the preceding furrow, in an angle of abont 50 degrees. In this pofition the grafs is turned down io as to rot; and there is a hoilow left below to allow the rain water to run freely off, and to receive the earth as it crumbies down by the weither: and if the larrow is dragged acrofs thefe ridges, it diftributes along the furfice the mould which was formerly at the bottom. The fod has got a trrit of $\mathbf{r} 30 \mathrm{de}$ grees: but it is evident, that after it has been turned $9 \circ$ degrees, or even a little before this, it is ready to fall over of itfelf. It is fufficient therefore that it be turned 90 degres when the heel of the wreft has reached it, and the remainder of the twilt is given to it by the wing or flap of the mould-board. This, then, diciates to us the manner of applying the inftrument.
Divide the edge DE (fig. 7.) of the wreft, or of a lath mailed on it, into go equal parts, and concinue the divifions backwards to G in the fame line to 130 . Numher the divifions backwards from the point of the fock; then place the protrathor on the edze of the wreft, with the point B of fig. 5 at the goth divifion (fig. $\mathrm{i}^{\text {. }}$ ); that is, juft at the heel, with the flock under the wref, and the fille raifed to $90^{\circ}$, and prefs it home to the joint, fo that the flock may be fquare to the edge, and then the file will be in the pofition fuiting that part of the mould-board. In like manner flide the flock forward to the 8oth divififon, and lower the fyle to $80^{\circ}$, and it will have the pofition which fuits that part of the monldhoard. In the fame way flide it forivard to $70,6 c, 50$, \&ce, and lower the tite to $70^{\circ}, 60^{\circ}, 50^{\circ}$, \&cc. and we thaill have the pofition for there feveral parts of the mould-hoard; and thus it may be formed to the very point-of-the fock, becaufe the itraight edge of the wrell may be continu:d fo far. A biock of wood may be hewed to fit thefe feveral pofitions of the protractor ftile ; and his, when placed with its fraight edge on the outer line of the wreft, and cut away belind in the land-fide plane, will be the exar thape of the ploughwedge. It would rife up indeed into a tall picce of fingular Rape, gradually tapering down to the point of the fock; brit when cat off paratel to the growud, at the height of about 12 inches, it will form the mould.
Vor. xv .
hoard, the front or edge of the fieath, ant the whole back of the fock cxeep: the feahiher, which is an cxtranecus picce. The whing or flyp of the moulld.board is formed in the farae manner, by fliding the fock of the protractor to 100, 1to, 120, 130, and opening the ftile to $50^{\circ}, \mathrm{t} .10^{\circ}, 120^{\circ}, 130^{\circ}$. This sill cxtend the top of the niould-board to about 22 or 23 inches ; but the lower part of the wing mant be cut awiy, because it would pulh the fod too far afide iffer it lias got the projer twill. The form of this part fhould be fuch as would exafly apply iffelf to a plank fet at the hecl of the wref, parallel to the land-fide of the head, and leaning outward 40 degrees. This will be very nearly the care if it be made a fireep fimilar to the cdge of the fheath. Fig. 8 . is a refemblance of the furface of the mould:borrd; AD being the edge of the fienth, E: the heel of the wref, and ELC the wing or flap. When cut through in a petpendicular direftioia the fection is hollow; if cut horizontally it is convex; and if in the direftions CE, making an angle of $74^{\circ}$ with ED, it is fraight. If the protractior be fet on it at D , and gradu illy fidden backiwards, the mould-board will gradually open the file, and the filic will fkim its whole furface without vacuity between them.
This form is given to the mould-board on the authority of the fuppofition that the fum of the refifances arifing from weight and tenacity remair.s pretts cor. fant in its whole length. This cannotbe affirmed with confidence in any cafe, and is by no means true in all. In fiiff clay foils the effects of tenacity prevail, and in light or crumbling foils the weight is the chief refiftance. The advantage of this mode of con?ruttion is, that it can be adapted to any foil. If the difficulcy of cutting and raifing the fod is much greater than theit of fhoving it afide and turning it over, we have only to make the rife and twitt more gentle towards the point of the fock, and more rapid as we advance; and it is eafy to do this according to any law of acceleration that we pleare. Thus, inftead of dividing the edge of the wrelt DE (fig. 9 ) ) continued to $G$ into 130 parts, draw a line G \& perpendicular to it , and draw fome curve line $\mathrm{D} g$ convex toward DG, and divide this into equal parts in the points 10, 20, 30,40 \& \&c.; and the: draw perpendiculars to the wreft edge, cutti:es it in io, $20,30,40,8 \mathrm{cc}$. and apply the protracor to thefe points. It is evident that the divifions of the wref line are big. ger at $D$, and grow gradually lef's towards $G$; and therefore, becaure each has $10^{\circ}$ more twift than the preceding, the twift will be more mpid as it approachics the end of the mould-board. This curve may be chofen f as as to produce any law of acceleration. On the contrary, we produce a retarded or diminilined twil by making the curre concave towards DG, as reprefentcd by the dotted curve.
The mathematical reader will obferve, that this confruction aims at regulating the twit round the line of the wrell ED. This does not produce precifely the fame regulation round the line FD, which is the line of the plough's mution, and of the fod's pofition before iz is ploughed over. The difference, however, is not wrorthi attending to in a matter fol lititle fufceptible of preciiun. But the twift round the line FD may be regulated as:cording to any law by this infrum nent with equal fuciyity. Infead of plating the fock of the poomatonr fquare with the edge of the wreft, it mivy be placed K : iquare

## P L O

tlough. $\rightarrow \rightarrow \sim$
quare with the land fide of the plough. To do this, draw a line BL (fig. $5 \cdot \mathrm{n}^{\circ}$. 2.) acrofs the flock from the point B , making the angle $\mathrm{LBC} 16^{\circ}$, and puta brafs pin at L, making a hole in the fyle that it may not be prevented from folding down. Then in ufing the inftrument let the points B and and L reft againt the edge of the wreft, and proceed as directed.

A fill greater variety of forms, and accommoda. tion to particular views, with the fame general dependence on principle, will be procured by giving the rod $B A$ a motion round $B$ in the plane of the file, fo as to form, a Atile of a variable angle.

A tool may even be conftructed in which the rod BA might be a cutting knife : and the whole may be led along by a fcrew, while this knife turns round according to any law, and would gradually pare away the mould-board to the proper form.

Thus have we reduced the fathioning the operative part of the plough to a rule which is certain. We do not mean by this, that a mould-board made according to the maxim now given will make the beft poffible plough; but we have given a rule by which this part of the plough can be made unequivocally of a certain quality by every workman, whatever this quality may be, and this without being obliged to enpy. No defeription of any curve mould board to be met with ia books has this advantage; and we fay that this rule is capable of any fyltematic variation, either with refpect to the width of furrow, or the quantity or variation of its $t$ wift. We have therefore put it in the power of any intelligent perfon to make fuch gradual and progreffive changes as may ferve to bring this moft ufeful of all inffruments to perfection. The angle of the head and wreft, and the curve for dividing the wreft line, can always be expreffed in writing, and the improvements communicated to the public at large.

After this defeription of the working parts of a plough, and directions for giving it the mof effective form, it will not be improper to confider a little its mode of action, with the view of attaining a more difinct coneeption of what is done by the ploughman and the cattle, and to direet him in his procedure.

Returning again to the wedge (fig. 1.), we fee that it is preffed down at the point D , and as far back along the mould-beard as its furface continues to look upward, that is, all the way to the heel of the wreft. Behind this, the perpendicular fections of the mould-board overhang, and look downward; and here, while prefling down the fod, the plough is preffed upwards. Thele two preflures tend to twift the plongh round a tranfverfe line fomewhere between the heel and the point. The plough therefore tends to rife at the heel, and to sun its point deeper into the ground. Upon the whole, the prefure downwards is much greater than the upward preffurs. It is excrted over a much greater fpace, and is greater in molt parts of that fate. Behind, very Bittle downward prefure is necelfary, the fod being ready to fall down of ittelf, and only requiring a gentle toucl? to laty it in a proper pofition.

In like menner the plough is preffed backward by the refifance made to the coulter and fock, and part of the refifance made to the floping fide of the mouldboward: and it is prelfed to the left by the othei part of the prefure on the rock and mould-beard.

## P L O

All thefe preffures muft be balanced by the joint ac- Piousti, tion of the cattle the refiltance of the bottom, and the refistance of the firm ground on the left hand or landfide.

It is the action of the cattle, exerted on that point to which they are attached, which produces all thefe preffures. It is demonflrated by the principles of mechanics, that this force mult not only be equal to the mean or compound force of thefe refilting preflures, but mult alio be in the oppolite direction.

It is further demonftrated, that if a body be dragged through any refifing fubftance by a force acting on any point $G$, and in any direction whatever GH, and really moves uniformly in that direction, the force exerted exactly balances the refiftances which it excites, both as to quantity and direction : And if the body advances without turning round the point by which it is drag. ged the reliftances on one fide of this point are in equilibrio with thofe on the oppofite fide.

And, laftly, it is demonftrated, that when this equilibrium is obtained, it is indifferent to what point in the line GH the force is applied. Thercfore, in fig. 3, $n^{\circ} 1$, the force acting in the direction HO may either be applied to the point of the beam H , or to the point $N$ of the coulter, or to the peint $O$ of the fock.

When therefore a plough advances'fteadily, requiring no effort of the ploughman to diren it, if the line of draught OM (fig. Io.) be produced backwards to the point $G$ of the mould-board, that point is the place round which all the refiftances balance each other. This point may be called the centre of refifance and the centre of a Iion.

It would be of importance to determine this point by principle; but this can hardly be done with precifion even in a plough of a known form : and it is impoflible to do it in general for all ploughs, becaufe it is different in eacl. It even varies in any plough by every variation of the proportion between the weight and the cohefion of the fod. We fee how it can be found experimentally in any given uniform fod, viz. by producing backwards the line of dranght. 'Then, if the draught-rope, inftead of being fixed to the muzzle of the beam, were fixed to this point, and if it were pulled in the fame direction, the plouglh would continue to perform its work without any affitance from the ploughman, while the fod continued uniform. But the fmall. eft incquality of fod would derange the plough fo as to make it go entirely out of its path. Should the refiftances between $G$ and $D$ prewail, the plough would go deeper, which would increafe the refiflances on that fide where they already exceed, and the plough would run till decper. Should the refiftances bchind G prevail, the heel would be preffed down, and the point would rife, which would fill farther dellroy the equilibrium, and, producing a greater deviation from the right path, would quickly throw the plough ont of the ground.

For thefe reafons we muft not think of attaching the draught to the centre of retiltance; but muft contrive a point of draught fuch as thall reftore the plough to its preper polition when it has been driven out of it by any obftrustion.

The mazale or end of the beam is a point which will Muzzle completely fuit cur purpofe. For fuppefe that the re- the beam fiftance

## I L O

gh. filtance on the back of the fock has prevailed, and the plough MNFD (tig. 10.) has takell the pofition m $n$ f $d$ reprefented by the dotted lines, the draught line GMO is brought down into the pofition gmo, diverging a little from GMO , and mecting the nould-board in : point $\delta$ confiderably before G. By this means the refitances on the hinder fide of $g$ are iacreafed, and thofe before it are dimminithed, and the plough quichly regains its former pufition.

From thefe obfervations it is plain, that whatever is oint, the fituation of the centre of reliftance, the point of draught may be fo chofen that the action of the cattle fhall be direetly oppofed to the refiftance of the ground, and that moreover the plough fhall have no tendency either to go deeper or to run out. This is the ufe of the apparatus at the point of the beam called the muzzle, reprefented at H (fig. 3.) lt turns round a bolt $i$ through the beam, and can be fopped at any height by another pin $k$ put through the holes in the arch $l \mathrm{~m}$. A figure is given of the muzzle immediately below, as it appears when looking down on it. The eye to which the draught rope is hooked is fpread out horizontally, as fhown by HK, and has feveral notches O in it, to either of which the hook can be applied. This ferves to counterad any occafional tendency which the plough may have to the right or left.

When the plough goes on teadily, without any ef. fort of the ploughman, it is faid to be in trim, and to fivimfair; the preffure before and behind the centre of astion being in equilibrio with each other. In order to learn whether a plough will be in this manner under management, hook the draught-rope as high as pollible. In this fate the plough thould have a continual tendency to rife at the heel, and even to run a little into the ground. Then hook the rope as low as poffible. The plough fhould now prefs hard on the furrow with the heel, and have fome tendency to run out of the ground. If both thefe are obferved, the plough is properly conftructed in this refpect ; if not, it muft be altered, either by changing the pofition of the fock or that of the beam. Lowering the end of the beam will correct the tendency of the plough to go deeper ; the raifing the point of the fock will alio have the fame ef. fect. But it is of confiderable importance not to take the point of the fock out of the plane of the fod, and it is much better to make the alteration by the beam. The flope of the coulter has a confiderable effect, but it cannot be placed very far from the inclination of $45^{\circ}$ without the rifk of choaking the plough by driving the roots and ftones before it. It is of great confequence to have the coulter fit exatly in the direction of the plough's motion: if it is in any other direction, it will powerfully twilt the plongh into its own track. As it muft be fixed in the middle of the beam's thicknefs to have ttrength, it is removed a little from the plane of the land-fide, and it was the ufual practice to point it to the left below to compenfate for this; but this by no means removes the difpofition to twift. And it expofes to the rifk of catching a Itone between its point and that of the fock, which mult now be driven forward through the firm ground at a great expence of labour to the cattle. Mr Small has very ingenioufly remedied this by giving the coulter a fhort knee to the left inmediately helow the beam, and thus pninting it downwards in the plumb of the land-fide. Siee fig. 6.

75 ] 19 L O
It is not withont its ufe to know the abfolute force Hough. necellary for tilling the ground. 'I his has been frequently meafured with a firing feel-yard. One of Small's ploughs, worked by two horfes, and cmpl yed in breaking up tiff land which had been ploughed before winter, and much confolidated by the rains, re. quired a force of 360 lbs a avoirdupois; and we may fate this as the ordinary rate of fuch work; but mederately firm fod, under good culture, requires at a medium $3 \geq 0$ lbs.

As we wifh to embrace every opportunity of rendering this work ufeful to the public, we fhall conclude this article with an account of a plough which has juit now been recommended to public $n$ tice by the Scots Highland Society as extremely proper for a hilly country. The inventor, the Rev. Alexander Campbell minilter at Kilcalmonell in Argylefhire, was honoured with the Society's gold medal, value L. 25 .

A, the fock (fig. II.) ; the land-lide of which fup. The ${ }^{23}$ plies the place of the conlter, and the fole of it ferves gyleftire for a feather; it is 18 inches long, and is made of a plough. plate of iron 12 inches broad when finifhed, and fomewhat under half an inch thick.--B, the head; to be made of iron in a triangular form, 4 inches broad by 2 inches at the thickelt part. There ars 5 inches of the head fixed in the fock.-C, the beam, 4 inches thick by 5 inches deep, gradually tapered thinner; the length 6 feet--E, the fheath, mult be of the fame thicknefs with the beam above and the head below, and is five inches broad. An iron fcrew-bolt connects the beam and head beloind the theath. -F , the handles are fo made that the flope of the mould-board, which is fixed to one of them, may be the longer and more gradual. They are 5 feet 8 inches long, and 2 feet 4 inches afunder at the ends.-G, the mould-board, conlitts of 7 rounded flicks 2 inches in diameter; the covert of them is in the plane of the fole, the reft in fucceffion clofe to each other aboveit. This makes the mould-board 14 inches broad. To prevent any earth from getting over the mould-board, a thin dale 4 or 5 inches broad is fixed above it. The mould-board, land-fide, and folc of the plough, are clad with iron.-The length is 20 inches: this added to 18 inches, the length of the fock, makes the length from point to heel 3 feet 2 inches. - The muzzle or bridle OPH is alfo of a more convenient and better conitruction than thofe commonly in ufe. By means of the fcrew-pins at $L$, and $M$ different degrees of land may be given to the plough; the in on rod LH being thereby moved fidewife in the focket LN, and up and down by OP. The rod is 30 inches long, one broad, and half an inch thick. It is hooked into a fcrew-bolt at H. Two inches of the rod project at N , in the form of an eye, before the muzzle, to receive the hook of the crofs-tree.

The adrantages of this plough are faid to be: It is not fo liable to he interrupted or turned out of its courfe by fones, roots, 太c. as other ploughs are; nor does it dip fo deep as to be liable to be broken by large ftones or flags. The motion of the muzale is alfo thought an improvement. A nother advantage it has over other ploughs is, its not being fo liable to be choaked up by ftubble, \& c. This we underftand to be its chief excellen$c y$, and an object much defired in the conftruction of the plough. Upon the whole, we are informed that this plongh is lighter, lefs expenfive, and lels liable to lk 2

oljections to iss conH1: Livon.
go out of trim than the ordinary plough, and that with it two horfes can plough land which require four with any other plough.

Such are faid to be the advantages of this confruc? tion; but we cannot help exprelling our apprehenfion that the uniting the coulter and feather at the point of the fock will expofe the phough to great rifks of being put out cf order. When the upright edge frikes a ftone obliquely, efpecially on the land-fide, it mult be violently twifted round the point of the head; and, having but a moderate thickncfs at this part, may be broken or permanently twifted. 'I'he plough will then be continually running out of its direclion: and we apprehend that this defect cannot be ameinded without taking off the fock and putting it in the fire. When a coulter is bent by the fame caufe, the ploughman can either rectify it by altering the wedging, or he can Itraighten it in the field; and it mult be obferved, that the plough oppofes much lefs refritance to the derangement of this fort of coulter than of the common one. In the common coulter the ftrain does not fo much tend E) twitt the plough round the line of its motion, as to prefs it wholly to landward. The reliftance to this is rreat; but a very moderatc force will twilt it round its line of motion. In either cale, if the blow be given in that point of the coulter where the draught line crofles it, there will be no twift of the whole plough, but the point of the plough will be forced horizontally to or from the land. When the blow is out of this line, the Rrain tends to tritt the beam or the plough. Expelience will determine which of the two is the molt haцardous. Thefe ploughs are made by Thomas Lindfay, Abbeytill, Edinburgh, and models are to be feen in tihe hall of the Highland Society.

Protgh-drill. Sie Drile foruing, and Agriculture, p. 3:8; and Plate VIl, and 2d Plate VH. In the Gentleman's Magazine for July 1793, p. 602, Mr Wickin's of Pondhead Lodge, New Foref, gives an account of a fimplified dill-plongh invented by himfelf. Its importarce is increated, he thinks, by the cheapnefs and eafy conftrustion of it, becaure it can be ufed upon' a fmall fcale by a fingle man, and upon a larger fale by two men, or a man and boy; fo that the inconvenience fuffered by horfes trampling the ground, \&c. is liareby avoided. To the drill for fowing is occafionally anneved a blade for hoeing between the rows : "t the good effeets of which (fays Mr Wickins) are no lefs obvious from its nurturing the growth of the roin, and producing collateral hoots from the applica. tion of freh foil, but alfo from its affording the means ri extirpating the weeds which are fo obroxious to it." He informs us likewife, that his fingle hand-anill hath been feen and approved by the Bath Society; and they have in confequence been pleafed to vote him an honorary and correfponding rember. Since that time, however, he fays, he has very materially improved and fim= whised it. Mr Wichins's defcription of his invention is fi: from being accurate; and the drawing, of which there is an engraving in the tame magazine, was taken when his machine was in its infint and lefs improved feate. He promifes, however, further information io the Gentlemu's Magazine, and he offers more particulars to fuch agricultural people as fhall defire it. We are far from decidelly thinking that this plough-drill is a esel improvement, or that itever will come to be real-
ly and generally ufeful. We have feen fo many of thefe and fuch like improvements make a great noife for a while, and then fall into neglect, without having ever come into ufe, as makes us thy in forming opinions refpecting the utility of thofe inftruments which are fo often and fo boldly obtruded on the world as the ne plus ultra of improvements in their feveral fpheres. We think it our duty, however, to give every attempt at improvement, efpecially in the ufeful arts, all the juRice in our power; and, on this account, it has always been our cuftom to lay before our readers fuch claims to it as have occurred in the courfe of our work, whether thofe claims appeared to ourfelves to be juft or not.

PLOUGHMAN, the perfon who guides the plougl: in the operation of tilling.

PLOUGHING, in agriculture, the turning up the earth with a plough. See Agriculture, Pait II. pafim.

PLOVER, in ornithology, a fpecies of Chara. prius.

Thefe birds ufually fly in exceedingly large flocks in the places they frequent; people talk of 20,000 or 30,000 being feen in a flock. They generally come to England in September, and leave it about the end of March. In cold weather they are found very conmonly on lands lying near the fea in quelt of food; but in thaws and open feafons they go higher up in the country.

They love to feed on ploughed lands, but never remain long at a time on them, for they are very cleanly in their nature; and the dirt which lodges on their beaks and feet give them fo much uneafneis, that they fly to the nearelt water to wafl themfelves. When they roolt, they do not go to trees or hedges; but fit fquatting on the ground like ducks or geele, far from trees or hedges, when the weather is calm; but when it is formy, they often get under fhelter. In wet wather they do not fleep in the night at all, bat run about picking up the worms as they crawl out of the ground; during this feeding they: are continually making a fmall cry, that ferves to keep them together; and in the morning they take flight. If in their tlight they fpy any others on the ground, they call them up; and it they refufe to come, the whole body defcends to fee what food there is in the place that detains them.

Plovers are very eafily taken at the time of their firft coming over, when they have not got any other birds mixed anneng them; but when they a!terwards pick up the tenl and other Shy birds among them, it hecomes more difficult. The beft feafonfor takng them is in Oficber, efpecially in the beginning of that month: after this they grow timorous, and are not eafily taken again till March, winch is the time of their coupling. The feverelt frots are not the befl feafon for taking them in reft, but variable weather cioes better. The nortl: weit wind is found difadvantageons to the taking of them; and in general, great regand is to be fad to the courle of the wind in the fetting of the nets. All feaLowl ly ag:hit the wind when the land lies that way ; and the nets for taking them are therefore to be placed in a proper direction accordingly.

PLOWDEN (Edmund), ferjeant at law, was the foin of Humphrey Plowden of Plowden in Shropthire, of an ancient and genteel family. He was firt a ftudent of the univerity of Cambridge, where he fpent thace years in the fudy of philofophy and medicine.

PLU
L'luche.
He then renoved to Oxford, where, having contianced his former ftudies about four years mole, in 1552 h was admitted to the practice of phyfic and furgery; but probably finding the practice of the at of healing lefs agreeable than the la udy, he entered himbelf of the Middle Temple, and began to read law. Wood fiys, that in 1557 he was funmer reader to that fociety, and Lent-reader three years atter, being then fergent and oracle of the law. He died in the year 1584,aged 67; and was buried in the 'lemple-church, near the north. wall, at the ealt end of the choir. He married the daughter of William Shuldon of Eoley in Worecterfhire; by whem he had :t fon, who died foon after his faiher. He rrote, I. Commentaries or reports of divers Cates, \&c. in the reigns of King Edw. VI. Queen Nary, and Queen-Elizabeth; London, 1571, 783, 99, 16i3, 2ic. Written in the old Norman language. 2. Queries, or a Moot-book of cafes, \&c. tranllated, methodized, and enlarged, by H. B. of Lincoln's-Inn; Lond: 1662, 8vo.

PLUCHE (Antony), born at Rheims in 1688 , merited by his engaging manners and proficiency in the belles lettres the appointment of humanif in the univerfity of that city. Two years after he obtained the profeffor of rhetoric's chair, and was admitted into holy orders. The bifhop of Laon (Clermont) informed of his talents, offered him the direction of the college of his epifcopal city. By his induftry and fuperior knowledge, a proper order and fubordination foon took place in it; but fome particular opinions refpecting the affairs of the time difturbed his tranquillity, and obliged him to quit his office. The intendant of Romen, at the requeft of the ce!ebrated Rollin, entrufted him with the education of his fon. Abeé Pluche having filled that place with fuecefs and great honour to himfelf, left Rouen and went to Paris, where, by the patronarge of fome literary friends and his own excellent writings, he acquired a very diftinguifhed reputation for learning. He publithed, t. Le Speciacíe de la Nature (Nature Difplayed), in 9 vols in 12 mo. This work, which is equally inftructive and entertaining, is written with perfpicuity and elegance; but the form of dialngue which he adopted has drawn lim into the fault of being rather too prolix. The ipeakers, who are the Prior, the Count, and Countels, are not diftinguilhed by any Ariking feature ; but they have all the common eharakter, which is tolerably pleafing, not excepting even that of the little chevalier De Bruei], who is, however a mere fcholar. This is the opinion which Abbe Desfontaines has formed of this work. Though the author has given the converfations a pretty ingenious turn, and even fome vivacity, yct they now and then fall into the tone of the college. 2. Hijloire du Ciel, or Hillory of the Heavens, in 2 vols in 12 mo . In this performance we find two parts almof independent of one another. The firf contains fome lcarned inquities into the origin of the poetic heavens. It is nearly a complete mythology, founded upon ideas which are new and ingenious. The fecond is tle hitfory of the opinions given by philofo. phers refpesting the formation of the world. The anthor fnows the inutility, the inconfancy, and uncestainty, of the mont efteemed fytems; and concludes with pointing out the excellence and fublime fimplicity of the Molaic account. Defides a noble and well-turned esprefion, we find in it an erudition which does not

77 ] PI U
faispue the miond. As to the fourdation of the foflem explained in the tirlt part, though it appars extromely platufible, we will not take upon us fo tay how far it is true: Voltaire called it Fask du Cos!, or a l'able of the Heavens. 3. De linguarant Antficio; at work which he tranflated with this title, Lu Jirchanigue des Langues, in 12 mo. In this treatide he propofes a llont and eally methad of leaming languges, which is by the ute of tramations infiead of thencs or exercifes; and we muft admit his reflusions on that fubject are both judicious and well exprefied. 4. Harmony of the Phalns and the Gofpel, or a Trantation of the D'alms and Iymms a the church, which Notes relarive to the Vulgate, the Septlagint, and Hebrew I'ext, printed at l'aris in ${ }_{17} 6+$, it 12 mo . In 1749 , Abbé Pluche retired to varenre St Miture, where he gave himfelf up entirely to devotion and iludy. Having become fo deaf that he could not hear without the help of a trumpet, the eapital afforded him very little entertainment. It was in this retreat that he died of an apoplexy on the 2 cth of November 1761, at the age of 73 years. He pofferied thofe qualities which form the foholar, the honef man, and the Chriftian: temperate in his neeals, true to his word, an affectionate parent, a fentible friend, and a humane philofopher; he gave leffons of virtue in his life as well as in his writings. His fubmition to all the dogmas of religion was very great. Some deifs having been furprifed that, in matters of faith, he fhould thini and fpeak like the vulgar, his anfiver was, "I glory in doing fo: It is infinitely more rational to believe the word of God, than to follow the glimmering lights of a reafon which is limited and fubject to error."

PLUG, certain pieces of timber, formed like the fruftum of a cone, and ufed to top the haufe-holes and the breaches made in the body of a hip by cannonballs; the former of which are called baufe-plugs, and the latter /Wot-plugs, which are formed of various tizes in proportion to the holes made by the different fizes of flict, which may penetrate the fhip's fides or battom in battle; accordingly they are always ready for this purpofe.

PLUKENET (Leonard), a phyfician who fourih. ed in the reign of King Charles IL.was one of the moft excellent and laborious botanifts of that or any other age. He was author of the Phytographia Plucenctiana, the Almagefficum Britannicun, and other works of the like kind, on which he fpent the greate? part of his life and fortune. His Phytography is mentioned with the higheft cocomiums in the Philofophical tranfactions for February 1696\%. His Opera Bolania, with cuts, were puinted at London in 6 vols folio, in 1720 .

PLUM tree, in butany. See Prunus.
PLUMAGE, the feathers which derve birds for a covering. See Ornithology, p. 506.

PLUMB-Line, among at'ificers, denotes a perpendicular to the horizon; fo called as being commonly erected by means of a plummet.

PLUMBAGO, Lead-wort; a genus of the monogynia order, belonging to the pentandria clafs of flants. There are four fpecies; the moft remarkable of which are the Europsa and Zeylonica. The firt grows naw turally in the fouthen parts of Europe; and has a perennial root Ariking deep in the ground. There are many flender channelled ftalks, about three feet high, terminated by tults of fmall funnel-fhaped flowers, of a blue or white colour. 'Whe fecond grows naturally in

Plumbago, both the Indies. The upper part of the ftalk and em$\underbrace{\text { Plumbery. }}$ palement are covered with a glutinous juice, which catches the fmall fies that light upon it. The former fpecies is propagated by parting the roots, and by feeds; but the latter is too tender to ihrive in the open air in cold countries.

Plumbago. See B'ack-Lead.
PLUMBERY, the art of cafting and working lead, and $u$ firg it in building.

As this metal melts foon and with little heat, it is eafy to caft it into figures of any kind, by running it into moulds of brafs, clay, platter, \&c. But the chief article in plumbery is fheets and pipes of lead; and as there make the balis of the plumber's work, we thall here give the procefs of making them.

In cafting beet-land, a table or monld is made ufe of, which confilts of large pieces of wood well jointed, and bound with bars of iren at the ends; on the fides of which runs a frame confinting of a ledge or border of wood, three inclies thick and lour inches high from the mould, called the Barps: The ordinary width of the mould, within thefe fharps, is from four to five fect; and its length is 16,17 , or 18 feet. This fhould be fomething longer than the theets are intended to be, in order that the end where the metal runs off from the mould may be cut off, becaufe it is commonly thin or uneven, or ragged at the end. It muft fand very even or level in breadth, and fomething falling from the end in which the metal is poured in, viz. about an inch or an inch and a half in the length of 16 or 17 feet or more, according to the thinnefs of the fheets wanted; for the thinner the fheet, the more declivity the mould fhould have. At the upper end of the mould ftands the pan, which is a concave triangular prifm, compofed of two planks nailed together at right angles, and two triangular pieces fittted in between them at the ends. The length of this pan is the whole breadth of the mould in which the theets are caft ; it ftands with its bottom, which is a fharp edge, on a form at the end of the mould, leaning with one fide againtt it; and on the oppofite fide is a handle to lift it up by, to pour out the melted lead; and on that fide of the pan next the mould are two iron hooks to take hold of the mould, and prevent the pan from llipping while the melted lead is pouring out of it into the mould. This pan is lined on the infide with moiftened fand, to prevent it from being fired by the hot metal. The mould is alfo fpread over, about two inches thick, with fand fifted and moiftened, which is rendered perfeetly level by moving over it a piece of wood called a flrike, and fnootis. ing it over with a imoothing plane, which is a plate of polifhed brafs, about one-fiurth of an inch thick and nine inches fquare, turned up on all the four edges, and with a handle fitted on to the upper or concave fide. The fand being thus fmonthed, it is fit for calling fheets of lead: but it they would calt a ciftern, they meafure out the bigners of the four fides; and having taken the dimenfions of the front or fore-part, make mouldings by preffing long flips of wood, which contain the fame mouldirgs, into the level fand; and form the figures of birds, bealts, \&c. by preffing in the fame ranner leaden figures upon it, and then taking them off, and at the fame time fmovthing the furface where any of the fand is railed up by making theie impteffions upon it. The reft of the operation is the fome in cafting either citterns
or plain fleets of lead. But before we proceed to men- Plumbery tion the manner in which that is performed, it wiil be neceflary to give a more particular defeription of the frike. The frike, then, is a piece of board about five inches broad, and fometling longer than the breadth of the mould on the infide; and at each end is cut a notch about two inches deep, fo that when it is ufed it rides upon the fharps with thofe notches. Before they begin to caft, the frike is made ready by tacking on two pieces of an old hat on the notches, or by llipping a cafe of leather orer each end, in order to raile the under fide about one eighth of an inch or fomsthing more above the fand, according as they would have the fheet to be in thickne?s then they tallow the under edge of the frike, and lay it acrofs the mould. The le.td being melted, it is put into the pan with ladles, in which, when there is a fufficient quantity for the prefent purpofe, the lcum of the metal is fwept off with a piece of board to the edge of the pan, letting it fettle on the fand, which is by this means prevented from falling into the mould at the pouring out of the metal. When the lead is cool enough, which muft be regulated according to the thickneis of the fheets wanted, and is known by its beginning to ftand with a fhell or wall on the fand round the pan, two men take the pan by the handle, or elfe one of them lifts it by the bar and chain fixed to a beam in the ceiling, and pour it into the mould, while another man ftands ready with the ftrike, and, as foon as they have done pouring in the metal, puts on the mould, fweeps the lead forward, and draws the overplus into a trough prepared to receive it. The fheets being thus caft, nothing remains but to roll them up or cut them into any meafure wanted: but if it be a ciftern, it is bent into four fides, fo that the two ends may join the back, where they are foldered together ; after which the bottom is foldered up.

The method of cafting pipes without foldering. To make thefe pipes they have a kind of little mill, with arms or levers to turn it with. The moulds are of brafs, and confift of two pieces, which open and nut by means of hooks and hinges, their inward caliber or diameter being according to the fize of the pipe, ufually two feet and a half. In the middle is placed a core or round piece of brals of iron, fomewhat longer than the mould, and of the thickneis of the inward diameter of the pipe. This core is paffed through two copper rundles, one at each end of the mould, which they ferve to clofe; and to thefe is joined a little copper tube about two inches long, and of the thicknefs the leaden pipe is intended to be of. By means of thefe tubes, the core is retained in the middle of the cavity of the mould. The core being in the mould, with the rundles at its two ends, and the lead melted in the furnace, they take it up in a ladle, and pour it into the mould by a little aperture at one end, made in the form of a funnel. When the mould is full, they pafs a hook into the end of the core, and, turning the mill, draw it out; and then opening the mould, take out the pipe. If they defirc to have the pipe lengthened, they put one end of it in the lower end of the monld, and pafs the end of the core into it ; then thut the mould again, and apply its rundle and tube as before, the pipe jull caft ferving for a rundle, \&cc. at the other end. Things being thus re. placed, they pour in frefh metal, and repeat the operation till they have got a pipe of the length required.

Humbur For making pipes of theet-lead, the plumbers lave wooden cylinders, of the length and thicknefs required; and on thefe they form their pipes by wrapping the theet around them, and foldering up the edges all along then.
The lead whichlines the Chinefe tea-boxes is reduced to a thinncis which we are informed European plumbers cannot imitate. The following accomat of the procefs by which the plates are formed was communicited to a writer in the Gentleman's Magazine by an intelligent mate of an Eaft Indiaman. The cafter fits by a pot containing the melted metal; and has two large fones, the under one fixed, the upper moveable, directly before him. He raifes the upper fone by preffing his foot upon the fide of it, and with an iron ladle pours into the opening a proper quantity of the fluid metal. He then inmediately lets fall the upper fone, and by that means forms the lead into a thin regular plate, which is afterwards cut into a proper fhape. The furfaces of the flones, where they touch each other, are cxa.cly ground together.

Plumbum, lead. See Lead.
Pluksum Cornewm, a combination of lead with the marine acid. See Chemistry, no 812.

PLUME, in botany, the bud or germ. See GemM.

PLUMIER (Charles), a learned Minim, born at Marieilles, and one of the moft able botanifts of the ${ }^{17}$ th century. He was inftructed by the fanmous Maignan, who taught him mathematics, turnery, the art of making fpectacles, burning-glaffes, miciofeopes, and other works. He at length went to Rome to perfect himfelf in his ftucies, and there applied himfelf entirely to botany under a fkilful Italiau. At his return to Provence, he fetted in the convent at Bornes, a maritime place near Hieres, where he had the conveniency of making difcoveries in the fields with refpect to fimples. He was fome timeafter fent by the French king to America, to bring from thence fuch plants as might be of iervice in medicine. He made three different voyages to the Antilles, and fopped at the ifland of St Domingo. The king honoured him with a penfion; and he at latt fettled at Paris. However, at the defire of M. Fagon, he prepared to go a fourth tinie to America, to examine the tree whicl produces the Jefuits bark; but died at the port of Santa Maria near Cadiz, in 1706. He wrote feveral excellent works ; the principal of which are, 1 . A volume of the Plants in the American Inlands. 2. A treatife on the American Fern. 3. The Art of Turnery ; a curious work embillithed with plates.

PLUMMET, Plumb-Rule or Plamb line, an inftrument ufed by carpenters, mafons, \&c, in order to judge whether walls, \&c. be upright planes, horizortal, or the like. It is thus called from a piece of lead, faltened to the end of a chord, which ufually confitutes this infrument. Sometimes the ftring defcends along a wooden ruler, \&cc. raifed perpendicularly on anether; in which care it becomes a level.

PLUMMING, among miners, is the method of ufing a mine dial, in crder to know the exact place of the work where to fink down an air-thaft, or to bring an adit to the work, or to know which way the load in: clines when any flexure happens in it.

It is performed in this manner: A fkilful perfon with an affitant, and with pen, ink, and paper, and a long
line, and a fun-dial, after his guefs of the place abo:e ground defeends into the adit or work, and there falfens one cnd of the line to fome fised thing in it; then the incited needle is let to reft, and the exact point where it refts is marked with a pen: he then goes on farther in the line fill faftened, and at the text flexure of the adit he makes a mark on the line by a hnos or othcrwite: and then letting down the dial again, he there likewife no:es down that point at which the needle flands in this fecond pofition. In this mamner he procceds, from turning to turning, marking down the pints, and marking the line, till he comes to the intended place : this done, he afcends and begins to work on the furlace of the earth what he did in the adit, bringing the firte knot in the line in fuch a place where the mart of the place of the needle will again anfwer its pointing, and continues this till he.come to the defired place above ground, which is certain to be perpendicular over the part of the mine into which the airthaft is to be funk.

PLUMOSE, fomething formed in the manncr of a feather, with a ftem and ribres iffuing from it on each fide ; fuch are the antenne of certain moths, butterfies, \&c.

PLURAL, in grammar an epithet applied to that number of nouns and verbs which is ufed when we fpeak of more than one thing. See Grammar.

PLURALITY, a difcrete quantity, confinting of two or a greater number of the fame kind: thus we fay, a plurality of gods, \&cc. See the article Astronomy, no 157 , for the arguments both for and againit it plurality of worlds.

PIUR ALIT of Benfices, or Livings, is where the fame clerk is pofieiled ot two or more fpiritual preterments, with cure of fouls. Sce EENEFICE.

The fmallnefs of fome benefices firf gave rife to piuralites; for an ecclefiatic, unable to fubfilt on a fingle. one, was allowed to hold two ; and at length the num. ber increafed without bounds. A remedy was attempted for this abufe at the council of Lateran under Alexander III. and Innocent III. in the year 1215 , when the holding more than one benefice was forbid by a canon under the penalty of deprivation; but the fame canon granting the pope a power to difpenfe with it in favour of pertons of dittinguifhed merit, the prohibition became almoft ufelefs. They were alfo rettrained by flatute 21 Hen. VIII. cap. 13. which enacts, that if any perfon having one benefice with cure of fouls, of the yearly value of sl. or above (in the king's books), accept any other with cure of fouls, the firt fhall be adjudged in law to be void, \&ic. though the fame fuatute provides for difpenfation in certain cafes.
In England, in order to procure a difpenfation, the prefentee mult obtain of the bithop, in whofe diocefe the livings are, two certificates of the values in the king's books, and the reputed values and diflance; one forthe archbilhop, and the other for the lord-chancellor. And if the livings lie in two diocefes, then two eertificates of the fame kind are to be obtained from each bithop. He muft alfo fhow the archbifbop his prefentation to the fecond living; and bring with him two teftimonia's from the neighbouring clergy concerning his behaviour and converfation, one tor the arcbbifhop and the other for the lord-chancellor; and he mult alfo thow the archbilhop his letters of orders, and a certificate of his h.a-

Ilaliwe $\downarrow$ Ilusalizy.

## ए \& U

ving taken the degree of matter of arts at the leaf, in one of the univerfities of this realm, mander the hand of the regiter. And if he be not doctor or buehelor of divinity, nor doftor nor bachelor of law, he is to procure a qualification of a chaplain, which is to be duly regitered in the faculty office, in order to be tendered to the arehbithop, according to the fatute. And if he hath taken any of the aforefaid degrees, which the fatute allows as qualitications, he is to procure a certificate thereof as already mentioned, and to fhow the fame to the archbifhop; after which his difpenfation is made out at the faculty office, where he gives fecurity according to the direction of the eanon. Ife munt then repair to the lord-chancellor for confirmation under the hroad feal; and he mult apply to the bilhop of the diocefe where the living lies for his admifion and inftitution. By the feveral ftamp att, for every thin, or paper, or parchmont, \&c. on which any difpenfation to hold tro ecclefiatical dignities or benefices, or a dig. nity and a beneficence, thall be engrofed or written, there fhall be paid a treble 40 s. ीamp duty.

TWe have alfo a regulation in regard $t$ pluralities; but it is often difpenfed with; for, by the faculty of dipenfation, a pluralit is required, in that benefice from which he thall happen to the molt abfent, to preain ${ }_{3}, 3$ fermons every year, and to exercife hofpitility for two months rearly.

In Germany the pope grants difpenfations for poffefing a plurality of benefices, on pretence that the ecelefiaftical princes there need large revenues to bear up againt the Proteftant princes.

PLUS, in algebra, a character marked thus + , ufed for the fign of addition. See Algebra, p. 400 , and Negatire Sine.

PLUSH, in commerce, ice, a kind of ftuff, havving a fort of velvet knap or fhag on one fide, compofed regularly of a woof of a fingle woollen thread and a double warp; the one wool, of two threads twifted; the other groats or camels hair ; though there are fon:e plufhes entirely of worfted, and others compofed wholly of hair.

PIUTARCH, a great philofopher and liftorian of antiquity, who lived from the reign of Claudius to that of Hadrian, was born at Chæronea, a fmall city of Boctia in Greece. Plutareh's family was ancient in Cheronea: his grandfather Lampiras was eminent for lis learning and a philofopher; and is oiten mentioned by Plutarch in his uritings, as is alfo his father. Plutareh was initiated early in fudy, to which he was naturally inclincd; and was placed under the care of Ammonius, an Egyptian, who, having taught philo. fophy with great reputation at Alexandria, from thence rravelled into Greece, and fettled at Athens. Under this matter he made great advances in lnowledge; and like a thorough philofopher, more apt to regard things than words, he purfued this knowledge to the neglect of languages. The Roman lancुuage at that time was not only the language of Rome, but of Grese alfo; and much more wed there than the Irench is now in England. Yet he was fo far from regarding it then, that, as we learn from himfelf, he became not converfant in it till the declention of his Ife: and, thnugh he is ruppofed to have refided in Rome near 40 years at difierent times, yet he never feems to have acquird a competenc fill in it. But
this was not the wort: he did not cultivate his motirer. Aatare tongue with any great exantnefs; and hence that harfhnefs, incquality, and obfcurity in his fiyle, which has for frequently and fo jukly been complained of.

After he was principled and grounded by A mmonius, having an infatiable thirtt for knowlegge, he refolved to travel. Egypt was at that time, as formerly it had bcen, fa mous for learning ; ar. 1 probably the myfterioufnefs of their doctrine might tempt him, as it had tempted Pythagoras and others, to go and converfe with the prielt. hood of that country. This appears to have been particularly his bufinefs, by his treatile of Ifis and Ofiris: in which he fhows himfelf verfed in the anciert theology and philofophy of the wife men. From Egypt he returned into Greece; and vifiting in his waty all the academies and fchools of the philof phers, gathered from thom many of thefe oblervations with which he has abundantly enriched pofterity. Ire does not feem to have been attached to any partictlar feet, but culled from each of them whatever he thought excellent and worthy to be regarded. Fe could not bear the paradoses of the Stoics, but yet wits more averfe from the impiety of the Epicureans: in many things lre followed Aritotle; but his favourites were Socrates and Plato, whofe memory he revercd fo highly, that he annually celebrated their birth-days with much folemnity. Befides this, he applied himfelf with extreme diligence to collect not only all books that were excellent in their kind, but alio all the fayings and obfervations of wife men which he had heard in converfation or had res ceived from others by tradition; and likewife to confult the records and public inftruments preferved in cities which he had vilited in his travels. He took a particular journey to Sparta, to fearch the archives of that famous conmonwealth, to underitand thoroughly the model of their ancient government, the hiftory of their leginators, their kings, their ephori ; and digefted all their memorable deeds and fayings with much care. He took the fame methods with regard to many other commonwealths; and thus was enabled to leave us in his works fuch a rich cabinet of obfervation upon men and manners, as, in the opinion of Montaigne and Bayle, liave rendered him the moft valuable author of antiquity.

The circumtances of Plutarch's life are not known, and therefore cannot be related with any exactnefs. According to the learned Fabricius, he was born under Claudius, 50 years after the Chriftian era. He was married to a mof amiable woman of his own native town, whofe name, according to the probable conjecture of Rualdus, was Timoxenc, and to whofe fenfe and virtue he has borne the mot affectionate. teftimony in his moral works. He had feveral children, and anzong them two fons; one called Plutarch after himfelf, the other Lamprias in memory of his grandfather. Lamprias was he, of all his ehildren, whon feems to have inherited his father's philorophy; and to him we owe the table or catalogue of Plutarch's writings, and perhaps alfo his apophthegms. He had a nephew, Sextus Cheroneus, who taught tlic learnedemperor Marcus Au. relius the Greek tongue. and was much honoured by him. Some think, that the critic Longinus was of lif's family; and Apuleius, in the furt book of his Metamorphofes, affirms himfelf to be defeended from him.

On whit oceafion, and at what time of his life, he
rch, went to Rome, how long he lived there, and when he finally returned to his own country, are all uncertain. It is probable, that the fame of him went thither before him, not only becaufe he had publifhed feveral of his works, but tecaufe immediatcly upon his arrival, as there is reafon to believe, he had a great refort of the Roman mobility to hear him: for he tells us himfelf, that he was fo taken up in giving lectures of philofoplyy to the great men of Rome, that he had not time to make himfelf mafter of the Latin tonguc, which is one of the firt things that would naturally have engaged his attention. It appears that he was feveral times at Rome; and perhaps one motive to his inlabiting there was the intimacy he had contracted in fome of thefe jonrneys with Sclius Senecio, a great and worthy man, who had been four times conful, and to whom Plutarch has dedicated many of his lives. But the great inducement which carrie: him firft to Rone was undoubtedly that which had carried him into fo many other parts of the world; namely, to make obfervations upon men and manners, and to collect materials for writing the lives of the Roman worthies, in the fame manner as ke had already written thofe of the Grecian: and accordingly he not only converfed with all the living, but fearched the records of the Capitol, and of all the libraries. Not but, as we learn from Suidas, he uras intrufted alfo with the management of public affairs in the empire, during his refidence in the metropolis. "Plutarch (fays he) lived in the time of Trajan, who beflowed on him the confular ornaments, and alfo caufed an ediet to be paffed, that the magiftrates or officers of Illyria fhould do nothing in that province without his knowledge and approbation."

When and how he was made known to Trajan is likewife uncertain: but it is generally fuppofed that Trajan, a private man when Plutarch firtt came to Rome, was, among other nobility, one of his auditors. It is alfo fuppofed, that this wife emperor made ufe of him in his councils; at leaft, much of the happinefs of his reign has been imputed to Plutarch. Fabricius afferts that he was Trajan's preceptor, and that he was raifed to the confular dignity by him, and made procurator of Greece in his old age by the emperor Adrian. We are equally at a lofs concerning the time of his abode in the imperial city; which, however, at different rimes, is not imagined to fall much fhort of 40 years. The defire of vifiting his native country, fo natural to all men, and efpecially when growing old, prevailed with him at length to leave Italy: and at his return he was unanimoully chofen archon or chief magiltrate of Chæronea, and not long after admitted into the num. ber of the Delplic Apollo's priefts. We have no particular account of his death, either as to the manner of it or the year; only it is evident that he lived, and continued his ftudies, to a good old age. The molt probable conjecture is that of Fabricius, who fays he died in the fifth year of Adrian at the age of 70 .

His works have been divided, and they admit of a pretty equal divifion, into Lives and Morals: the former of which, in his own eftimation, were to be preferred as more noble than the latter. His Atyle, as we have already obferved, has been excepted to with fome reafon: he has alfo been criticifed for fome miftakes in Roman antiquities, and for a little partiality to the Greeks. On the other hand, he has been juftly praifed Vol, XV.
for the copionfnefs of his fine fenfe and learairg, for his integrity, and for a certain air of goodieefs which appears in all he wrote. His bulinefs wats not to pleafe the ear, but to inftus and charm the mind ; and in this none ever went bejond him. Of his moral writings it is to be regretted that we have no elegant Enislifh tranflation. Even his Lives vere chiefly lnowis to the Englifh reader by a morler and mifcrable verion, till a new one executed with fidelity and fipit was prefented to the public by the Langhornes in 1770 . On the whole, it is to be wifhed that this mof amithle moralift and biographer had added a life or himelf to thone whicin he has given to the world of others, as the purticulars which othcr write:s have preferved of his pıtfonal hiftory are very doubtful and imperfect.

PLUTO, in Pagan worlhip, the king of the infernal regions, was the fon of Saturn and Ops, and the brother of Jupiter and Nepture. This deity finding himfelf childlefs and unmarried, mounted his chariot to vifit the world; and arriving in Sicily, fell in love with Proferpine, whom he faw gathering flowe.s with her companions in the valley of Enna, near mount Eina; when, forcing her into his chariot, he drove her to the river Chemarus, through which he opened himfelf a paffage back to the realms of night. See Ceres and Proserpine.

Pluto is ufually reprefented in an ebony chariot drawn by four black horfes; fometimes holding a fceptre, to denote his power; at others a wand, with which he drives away the ghofts; and at others, fome keys, to fignify that he had the keys of death. Homer obferves, that his helmet had the quality of rendering the wearer invifible, and that Minerva borrowed it in order to be concealed from Mars when the fought againft the Trojans. Pluto was greatly revered both by the Greeks. and Romans, who erected temples and altars to him. To this god facrifices were offered in the night, and it was not lawful to offer them by day.

PLUTUS, in Pagan worfhip, the god of riches, is frequently confounded with Pluto. He was reprefented as appearing lame when he approached, and with wings at his departure; to fhow the difficulty of amaffing wealth, and the uncertainty of its enjoyment. He was alfo frequently reprefented blind, to fhow that he often beftowed his favours on the moft unworthy, and left in neceffity thofe who had the greateft merit.
PLUVIALIS. Sce Charadius, $n^{\circ} 7$.
PLUVIUS, a furname of Jupiter. He was invoked by that name anong the Romans whenever the earth was parched up by continual heat, and was in want of refrefling raias. He had an altar in the temple on the capitol.

PLYERS, in fortification, denote a kind of balance ufed in railing or letting down a draw-bridge. They confift of two timber levers, twice as long as the bridge they lift, joined together by other timbers framed in the form of a St Andrew's crofs to counterpoife them. They are fupported by two upright jambs, on which they fwing; and the bridge is railed or let down by means of cladins joining the ends of the plyers and bridge.

PLYING, in the fea language, the adt of making, or endeav ouring to make, a progrels againft the direction of the wind. Hence a fhip that advances well in her courfe in this manner of failing, is faid to be a gond
plyer.

IYyirg.

## PL Y <br> PLY

Plymuth. plyor. Sec the articles Brating, Pirching, and Tacking.
PLYMOUTH, a town of Devonlhire, in England, about 215 miles from London, Itands between the rivers Plym and 'Tamar, jult before they fall into the Britifl Channel. From a mere fifhing village it has become one of the largeft towns in the county; and in one of the chief magazines in the kingdom, on account of its port, which is one of the fafeft in England, and which is folarge as to be able to contain 1000 fail. It is defonded by feveral different forts, mounting altogether nearly 300 guns ; of which the chief is the Royal Citadel erected in the reign of Charles II. oppofite to St Nicholas Ifland, which is within the circuit of its walls, and contains a large fore-houfe and five regular baftions. In time of war the outward bound convoys generally rendecvous at Plymouth, and homeward-bound dhips generally put in to provide pilots up the Channel. It is alfo a great place of refort fir men of war that are wind-bound.

The mouh of the Tamar is called Ham-Ooze, and that of Plym Catwater, which are both commanded by the caftle of St Nicholas Inland. $\Lambda$ bout two miles up the mouth of the Tamar there are four docks, two of which were built in the reign of William III. one wet and the other dry, and two which have been built fince. They have every conveniency for building or repairing fhips, and one of them is hewn out of a mine of flate and lined with Portland ftone. This town enjoys a pilclard fifhery of confiderable importance, and carries on an extenfive trade with Newfoundland and the Straits. There is a cultomhoufe in it; and though there are two churches (and befides feveral meeting houfes), yet each church has folarge a cure of fouls, that the parifle clerks were till very lately in deacon's orders, to enable them to perform all the incafional and other offices. The feat rents are given to the poor. The lecturers are chofen every three years by the corpnration, which was conftituted by Henry VI. and confifts of a maycr, 12 aldermen, and 24 common council men. The mayor is clected by a jury of 36 perfons, chofen by four others, two of whom are appointed by the mayor and aldermen, and the other two by the common-council. There is alfo a recorder, and a town-clerk, whofe place is very profitable. The town confifts of four divilions, which were anciently governed by fuur captains, each of whom had three conftables under him. It is well fupplied wih frefh water, which was brought from the dillance of feven miles, by sir Francis Drake a native of the town. The toll of the markets, and of the cotton, yarn, \&c. with the profit of the mill, which is very ronfiderable, belongs to the corporation, as do the revenues of the thambles, which are farmed out for the mayor's kichen. There is a charity-fchool in Plymouth, four hofpitals, and a workhoufe, in all which 100 poor children are clothed, fed, and taught; and there are two printing houfes. To one of the hofpitals Colonel Jory gave a charity for 12 four widows, as he did a mace worth 1201. to be caried before the mayor, and
fix good bells, valued at 5001 . to Charles-Church, fo Plymouth, called from the kings in whofe reigns it was begwn and Plynteri. finifhed. In the entrance of the bay lies the famous Edyltone-rock, which is covered at high-water, and on which the ingenious Mr Winftanley built a light-houfe, that was blown down in the terrible hurricane of Nov. 27 th $1 \% 03$, and himfelf, with others that were with lim in it, never more heard of. However another was erested in the room of it, by the corporation of the Trinity-houfe, in purfuance of an at of the 5 th of Queen Ame, which was deftroyed by an accidental fire Dec. $\downarrow$ th. 1755, but rebuilt in 1759 : which alfo was burnt down, and rebuilt in the year 1770. In the reign of Edward III, the French landed, and burnt part of the town, but werc foon repulfed by Hurg Courtenay earl of Devon. In the reign of Henry IV. the French landed here again, and burnt 600 houles. Between this town and the fea is a hill called the Haw, which has a delightful plain on the top, laving a pleafant profpect all round it, and a good land-mark for the ufe of mariners. The lit of parliament-men for this borough, fermerly divided into two parts, by the names of Sutton-Valtort and Sutton-Prior, commences the 26 th of Edward I. and continues to the i4 th of Edward III. after which we find no return made for it till the zoth? of Henry VI. when the privilege was renewed. On the Haw is a fort, which at once awes the town and defends the harbour. Here is a ferry over the Tamar, called Cromwell or Crimble Paflage, the weft fide of which is called Weftone-Houfe, and is in Devonhhire, though mof of the parifl wherein it fands is in Cornwall. In April 1759 the parliament granted 25,1591. for the better fortifying the own and dock of Plymouth; which was vifited by George III. with the Queen, \&c. in Augutt ${ }^{2789}$. N. Lat. 50. 26. W. Long. 4. 15.

Plymouth, in New England, a fea-port town, and capital of the county of the fame name, in the province of Maffachufets Bay, in North America. It is remarkable for having been the firfl fettlement in New England, and for laving had the firft place of worthip. It is feated at the fouth end of Plymonth Bay. W. Long. 70. 10 N. L.at. $41.5^{3 .}$

PLYNTERIA, a Grecian feftival in honour of Aclauros, or rather of Muerva, who reccived from the daughter of Cecreps the name of Aglauris. The word is derived from $\pi$ atver, lavare, recaule during the folemnity they undreffed the flatue of the goddefs and waffed it. The day on which it was obferved was lroked upon as unfortunate and inaufp:cious; and therefore no perfon was permitied to appear in tic temple, as they we:e purpofely furrounded with ropes. The arrival of Alcibiades in Athens that day was thought very unfortunate, but the fucceis that ever after attendeil lionz proved it to be otherwife. It was cultomary at this feftival to bear in proceflinn a clufter of figs ; whi 1 l intimated the progrefs of civilization among the firf inhabitarts of the eartb, as figs ferved them for food after they had found a dinike fur acorns.

mHIS term is reftriged, in the prefent labits of our language, to that part of natural philofophy which trats of the mechanical properties of elatic fluids. The word, in its original meaning, exprefles a quality of air, or more propesly of breath. Under the article Prysics we oblerved, that in a great number of languages the term ufed to exprefs breath was alfo one of the terms ufed to exprefs the animating priuciple, nay, the intellectual fubtance, the foul. Ft has been perhaps owing to fome attention to this chance of confufion that our philofophers have appropriated the term Preumatics to the fcience of the mechanical proporties of air, and Preumatology to the fience of the intellectual phenomena confequent on the operations or affections of our thinking principle.

We have extended (on the authority of prefent cuftom) the term Paeumatics to the ftudy of the mechanical properties of all elattic or fenfibly compreffible fluids, that is, of fluids whofe elafticity and compreffibility become an interelting objec of our attention ; as the term Hydrostatics is applied to the fludy of the mechanical properties of fuch bodies as interef us by their fluidity or liquidity only, or whofe claticity and comprefitility are not familiar or interefting, though not lefs rcal or general than in the cafe of air and all vapours.
We may be indulged in the obfervation by the bye that there is no precife limit to the different claffes of natural bodies with refpet to their mechanical properties. There is no fuch thing as a body perfectly hard, perfectly foft, perfectly elaftic, or perfeally incompretlible. All bodies have fome degree of elanticity intermixed with fome degree of ductility. Water, mercury, oil, are compreffible; but their compreflibility need not be attended to in order perfectly to underftand the phenomena confequent on their materiality, fluidity, and gravity. But if we neglect the compreffibility of air, we remain ignorant of the caufe and nature of its moft interefting plenomena, and but imperfectly informed with refpect to thofe in which its elafticity has no fhare ; and it is convenient to attend to this diftinction in our refearches, in order to undertland thofe phenomera which depend folely or chiefly on comprefliblility and elaficity. This obfervation is important ; for here elafticity appears in its moft fimple form, unaccompanied with any other mechanical affection of matter (it we except gravity), and lies moft open to our obfervation, wherher cmployed for inveftigating the nature of this very property of bodies, or for explaining its mode of action. We thall even find that the conftitution of an avowedly elaftic tluid, whofe compreflibility is to very fentible, will give us the diflincteft notions of fluidity in general, and cnable us to underfand its characterific appearances, by which it is diftinguidhed from folidity, namely, the equable diftribution of preflure thro' all its parts in every direation, and the horizontality which tis furfuee alfumes by the action of gravity : phenomena which have been affumed as cquivalent to the definition of a perfect fluid, and from which all the laws of hydroftatics and hydraulics have been derived. And
thefe haw bave been applied to the explanation of the phenomena around us; and water, mercury, cil, \&te. have been denominated finid on'y becaufe the ir appearances have been found to tally exactly with thele confequences of this delinition, while the definition itiflf remains in the form of an allumption, unfupporte t by any other proof of its obtaining in nature. A real mechirne:cal philofopher will therefore attach himfelf with great eagernef's to this property, and confider it as an introduction to much natural feience.

Of all the fenfibly compreffible fluids air is the moft familiar, was the firlt Atudicd, and the moft minutely examined. It las therefore been generally taken as the example of their mechanical properties, while thofe mechanical properties which :ure peculiar to any of them, and therefore characteritic, have ufually been treated as an appendix to the general fcience of pneumatics. No objection occurs to us againf this method, which will therefore be adopted in treating this article.

But alihough the mehcanical propeties are the pro- Diferent ${ }^{5}$ per fubjects of our contideration, it will be impoffible propertice to avoid confidering occalionally propertics which are of it. more of a chemical nature; becaufe they occafion fuch modifications of the mechanical properties as would frequently be unintelligible without eonfidering them in conjunction with the other; and, on the other hand, the mechanical properties pruduce fuch modifications of the properties merely chemical, and of very interefting phenomena confequent on them, that thefe would oftern pafs unexplained unlefs we give an account of them in this place.

By mechanical properties we would be underltood to nical promean fuch as produce, or are connected with, fenfible pertic. changes of motion, and which indicate the prefence and agency of moving or mechanical powers. They are therefore the fubject of mathernatical difution ; admitting of meafure, number, and direction, notions purely mathematical.

We fhall therefcre begin with the confideration of air. 5
$\qquad$ $-$
$\qquad$

It is by no means an idle queftion, "What is this air? air of which fo much is faid and writen?" We fee nothing, we feel nothing. We find ourfelves at liberty to move about in any direstion without any let or hindarance. Whence then the afertion, that we are furrounded with a matter called a:r? A very few fimple obfervations and experiments will thow us that this affertion is well founded.

We are accuftomed to fay, that a vefiel is empty troufs that when we when we have poured out of the water whit.) it contained. Take a cylindrical glafs jar (fig. r.), having Plate a fmall hole in its bottom; and having topped this hole, fill the jar with water, and then pour out the water, leaving the glafs empty, in the common acceptation of the word. Now, throw a bit of cork, or any light body, on the furface of water in a ciltern: cover this with the glafs jar held in the hand with its bottom up. wards, and move it downwards, keeping it all the while in an upright pofition. The cork will continue to fluat on the furface of the water in the infide of the glafs,
and will mof diftinctly fhow whercabouts that furface is. It will thus be feen, that the water within the glafs has its furface confiderably lower than that of the firrounding water; and however deep we immerge the arlafs, we fhall find that the water will never rife in the infide of it fo as to fill it. If plunged to the depth of 32 feet, the water will only half fill it; and yet the dalnowledged laws of hydroftatics tell us, that the wa. ter wonld fill the ghafs if there were nothing to hinder it. There is therefore fomething already within the glafs which prevents the water from getting into it; manifefting in this manner the molt diftindtive property of matter, viz. the hindering other matter from occupying the fame place at the fame time.
Poffelifed if impulfive force, While things are in this condition pu!l the fopper out of the hole in the bottom of the jar, and the water will infantly rife in the infide of the jar, and fand at an equal height within and without. This is jultly afcribed to the efcape through the hole of the matter which formerly obftructed the entry of the water: for if the hand be held before the hole, a puff will be diftinetly felt, or a feather held there will be blown afide; indicating in this manner that what prevented the entry of the water, and now efcapes, poffeffes another charafterittic property of matter, impu'five force. The materiality is concluded from this appearance in the fame manner that the materiality of water is concluded from the impulfe of a jet from a pipe. We alfo fee the mobility of the formerly pent up, and now liberated, fubfance, in confequence of external preffure. viz. the preffure of the furrounding water.
Impenetra- Alfo, if we take a fmooth cylindrical tube, fhut at bility, one end, and fit a plug or cork to its open end, fo as to fide along it, but fo tightly as to prevent all pafage by its fides; ard if the plug be well foaked in greafe, we fhall find that no force whatever can pulh it to the bottom of the tube. There is therefore foncthing within the tube preventing by its impenetrability the entry of the plug, and therefore poffeffing this characteriltic of matter.

In like manner, if, after having opened a pair of common bellows, we fhut up the nozzle and valve hole, and try to bring the boards together, we find it im. poffible. There is fomething included which prevents this, in the fame manner as if the bellows were filled with wool; but on opening the nozzle we can eafily fhut them, viz. by expelling this fomething; and if the compreffion is forcible, the fomething will iffie with confiderable force, and very fenfibly impel any thing in its way.

It is not accurate to fay, that we move about without any obftraction ; for we find, that if we endeavour to move a large fan with rapidity, a very fenfible hin- derance is perceived, and that a very fenfible furce mult be exerted; and a feafible wind is produced, which will agitate the neightouring bodies. It is therefore jufly concluded that the motion is poffible only in confequerce of having diriven this obfructing fubflance out of the way; and that this impenetrable, refifing, moveable, impelling fubftance, is matler. We perceive the perfeverance of this matter in its fate of ref when wic wave a fan, in the fame manner that we perceive the inertia of water when we move a paddle through it. The effeets of wind in impelling our thips and mills, in
tearing up trees, and overturning buildings, are equal indications of its perfeverance in a ftate of motion.
To this matter, when at ref, we give the name $\mathrm{A}_{\text {IR }}$; and when it is in motion we call it Wind.

Air, therefore, is a material fluid: a fluid, becaufe $I t$ is the its parts are eafily moved, aral yield to the fmalleft inequality of preffure.

Air pofiefles fome others of the very general, though ${ }_{4}$ not effential, properties of matter. It is heavy. This appears from the following facts.

1. It always accompanies this globe in its orbit round the fun, furrounding it to a certain diftance, under the name of the Atmosphere, which indicates the being councefed with the earth by its general force of gravity. It is chiefly in confequence of this that it is continually moving round the earth from ealt to weft; forniisg what is called the trade-wind, to be more particularly confidered afterwards. All that is to be obferved on this fubject at prefent is, that, in confequence of the difturbing force of the fun and moon, there is an accumulation of the air of the atmofphere, in the fame manner as of the waters of the ocean, in thofe parts of the globe which have the moon near their zenith or nadir: and as this happens fuccellively, going from the eaft to the weft (by the rotation of the earth round its axis in the oppofite direction), the accumulated air muft gradually flow along to form the elevation. This is chiefly to be obferved in the torrid zone; and the generality and regularity of this motion are greatly dillurbed by the changes which are continually taking place in different parts of the atmofphere from caufes which are not mechanical.
2. It is in like manner owing to the gravity of the Support air that it fupports the clouds and vapours which we the clot fee conflantly floating in it. We have even feen bodies of no inconfiderable weight float, and even rife, in the air. Soap bubbles, and balloons filled with inflammable gas, rife and float in the fame manner as a cork rifes in water. This phenomenon proves the weight of the air in the fame manner that the fwimming of a piece of wood indicates the weight of the water which fupports it.
3. But we are not left to thefe refined obfervations Fanilia 16 for the proof of the air's gravity. We may obferve proofs familiar phenomena, which would be immediate confc- its weis quences of the fuppofition that air is a heavy fluid, and, like other heavy fluids, preflies on the outfides of all bodies immerfed in or furrounded by it. Thus, for inftance, if we thut the nozzle and vaive hole of a pair of bellows after having fqueezed the :ir out of them, we fhall find that a very great force, even fome hundred pounds is necefliary for feparating the boards. They are kept together by the preffure of the heavy air which furrounds them in the fame manner, as if they were immerfed in water. In like manner, if we flop the end of a fyringe after its pifton has been prefled down to the bottom, and then attempt to draw up the pifton, we fhall find a confiderable force neceßary, viz. about 15 or 16 pounds for every fquare inch of the fection of the fyringe. Exerting this force, we can draw up the piflon to the top, and we can hold it there; but the moment we ceafe acting, the pifton rufies down and ftrikes the bottom. It is calied a fuction, as we feel fomething as it were drawing in the pifton; but it is really the weight

## P N E U M A TM C S.

of the incumbent air preffing it in. And this obtains in every polition of the fyringe; becaufe the air is a fluid, and preffes in every direction. Nay, it preffes on the fyringe as well as on the pilton; and if the pifon be hung by its ring on a nail, the fyringe requires force to draw it down (juft as nuch as to draw the piflon up); and if it be let go, it will fpring up, unlefs loaded with at leaft 15 pounds for every fquare inch of its tranfverfe fection (fee fig. 2.)
4. But the molt diret proof of the weight of the air is had by weighing a velfel empty of air, and then weighing it again when the air has been admitted; and this, as it is the moft obvious confequence of its weight has been afferted as long ago as the days of Aritotle. He fays ( $\pi$ spi cupzov, iv. t.), That all bodies are heavy in their place except fire : even air is heavy; for a blown bladder is heavier than when it is empty. It is fomewhat furprifing that his followers flould have gone into the oppofite opinion, while profefling to maintain the doctrine of their leader. If we take a very large and limber bladder, and fqueeze out the air very carefully, and weigh it, and then fill it till the wrinkles juft begin to difappear, and weigh it again, we flall find no difference in the weight. But this is not Ariftotle's meaning; becauic the bladder, contidered as a veffel, is equally full in both cafes, its dimenfions being changed. We cannot take the air out ot a bladder withour its immediately collapfing. But what would be true of a bladder would be equally true of any veffiel. Therefore, take a round veffel A (fig. 3.), fitted with a topcock B , and fyringe C . Fill the whole with water, and prefs the pifton to the bottom of the fyringe. Then keeping the cock open, and holding the velfel upright, with the fyringe undermoft, draw down the pifton. The water will follow it by its weight, and leave part of the veffel empty. Now fhut the cock, and again pufh up the pifton to the bottom of the fyringe; the water efcapes through the piton valve, as will be explained afterward: then opening the cock, and again drawing down the pifton, more water will come out of the veffel. Repeat this operation till all the water have come out. Shut the cock, unfcrev the fyringe, and weigh the veffel very accurately. Now open the cock, and admit the air, and weigh the veffel again, it will be found heavier than before, and this additional weight is the weight of the air which fills it; and it will be found to be 523 grains, about an ounce and a fifth avoirdupoife, for every cubic foot that the veffel contains. Now fince a cubic foot of water would weigh 1000 ounces, this experiment would flow that water is about $\delta_{40}$ times heavier than air. The moft accurate judgment of this kind of which we have met with an account is that recorded by Sir George Shuckbourgh, which is in the Gyth vol. of the Philofcphical Tranfactions, P. 560 . From this it follows, that when the air is of the temperature 53 , and the barometer ftands at $29_{4}^{*}$ inches, the air is 836 times lighter than water. But the experiment is not fufceptible of fufficient accuracy for determining the exact weight of a cubic foot of air. Its weight is very fmall; and the veffel muft be ftrong and heavy, fo as to overload any balance that is fuficiently nice for the experiment.

To avoid this inconvenience, the whole may be weighed in water, firf loading the veffel fo as to make it preponderate an ounce or two in the water. By this
means the balance will be loaded only with this fmall preponderancy. But even in this cafe thencare confiderable fources of error, ariling from changes in the fpecific gravity of the watcr and other caufec. The expcriment has oiten been repeated with this view, and the air has been found at a medium to be about 840 tinmes as light as water, but with great variations, as may be expetied from its very heterogencous mature, in confcquence of its being the mentl rum of almoft every fluid, of all vapours, and even of molt folid bodies; all which it holds in folution, forming a fluid perfegly tramfparent, and of very different denfity according to its compofition. It is found for inftance, that perfectly pure air of the temperature of our ordinary fimmer is confiderably denfer than when it has diffolval about half as much water as it can loold in that temperature ; and that with this quantity of water the difference of denfity increafes in proportion as the mafs grows warmor, for damp air is morc expanfible by heat than dry air. We thall have occafion to confider this fubject again, when we treat of the conneatirn of the mechanical properties of air with the llate of the weather. See Weather.

Such is the refult of the experiment fuggened by This proAriftotlc, evidently proving the weight of the air; and perty of yet, as has been obferved, the Peripatetics, who profefs air denicd to follow the diftates of Arifotle, uniformly refufed it ty the Pethis property. It was a matter long debated among rithough acthe philofophers of the laft century. The reafon was, knowledgthat Ariftotle, with that indifinetnefs and inconfiftency ed by their which is obferved in all his writings which relate to mafter. matters of fact and experience, affigns a different caufe to many phenomena which any man led by common obfervation would afcribe to the weight of the air. Of this kind is the rife of water in pumps and fyphons, which all the Peripatetics had for ages alcribed to fomething which they called nature's abborrence of a void. Aritotle had affierted (for reafons not our bufinefs to adduce at prefent), that all nature was full of being, and that nature abhorred a void. He adduces many facts, in which it appears, that if not abfolutcly impoifible, it is very difficult, and requires great force, to preduce a face void of matter. When the operation of pumps and fyphons came to be known, the philofophers of Europe (who had all embraced the Peripatetic doctrines) found in this fancied horror of a fancied mind (what elie is this that nature abhors?) a ready folution of the phenomena. We fhall fate the facts, that every rcader may fee what kinds of reafoning were reccived among the learned not two centuries ago.

Pumps were then conftructed in the following man- Con月ruc. ner : A long pipe GB (fig. 4.) was fet in the water tion of of the well A. This was fitted with a fucker or pifton pumps in C , having a long rod CF, and was furnifhed with a the laft valve B at the bottom, and a lateral pipe DE at the ${ }^{\text {century. }}$ place of delivery alfo furn thed with a valve. The fack is, that if the pifton be thruft down to the bottom, and then drawn up, the water will follow it; and upon the pifton being again pufhed down, the water fhuts the valve $B$ by its weight, and efcapes or is expelled at the valve $E$; and on crawing up the pifton again the valve $E$ is fhat, the water again rifes after the pifton, and is again expelled at its next defcent.

The Peripatetics explain all this by faying, that if the water did not follows the piflon there would be a void

## A T I C C .

was owing to the preflure of the air, and was the mea. fure of this preffure, metcury would in like manner be fupported by it, and this at a height which was alfo the neafure of the air's prelfure, and therefore 13 times lefs than water. He hat the pleafure of feeing his expectation verified in the completeit manner; the mercury defeending in the tube $A B$ (fig. 5.), and finally fettling at the height $\int \mathrm{B}$ of $2 g_{7}^{3}$ Roman inches: and he found, that when the tube was inclined, the point $f$ was in the fame horizontal plane with $f$ in the upright tube, according to the reccived laws of hydroftatical prefure. The experiment was often repeated, and foon became famous, exciting great controverfies among the philofophers about the pofibility of a vacuum. About three years afterwards the fame experiment was publifhed, at Warfaw in Poland, by Valeriamus Magnus as his own fuggeftion and difcovery: but it appears plain from the letters of Roberval, not only that Toricelli was prior, and that his experiment was the general topic of difcuffion among the curious; but alfo lighly probable that Valerianus Magnu: was informed of it when at Rome, and daily converfant with thofe who lad feen it. He denies, however, even having heard of the name of Toricelli.

This was the era of phiofophical ardour ; and we think that it was Galileo's invention and immediate application of the telefcope which gave it vigour. Difcoveries of the molt wonderful kind in the heavens, and which required no extent of previous knowledge to underftand them, were thus put into the hands of every perfon who could purchafe a fpy-glafs; while the high degree of credibility which fome of the difoveries, fuch as the phafes of Venus and the rotation and fatellites of Jupiter, gave to the Copernican fy fem, immediately fet the whole body of the learned in motion. Galileo joined to his ardour a great extent of learning, particularly of mathematical know.ledge and found logic, and was even the firft who formally united mathematics with phyfies ; and his treatife on accelerated motion was the firft, and a precions fruit of this union. Alout the years 1642 and 1644 , we find clubs of gentleman affociated in Ox. ford and Londen for the cultivation of knowledge by societ experiment; and before 1655 all the doctrines of hy- Scc. droftatics and pneumatics were faniliar there, eftablifhed uponexperiment. Mr Boyle procured a coalition and correfpondence of there clubs under the name of the Invifible and Philofophical Society. In May 1658 Mr Hooke finithed for Mr Boyle an air-pump, which had en: ployed him a long time, and occalit ried him feveral journeys to London for things which the workmen of Oxfort could not execute. He rpeaks of this as a great improvement on Mr Boyle's own pump, which he had been ufing tome time before. Boyle therefcre muft have invented his air-pump, and was not indebted for it to Schottus's account of Otto Guerick's, pablifhed in his (Schotus) Dlectanaica Hybrazalopracumatica in 1657 , as he afferts (Techno Curioja). The Royal Society of London arofe in $16 ; 6$ from the cualition of thefe clubs, after 15 years en-operation and correffondence. The Montmorine Society at laris had fubfitted nearly abcut the fime time ; for we find Patchal in 1648 f peaking of the mectings in the Sorbonne College, from which we know that ficiety originated. - Nurcmberg, in Germany, was alfo a difin guifhed feminary of experimental phlofophy. The

the fame preflurc on its furface as the air does. In this cafe we are certain that the water will be preffed into the pipe, and will raife up the water already in it, and follow it till it is equally high wilhin and without. The fame preflire of the air fluts the valve $\mathbf{E}$ during the defcent of the piften (See Gal. Difourfes.)

He did not wait for the very obvious objection, that if the rife of the water was the effect of the air's preffure, it would alfo be its meature, and would be raifed and fupported only to a certain height. He directly faid fo, and adduced this as a decifive experiment. If the horror of a void be the caufe, fays he, the water muft rife to any height however great; but if it be owing to the pleflure of the air, it will only rife till the weight of the water in the pipe is in equilibrio with the weight of the water in the pipe is in equibiono with
the preflere of the air, according to the common laws of hydroftatics. And he adds, that this is well known;
for it is a fact, that pumps will not draze water nuch of hydroftatics. And he adds, that this is well known;
for it is a fact, that pumps will not draze water nuch above forty palms, although they may be made to propel it, or to lift it to any height. He then makes an affertion, wh ch, if true, will be decilive. Let a very altertion, wh ch, if true, will be ccilive. Let a very
long pipe, flut at cue end, be filled with water, ard let it be erceled perpendiculary with the clofe ent uppormoft, and a llopper in the other end, and then its lower orifice immerted into a veffel of water; the wat:r will fubtide in the pipe upon removing the fopper, till the ruaning colum is in equil:brio with the preftiure of the external air. This experiment he propsfes to the chicus; fuying, however, wat he thought it unreecfiary, there being already fuch abuadant profs of the air's preifure. dit apparas protrack the raning oftis cxperiment, fid by To. Ancther cqually conclufive, and machealicr, was made ricell's ex- in 16.42 aficr Galilen's death, Dy his zealous and learned is impofible: therefore the water follows the pitun. It is not worth while to criticife the wretched reafoning in this pretence to explanation. it is all overiurned by one obfervation. Suppofe the pipe flat at the bottom, the piiton can be drawn up, and thus a vnid prodaced. No, fiy the Peripatetics; and thes fipeak of certain firits, flluvia, \&c. which occupy the tiace. But if 10 , why needs the water tife? 'This therefore is not the caufe of its afcent. It is a curious and important phenomenon.
The fagacious Galileo feems to have been the firt Who feriouly afcribed this to the weight of the air. M.nny before him had fuppofed air heavy ; and thus explained the difficulty of raifing the board of bellows, or the pifton of a fyringe, scc. But he diftinctly applies to this allowed weight of the air all the confequences of hydroftatical laws; and he reafons as follows.

The heavy air refts on the water in the ciftern, and preffes it with its wight. It does the fame with the watcr in thee pipe, and therefore both are on a level: but if the pinon, i.fer being in contact with the furface of the water, be drawn up, there is no longer any pref. fire on the furface of the water within the pipe; for the air now relts on the pifton only, and thusoccafions a dificulty in drawing it up. The water in the pipe, therefore, is in the fame fituation as if more water were poured into the cillern, that is, as much as would exert and fupported only to a certain height. He directly

It is probable that the cumberfomenefs of the necefdiciple Traicelli. He filled a glafs tube, clofe at one end, wit? mercury ; judging, that if the fupport of the sater
magitrates, fenfible of its valuable influence in manufactures, the fource of the opulence and profperity of their city, and many of them philufophers, gave philofophy a profeffed and munificent patronage, furnilhing the philofophers with a copious apparatus, a place of affembly, and a fund for the expence of their experiments; fo that this was the firt academy of fciences out of Italy und st the patronage of government. In Italy, inded, there had long exitted inllitutions of this kind. Rome was centre of the church-government c- and the refort of all expectants for preferment. The clergy were the majority of the learned in all Chriftian nations, and particularly of the fyhematic philofophers. Each, eager to recommend himielf to notice, brought forwatdevery thing that was curions; and they were the willing vehicles of philofophical conmunications. Thus the experiments of Galiieo and Toricellı were rapidly diffured by perions of rank, the dignitas:es of the church, or by the monks their nbfequious fervants. Perhaps the recent defeStion of E.gland, and the want of a refiding embalfy at kome, made her fometimes late in receiving or pipreading philufophical refearches, and was the caule that more was dune there proprio Narte
We hope to be excufed for this digrefion. We were naturally led into it by the pretentions of Valerianus Magnus to originality in the experiment of the neecury fupported by the preffure of the air. buch ts the ftrength of nati, nal attachment, that there were not med wanting fome who found that Toricelli had borrowed his experiment from Honuratus Fabri, who had propofed and explained it in 1641 ; but whotver knows the writings of Toricelli, and Galieo's high opinion of him, will never think that he contid need fuch hi.ps. (See the iurmile of Mounier in Schott. Tech. Cur. III. at the end.)
Galileo muft be confid, red as the author of the experiment when he pro;ofes it to be made. Vaierianus Magnus owas himfelf indebied to him for the principle and the contrivance of the experiment. It is neither wonderful tha: many ingenious men, of one opinion, and inftrueted by cialieo, fhould feparately hit on fo obvious a thiny; nor that Toricelli, his immediate difciple, his enchutiantic admirer, and who was in the habits of correfpon ting with him till his death in 1642, fhould be the firft $t$ put it in prastice. It became the fubject of difpute from the nat:onal arrogance and felf-conccit of fome Fre..chnen, who have alway fhown themfeives difpofed to contider their nation as at the lead of the repubiic of letters, and camnot brook the concurrence of any foreigners. Robcrval was in this intance, however the champion of Toricelli; but thofe who know his contro.erfies with the mathematicians of France at this time will eafly account for this exception.

All now agree in giving Toricelli the honour of the firff invention; and it univerfally palfies by the nume of the Toricellian Experiment. The tube is called the Toricellian Tube; anc the fpace left by the mercury is called the Toricellan Vacuum, to diftinguifh it from the Boylean Vacuun, which is only an extrenie raretation.
The experiment was repeated in various forms, and - with apparatus which enabled philofophers to e:ranine feveral effeats which the vachum profuced on bodies expofed in it. This was done by making the upper
part of the tube terminate in a veffel of fome capacity, or communicate with fuch a velfel, in which were included along with the mercury bodics on which the expesiments were to be raide. When the meercury had run out, the jthenomera of thefe bodies were carelinlly obferved.

An objection was made to the conclufion drawn $\frac{1 n}{32}$ objec. from Toricelli's experimont, which appears formidable. tion to the It the 'loricellian tube be fufpended on the arm of a conclution balance, it is foued that the counterpoife nual be equal frawn it ob to the weight both of the tube and of the mercary it viated. contains. This could not be, fiy the objefors, if the mercury were fupported by the air. It is evidently fupported by the talance; and this ave rife to another notion of the canfe different from the peripatetic fugh racui : a fuffenlive force, or rather attration, was af. figned to the upper part of the tule.

But the true explanation of the fhen menon is molt eafy and fatistatory, Suppofe the mencury in the ciltern and tube to freeze, but without adhering to the tube, fo that the tube could be frecly drawn up and down. In this cafe the mercury is fupperted by the bafe, without any dependence on the preflure of the air: and the tube is in the fame condition as before, and the folid mercury paforms the office of a pitton to this kind of fyringe. Suppofe the tube thruft d wn till the top of it touches the top of the mercury. It is evident that it muft be drawn up in oppofition to the preflite of the external air, and it is precificly fimilar to the fyringe mentioned in $n^{Q} \mathbf{1} 6$. The weight fuftained therefire by this arm of the balance is the weight of the tube and the downward preffure of the atmoff here on its tep.

The curiofity of rhilofophers being thus excited by Gather, 3. this very manageable experiment, it was natural now to criginal extry the origina! experin.ent propoled by Galileo. Ac-periment: cordinely Berti in Italy, Palchal in France, and many performed. others in different places, made the experiment with a tube filled with water, wine, oil, \&cc. and all with the fuccefs which might be expected in to fimple a mater: and the doctrine of the waight and prelliure of the air was eltabliflhed beyond contradiction or duubt. All was done before the year 1548.-A very beautiful experiment was cxhibited by Auzour, which completely fatisfied all who had any remaining doubts.

A fmall box or phial EFGH (fir. 6.) had two glafs in cxierio tubes, $\mathrm{AB}, \mathrm{CD}$, thrce feet long, inferted into it in fuch ment vy a manner as to be firmly fixed in one end, and to reach suzout. nearly to the other end. AB was open at both ends, plate and CD was clofe at D. This apparatus wais cois plete. ccezcix, ly filled with mercury, by unferewing the tube $A B$, filling the box, and the hole CD ; then forewing in the tube $A B$, and filling it : then holding a finger on the orifice $A$, the whole was inverted and fet upright in the pofition reprefented in figure $\beta$, immerling the orifice A (now $d$ ) in a fmall veffel of quickfilver. The refult was, that the mercury ran out at the ofifice $a$, till its furtace $m n$ within the phial defeended to the top of the tube ba. The mercury alfo began to defiend in the tube $d_{i}$ (formerly DC ) and ran over into the tube la, and ran out at $a$, till the mercury in $d$ : was very near equal in a level with non. The mercury defcending in batill it thood at $k$, 29 ? inches above the firface of of the mercury in the cilera, jult as in the Toricellian tube.

The rationale of this experiment is very eafy. The whole apparatus maly firft be confideted as a Toricellian tube of an uncommon thape, and the mercury would How out at $a$. But as foon as a drop of mercury comes out, leaving a face above $1: n$, there is nothing to keep up the mercury in the tube $d c$. Its mercury therefore defeends alfo; and ruming over into $b a$, continues to fupply its experice till che tube $d c$ is almolt empty, or can no longer fupply the wafte of $b a$. The immer furface therefore falls as low as it can, till it is level with $b$. No more mercury can enter $b a$, yet its column is too heavy to be fuppo:ted by the preffure of the air on the nercury in the ciltern below ; it therefore defcends in $b a$, and finally fettles at the height $k o$, equal to that of the mercury in the Toricellian tube.
$\frac{35}{35}$ the ques:tion.

The prettieft circumflance of the experiment remains. external air immediately rufies in by its weight, and now preffes on the mercury in the box. This inmediately ruifes
 It prefles on the mercury at $k$ in the tube $b a$, balancing the preflure of the air in the ciftern. The merculy in the tube therefore is left to the influence of its own weight, and it defcends to the bottom. Nothing can be more appofite or decifive.

And thus the doetrine of the gravity and preffure of the air is eftablifhed by the molt unexceptionable evidence: and we are inititled to aflume it as a fatical principle, and to affirm à priori all its legitimate confequences.

And in the firt place, we obtain an exad meafure of the preffure of the atmotphere. It is precifely equal to the weight of the column of mercury, of water, of oil, \&c. which it can fupport; and the Toricellian tube, or others fitted up upon the fame principle, are juntly termed barofcopes and barometers with refpect to the air. Now
it is obferved that water is fupported at the height of 32 feet nearly: The weight of the column is exactly 2000 avoirdupois pounds on every fquare foot of bafe, or ${ }^{13}$ :' $^{\circ}$ on cevery fquare inch. The fame conclufion very nearly may be drawn from the column of mercury, which is nearly $29^{\prime}$ inches high when in equilibrium with the preflure of the air. We may here oblerve, that the meafure taken from the height of a column of water, wine, fpirits, and the other fluids of confiderable volatility, as chemilts term it, is not fo exad as that taken from mercury, oil, and the like. For it is obferved, that the volatile fluids are converted by the ordinary heat of our climates into vapour when the confining preflure of the air is removed; and this vapour, by its elanticity, exerts a fmall preffure on the furface of the water \&c. in the pipe, and thus counteracts a fmall part of the external preflure ; and therefore the column fupported by the remaining prefifure mutt be lighter, that is, fhorter. Thus it is found, that rectified ipirits will not ftand much higher than is competent to a weiglit of 13 pounds on an inch, the elafticity of its vapour balancing about $T_{T}^{\prime}$ of the preffure of the air. We flatl afterwards have occalion to conlider this matter more particularly.

As the medium height of the mercury in the barometer is 29 ' inches, we fee that the whole globe fuftains a preffure equal to the whole weight of a body of mercury of this height; and that all bodies on its furface
fulain a part of this in propettion to their fublances. An ordinary fized man fullains a preflure of feveral thoufand pounds. How comes it then that we ate not $A$ diffic feafible of a preffure which one fh ould think enough to ty folve crufh us together? This has been confidered as a ftrong objection to the preffure of the air for when a man is plunged a few feet under water, he is very fenfible of the preffure. The anfwer is by no means fo caly as is commonly imagined. We feel very diftinctly the effects of removing this preffure from any part of the body. If any one will apply the open end of a fy. ringe to his hand, and thend draw up the pifon, he will find his hand fucked into the fyringe with great force, and it will give pain ; and the foft part of the hand will fivell into it, being preffed in by the neighbouring parts, which are fubject to the action of the external air. If one lays his hand on the top of a long perpendicular pipe, fuch as a pump filled to the brim with water, which is at firlt prevented fiom running out by the valve bclow; and if the valve be then opened, fo that the water defcends, he will then find his hand fo hard preffed to the top of the pipe that he cannot draw it away. But why do wee only feel the inequalizy of preffure? There is a fimilar inflance wherein we do not feel it, although we cannot doubt of its exiftence. When a man goes flowly to a great depth under water in a diving-bell, we know unqueftionably that he is expofed to a new and very great preffure, yet he does not feel it. But thofe facts are not fufficiently familiar for general argument. The human body is a bundle of folids, hard or foft, filled or mixed with fluids, and there are few or no parts of it which are empty. All communicate either by veffels or pores; and the whole furface is a fieve through which the infenfible perfipiration is performed. The whule extended furface of the lungs is open to the preflure of the atmofphere; every thing is therefore in equilibrio : and if free or fpeedy accefs be given to every part, the body will not be damaged by the preffure, however great, any more than a wet fponge would be deranged by plunging it any depth in water. The preffure is inftantaneoutly diffufed by means of the incomprefifibe fluids with which the parts are filled; and if any parts are filled with air or other compreflible fluids, thefe are compreffed till their elafticity again balances the preffure. Befides, all our fluids are acquired flowly, and gradually mixed with that proportion of air which they can diffolve or contain. The whole animal has grown up in this manner from the firf vital :ttom of the embryo. For fuch reafons the preflure can occafion no change of thape by fqueezing together the flexible parts; nor any obftruction by comreffing the velfels or pores. We cannot fay what would be felt by a man, were it poffible that he could have been proditced and growa up in vacuo, and then fabjected to the comprefion. We even know that any fudden and comfiderable change of general preffure is very teverely felt. Perfons in a diving-bell have been almoft 'illed by letting them down or drawing them up too fu:d denly. In drawing up, the elatic matters with in have fuddenly fwelled, and not finding an immediate efcape have burft the velfels. Dr Halley experienced this, the blood gufhing ont from lis ears by the expanfion of air contained in the internal cavities of this organ, from which there are but very flender paffages.

## P N F. U M A T I C S.

A very important obfervation recurs here: the preffure of the atmofpiere is variable. This was obferved almoft as foon as plilofophers began to attend to the barometer. Pafchal obferved it in France, and Defcartes obferved it in Sweden in 1650. Mr Boyle and others obferved it in England in 1656. And before this, obfervers, who took notice of the concomitancy of thefe changes of acrial preffure with the fate of the atmofphere, remarked, that it was generally greateft in winter and in the night; and certainly molt variable during winter and in the northem regions. Familiar now with the weight of the air, and conlidering it as the vehicle of the clouds and vapours, they noted with care the connection between the weather and the preffurc of the air, and found that a great preffure of the air tras gencr:illy accompained with fair weather, and a dimination of it with rain and mifts. Hence the barometer came to be confidered as an index not only of the prefent fate of the air's weight, but alfo as indicating by its vaiations changes of weather. It became a Weather-glass, and continued to be anixiounly obferved with this view. This is an important fubject, and will afterwards be treated in fome detail.

In the next place, we may conclude that the preflure to their elevation above the furface of the ncean: for if air be an heavy fluid, it mult prefs in fome proportion according to its perpendicular heignt. If it be a homngeneous fluid of equal denfity and weight in all its parts, the mercury in the ciftern of a barometer muft be preffed precifely in proportion to the depth to which that ciftern is immerfed in it; and as this preffure is exadtly meafured by the height of the mercury in the tube, the height of the mercury in the Toricellian tube muft be exactly proportional to the depth of the place of obfervation under the furface of the atmofphere.

The celebrated Defcartes firf entertained this thought (Epift. 67. of Pr. III.), and foon after him Pafchal. His occupation in Paris not permitting him to try the jaftnefs of his conjecture, he requelted Mr Perrier, a gentleman of Clermont in Auvergne, to make the experiment, by obferving the height of the mercury at one and the fame time at Clermont and on the top of a very high mountain in the neighbourhood. His letters to Mr Perrier in 1647 are ftill extant. Accordingly Mr Perrier, in September 1648 , filled two equal tubes with mercury, and obferved the heights of both to be the fame, viz. $26_{\frac{7}{7}}^{7}$ inclies, in the garden of the convent of the Friars Minims, fituated in the loweft part of Clermont. Leaving one of them there, and one of the fathers to obferve it, he took the other to the top of Puy de Dimme, which was elevated nearly 500 French fathoms above the garden. He found its height to be $23^{\frac{2}{2}}$ inches. On his return to the town, in a place called Font de l'Arbre, 150 fathoms above the garden, he found it $=5$ inches; when he returned to the garden it was again $26_{2}{ }^{-}$, and the perfon fet to watch the tube which had been left faid that it had not varied the whole day. Thus a difference of elevation of 3000 French feet had occafioned a depreflion of 3 : inches; from which it may be concluded, that $3 \%$ inches of mercury weighs as much as 3000 feet of air, and onetenth of an inch of mercury as much as 96 feet of air. The next day he found, that taking the tube to the top of a fteeple 120 feet high made a fall of one-fixth of an

Vol. XV.
inch. This gives 72 fect of air for ons-tenthof an incla of mercury; but ill agreeing with tixe Cormer experiment. Hut it is to be obferved, that a very fmall ceror of ob. fervation of the barometer would corrcfipond to a great difference of clevation, and alfo that the heght of the mountain had not been meafured with any precition. This has been fince done (Mem. Acad. par. $1 / 203$ ), and found to be 529 French loifes.

Pafchal publifhed an account of this great experi- which ment (Grande Exp. fibr la Pefantour de l'Air). and it were re. was quickly repeated in many places of the world. In fated by 1653 it was repeated in England by Dr Power (Power's others. Exper. Pinl, ); and in Scotland, in 166 I , by Mr Sinclair profellor of philofuphy in the univerfity of Glafgow, who obferved the barometer at Lanark, on the top of mount Tintock in Clydfdale, and on the top of Arhur's Seat at Edinburgh. He tound a depreflion of two inches between Glafgow and the top of 'lintock, three quarters of an inch between the botiom and top of Arthur's Scat, and $\frac{5}{3} \frac{5}{2}$ of an inch at the cathedral of Glafgow on a height of 126 feet. See Sinclair's Ars Nowis of Magna Giaritatis et Levilatis; Sturnii Collegium Experimentale, and Schotti Technica Curiofa.

Hence we may derive a method of meafuring the Hence a heights of mountains. Having afcertained with great rathod of precifion the elevation correfponding to a fall of one. meafuring tenth of an inch of mercury, which is nearly 90 feet, heights. we have only to oblerve the length of the mercurial co. lumn at the top and bottom of the mountain, and to allow 90 feet for every tenth of an inch. Accordingly this method has been practifed with great fuccefs: but it requires an attention to many things not yet confidered; fuch as the change of denfity of the mercury by heat and cold; the changes of denfity of air, which are much more remarkable from the fame caufes; and above all, the changes of the denfity of air from its compreflibility; a change immediately connected with or dependent on the very elevation we wifh to meafure. Of all thefe afterwards.

Thefe obfervations give us the molt accurate meafurc Alfo a ${ }^{44}$ of the denfity of the air and its fpecific gravity. This meafure of is but vaguely though directly meafured by weighing the denfity air in a bladder or reffel. The weight of a manageable of the air, quantity is fo fmall, that a balance fufficiently ticklifh to indicate even very fenfible fractions of it is overloaded by the weight of the veffel which contains it, and ceafes to be exact: and when we take Bermoulli's ingenious method of fufpending it in water, we expofe ourfelves to great rifk of error by the variation of the water's denlity. Alfo it mult neceffarily be humid air whicla we can examine in this way: but the proportion of an elevation in the atmofphere to the depreffim of the column of mercury or other fluid, by which we meafure its preffure, gives us at once the proportion of this weight or their fpecific gravity. Thus fince it is found that in fuch a ltate of prelfure that the barometer ftands at 30 inches, and the thermometer at $3^{\circ}, 87$ feet of rife produces one-tenth of an inch of fall in the barometer, the air and the mercury being both of the freezing temperature, we muft conclude that mercury is $10,4,40$ times heavier or denfer than air. Then, by compating mer-
 air relative to water: but this varies fo much by heat and moifture, that it is ufelefs to retain any thing more than 2 general notion of it: nor is it ealy to determine
whether
whether this method or that by actual weighing is preferable. It is extremely difficult to obferve the height of the mercury in the barometer nearer than ${ }_{3}{ }^{\circ}$ of an inch; and this will produce a difference of even five fiet, or ${ }_{\text {r }}$ : of the whole. Perhaps this is a greater propor45 Lion than the enot in weighing.
And fone From the fame experiments we alfo derive fome knowknowledge ledge of the height of the aerial covering which furronnds of the height of the atmo. fyhere. our globe. When we raife om barometer 87 feet above the furface of the fea, the mercury falls about one tenth of an inch in the barometer: therefore if the barome-
ter hows 30 inches at the fea-fhore, we may expect that, by railing it 300 times 87 fest or 5 miles, the mercury in the tube will defeend to the level of the cillern, and that this is the height of our atmofphere. But other appearances lead us to fuppofe a much greater height. Meteors are feen with us much higher than this, and which yet give undoubted indication of being fupported by our air. There can be little doubt, too that the vifibility of the expanfe above us is owing to the reflection of the lim's light by our air. Were the heavenly fpaces perfecily tranfparent, we fhould no more fee them than the pureft water through which we fee other objects; and we fee them as we fee water tinged with milk or other fæculx. Now it is eafy to fhow, that the light which gives us what is called twilight mult be reflected from the height of at leaft 50 miles; for we have it when the fun is depreffed 18 degrees below our horizon,
Why this A little attention to the conftitution of our air will knowledge convince us, that the atmofphere muft extend to a much is not accu-greater height than 303 times 87 feet. We fee from rate. the moft familiar facts that it is compreffible; we can
fqueeze it in an ox-bladder. It is alfo heavy; preffing on the air in this bladder with a very great force, not lefs than 1500 pounds. We mult therefore confider it as in a flate of compreffion, exifting in fraller room than it would affume if it were not compreffed by the incumbent air. It mult therefore be in a condition fomething refembling that of a quantity of fine carded wool thrown loofely into a deep pit; the lower Atrata carrying the weight of the upper ftrata, and being compreffed by them; and fo much the more compreffed as they are further down, and only the upper fratum in its unconftrained and moft expanded ftate. If we fhall fuppofe this wool thrown in by a hundred weight at a time, it will be divided into frata of equal weights, but of unequal thicknefs; the loweft being the thinneft, and the fuperior Arata gradually increafing in thicknefs. Now, fuppofe the pit filled with air, and reaching to the top of the atmofphere, the zeights of all the frata above any horizontal plane in it is meafured by the height of the mercury in the Toricellian tube placed in that plane; and one-tenth of an inch of mercury is jult equal to the weight of the lowent fratum 87 feet thick: for on raifing the tube 87 feet from the fea, the furface of the mercury will defcend one-tenth of an inch. Raife the tube till the mercury fall another tenth: This fratum mult be more than 87 feet thick; how much more we camot tell, being ignorant of the law of the air's expinfion. In order to make it fall a third tenth, we mult taife it through a fratum fill thicker; and fo on continually.

All this is abundantly confirmed by the very firt experiment made by the order and directions of Pafchal: For by car.ying the tube from the garden of the con-
vent to a place 150 fathoms higher, the mercury fell $1{ }^{7}$ T inches, or 1,2917 ; which gives about 69 feet 8 inches of acrial ftratum for : of an inch of mercury ; and by carrying it from thence to a place 350 fathoms higher, the mercury fell $1^{\frac{1}{2}}$, or 1,9167 inches, which gives 109 feet 7 inches for ${ }^{\prime}{ }^{\prime}$ © of an inch of mercury. Thefe experiments were not accurately made; for at that time the philofophers, though zealous, were but fobolars in the fiime of experimenting, and novices in the art. But the refults abundantly fhow this general truth, and they are completely confirned by thoulands of fubficquent obfervations. It is evident from the whole tenor of them, that the Atrata of air decreafe in denfity as we afcend through the atmofphere; but it remained to be difcovered what is the force of this decreafe, that is, the law of the air's expanfion. Till this be done we can fay mothing about the connitution of our atmofphere: we cannot tell in what manner it is fitteff for raifing and fupporting the exhalations and vapours which are continually ariling from the inhabited regions; not as an excrementitious wafte, but to be fupported, perhaps manufactured, in that valt laboratory of nature, and to be returned to us in beneficent fhowers. We cannot ufe our knowledge for the curious, and frequently ufetul, purpofe ( f meafuring the heights of mountains and taking the levels of extenfive regions; in fhort, without an accurate knowledge of this we can hardly acquire any acquaintance with thofe mechanical properties which diftinguifh air from thofe liquids which circulate here below.

Having therefore confidered at fome length the lead- Conipre ing confequences of the air's fluidity and gravity, let bility of us confider its compreffibility with the fame care; and air. then, combining the agency of both, we fhall anfwer all the purpofes of philofophy, difcover the laws, explain the phenomena of nature, and improve art. We proceed therefore to confider a litle the phenomena which indicate and characterife this other property of the air. All fluids are elaftic and compreffible as well as air ; but in them the comprefibility makes no figure, or does not interelt us while we are confidering their preffiures, motions, and impulfions. But in air the compreffibility and expanfion draw our chief attention, and make it a proper reprefentative of this clafs of fluids.

Nothing is more faniliar than the compreflibility of air. It is feen in a bladder filled with it, which we can forcibly fqueeze into lefs room; it is feen in a fyringe, of which we can puth the plug farther and farther as we increafe the preflure.
But thefe appearances bring into view another, and Shows it the moft interelling, property of dir, vis. its elaflicity. elafticity When we have fqueezed the air in the bladder or fyringe into lefs room, we find that the force with which we compreffed it is neceflary to keep it in this bulk; and that if we ceafe to prefs it together, it will fivell out and regain its natural dinenfions. This dintinguifhes it effentially from fuch a body as a mafs of flour, falt, or fuch like, which remain in the compreffied fate to which we reduce them.

There is therefore fomething which oppofes the com 50 preflion different from the fimple impenetrability of force, an the air : there is forething that oppoies mechanical producin force: there is fomething too which produces motion, motion, not only refifting comeprefion; but pufhing back the compreffing body, and communicating motion to it. As
an arrow is gradually accelcrated by the bow-Atring preffing it forward, and at the moment of its difcharge is brought to a flate of rapid motion; fo the bail from a pop gun or wind-gun is gradually accelerated along the barrel by the preflure of the air during its expinfion from its comprefled flate, and finally quits it with an accumulated velocity. Thefe two motions are indications perfectly fimilar of the elafticity of the bow and of the air.
Thus it appears that air is heavy and elaftic. It needs little confideration to convince us in a vague manner that it is fluid. The eafe with which it is penetrated, and driven about in every direstion, and the motion of it in pipes, and channels, however crooked and intricate, intitle it to this charakter. But bcfore we can proceed to deduce confequences from its fluidity, and to offer them as a true account of what will happen in thefe circumitances, it is neceffary to exhibit fome diftinct and fimple cafe, in which the charafteriftic mechanical property of a fluid is clearly and unequivocally obferved in it. That property of fluids from which all the laws of hydroftatics and hydrauliss are derived with fristeft evidence is, that any preffure applied to any part of them is propagated through the whole mafs in every direction: and that in confequence of this diffufion of preflure, any two external forces can be put in equilibrio by the interpofition of a fluid, in the fame way as they can be put in equilibrio by the intervention of any mechanical engine.

Let a clofe veffel ABC (fig. 7.), of any form, have two upright pipes EDC, GFB, inferted into any parts of its top, fides, or bottom, and let water be poured into them, fo as to 1tand in equilibrio with the horizontal furfaces at $\mathrm{E}, \mathrm{D}, \mathrm{G}, \mathrm{F}$, and let $\mathrm{D} d, \mathrm{Ff}$, be horizontal lines, $i t$ will be found that the height of the column $\mathrm{E} d$ is fenfibly equal to that of the column $\mathrm{G} f$. This is a fact univerfally obferved in whatever way the pipes are inferted.

Now the furface of the water at D is undoubtedly preffed upwards with a force equal to a column of water, having its furface for its bafe, and Ed for its height; it is therefore prevented from rifing by fome oppofite force. This can be nothing but the elafticity of the confined air preffing it down. The very fame thing mult be faid of the furface at F ; and thus there are two ex:ernal preffures at $D$ and $F$ fe in equlibrio by the interpofition of air. The force exerted on the furface D , by the preffure of the column $\mathrm{E} d$, is therefore fre pag ited to the furface at F ; and thus air has this charatteriftic mark of fluidity.

In this experiment the weight of the air is infenfible When the velfel is cf fmall fize, and has no fenfible fhare in the preflure reach ing at D and F . But if the elevation of the point F above D is very great, the column Ed aill le cbferved fenfibly to exceed the column Gf. Thus if F be 70 feet higher than $\mathrm{D}, \mathrm{E} d$ will be an inch longer than the column $C f$ : for in this cafe there is reaciing at $D$, not only the preffure propagated from F , but alfo the weight of a column of air, having the furface at $D$ for its bafe and 70 feet high. This is equal to the weight of a column of water one inch high.

It is by this propagation of preflure, this fuility, that the pellet is difcharged from a child's pop-gun. It fticks faft in the muzzle; and he ferces in another peldet at the other end, which he preffes forward with the
rammer, condenfing the air between them, and thus propagating to the other pallet the preffure which lie exerts, till the frittion is overcome, and the pellet is difcharged by the air expanding and following it.

There is a pretty philofophical play:hing which ịluftrates this property of air in a very peificuous manner, and which we thall after wards have occafion to confider as converted into a moft ufeful hydraulic machine. This is what is ufually called Hiero's funtain, having 54 been invented by a Syracufan of that name. It con-fountain. filts of two velfels KLMN (fig. 8.), OPQR, which are clofe on all fides. A tube AB, having a funnel a top, paffes through the uppermoft velfel without communicating with it, being foldered into its top and bottom. It alio palfes thrcugh the top of the under-veffel, where it is alio foldered, and reaches almolt to its botom. This tube is open at both ends. There is another open tube ST, which is foldered into the top of the underveffel and the bottom of the upper veffel, and reaches almoft to its top. Thefe two tubes ferve alfo to fupport the upper veffel. A third tube GF is foldered into the top of the upper veffel, and reaches almolt to its bottom. This tube is open at both ends, but the orifice G is very fmall. Now fuppofe the uppermolt velfel filled with water to the height EN, Ee being its furface a little below T . S:op the orifice G with the finger, and pour in water at A. This will defcend through AB, and comprefs the air in OQRP into lefs room. Suppofe the water in the under veffel to have acquired the furface C , the air which formerly occupied the whole of the fpaces OPQR and KLe E will now be contained in the fpaces oPc C and KLeE ; and its elafticity will be in equilibrio with the weight of the column of water, whofe bafe is the furface E e, and whofe height is Ac. As this preffure is exerted in every part of the air, it will be exerted on the furface $\mathrm{E} c$ of the water of the upper velfel; and if the pipe FG were continued upwards, the water would be fupported in it to an height $e \mathrm{H}$ above $\mathrm{E} e$, equal to A c. Therefore if the finger be new taken from off the orifice G, the water will fpout up to the fame height as if it had been immediately forced out by a column of water $A c$ without the intervention of the air, that is, nearly to H . If infead of the funnel at A , the veffic hạye a brim which will caufe the water difcharged at $G$ to run down the pipe $A B$, this fountain will play till all the water in the upper velfel is expended. The operation of this fecond fountain will be better undertood from fig. 9 . which an intelligent render will fee is perfeetly equivalent to fig. 8. A very powerful engine for raifing water upon this principle has long been employed in the IIungarian mines; where the pipe $A B$ is about 200 feet high, and the pipe FG about 120; and the condenfation is made in the upper velfel, and communicated to the lower, at the bottom of the mine, by a long pipe. See $W_{\text {at }}$ re $W_{\text {orks }}$.
We may now apply to air all the laws of hydroftatics Laws of and hydraulics, in perfect confidence that their legiti-hydrofta- $\}$ mate coniequences will be obferved in all its lituations, rics appliWe fhall in future fubfitute, in place of any force act- cable to air, ing on a furface of air, a column of water, mercuiy, or any other fluid whoie weight is equal to this force: and as we know diftinetly from theor; what will be the confequences of this hydroftatic prefiure, we fh ll determine à prior the phenomena in air; and in cafes

From fuch familiar and fimple obfervations and experiments, the fluidity, the heavinefs, and elafticity, arc difcovered of the fubllance with which we are furrounded, and which we call air. But to underfand thefe properties, and completely to explain their numerous and important confequences, we mult call in the aid of more refined obfervations and experiments which even this fcanty knowledge of them enables us to make; we mult contrive fome methods of producing with precifion any degree of condenfation or rarefaction, of employing or excluding the gravitating preffure of air, and of modifying at pleafure the action of allits mechanical properties.

Nothing can be more obvions than a method of comprefling a quantity of air to any degree. Take a cy-
linder or prifmatic tube AB (fig. 10.) fhut at one end, and fit it with a pifton or plugg C , fo nicely that no air
where theory does not enable us to fay with precifion what is the effect of this preffure, experience informs us in the cafe of water, and analogy enables us to tranffer this to air. We thall find this of great fervice in fome cafes, which otherwife are almoft defperate in the prefent fate of our knowledge. can pals by its fides. This will be beft done in a cylindric tube by a turned fopper, covered vith oilcd leather, and fitted with a large handle CD. When this is thrut down, the air which formerly occupied the whole capacity of the tube is condenfed into lefs room. The force neceflary to produce any degree of compreffion may be concluded from the weight necelfary for pufhing down the plug to any depth. But this inflrument leaves us little $o_{j}^{\circ}$ portunity of making interefting experiments on or in this condenfed air; and the force required to make any degree of compreflion cannot be meafured with much accuracy ; becaufe the piton muft be very clofe, and have great friction, in order to be fufficiently tight: And as the compreflion is increafed, the leather is more fqueezed to the fide of the tube; and the proportion of the external force, which is employed merely to overcome this variable and uncertain fricion, cannot be aftertained with any tolerable precifion. To get rid of thefe imperfections, the following addition may be made to the inftrument, which then 39 becomes what is called the condenfing fyringe.
The condenfing fysinge with

The end of the fyringe is perforated with a very fmall hole ef; and being externally turned to a fmall cylinder, a narrow flip of bladder, or of thin leather, foaked in a mixture of oil and tallow, mult be tied over the liole. Now let us fuppofe the pifton pufled down to the bottom of the barrel to which it applies clofe; when it is drawn up to the top, it leaves a void behind, and the weight of the external air prefles on the flip of bladder, which therefore claps clofe to the brafs, and thas periorms the part of a valve, and keeps it clofefo that no air can cuter. But the piton having reached the top of the barrel, a hole $F$ in the fide of it is juft below the piflon, and the air ruthes through this hole ind fils the barrel. Now pufh the pitton down again, it immediately palles the lole $F$, and no air effapes through it; it therefore forces open the valve at $f$, and s9 efcapes while the pilton moves to the bottom.
Ies vilifor Now let $E$ be any veffel, fich as a glais bottle, harectizer. ving its mouth furnifhed with a brafs cap firmly ceming its month furnithed with a brafs cap firmly cefcrew $p$, thene $\pm$ on the cylindric nozzle of the fyringe.

Screw the fyringe into this cap, and it is evident that the air forced out of the fyringe will be accumulated in this veffel: for upon drawing up the pifon the valve $f$ always thuts by the elafticity or expanding force of the air in E ; and on pulhing it down again, the valve will open as foon as the pifton has got fo far down that the air in the lower part of the barrel is more powerful than the air already in the veffel. Thus at every flroke an additional barrelful of air will be forced into the velfel $E$; and it will be found, that after every ftroke the pifton nuut be farther pulted down before the valve will open. It cannot open till the preffure arifing from the elallicity of the air condenfed in the barrel is fuperior to the elaflicity of the air condenfed in the velfel; that is, till the condenfation of the firf, or its denfity, is fomerubat greater than that of the lat, in order to overcome the flraining of the valve on the hole and the nicking occafioned by the clammy matter employed to make it air-tight.

Sometimes the fyringe is confrueted with a valve in the pifton. This pifton, inftead of being of one picce and folid, confits of two pieces perforated. The upper part $i k n m$ is connected with the rod or handle, and has its lower part turned down to a fmall cylinder, which is fcrewed into the lower part $k / 0 z$; and has a perforation $g l$ going up in the axis, and terminating in a hole $b$ in one fide of the rod, a piece of oiled leather is frained acrofs the hole $g$. When the pitton is drawn up and a void left below it, the weight of the extermal air forces it through the hole $b g$, opens the valve $g$, and fills the barrcl. Then, on pufhing down the pilton, the air being fqueezed into lefs room, prefles on the valve $g$, fhuts it; and none efcaping through the pifton, it is gradually condenfed as the pifton d=feends till it opens the valve $f$, and is added to that already accumulated in the veficl E .

Having in this manner forced a quantity of air into the vefiel E , we can make many experiments in it in this ftate of condenfition. We are chiefly concerned at prefent with the effect which this produces on its elatticity. We fee this to be greatly increafed; for we find more and more force required for introducing every fucceflive barrelful. When the fyringe is unforewed, we fee the air ruth out with great violence, and every indicati $n$ of great cxpanding force. If the fyringe be connected with the veffel $E$ in the fame manner as the fyringe in $n^{\circ} 17$, viz. by intcrpofing a fopcock B between them (iec fig. 3 ), and if this Atopcock have a pipe at its extremity, reaching near to the bottom of the veffel, which is previonlly half filled with water, we can obicrve diftindly when the elallicity of the air in the fyninge excecds that of the air in the receiver : for the pifon muft be pufhed down a cortain length before the air from the fyringe bubbles up thro' the water, and the pifton mult be farther down at each fuccellive ftroke before this appearance is obferved. When the air lass thas been accumulated in the recciver, it preffes the fides of it ontward, and will burft it if not ftrong enongh. It alfo prefics on the furface of the water; and if we now fint the cock, mufcrew the fyringe, ard open the cock again, the air will force the water through the pipe with great velocity, caufing it to rife in a beautiful jer. When a metal-receiver is ufid, the condenfation may be pufhed to a great length, and the jet will then rife to a great height; which gradually
dually diminifhss as the water is expended and roon given to the ail to expanditfelf. See the figure.

We judge of the condenfation of air in the vellel I: by the number of Atrokes and the proportion of the capacity of the fyringe to that of the vellel. Suppo.c the firft to be one.tenth of the laft; then we hnow, that after 10 ftrokes the quantity of air in the veliel is doubled, and theretore its denfity dombie, and fo on ato ter any number of Arokes. Let the capacity of the lyringe (when the pifton is drawn to the top) be a, and that of the vefiel be $l$, and the number of trokes be $n$, the denfity of air in the veffel will be $\frac{b+n a t}{b}$, or $\mathrm{x}+\frac{n a}{b}$.

But this is on the fuppofition that the piton accurately fills the barrel, the hottom of the one applying clofe to that of the orber, and that no force is necellary for opening either of the valves: but the firlt cannot be infured, and the laft is very far from being truc. In the confruction now defcribed, it will require at lealt one twentieth-part of the ordinary preffure of the air to open the pilton valve: therefore the air which gets in will want at lealt this proportion of its complete elafticity; and there is always a fimilar part of the elafticity employed in opening the nozzle valve. The condenfation therefore is never nearly equal to what is here determined.

It is accurately enough meafured by a gage fitted to the inftrment. A glafs tube GH of a cylindric bore, and cl?fe at the end, is ferewed into the fide of the cap on the mouth of the veffel E. A fmall drop of water or mercury is taken into this tube by wamming it a little in the hand, which expands the contained air, fo that when the open end is dipped into water, and the whole allowed to cool, the water advances a little into the tube. The tube is furnithed with a fcale divided into fimall equal parts, numbered from the clofe end of the tube. Since this tube communicates with the veffel, it is evident that the condenfation will force the water along the tube, acting like a pilton on the air beyond it, and the air in the tube and veffel will always be of one denfity. Suppnfe the number at which the drop Aands before the condenfation is made to be $c$, and that it ftands at $d$ when the condenfation has attained the degree reguired, the denlity of the air in the remote end of the gage, and confequently in the velfel, will be $\stackrel{c}{a}$

Sometimes there is ufed any bit of tube clofe at one end, having a drop of water in it, limply laid into the veffel $\dot{L}$, and furniflied or not with a feale: but this can only be ufed with glafs venfels, and thefe are too weak to refift the piefture ariling from great condenfition. In fuch experiments metalline vefiels are ufed, fitted with a varicty of apparatus for different experiments. Some of thefe will be occafionally mentioned afterwards.

It muft be obferved in this place, that very great condenfations require great force, and therefure imall fyringes. It is therefne convenient to have them of vasious dizes, and to begin with thofe of a larger diameter, which operate more quickly; and when the condenfation becomes fatiguing, to change the fyringe for a finaller.

For this reafon, and in genern to make the conden-
fins apparatus more conveniont, it is proyer to have a A acp-fop-cock interpofed between the fyringe and the veflel, cock beor as it is ufually called the receiver. 'T'l is confint of a fyringene the Lrafs pipe, which has a well-ground coc!- in its middle, scociocr. and has a hollow forew at onc end, whicla reccives the nozzle ferew ni the fyringe, nnd a folid ferew at the ather and, which fits the ferew of the recsiver. See fig. 3.
by thefe gages, or contrivances fimilar to them, we irfances of have been able to afcertain very great degrees of con- y teat condenfation in the coufe fome experiments. Dr Hales denf.tion found, that when dry wood was putia!o a ftrong velfel, prove which it almoit filled, and the remander was filled with water, the fwelling of the wood, occafioned by its imbibition of water, condenfed the air of his gage inte the thoufandth of its original bulk. He fourd that peafe treated in the fame way generated elanic air, which prefling on the air in the gage condenfed it into the fifteen hundredth part of its bulk. This is the greateft condenfation that has been afcertained with precilion, although in other experiments it has certainly been carried much farther ; but the precife degree could not be afcertained.

The only ufe to be made of this oblervation at pre. Air and fent is, that fince we lave been able to exhibit air in a water to be denfity a thoufand times greater tha: the ordinary den. efientially fity of the air we breathe, it cannot, as fome imagine, diferent; be only a different form of water; for in this fate it is as denfe or denfer than water, and yet retains its great expanfibility.

Another important obfervation is, that in every nate And fiow of denfity in which we find it, it retains its perfect the crror fluidity, tranfmitting all preffures which are applied to of feme it with undiminifhed force, as appears by the equality opiaiars confantly obferved between the oppofing columns of refpeeting water or other fluid by which it is compreffed, ant by elaficity. the facility with which all motions are performed in it in the molt compreffed fates in which we can make cbfervations of this kind. This fan is totally incompatible with the opinion of thofe who afcribe the elafticit ) of air to the fpringy ramified fructure of its particles, touching each other like fo many pieces of fonge or foot-balls. A collection of firch particles might indeed be pervaded by folid bodies with confiderable cafe, if .they were merely touching each other, and not fubje.fsed to any external preffure. But the moment fuch preffure is exerted, and the affemblare fqueezed into a imaller lpace, each prefies on its adjoining particles: they are individually compreffed, fattened in their tonching furtaces, and before the denfity is doablid they are fqueezed into the form of perfect cubes, and cormpere a mafs, which may indeed propagate preflure from onc place to another in an imperfect manner, and with great diminution of its intenfity, but will no more be fluid than a mais of foft clay. It will be of ufe to keep this obfervation in mind.

We have feen that nir is heavy and comprefible, and 78 might now proceed to deduee in order the explanation quences of of the appearances confequent on each of thefe pro. the air's perties. But, as has been already obferved, the elafti- elafticity, city of air modifies the effe?ts of its gravity fo remarsably, that they would be imperfetty anderfood if boin qualities were not combined in our confideration of either. At any rate, fome farther confequences of its cla*- ticity malt be confidered, beforc we underftand the means of varying at pleafure the effets of its
$\therefore 2$ gravity.
Its creat Since air is heavy, the lower Arata of a mafs of air expanfibili- mult fupport the upper; and, being compreffible, they ty. mult be condenfed by their weight. In this ftate of compreffion the elafticity of the lower At:ata of air acts in oppofition to the weight of the incum yent air, and balances it. There is no reafor which thould make us fuppoie that is expanding force belongs to it only when in fuch a tate of compreflion. It is more probable, that if we could free it from this prefliure, the air would exFand itfelf intollil! greater bulk. This is moft diftinsty
tis feen in the fol'owing experiment.
Into the cylindric jır ABCD (fig. 11.), which has a fmall hole in its bottom, and is furnilhed with an air-tight $p$ if on $E$, put a imall flaccid bladder, having
its mouth ticd tight with a hing. Having puthed the pifon near to the bottom, and noticed the itate of the bladder, Itop up the hole in the bottom of the jar with the finger and draw up the pifton, which will requare a confiderable force. You will obferve the bladder fwell out as if air had been blown into it ; and it will again cellapfe on allowing the pilton to defeend. Nothing can be more unexceptinnable than the conclution from this experiment, that ordinary air is in a Atate of comprefion, and that its elafticity is not limited to this fate. The bladder being flaccid, hows that the included air is in the fame flate with the air which furrounds it ; and the fame muft be affrmed of it while it fwell; but fill remains flaccid. We muft conclude, that the whole air within the velfel expands, and continues to fill it, when its capacity has been cnlarged. And fince this is obferved to go on as long as we give it more room, we conclude, that by fuch experiments we have not yet given it fo much room as it can occupy.
74 limits of this expantion; to know what was the natural unconfrained bulk of a quantity of air, beyond which force whe not expand thongh all external comprefling Accordingly philofophers conftucted inftruments for rarefying the air. The common water-pump inad been long familiar, and appeared very proper for this purpofe. The molt obvious is the following.
Afringe; Let the barrel of the fyringe AB (fig. 12.) communicate with the velfel V, with a fopcock C betw: n them. Let it communicate with the external air by another orifice D , in any convenient fituation, alfo furnilhed with a ftoponck. Let this fyringe have a pifton very accurately fitted to it fo as to touch the bottom all nver when puithed down, and have no wacancy about the fides.
Now fuppofe the pifton at the bottom, the cock C open, and the cock D lhut, draw the pifton to the top. The air which filled the veffel V will expand fo as to fill both that veffel and the barrel AB; and as no reafon can be given to the contrary, we muft fuppofe that the air will be uniformly diffufed through both. Calling $V$ and $B$ the capacity of the veffel and barrel, it is plain that the bulk of the air will now be $\mathrm{V}+\mathrm{B}$; and fince the quantity of matter remains the fame, and the denfity of a fluid is as its quantity of matter directly and its bulk iaverfely, the denfity of the expanded air

## A T I. C S.

will be $\frac{V}{V+B}$, the denfity of common air being I : for $V+B: V=1: \frac{V}{V+B}$.
The pillon requires force to raife it, and it is raifed in oppofition to the preffurc of the incumbent atmofphere; for this had formerly been balanced by the elafticity of the common air: and we conclude from the fact, that force is reguired to raife the piflon, that the a elafticity of the expanded air is lefs than that of air in its ordinary flate; and an accurate obervation of the force neceliary to raife it would fhow how much the elaficity is diminifhed. When theefore the pifton is let $g$, it will defcend as long as the preffure of the atmofphere exceeds the elafticity of the air in the barrel ; that is, till the air in the barrel is in a tate of ordinary denfity. To put it further down will require force, becalue the air mult be compreffed in the barrel; but if we now open the cock D, the air will be expelled through it, and the pifton will reach the bottom.

Now thut the difcharging cock D , and open the cock C, and draw up the pifton. The air which occupied V
the face V , with the denfity $\mathrm{V}+13$, will now occupy the fpace $V+B$, if it expands fo far. To have its denfity D , fay, As its prelent bulk $\mathrm{V}+\mathrm{B}$ is to its former bulk $V$, fo is its former denfity $\frac{V}{V+B}$ to its new denfity; which will therefore be $\frac{V \times V}{\overline{V+B} \times V+B}$, or $\left.\overline{v+}\right|^{\text {a }}$

It is evident, that if the air continues to expand, the denfity of the air in the veffel after the third drawing up the pifton will be $\left.\frac{\bar{V}+B}{}\right|^{3}$, after the fourth it will be $\frac{\frac{V}{V+B}}{}$, and after any number of ftrokes $n$ will be $\left.\frac{\frac{V}{v+B}}{\mid i}\right|^{1}$ Thus if a veffel is four times as large as the barel, the denfity after the fifth ftroke will

O. 2 the other hand, the number $n$ of Arokes necellary for reducing air to the denfity $D$ is Log D
$\overline{\log V-\log (V+B)}$.
Thus we fee that this infrument can never abftract the whole air in confequence of its expanfion, but only rarefy it continually as long as it continues to expand; nay, there is a limit beyond which the rarefaction can- this not go. When the pifton has reached the bottom, ment there remains a fmall fpace between it and the cock C filled with common air. When the piton is drawn up, this fmall quantity of air expands, and alfo a fimilar quanity in the neck of the other cock; and no air will come out of the receiver V till the expanded air in the barrel is of a fmaller denfity than the air in the receiver. This circumfance evidently direfts us to make thefe two fpaces as fmall as poffible, or by fome
contrivance

## P N E U M A T I C

contivance to fill them up altogether. Perlapas this when the pifton has reached the tup the dunfty of the may be done effectually in the following manner.

Let LE (fig. 13.) reprefent the bottom of the baredied rel, and let the circle HKI be the fegion of the key of the cock, of a large diameter, and place it as near to the barrel as can be. Let this communicate with the barrel by means of an hole FG widening upwards, as the frufum of a hollow obtufe cone. Let the buttom of the pitton $l f^{b} g e$ be Maped fo as to fit the bottom of the barrel and this hole exallly. Let the cock be pierced with two lioles. Ore of them, HI, palfes perpendicularly through its axis, and forms the communcation between the receiver and barrel. The other hole, KL, has one extremity K on the fame circumference with H , fo that when the key is turned a fourth part round, K will come into the place of H : but this hole is pierced obliquely into the key, and thus keeps clear of the hole HI. It goes no further than the axis, where it communicates with a hole bored along the axis and terminating at its extremity. This loole forms the communication with the external air, and ferves for difcharging the air in the barrel. (A fide view of the key is feen in fig. 14.) Fig. 12. fhows the polition of the cock while the pilton is moving upwards, and fig. 14. fhows its pofition while the pillon is moving downwards. When the pitton has reacled the bottom, the conical piece $f$ bg of the pilon, which may be of firm leather, fills the hole FHG, and therefore completely expels the air from the barrcl. The canal $\mathrm{KL} l$ of the cock contaius air of the common denfity; but this is turned afide into the pofition KL (fig. 13.), while the pifton is nill totching the cock. It cannot expand into the barrel during the afcent of the pifon. In place of it the perforation HLI comes under the pilton, filled with air that had been turned alide with it when the pifton was at the top of the barrel, and therefore of the fame denfity with the air of the receiver. It ap. pcars therefore that there is no limit to the rarefaction as long as the air will expand.

This inftrument is called an Exhausting Syringe. It is more generally made in another form, which is much lefs expenive, and more comvenient in its ufe. Inftead of being furnifhed with cocks for eftablifhing the communications and thutting them, as is neceffary, it has valves like thofe of the condenfing fyringe, but opening in the oppofite direation. It is thus made:

The pipe of communication or conduit MN (fig. 15.), has a male fcrew in its extremity, and over this is tied a flip of bladder or leather M. The lower haif of the pifon has alfo a male ficrew on it, covered at the end with a flip of bladder O. This is frewed into the upper half of the pitton, which is pierced with a hole H coming out of the fide of the rod.

Now fuppofe the fyringe ferewed to the conduating pipe, and that fcrewed into the receiver $V$, and the pitton at the bot:om of the barrel. When the pifon is drawn up, the preffure of the external air thuts the valve $O$, and a void is left below the pifton: there is therefore no prefiure on the upper fide of the valve $M$ to balance the elafticity of the air in the receiver which formerly balanced the weight of the atmolphere. The air therefore in the receiver lifts this valve, and dintibutes itfelf between the veffel and the barrel; fo that
air in both receiver and bartel is as before $\frac{V}{V+B}$

When the p:ton is let go it defemals, becarefe the elaficity of the expanded air is net a balance for the preffure of the atmoffhere, which therciore perifes down the pifon with the chference, keeping the pifton-valve thut all the while. At the fame sime the valve M alfo fluts: for it was opened by the prevailing elatticity of the air in the receiver, and while it is open the two airs have cqual denfity and elanicity; but the moment the pillon defecnds, the capacity of the barrel is diminifhed, the elaflicity of its air increare; by collapfing, and now prevailing over that of the air in the reciver muts the vitive M.
When it has arrived at fuch a part of the barrel that the air in it is of the denfity of the external air, there is no $f$. ree to pufh it further down; the hand mult therefore prefs it. This attempts to condenfe the air in the barrel, and therefore increales its elanticity; fo that it lifts the valve $O$ and efcapes, and the pifton gets to the bottom. When drawn up again, greater force is required than the latt time, becaufe the claticity of the included air is lefs than in the former ftroke. The pitton rifes further before the valve Mis lifted up, and when it has reached the top of the burrel the deality of the included air is $\left.\overline{\frac{V}{V+B}}\right)^{2}$. The piton, whan let go, will defcend further than it did befcre ere the pitonvalve open, and the preffure of the hand will ags in puth it to the bottom, all the air efcaping throngh O . The rarefaction will go on at every fuccenive flroke in the fame manner as with the other fyringe.

This fyringe is evidently more eafy in its ufe, renuir- Atvantare ing no attendance to the cocks to open and that them of this fyat the proper times. On this account this confruction ringe aver of an exhaufing fyringe is much more generally the forner, ufed.

But it is greatly inferior to the fyringe with cocks Its inferiowith refpect to its power of rarefaction. Its operation riiy. is greatly limited. It is evident that no air will come out of the receiver unlefs its elafticity exceed that of the air in the barrel by a difference able to lift up the val:e M. A piece of oiled leather tied acrofs this hole can hardly be made tight and certain of clapping to the hole without fome fmall Araining, which mult therefore be overcome. It muit be very gentle indeed not to require a force equal to the weight of two inches of water, and this is equal to about the 200th part of the whole elafticity of the ordinary air ; and therefore this fyringe, for this reafon alone, camot rarcfy sir abo:e 200 tumes, even though air were capable of an indefinite expanfion. In like manner the valve $O$ cannot be raifed without a fimilar prevalence of the elafticity of the air in the barrel above the weight of the atmofinere. Thefe caufes united, make it difficult to rarefy the air more than too times, and very few fuch fyringes will rarefy it more than 50 times; whereas the fyringe with cocks, when new and in good order, will razefy it :ceso times.

But, on the other hand, fyringes with cochs are Theformer much more expenfive, efpecially when furnilhed with apparatus for opening and fluting the cocl.s. They apparatus for opening and fluting the cocl.s. They nore habte
are more difficult to make equally tight, and (which is so go out

Air pump, the greateft objection) do rot remain long in food order. The cocks, by fo frequently opening and fhutting, grow loofe, and allow the air to eleape. No mathod has been fould of preventing this. They mult be ground tight by menns of eneery or other cutting powders. Some of thefe unavoidally flick in the metal, and continue to wear it down. Fer this reafon philofophers, and the makers of philofophical inftruments, have turned their chicf attention to the improvement of the fyringe with valies. We have been thus minute in the account of the operation of rarefaction, that the reader may better underftand the value of thefe improvements, and in general the operation of the principal preumatic eng:nes.

Confruc.
tion of his
pump.

An Arr-Pump is nothing but an exhaunting fyringe accommolated to a variety of experiments. It was firit invented by Otto Guericke, a yentleman of Magdeburgh in Germany, abont the year 1654 . We truat that it will ant be unacceptable 10 our readers to fee this inftrument, which now makes a principal article in at inlofophical apparatus, in its firit form, and to trace it through its fucceffive feps to its prefent flate of improvement.

Guericke, indiffcent about the foitary poffeflion of an invention which gave entertainment to nunbers who came to fee his rimderful experiments, gave a minute defiription of all his pneumatic apparatus to Gafpar Schottus profeffor of mathematics at Wirtemberg, who immediately publifhed it with the author's confent, with an account of fome of its performances, firf in 1657 , in his Michaniza Hydraulico-pneumatica; and then in his Tectrica Curiofa, in 166 the wonderful performances of art which he collected by a correfpondence uver all Europe.

Otto Guericke's air-pump contifts of a glafs receiver $\Lambda$ (fig. 16.), of a form nearly fpherical, fitted up with a brafs cap and cock $B$. The nozzle of the cap was fixed to a fyringe CDE, alfo of brafs, bent at D into half a right angle. This had a valve at D , opening from the ieceiver into the fyringe, and fhutting when preffed in the oppolite direction. In the upper fide of the fyringe there is another valve $F$, opening from the fyringe into the external air, and fhutting when preffed inwards. The pifton had mo valve. The fyringe, the cock B , and the joint of the tube, were immerfed in a ciftern filled with water. From this defcription it is eafy to underftand the operation of the inftument. When the pifton was drawn up from the bottom of the fyringe, the valve F was kept thut by the preffure of the external air, and the valve $D$ onened by the elanticity of the air-in the receiver. When it was pufhed downagain, the valve Dimmediately fhut by the fuperior clatticity of the air in the fyringe; and when this was fufficienly compreffed, it opened the valve $F$, and was difcharged. It was immerfed in water, that no air might find its way through the joints 93 or cocks.

It would feem that this machine was not very perfect, for Gurricke fays that it took feveral hours to produce an evacuation of a moderatc-lized veflel; but lic fays, that when it was in gond order, the rarefacion (for he aelinowledged that it was not, nor could be, a complete evacuation) was to great, that when the eccls
was opened, and water aimited, it filled the receiver Air-ju fo as fometimes to lenve no more than the bulk of a pea filled with air. This is a litte furprifing; for if the valve F be placed as far from the bottom of the fyringe as in Schottus's figure, it would appear that the rarefaction could not be greater than what muft arie from the air in DF expanding till it filled the whole fyringe: becaufe as foon as the piffon in its defent paffes $F$ it can difcharge no more air, but nuut comprefs it between $F$ and the bottom, to be expanded again when the pifton is drawn up. It is probable that the pifon wa: not very tight, but that on preffing it down it allowed the air to pafs it; and the water in which the whole was immerfed prevented the return of the air when it was drawn in again: and this accounts for the great time neceflary for producing the defired rarefaction.

Guericke, being a gentleman of fortune, fpared no His 94 expence, and added a part to the machine, which faved proven his numerous vifitants the trouble of liours attendance of it, before they could fee the curict:s experiments with the rarefied :ir. He made a large copper veffel G (fig. 17.), having a pipe and cock below, which paffed through the floor of the clamber into an under apartment, where it was joined to the fyringe immerfed in the ciftern of water, and worked by a lever. The upper part of the veffel terminated ir a pipe, furnifled with a ftopcock H, furrounded with a finall brim to hold water for preventing. the ingrefs of air. On the top was another cap I, alfo filled with water, to protect the junction of the pipes with the receiver K . This great veffel was always kept exhautled, and workmen attended below. When experiments were to be performed in the receiver K , it was fet on the top of the great vellel, and the cock $H$ was opened. The air in K immediately diffufed itfelf equalJy between the two veffels, and was fo much more rarefied as the receiver $K$ was fmaller than the veffel $G$. When this rarefaction was not fufficient, the attendants below immediately worked the pump.

Thefe particulars deferve to be recorded, as they fhow the inventive genius of this celebrated philofopher, and becaufe they are ufeful even in the prefent advanced flate of the lludy. Gnericke's nethod of excluding air from all the joints of his apparatus, by immerfing thefe joints in water, is the only method that has to this day been found effectual ; and there frequently occur experiments where this exclufion $f . r$ a long time is abfolutely neceffary. In fuch cafes it is neceffay to conitruct little cups or cifterns at every joint, and to bill them with water or nil. In a letter to Schotus, 1652.3 , he defribes very ingenious contrivances for producing complete rarefaction after the clafticity of the remaining air has bec: fo far diminithed that it is not able to open the valves. He opens the exhaufting valves by a plac, which is puthed in by the hand; and the dicharging valve is opened by a fmall pump placed on its outide, fo that it opens into a void intead of opening againf the preffure of the atmofphere. (See Schotti Tectnical Curiofa, p. 68, 70.) Thefe contrivances have been lately added to airpumps by Haas and Huiter as new inventions.
It munt be acknowledged, that the application of the pump or fy:inge to the exhauftion of air was a very obvious thought on the principle exhibitel in $n^{\circ}$ 17. and in this way it was alfo cmpluyed by Guericke, who firt filled the receiver with water, and then applied the fyringe. But this was by no means either his olject or veffel void of air, but to exhauft the air which was already in it ; and his principle was the power which he fufpected to be in air of expanding itclly into a greater fpace when the force tras removed which he fuppote 1 to comprefs it. Ile exprefsly fays (Trag. de Eixperimontis Mugdeurgizis, ct in LFiff. and Schothum), that the contrivance occured to him ace:dentally whea occupied with experiments in the 'Torricellian tube, in which he found that the air would really expand, and completely fill a much larger fpace than what it ufually occupied, and that he had found no limits to the expantion, evincing this by fats which we hiall perfectly underitand by and by. This was a doctrine quite new, and required a philofophical mind to view it in a general and fyiteratic manner; and it muft be owned that his manner of treating the fribject is equally remarkable for ingeauity

His doctrine and his machine were foon fpread over Europe. It was the age of literary ardour and philofophical curi: fity; and it is moft pleafant to us, who fanding on the thoulders of our predecefiers, can fee f.ar around us, to ooferve the eagernefs with which every new, and to us frivolous, experiment was repeated and canvaffed. The worthippers of A riftotle were daily receiving fevere mortifications from the experimenters, or empirics as theyaffected to call them, and they exerted themiclves ftrenuouf$1 y$ in fupport ur his now tottering caufe. This contributed to the rapid propagation of every difcovery; and it was a molt profitable and refpectable bufinefs to go tbrough the chief citics of Germany and France exhibiting fhilcfophical exper'men's.

About this time the foundations of the Royal Society of London were laid. Mr Boyle, Mr Wren, Lord Brounker, Dr Wallis, and other curious gentlemen, held meetings at Osford, in which were received accounts of whatever was doing in the fludy of nature; and many experiments were exhihited. The refearches of Galilen, Toricelli, and Pafchal concerning the preffure of the air, greatly engaged their attention, and many additions were made to their difcoveries. Mr Boyle, the mof ardent and fucceffful fudier of nature, had the principal flare in thefe improvements, his inquifitive mind being aided by an opulent fortune. In a letter to his nephew I.ord Dungarvon, he fays that he had made many attempts to fee the appearances exhibited by bodies freed from the preflure of the air. He had made Toricellian tubes, having a fmall veffel a-top, into which he put fome bodies before filling the tubes vith mercury; fo that when the tube was fet upright, and the mercury run out, the bodies were in cizitho. Ife had alfo abftracted the water from a vefiel, by a fmall pump, by uieans of its weight, in the manner deferibed in $n^{2}{ }^{1} 7$, having previoully put bodies into the veffel along with the water. But all thefe wars were very troublefome and imperfect. He was delighted when he learned from Schottus's firft publication, that Counfellor Guericke had effected this by the expanfive power of the air ; and immediately fet about confructing a machine from his own ideas, no defeription of Guericke's being then publiflied.

It contifted of a receiver $A$ ( $f \mathrm{~g} .18$.) furnifhed with a fopcock B , and fyringe CD placed in a vertical pofition below the recciver. Its valve C was in its bottona, clofe adjoining to the entry of the pipe of comVol. XV.
munication ; and the hole by withet the air iffued was Air-pump. farther fecurel by a plug which could be removed. 'i'he pifon was moved by a wheel and rackwork. The His airrecciver of Gucricke's pump was but ill adapted for punpr. any confiderable va icty of experiments; and accordingly very few were inale in it. Mr Boyle's receiver had a large opeaing EF, with a Arong glars margin. 'T'o this was fitted at Itrong brafs cap, pierced with a hole $G$ in its middle, to which was fitted a plug ground into it, and thaped like the key of a cock. The extremity of this key was furnihed with a fcrew, to which could be affed a hook, or a varicty of pieces for fupporting what was to be examined in the receiver, or for producing various motinns within it, without admitting the air. This was arther guarded againf by means of oil poured round the key, where it was retained by the hollow chp-like form of the cover. With a.1 thefe precautions, however, Mir Boyle ingenioufy confefles, that it was but feldom, and with great dificulty, that he could produce an extreme degree of rarefaction; and it appears by Guericke's letter to Schottus, that in this refpes the Magdeburgh machine had the advantage. But moft of Boyle's very interefting experiments did not require this extreme rarefaction ; and the va:iety of them and their philofophic importance, compenfated for this defect, and foon eclipfed the fame of the inventor to fuch a degree, that the fate of air in the receiver was generally denominated the vacuum Boylanum, and the air-pump was called machina Boyleana. It does not appear that Guericke was at all folicitous to maintaia his claim to priority of invention. He appears to have been of a truly noble and plitofophical minus, aiming at nothing but the advancement of fcience.

Mr Boyle found, that to make a veffel air-tisht, it was fufficient to place a piece of wet or oiled leather on its brim, and to lay a flat plate of metal upon this. The preffure of the external air fqueezed the two folid bodies fo hard together, that the foft leather effectually excluded it. This enabled him to render the whole machine incomparably more convenient for a variety of experiments. He caufed the conduit-pipe to terminate in a flat plate which he covered with leather, and on this he fet the glafs ball or receiver, which bad both its upper and lower brim ground flat. He covered the upper orifice in like manner with a piece of oiled leather and a flat plate, having cocks and a variety of other perforations and contrivances fuited to his purpofes. This he found infinitely more expeditious, and alfo tighter, than the clammy cements which he had formerly ufed for fecuring the joints.

He was now affited by Dr Hooke, the molt ingeni- 1)rHookee ous and iaventive mechanic that the world has ever leen. inproveThis perfon made a great improvement on the air-pump, by applying two fyringes whofe pifon-rods were worked by the fame wheel, as in fig. $20, n^{\circ}$, and putting valves in the piftons in the fame manner as in the pifton of a common pump. This evidently doubled the expedition of the pump's operation; but it alfo greatly diminifhed the labur of pumping; for it muft be obferved, that the pifton H mult be drawn up againf the preflure of the external air, and when the rarefaction is nearly perfeat this requires a force of nearly 15 pounds for every inch of the are:2 of the pifton. Now when one piftor H is at the botton of the barrel, the other K is at nent of Hoyle'saisp सn?

Air-parp, the top of the barrel, and the air below K is equally rare with that in the receiver. Therefore the preffure of the external air on the pilton K is nearly equal to that on the pifton H. Both, therefore, are acting in oppolite directions on the wheel which gave them motion; and the force neceffary for railing H is only the difference between the elafticity of the air in the barrel H and that of the air in the barrel K. This is very fmall in the beginning of the froke, but gradualls increafes as the piton K defcends, and becomes equal to the whole excefs of the air's preffure above the elafticity of the remaining air of the receiver when the air at $K$ of the natural denfity begins to open the pifton valves. An accurate attention to the circumfances will fhow us that the force requifite for working the pump is greatelt at firf, and gradually diminifhes as the rarefaction advances; and when this is nearly complete, hardly any more force is required than what is ncceffary for overcoming the friction of the piltons, except during the difcharge of the air at

Irifs piqe,
suit the end of each ftroke.

This is therefore the form of the air-pump which is moft generally ufed all over Europe. Some traces of national prepoffeffion remain. In Germany, air-pumps are frequently made after the original model of Gue. ricke's (TVolf Cyclomathefis); and the French generally ufe the pump made by Papin, though extremely aukward. We thall give a defeription of Boyle's airpump as finally improved by Hawkeflece, which, with fome fmall accommodations to particular views, fill remains the mof approved form.

Here follows the defcription from Defaguliers.
It confifts of two brafs harrels $a$ a, aa (fig. 19.), 12 inches high and 2 wide. The pittons are raifed and depreffed by turning the winch $b b$. This is faltened to an axis paffing through a Arong toothed wheel, which lays hold of the teeth of the racks $c \subset c \varepsilon$. Then the one is raifed while the other is depreffed; by which means the valves, which are made of limber bladder, fixed in the upper part of each pifon, as well as in the openings into the bottom of the barrels, perform their office of difcharging the air from the barrels, and admitting into them the air from the receiver to be afterwards difcharged; and when the receiver comes to be pretty well exhaufted of its air, the preffure of the atmofphere in the defcending pitton is nearly fo great, that the power required to raife the other is little more than is necelfary for overcoming the friction of the pifton, which renders this pump preferable to all others, which requirc more force to work them as the rarefaction of the air in the receiver advances.

The barrels are fet in a brafs difh abont two inches decp, filled with water or oil to prevent the infinuation of air. The barrels are fcrewed tight down by the nuts ee,ec, which force the frontifiece $f f$ down on them, through which the two pillars $g g, g g$ pafs.

From betwcen the barrels rifes a flender brafs pipe $h b$, communicating with each by a perforation in the tranf. verfe pieze of brafs on which they ftand. The mpper end of this pipe communicates with another perforated piece of brats, which ferews on underneath the plate $i i i i$, of ten iaches, diameter and furrounded with a brafs rim to prevent the fhedding of water ufed in tome experiments. This piece of brafs has three branches: ift, An horizon:al one communicating with the conduit-
pipe $b b$. 2. An upright one forewed into the middle Air.pu of the pump-plate, and terminating in a fmall pike $k$, rifing about an inch above it. 3 d, Is a perpendicular one, looking downwards in the continuation of the pipe $k$, and having a hollow fcrew in its end receiving the brafs cap of the g:tge-pipe $/ 1 / 1 /$, which is of glafs, 34 inches long, and inmerlied in a glafs ciftern1 mm filled with mercury. This is covered a-top with a cork float, carrying the weight of a light wooden fcale divided into inches, which arc numbered from the furface of the mercury in the ciftern. This fale will therefore rife and fall with the mercury in the ciltern, and indicate the true elevation of that in the tube.

There is a flopocock immediately above the infertion Stopec of the gage pipc, by which its communication may be cut off. There is another at $n$, by which a communication is opened with the external air for allowing its readmiffion; and there is fometimes another iminediately within the infertion of the conduct-pipe for cutting off the communication between the receiver and the pump. This is particularly ufeful when the rarefaction is to be continued long, as there are by thefe means fewer chances of the infinuation of air by the many joints.

The receivers are made tight by fimply fetting them Receiv on the pump-plate with a piece of wet or oiled leather between ; and the receivers, which are open a-top, have a brafs cover fet on them in the fame manner. In thefe covers there are various perforations and contrivances for various purpofes. The one in the figure has a tlip wire paffing through a collar of oiled leather, having a hook or a ferew in its lower end for hanging any thing on or producing a variety of motions.
Sometimes the receivers are fet on another plate, which contr has a pipe forewed into its middle, furrifhed with a vance ftopcock and a fcrew, which fits the middle pipe $k$. remov When the rarefaction has been made in it, the cock is them. thut, and then the whole may be unfcrewed from the pump, and removed to any convenient place. This is called a tranfporter plate.

It only remains to explain the gage $11 / 1 \%$. In the princi ordinary ftate of the air its elafticity balances the pref- upony fure of the incumbent atmofphere. We find this from the ga the force that is neceflary to fqueeze it into lefs bulk in oppofition to this elafticity. Therefore che elafticity of the air increafes with the vicinity of its particles. It is therefore reafonable to expect, that when we allow it to occupy more room, and its p:rticles are farther afunder, its elafticity will be dimin:fhed though not annihilated ; that is;' it will no longer balance the whole preflure of the atmofphere, though it may ftill balance part of it. If therefore an upright pipe have its lower end immerfed in a veffel of mercury, and commuricate by its upper end with a veffel containing rarefied, therefore lefs elaftic, air, we fhould expect that the preffure of the air will prevail, and force the mercury into the tube, and canfe it to rife to fuch an beight that the weight of the mercury, joined to the elafticity of the rarefied air alling on its upper furface, thall be exactly equal to the whole preffure of the atmofphere. The height of the mercury is the exact meafure of that part of the whole preffure which is not balanced by the elafticity of the rarefied air, and its deficiency from the hicight of the mercury in the Toricellian tube is the exact meafure of this remaining elafticity.

It is evident therefore, that the pipe will be a fcale of the elafticity of the remaining air, and will indicate ia fome fort the degree of ratetation: for there mult be fome analogy between the deafity of the air and its elafticity; ard we have no reafon to imagine that they do not increafe and diminith together, although we may be ignorant of the l.ww, that is, of the change of elafticity correfponding to a known change of denfity. This is to be difcovered by experiment; and the air-pump itfelf furnifhes us with the belt experiments for this purpofe. After ratcfying till the mercury in the gage has attained half the hcight of that in the Toricellian tubc, flut the communication with the barrels and gage, and admit the water into the receiver. It will go in till all is again in equilibrio with the preflure of the atmofphere; that is, till the air in the receiver has collapfed into its natural bulk. This we can accurately meafure, and compare with the whole capacity of the receiver; and thus obtain the precife degree of rarefaction correfponding to half the natural elaiticity. We can do the fame thing with the elafticity reduced to one third, one fourth, \&c. and thus difeover the whole law.

This gage mult be confidered as one of the molt ingenious and convenient parts of Hawkebee's pump; and it is well difpofed, being in a fituation protected againft accidents: but it neceffarily increafes greatly the fize of the machine, and cannot be applied to the t: ible-pump, reprefented in fig. $20, \mathrm{n}^{\circ} \mathrm{I}$. When it is wanted here, a fmall plate is added behind, or between the barrels and receiver; and on chis is fet a fmall tubulated (as it is termed) receiver, covering a common weather-glaf's tube. -This receiver being rarefied along with the other, the preflure on the mercury in the ciffern arifing from the elafticity of the remaining air is diminifhed fo as to be no longer able to fupport the mercury at its full height; and it therefore defeends till the height at which it fands puts it in equilibrio with the elalticity. In this form, therefore, the height of the mercury is directly a meafure of the remaining elafticity; while on the other it meafures the remaining unbalanced preffure of the atmofphere. But this gage is extremely cumberfome, and liable to accidents. We are feldom much interefted in the rarefaction till it is great: a contracted form of this gage is therefore very uieful, and was early ufed. A fyphon ABCD (fig. 20, $\mathrm{n}^{\circ} 2$.), each branch of which is about four inches long, clofe at $A$ and open at $D$, is filled with boiling mercury till it occupies the branch $A B$ and a very fmall part of $C D$, having its furface at O. This is fixed to a fmall ftand, and fixed into the receiver, along with the things that are to be exhibited in the rarefied air. When the air has been rarefied till its remaining elafticity is not ahle to fupport the column $B A$, the mercury defcends in $A B$, and rifes in $C D$, and the remaining elafticity will always be meafured by the eievation of the mercury in AB above that in the leg CD . Could the exhauftion be perfected, the furfaces in both legs would be on a level. Another gage might be put into the fame foot, having a fmall bubble of air at A. This would move from the beginning of the rarefaction; but our ignorance of the analogy between the denfity and elafticity hinders us from ufing it as a meafure of either.

It is enough for our prefent purpofe to obferve, that the barometer or fyphon gage is a perfect indication
and meafure of the performance of an arir pump, and that a pump is, (cateris puribus) fo much the more perfôt, as it is able to raife the mercury higher in the gage. 182 It is in this way that we difcover th:te none can pro. esh union duce a complete exhation, and that their operation ior fiested is only a very great ratefation: for none can raife ly y the ar the morcury to that height at which it flands in the luy. Toricellian tube, well purged of air. Few pumpi will bring it within t: of an incle. H.wlefbee's, fitted up according to his inftuctions, will feldom bring it with
 the principles mentioned when fpeating of the exl:atu. ing fyringe, and new and in fine order, will in fivour. able circumftances bring it within $\mathrm{J}^{\prime}$. None with valves fitted up with wet leather, or when water or volatile fuids are allowed accefs into any part, will bring it nearer than $\frac{5}{\frac{1}{3}}$. Nay, a pump of the beft kind, and in the fineft order, will have its rarefying power reduced to the loweft fandard, as meafured by this gage, if wc put into the receiver the tenh part of a Iquare inch of white fheep-fkin, frefh from the fhops, or of any fubftance equally damp. This is a difcovery made by means of the improved air-pump, and leads to very extenfive and important confequences in general phyfics ; fome of which will be treated of under this article: and the obfervation is made thus early, that our readers may better underfand the improvements which have been made on this celebrated machine.

It would require a volume to defcribe all the changes which have been made on it . An inftrument of fuch multifarious ufe, and in the hands of curious men, each diving into the fecrets of nature in his favourite line, mult have received many alterations and real inprovements in many particular refpefs. But thefe are befide our prefent purpofe; which is to conlider it mercly as a machine for rarefying elaftic or expanfive fluids. We muft therefore confine ourfelves to this view of it ; and fhall carefully flate to our readers every improvement founded on principle, and on rneumatical laws.

All who ufed it perceived the limit fet to the rarefac. By attion by the refiftance of the valves, and tried to perfect tempring the conftruction of the cocks. The Abbé Nollet and to perfect Gravefande, two of the moft eminent experimental pli:lofophers in Europe were the moft fuccefsful.

Mr Gravefande jufly preferred Hooke's plan of a double pump, and contrived an apparatus for turning the cocks by the motion of the pump's handle. This is far from either being fimple or caly in working; and occafions great jerks and concuftions in the whole machine. This, however, is not neceffarily connefted with the truly pneumatical improvement. His pifon has no valve, and the red is connected with it by a Atirrup D (fig. 21), as in a common pump. The rod has a cylindric part $c p$, which paffes through the fintup. and has a fiff motion in it up and down of about half an inch; being flopped by the fhoulder $\sigma$ above and the nut below. The round plate fupported by this firrup has a thort fquare tube $23 d$, which fits tiglat into the hole of a piece of cork $F$. The round plate $E$ has a fquare fhank $g$, which goes into the fquare tube $n d$. A piece of thin leather $f$, foaked in oil, is put between the cork and the plate E, and another between the cort and the plate which forms the fole of the firrup. All thefe pieces are ferewed together by the nail $e$, whofe that head covers the bole n. Suppole, thencerre, the piltoa $\mathrm{N}_{2}$
touching

Air-pump. touching the bottom of the batrel, and the winch turning to raife it again, the fristion of the pitton on the
116 And man- barrel keeps it in its place, and the rol is drawn up ucr of ufing through the firrup D. Thus the wheal has liberty to turn about an inch; and this is fufficient for turning the cock, fo as to cut off the communication with the exteraul air, and to open the communication with the receiver. This being done, and the motion of the winch continued, the pifton is raifed to the top of the barrel. When the winch is turned in the oppofite direction, the piton remains fixed till the cock is turned, fo as to thut the communication with the receiver and open that with the extemal air.
'This is a pretty contrivance, and does not at firf appear neceffary; becaufe the cocks might be made to tuin at the beginning and end of the Atroke without it. But this is jult pollible ; and the fmalleft error of adjuftment, or wearing of the apparatns, will caufe them to be open at improper times. Befides, the cocks are not turned in aninfant, and are improperly open during fome very fmall time; but this conttivance completely obviates this difficulty.

The cock is precifely fimilar to that formerly defcribed, having one perforation diametrically through it and another entering at right angles to this, and after reaching the centre, it paffes along the axis of the cock, and comes out to the open air.

Remedied.

125
Highly ex-
tulled, bue

It is cvident, that by this confruction of the cock, the ingenious improvement of Dr Hooke, by which the prefture of the atmofphere on one piton is made to balance (in great part) the preffure on the other, is given up: for, whenever the communication with the ait is opened, it ruthes in, and immediately balances the preffure on the upper fide of the pitton in this barrel; fo that the whole preffure in the other muft be overcome ly the perfon working the pump. Gravefande, aware of this, put a valve on the orince of the cock; that is, tied a flip of wet bladder or oiled leather acrofs it ; and now the pifion is prelfed down, as long as the air in the barrel is rarer than the outward air, in the fame manner as when the valve is in the piton itfelf.

This is all that is neceffary to be defcribed in Mr Gravefande's air-pump. Its performance is highly extolled by him as far exceeding his former pumps with valves. The fame preference was given to it by his fucceffor Mufchen:bruck. But, while they both prepared the piftons and valves and leathers of the pump, by fteeping them in oil, and then in a mixture of water and fpisits of wine, we are certain that no juft eftimate conld be made of its performance. For with this preparation it could not bring the gage within $\div$ of an inch of the barometer. We even fec other limits to its rarefation: from its confruction, it is plain that a very confiderable fpace is left between the pilton and cock, not lefs than an inch, from which the air is never cxpelled; and if this be made extremely fmall, it is plain that the pump mut be worked very flow, other. wife there will not be time for the air to diffure iffelf from the recciver int , the barrel, efpecially towards the end, when the expelling force, viz. the elaticity of the ramaniarg air, is very fmall. There is alio the fime limit to the rarefaction, as in Hooke's or Hawleftes'o rump, oppofed by the valve $E$, which will not rpen till the air below the piton is confiderably denfer than the external ar: and this pump foon lof any ad.
vantages it poffeffed when frefh from the workman's Air. hands, by the cock's growing loofe and admitting air. It is furprifing that Gravefande omitted Haukefbee's in on fecurity againft this, by placing the barsels in a difn fil- ipoce led with cil ; which would effectually have prevented this rior inconvenience.

We mult not omit a feemingly paradoxicalobfervation of Gravefande, that in a pump conftructed with valves, Haw
bee's and worked with a determined uniform velocity, the re- of th quired degree of rareftetion is fooner produced by thort harre barrels than by long ones. It would require too much time to give a general demonitration of this, but it will eafily be feen by an example. Suppofe the long barrel, to have equal capacity with the receiver, then at the end of the firf Atroke the air in the receiver will have its natural denfity. Now, let the fhort barrels have half this capacity: at the end of the firft Atroke the denfity of the ain in the receiver is ${ }_{5}^{2}$, and at the end of the ficon flroke it is $\frac{4}{5}$, which is lefs than $\frac{2}{2}$, and the two Arokes of the fhort barrel are fuppofed to be made in the fame time with one of the longeft, $\& c$.

Hawkelbee's pump mantained its pre-eminence without rival in Britain, and generally too on the continent, except in France, where every thing took the ton of the Academy, which abhorred being indebted to foreigners for any thing in fcience, till about the year 1750, when it engaged the attention of Mr John Smeaton, a perfon of uncommon knowledge, and fecond to none but Dr Hooke in fagacity and meehanical refource. He was then a maker of philofophical inftruments, and made many attempts to perfect the pumps with cocks, but found, that whatever perfection he could bring them to, he could not enable them to preferve it; and he never would fell one of this conftruction. He therefore attached himfelf folcly to the valve pumps.

The firt thing was to diminifh the refitance to the Byenl entry of the air from the receiver into the barrels: this ing th he rendered almof nothing, by enlarging the furface valveon which this feebly elaftic air was to prefs. Inftead of making thefe valves to open by its preflure on a circle of ${ }^{\prime}$ : of an inch in diameter, he made the valve.hole one inch in diameter, enlanging the furface 400 times; and, to prevent this piece of thin leather from being burf by the great preflure on it, when the pifton in its defcent was approaching the bottom of the barrel, he fupported it by a delicate but Arong gratin.5, dividing the valve-hole like the fection of a honey-comb, as reprefented in fiz. 22, $n^{\circ} 3$; and the ribs of this grating are feen edgewife in fig. $22,11^{\circ} 1$, at $a b c$.

The valve was a piece of a thin membranc or oiled filk, gently frained over the mouth of the valve-hole, chat 12 and tied on by a fine filk thread wound round it in the fit the fome manner that the narrow flips had been tied ture 0 on formerly. This done, he cut with a pointed knife valve, the leather round the edge, nearly four quadrantal arcs, leaving a finall tongue between each, as in fig. $22, n^{\circ}$ 3. The ftrained valve immediately frinks inwards, as reprefented by the fladed parts; and the Arain by which it is kept down is now greatly diminifhed, taking place only at the corners. The gratiags being reduced nearly to an edge (but not quite, leif they thonld cut), there is very little preflure to produce adhefion by the clammy oil. Thus it appears, that a very fmall elaficity of the air in the receiver will be fuficient to raite the valve; and Mr Smenton found,
pump. that when it was not able to do this at firt, when ouly about $2:$. of the natural elalticity, it would do it after keeping the pifton up eight or ten feconds, the air having been all the while undernining the valve, and gradually detaching it from the gratio
Unfortunately he could not follow this method with the pilfon valve. There was not roons round the rod for fuch an expanded valve; and it would have obliged him to have a great fpace below the valve, from which he could not expel the air by the defecnt of the pifon. Hisingenuity hit on a way of incrcafing the expelling force through the common valve: he inclofed the rod of the pifton in a collar of leather $l$, through which it moved freely without allowing any air to get paft its fides. For greater fecurity, the collar of leather was contained in a box terminating in a cup filled with nil. As this makes a material change in the principle of confiruction of the air-pump (and indeed of pneumatic engines in general), and as it has been adopted in all the fubfequent attempts to improve them, it merits a particular confideration.

The piton itfelf confirts of two picces of brafs fattened by fcrews trom below. The uppermoft, which is of one folid piece with the rod GH (fig. $22, \mathrm{n}^{\circ} \mathrm{I}$.), is of a diameter fome what lefs than the barrel; fo that when they are ferewed together, a piece of leather foaked in a mixture of boiled oil and tallow, is put between them; and when the pitton is thrut into the barrel from above, the leather comes up around the fide of the pifton, and fills the barrel, making the pifton perfenly air-tight. The lower half of the pifton projeets upwards into the upper, which has a hollow gbcg to receive it. There is a fmall hole through the lower half at $a$ to admir the air; and a hole $c d$ in the upper half to let it through, and there is a flip of oiled filk flrained acrofs the hole $a$ by way of valve, and there is room enough left at $b c$ for this valve to rife a little when preffed from below. The rod GH paffes through the piece of brafs which furms the top of the barrel fo as to move freely, but without any fenfible fhake : this top is formed into a hollow box, confifing of two pieces ECDF and CNOD, which fcrew together at CD. This box is filled with rings of oiled leather exactly fitted to its diametter, each having a hole in it for the rod to pafs through. When the piece ECDF is fcrewed down, it compreffes the leathers; fqueezing them to the rod, fo that no air can pafs between them; and, to fecure us againf all ingrefs of air, the upper part is formed into a cup EF, which is kept filled with oil.

The top of the barrel is alfo pierced with a hole LK, which rifes abnve the fat furface NO, and has a fip of oiled filk tied over it to act as a valve; opening when prelfed from below, but fhuting when preffed from above.

The communication between the barrel and receiver is made by means of the pipe ABPQ : and there goes from the hole K in the tnp of the barrel a pips KRST. which either communicates with the open air or with the receiver, by means of the enck at its extromity T'. The conduit pipe ABPQ has alfo a cock at $Q$, by which it is made to communicatc either with the leceiver or with the open air. Thefe channels of commonication are variounly conduted and terminatecl, according to the views of the maker : the fketch in this figure is fufficient for explaining the principle, and is fuited to the
general form of the pump, as it has been fiequently Air-punpp. mate by Nairne and other artifts in London.

130
Let ns now fuppofe the pifton at the top of the barrel, seperiority and that it applies to it all cver, and that the air in the of this conbarrcl is very much ratefied: in the common punp the frution. pifton valve is pacfled hard down by the atmofiphere, and continues thut till the pifton gets far down, cond mies the air below it beyond its natural fate, and ensbles it to fore up the valves. But here, as $f$ on as the piftuas quits the top of the barrel, it leaves a void behind it; for no air gets in round the pifon rod, and the valve at $\mathbb{K}$ is flut by the preflure of the atmofphere. There is nothing now to oppofe the elaficity of the air bclow but the Ptiffinefs of the valve $b c$; and thus the expelling (or more accurately the liberating) force is prodigioufly increafert.

The fuperincity of this confruction will be beit feen Shown by by an example. Suppofe the fiffers of the valve equal an cxamto the weight of ts of an inch of mercury, when the ba. ple. rometer ftands at 30 incles, and that the pump gage ftands at 29.9; then, in an ordinary pump, the valve in the pifton will not rife till the pifton has get within the $300 t h$ part of the bnttom of the barrel, and it will leave the valve hole filled with air of the ordinary denfity. But in this pump the valve will rife as foon as the pillon quits the top of the barrel; and when it is quite down, the valve hole $a$ will contain only the 300th part of the air whieh it would have contained in a pump of the ordinary form. Suppofe further, that the barrel is of equal capacity with the receiver, and that both pumps are fo badly confructed, that the fpace left below the pifton is the 3000 th part of the barrel. In the common pump the pifton valve will rife no more, and the rarefaction can be carried no farther, however delicate the barrel valve may be; but in this pump the next ftroke will raife the gage to 29.95 , and the pifon valve will again rife as foon as the pifton gets half way down the barrel.

The limit to the rarefaction by this pump depends chiefly on the fpace contained in the hole LK ; and in the fpace bed of the pifton. When the pifton is brought up to the top, and applicd clofe to it, thofe faces remain filled with air of the ordinary denfity, which will expand as the pifton defends, and thus will retard the opening of the piffon valve. The rarefaction will ftop when the elafticity of this fmall quantity of air, expanded fo as to fill the whole barrel (by the defcent of the pifton to the bottom), is juft equal to the force requifite for opening the pifton valve.
Another advantage atterding this confruction is, It is eafly that in drawing up the pillon, we are noc refifed by worlied. the whole preffure of the air; becaufe the air is rarefied above this pilton as well as below it, and the pitton is in preciely the fame ftate of preffure as if conneked with another pifon in a double pump. The refiftance to the afcent of the fillon is the excefs of the claftieity of the air above it over the elanticity of the air below : this, towards the end of the rarefaction, is very fmall, while the pifton is near the botton of the barrel, but gradually increafes as the piton rifes, and reduces the air above it into fmaller dimenfions, and becomes equal to the preflure of the atmofphere, when the air above the pifton is of the common denfity. If we thould raife the pilton fill farther, we mult condenfe the air above it: but Mr Smeaton has here made an iffue for the air by a fmall bole in the top of the barrel, covered with a delicate

Air pump.

 Cčct. 133. Defcription of Smea. ton's Fung.
## P N E U M

 deticate valve. This allow:s the air to efcape, and fhuts again as foon as the pifton begins to defcend, leaving almoft a perfect void behind it as before.This pump has another advantage. It may be changed in a moment from a rarefying to a condenfing engine, by fimply turning the cocks at $C$ and T. While $T$ communicates with the open air and $C$ with the receiver, it is a rarefying engine or air pump: but when $T$ conmunicates with the recciver, and $Q$ with the open air, it is a coudenling engine.

Fig. 23. reprefents Mr Smeaton's air-pump as it is ufually made by Nairne. Upon a folii bafe or table are fer up three pillars $\mathrm{F}, \mathrm{H}, \mathrm{H}$ : the pillar F fupports the pump-plate A ; and the pillars $\mathrm{H}, \mathrm{H}$, fupport the front or head, containing a brafs cog-wheel, which is turned by the handle $B$, and works in the rack C faftened to the upper end of the rifton rod. The whole is Aill farther fleadyed by two pieces ot brafs $c b$ and o $k$, which connet the pump-plate with the front, and have perforations comminicating between the hole a in the middle of the plate and the bartel, as will be defcribed immediately. DE is the barrel of the pump, firmly fixed to the tabie by ferews thro' its upper flanch: ef $d c$ is a flender brafs tube ficewed to the bottom of the barrel, and to the under hole of the horizontal canal $c b$. In this canal there is a cock which opens a communication between the barrel and the receiver, when the key is in the pofition reprefented here: but when the key is at right angies with this pofition, this communication is cut off. It that fide of the key which is here drawn next to the pump plate be turned outward, the external air is admitted into the receiver; but if turned inwards, the air is admitted into the barrel.
$g b$ is another nlender brafs pipe, leading from the difclairging valve at $g$ to the horizontal canal $b k$, to the under fide of which it is ferewed faft. In this horizontal canal there is a cock $n$ which opens a paffage from the barrel to the receiver when the key is in the pofition here drawn; but opens a palfage from the barrel to the external air when the key is turned outwards, and from the receiver to the external air when the key is turned inwards. This communication with the external air is not immediate but through a fort of box $i$; the ufe of this box is to receive the oil which is difcharged through the top valve $g$. In order to keep the pump tight, and in working order, it is proper fometimes to pour a tablefpoonful of olive-oil into the hole $a$ of the pump-plate, and then to work the pump. The oil goes along the conduit $b c d f_{e}$, gets into the barrel and through the pilton valve, when the pifon is preffed to the bottom of the barrel, and is then drawn up, and forced through the difcharging valve $g$ along the pipe $g b$, the horizontal paflage $b t$, and finally into the box $i$. This box has a imall hole ia its fide near the top, through which the air eicapes.

From the upper fide of the canal $c b$ there rifes a flender pipe which bends outward and then turns downwards, and is jaincd to a fmall box, which cannot be feen in this view. From the bottom of this box proceeds downwards the gare-pipe of glafs, which enters the ciffern of mercury G fixed below.

On the upper fide of the other canal at 0 is feen a fmall ftud, having a fhort pipe of glafs projecting horizontally from it , elofe by and parallel to the front piece of the pump, and reaching to the other canal. This

## A T I C S.

pipe is clofe at the farther ond, and has a imall drop of sir-pur mercury or oil in it at the end 0 . This ferves as a gage in condenfing, indicating the degree of condenfation by the place of the drop: For this drop is forced along the pipe, condenfing the air before it in the fame degree that it is condenied in the barrel and receiver.

In confructing this pump, Mr smeaton introduced Methou a method of joining together, the different pipes and joining other pieces, which has great advantages over the ufual gether manner of forewing them together with leather betwecn, and which is now much ufed in liydraulic and pneumatic engines. We fhall explain this to our readers by a defcription of the manner in which the exhaufting gage is juined to the horizontal duct $c b$.
The piece $b i p$, in fig. $22, n^{\circ} 2$. is the fame with the Plat little cylinder obfervab.e on the upper fide of the hori- Ccce zontal canal $c d$, in fig. 23. The upper part $h i$ is plat formed into an outfide icrew, to fit the hollow fcrew of the piece deed. The top of this laft piece has a hole in its midale, giving an eafy palfage to the bent tube $c b a$, fo as to flip along it with freedom. To the end of this bent tube is foldered a piece of brafs $c f g$, perfo. rated in continuation of the tube, and having its end ground flat on the top of the picce $b i p$, and allo covercd with a flip of thin leather frained acrofs it and pierced with a bole in the middle.

It is plain from this form, that if the furface $f g$ be applied to the top of $b i$, and the cover deed be fcrewed down on it, it will draw or prefs them together, fo that no air can efcape by the joint, and this without turning the whole tube cba round, as is neceffary in the ufual way. This method is now adopted for joining together the conducting pipes of the machines for extinguifhing fires, an operation which was extremely tronblefome before this improvement.

The conduit pipe $\mathbf{E}$ efc (ig. 23.) is fattened to the bottom of the barrel, and the difcharging pipe $g b$ to its top, in the fame manner. But to return to the gage; the bent pipe $c b a$ cnters the box $s t$ near one fide, and obliquely, and the gage pipe $q r$ is inferted through its bottom towards the oppofite fide. The ufe of this box is to catch any drops of mercury which nay fometimes be dathed up through the gage pipe by an accidental ofcillation. This, by going through the paffages of the pump, would corrode them, and would act particularly on the joints, which are generally foldered with tin. When this bappens to an air-pump, it mult be cleaned with the molt fcrupulous attention, otherwife it will be quickly dettroyed.

This account of Smeaton's pump is fufficient for Great enabling the reader to underfand its opciation and to power fee its luperiority. It is reckoned a very fine pump of this pa the ordinary conftruction, which will rarefy 200 times, or raife the gage to 29.85 , the barometer ftanding at 30. But Mr Smeaton found, that his pump, even after long uing, raifed it to 29.95 , which we confider as equivalent to rarefying 600 times. When in fine order he found no bounds to its rarefaction, frequently raifing the gage as high as the barometer, and he thought its performance io perfeet, that the barometer gage was not fuficiently delicate for meafuring the rarefaction. He therefore fubfituted the fyphon gage alteady defcribed, which he gives fome reafons for preferring; but even this be found not fufficiently fenfible.

He contrived another, which could be carried to
any degree of fenfibility. It confifted of a glafs body A (fig. $z^{4}$ ) , of a pear fhape, and was therefore called the pear-gage. This had a fmall projecting orifice at $B$, and at the other en a tube CD, whofe capacity was the hundredth part of the capacity of the whole veffel. This was furpended at the flip wire of the receiver, and there was fet below it a fnall cup with mercury. When the pump was worked, the air in the pear.gage was rarefied along with the reft. When the rarefaction was brought to the degree intended, the gage was let down till B reached the bottom of the mercury. The external air being now let in, the mercury was raifed into the pear, and ftood at fome height E in the tube CD. The length of this tube being divided into roo parts, and thofe numbered from D , it is evident that $\frac{\mathrm{DE}}{\mathrm{DB}}$ will exprefs the degree of rarefaction which had been pro. duced when the gage was immerfed into the mercury: or if DC be $\frac{1}{6}$ of the whole capacity, and be divided into 100 parts by a fcale annexed to it, each unit of

This was a very ingenious contrivance, and has been the means of making fome very curious and important difcoveries which at prefent engage the attention of philofophers. By this gage Mr Simeaton found, that his pump frequently rarefied a thoufand, ten thoufand, nay an hundred thoufand, times. But though he in every inflance faw the great fuperiority of his pump above all others, he frequently found isregularities which he could not explain, and a want of correfpondence between the pear and the barometer-gages which puzzled him. The pear-gage frequently indicated a prodigions rarefaction, when the barometer-gage would not thow more than 600 .

Thefe unaccountable phenomena excited the curiofity of philofophers, who by this time were making continual ufe of the air-pump in their meteorological refearches, and much interefted in every thing connceted with the flate or confitution of elaftic fluids. Mr Nairne, a moft ingenious and accurate maker of philofophical inftruments, made many curious experiments in the examination and comparifon of Mr Smeaton's pump with thofe of the ufual confrustion, attending to every circumftance which could contribnte to the inferiority of the common pumps or to their improvement, fo as to bring them nearer to this rival machine. This rigorous comparifon brought into view feveral circumftances in the conflitution of the atmofpheric air, and its relation to other bodies, which are of the moft extenfive and important influmes in the operations of nature. We fhall notice at prefent fuch only as have a relation to the operation of the air-pump in extracting AIR from the receiver.

Mr Nairne found that when a little water, or even a with bit of paper damped with water, was expofed under the receiver of Mr Smeaton's air-pump, when in the moft perfect condition, raifing the mercury in the barometergage to 29.95 , he could not make it rife above 29.8 if Fahrenheit's thermometer indicated the temperature $47^{\circ}$, nor above 29.7 if the thermometer flood at $55^{\circ}$; and that to bring the cage to this height and keep it there, the operation of the pump muft be continued for a long time after the water had difappeared or the paper become perfectiy dry. He found that a drop of fipirits, or paper raoitened with fpisits, could not in
thofe circumftances allow the mercury in the gage to Air-punp. rife to near that height ; and that fimilar effects follow. ed from admitting any volatile body whatever into the recciver or any part of the the apparatus.

J49
This flowed him at once how improper the direc- Show the tions were which had been given by Guenicke, Boyle, improprieGravefande, and other's, for fitting up the air-pump for ty of feakexperiment, ly foaking the leather in water, covering ing the lea. the joints with water, or in fhort, admitting water or water, any other volatile body ncar it.

I4r
He therefore took his pumps to pieces, cleared them And the of all the moifture which he could drive from them by veility of heat, and then leathered them anew will leather fnaked in a mixture of olive oil and tallow, from which he liad oil and expelled all the water it ufually contains, by boiling it till the firt frothing was over. When the pumps were fitted, up in this manner he uniformly found that Mr Smeaton's pump rarefied the gage to 29.95 , and the belt common pump to 29.87, the firt of which he computed to indicate a rarelaction to 600 , and the other to 230. But in this ftate he again found that a piece of damp paper, leather, wond, \&cc. in the recciver, reduced the performance in the fame manner as before.

But the mof remarkable phenomenon was, that when A ${ }^{142}$ he made ufe of the pear-gage with the pump cleared from able pheall moifture, it indicated the fame degree of rarefaction nomcuon. with the barometer-gage : but when he expofed a bit of paper moillened with firits, and thus reduced the rarefaction of the pump to what he called 50 , the baro-meter-gage fanding at 29.4, the pear-gage indicated a rarefaction exceeding 100,000 ; in hhort, it was net meafurable; and this phenomenon was almof conftant. Whenever he expofed any fubltance fufceptible of evaporation, he found the rarefaction indicated by the ba-rometer-gage greatly reduced, while that indicated by the pear-gage was prodigioufly increafed; and both thefe effects were morc remarkable as the fubject was of cafier evaporation, or the temperament of the air of the chamber was warmer.

This uniform refult fuggefted the true caufe. Water Account boils at the temperature 212 , that is, it is then con. for, verted into a vapour which is permanently elaftic whila of that temperature, and its elafticity balances the preffure of the atmorphere. If this preffure be diminithed by rarefying the air above it, a lower temperature will now allow it to be converted intn elaftic vapour, and keep it in that flate. Water will boil in the receiver of an air-prump at the temperament 96 , or cven under it. Philofophers did not think of examining the fate of the vapour in temperatures lower than what produced ebullition. But it now appears, that in much lower heats than this the fuperficial water is converted into elatitic vapour, which continues to exliale from it as long as the water lifts, and, fupplying the place of air in the receiver, excrts the fame elafticity, and hinders the mercury foom rifing in the gage in the fume manner as fo much air of equal elafticity would have done.

When Mr Nairne was exlibiting thefe experiments Experi- 14 to the Honourable Henry Cavendilh in 1776 , this gen- ments ittleman informed him that it appeared from a frries of lufrating experiments of his father Lord Char les Cavendilh, that this ac. when water is of the temperature 72 , it is converted ${ }^{\text {cenint. }}$ into vapour, under any prefiure lef, than three-fourths of an inch of mercury, and at $43^{\circ}$ it becomes vapour when the preffure is lefs than one-fourth of an inch:

104

## P N E U M

Air-punp. Even mercury evaporates in this manner when all preffure is removed. A dewy appearance is frequently obferved covering the infide of the tube of a barometer, where we utitally fuppofe a vacuum. This dew, when viewed through a microficope, appears to be a fit of detached wlobales of mercury, and upon inclining the tube fo that the mercury may afcend along it, thefe glcbules will be all licked up, and the tube become clear. The dew which lined it was the vapour of the mercury condenfet by the fice of the tuhe; and it is nerer oblerved but when one fide is a..pofed to a Aream of cold air from a window, sic.

To return to the vapour in the air-pump receiver, it munt be obierved, that as long as the water cortinues to yield it, we may continue to work the pump; and it will be continualiy abfrafel by the barrels, and difcharged in the form of water, becaufe it collapfes as foon as expofed to the external preflure. All this while the gare will not indicate any more rarefation, becaufe the thing imnediately indicated by the baro-meter-gage is diminifeet elaficity, which does not happen here. When all the water which the temperature of the room can keep elanic has evaporated under a certain prefure, fuppofe $\frac{1}{2}$ an inch of mercury, the gage ftanding at 29.5 , the vapour which now fills the receiver expands, and by its diminilled elanticity the gage rifes, and now fome more water which had been attached to bodies by chemical or corpulcular attraction is detached, and a new fupply continues to fupport the gage at a greater height ; and this goes on continually till almoff all has been abitracted: but there will remain fume which no art can take away; for as it paffes through the barrels, and gets between the pifton and the top, it fuccefively collapfes into water during the afcent of the fiton, and again expands into vapour when we pufh the pilton down again. Whenever this happens there is an ond of the rarefaction.

145
Air and

## vapour not

 unifurmly mixed tugether.While this operation is going on, the air comes out along with the vapour; but we cannot fay in what proportion. If it were always uniformly mixed with the vapour, it would dimisifls rapidly; but this does not appear to be the cale. There is a certain period of rarefaction in which a tranfient cloudinefs is perceive $\downarrow$ in the receiver. This is watery vapour formed at that degree of rarefaction, mingled with, but not diffolved in or united with, the air, otherwife it wonld be tranfparent. A fimilar cloud will appear if damp air be admited fuddenly into an exhaulled receiver. The vapour, which fermed an uniform tranfparent mals with the air, is cither fuddenly expanded and thos detached from the cther ingredient, or is fuduenly let go by the air, which expands more than it docs. We camot arfirm with probability which of the fe is the caic: dilerent compofitions of air, that is, air haded with vapours from different lubflances, exhilit remarkable ciifferences in this refpect. But we fee from this and cther phenomena, which flall be mentioned in their proper places, that the ar and vapour are not always intimate!y united; and therefore will not always be drawn out together by the air-pump. But let them be cyer fo confufedly blended we fee that the air mult come out along with the vapour, and its quantity remaining in the receiver muth be prodigioufly diminifhed by this affociation, probably much more than could be, hat the receiver only contained pure air.

## A T I C S.

Let us now confider what mut happen in the pear- Ais pi gare. As the zir and vapour are continually drawn off from the receiver, the air in the pear expands and goes off with it. We fhall fuppofe that the generated va- quence pour hindzrs the gage from riing beyond 29.5 . Du- this di: ring the continned working of the pump, the air in ent in the pear, whofe elafticity is 0.5 , flowly mixes with pear a the vapour at the mouth of the pear, and the mix- gages ture even advances into its infide, fo that if the pumping be long enough continued, what is in the pear is nealy ot the fame compofition with what is in the receiver, conlifting perthaps of 20 parts of vapour and one part of air, all of the clafticity of 0.5 . When the pear is planged into the mercury, and the extermal air allowed to get into the reeeiver, the mercury rifes in the pear-gage, and leaves not $\frac{1}{60}$, but $\frac{1}{60 \times 20}$ or $\frac{1}{1200}$ of it filled with common air, the vapour hat ving collapred into an invifible atom of water. Thus the pear gage will indicate a rarefaction of 1 200, while the barometer-gage only fowed 60 , that is, fhowed the elafticity of the ineluded fubftance diminifhed 60 times. The conclufinn to be drawn from thefe two meafures (the one of the rarefaction of air, and the other of the diminution of elanticity) is, that the matter with which the receiver was filled, immediately before the readmiffion of the air, conflited of one part of incondenfible air, and $\frac{1200}{60}$, or 20 parts of watery vapour.

The only obfcure part of this account is what relates to the compofition of the matter which filled the peargage before the admiflion of the mer cury. It is not eafy to fee how the vapour of the receiver com in by a narrow mouth while the air is coming out by the fame paffage. Aecordingly it requires a very lorig time to produce this extreme rarefaction in the pear-gage; and there are grcat irregularities in any two fucceeding experiments, as may be feen by looking at Mr Nairne's accuunt of them in Philofophical Tranfactions, Vol. LXV II. Some vapours appear to have mixed much more readily with the air than others; and there are fome unaccountable cafes where vitriolic acid and fulphureous bodies were included, in which the diminution of denfity indicated by the pear-gage was uniformly lefs than the dimiantion of elaRicity indicateu by the barometer-gage. It is enough for us at prefent to have eflablifhed, by unqueftionable facts, this production of elalic vapour, and the neceffity of attending to it, both in the confruction of the air-pumpand in drawing refults from experiments exhibited in it,

Mr Smeaton's pump, when in good order, and per- The feqty free from all moinure, will in dry weather rarefy air about 600 times, raifug the barometergage to within $\frac{1}{5}$ of an inch of a fine barometer. This wis a performance fir mach fuperior to that of all others, and by means of Mr Nairne's experizents opened forew a ficld of obfervation, that the air-pump once more became a carital indrument among the experimental philofophers. The causes of its fuperiority were ahio fo ditinct, that artifts wese inmediately excited to a farther improvement of the machine; fo that this becornes a new epoch in its liRory.

This is one imperfection which $\operatorname{Mr}$ Smeaton has not aitempred to remove. The difcharsing value is ftill open-
r-pump. ed ngainf the preffure of the atmofpherc. An author valve, which exhaufs the nir from abore it, :md thus pats it in the fituation of the piffon vaive. We do not find that this improvement has been adnpted in as to beeme feneral. Indeed the quantity of air which remains in the paffage of this valve is fo exccedingly little, that it docs not feem in merit nttention. Suppofing the valve-hole $\therefore$ of an inch wide and as decp (and it need not be more), it will not occupy more than $\ddagger$;ig part of a barrel twelve inches long and two inches wide.

Air Smeaton, hy his ingenious conftrugion, has great$1_{\mathrm{j}}$ diminifhed, but has not annililated, the obitruetions to the paflage of the air from the receiver into the barrel. His fuccefs encouraged farther attempts. One ef the firft and moft ingcnious was that of Proffflor Rurf. fel of the univerfity of Edinburgh, who about the year ryio comitrueted a mamp in which both coeks and valves wore avoided.
The pilton is folid, as reprefented in fig. 25. and its rod fanfes through a collar of leather on the tup of the batrel. This collar is divided into three portions by two brafs rings $a, l$, which leave a very fmall fpace ronnd the pirton rod. The upper ring a communicates by means of a lateral perforavien with the bent tube 1 mz , which enters the barrel at its midalen. The lower ring $\psi$ commanicates with the bent tabe $\boldsymbol{r} d$, which commamicates with the horizontal paffage $d x$, going to the middter, of the promp plate. By the way, however, it communicates alio with a barometer gage $p c$, ftanding in a cittern of mercury 0 , and covered with a glats tube clore at the top. Beyond $\varepsilon$, on the oppofite circumferef ce of the receiver plate, their is a cock or plug $f$ ermmunicating with the atmofphere.

The pifnn rod is clofely embraced by the three colJars of leather; but, as already faid, has a free fpace round it in the two brafs rings. To produce this preffure of the leathers to the rod, the brafs rings which feparate them are turned chinner on the irmer fide, fo that their crofs fection along a diameter would the a taper weige. In the fide of the pifton rod are tro cavities or, is, about one-tenth of an inch wide and decp, and of a length equal to the thickners of the two rimgs $a, h$, and the intermediate colkar of leathers. Thefe cavitics are fo placed on the pifon-rod, that when the piton is applied to the bottom of the barrel, the cavity 4 :s in the upper end of the rod has its upper end oppofite to the ring $a$, and its lower end oppofite to the ring $b$, or to the mouth of the pipe' $c$ d 'Therefore, if there be a woid in the barrel, the air from the receiver will come from the pife $t d$ into the cavity in the pifton rod, and by it will get paft the collar of leather between the rings, and thus will get into the finall interftice between tlre ood and the upper ring, and then into the pipe $/ m n$, and into the empty barrel. When the pifton is drawn up, the folid rod immediately thuts up this paffage, and the pifon drives the air tirrougln the difcharging valve $火$. When it has reached the top of the barrel, and is clofely applied to it, the caviry $q r$ is in the fituation in which is formerly was, and the commnnication is again opened between the receiver and the empty barrel, and the air is again diffured between them. Pufling down the pifon cxpels the air by the lower difcharging pipe and valve $b i$; and thus the oferation may be continued.

Vo.. XV.

This mult be acknowledged to be a mof fimple and ingenious conltraction, and can neither becalled a cock nor a valic. It feems to appofe no obfruction whatcver: and it has the fuperior advantage of rarefying both during the afcent and the defcent of the pillon, doubling the espedition of the performance, atid the rperator is not oppofed by the prefure of the atmo. fohere except towards the end of each ftroke. The ex. pedition, however, is not fo great as ore fiould expeat ; for nothing is gring on while the pifon is in motica, and the operator muf fiop a while at the end of each ftroke, that the air may have time to come through this long, narrow, and crooked patlage, to fill the bared. But the chief difficulty which occured in the execution arofe from the clammy oil with which it was necefliary to impregnate the coller of leathers. Thefe were almays in a thate of frong comprefion, that the; might clofely sialp the pifon rod, and prevent anl patrage of ait during the motion of the pifton. Whenever therefore the cavitics in the pifon rod come into the fruations neceflary for connecing the receiver and barrel, this oil is fqueezed into them, and choaks them up. Ifence it always happened that it pas fome time after the Aroke before the air could force its wizy round the piton rod, carrsing with it the clammy oil which choaked up the tube $7.7 n \mathrm{n}$; and when the rarefaction had proceoded a certain lengith, the diminifhed elafioity of the air was not able to make its way through thefe obftructions. The death of the ingenious author put a flop to the improvements by which he hoped to remedy this defec, and we have not heard that any other perfon has fince attempted it. We have inferted it here, becaufe its principle of conftruction is not only very ingenious, but entirely different from all others, and may furnifh very ufefal hints to thofe who are much engaged in the conftrution ef preumatic engines.

In the 73 d volunie of the Philofoplical Tranfagions, liy Has Mr Tibcrius Cavallo has given the defcription of an and Har. air-pump contrived and executed by Meffrs Haas and ter, Hirter, inftument-makers in London, where thefe artifts have received Guericke's method of opening the bar-rel-valve during the latt frokes of the pamp by a force noting from withont. We thall infert fo much of this defctiption as relates to this diftinguifling circumfance of its confruction.

Fig. 2\%. reprefents a fection of the bottom of the barrel, where AA, is the barrel and BB the botom, which has in its middle a hollow cyiinder CCFF, projeciling about half an inch into the barrel at CC, and extending a good way downmards to FF. The fpace between this projection and the fides of the barrel is filled up by a brats ring DD, over the top of which is ffrained a piece of oiled filk EE, which performs the office of a valve, covering the hole CC. But this hole is filled up by a piece of Lrais, or rather an alfemblage of pieces ferewed together GGHHII. It conlifts of three projecting fillets or fhoulders GG, HH, II, which form tro hollows between them, and which are filled with rings of oiled leather $O$; IP, firmly fcrewed together. The extremre fillets GG, 11 , are of equal diameter with the infide of the cylinder, fo as to fill it exactly, and the whole ftuffed with oiled leather, fide us and down without allowing any air to pafs. The middle fillet HH is not fo broad, but thicker. In the upper fillet GG there is formed a flallow difhabout ; of an inch
dee ${ }^{\text {P }}$ periments rarefied 600 times.

Aiming fill at the removing the obftrutions to the entry of the air from the receiver into the barrels, Mir Prince, an American, has contructed a pump in which there is no valve or cock whatever between then. In this pump the pitton rod paffes through a collar of leathers, and the air is finally difcharged through a v.llve, as in the two laft. But we are chiefly to attend, in this place, to the communication between the batrel and the receiver. The barrel widens below into
deep and ${ }^{3}$ wide. This, dih is covered with a thin plate, pierced with a grating like Mr Smeaton's valve-plate. There is a perforation VX along the axis of this picce, which has a pallage out at one fide H , through the middle fillet. Oppofite to this paffage, and in the ficle of the cylinder CCFF, is a hole M, communicating with the conduit pipe MN, which leads to the receiver. Into the lower end of the perfuration is ficiewed the pin KL, whofe tail L paffes through the cap FF. The tail L is connected with a lever RQ, moveable round the joint Q. This lever is pufhed upwards by a fping, and thus the whole piece which we have been deferibing is kept in contact with the flip of oiled filk or valve EE. This is the uf:al fituation of things.

Now fuppofe a void formed in the barrel by drawing up the pifton; the clafticity of the air in the receiver, in the pipe NM, and in the paffage XV, will prefs on the great furface of the valve eapofed through the grating, will raife it, and the pump will perform precielely as Mr Smeaton's does. But fuppofe the rare. fation to have been fo long continued, that the air is no linger able to raife the valve; this will be feen by the mercury rifing no more in the pump-gage. When this is perceived, the operator muft prefs with his foot on the cnd R of the lever RQ. This draws down the pin KL, and with it the whole hollow plug with its grated top. And thus, inftead of raifing the valve from its plate, the plate is here drawn down from the valve. The air now gets in without any obftruction whatever, and the rarefaction proceeds as long as the piton rifes. When it is at the t"p of the barrel, the operator takes his foot from the lever, and the fpring prefles up the plug again and thuts the valve. The pifton rod pafies through a collar of leather, as in Mr Smeaton's pump, and the air is finally difcharged through an outward valve in the top of the barrel. Thefe parts have nothing peculiar in them.

This is an ingenious contrivance, fimilar to what was adapted by Guericke himfelf; and we have no doubt of thefe pumps performing extremely well if carefully made: and it feems not difficult to keep the plug perfectly air-tight by fupplying plenty of oil to the leathers. We cannot fay, however, with precifion what may be expetted from it, as no account had been given of its effects befides what Mr Cavallo publifled in Philofophical Tranfalions $17_{7} 8$, where he only fays, that when it had been long ufed, it had, in the courfe of fome exa fort of ciftern $A B C D$ (fio. 27.), communicating w th the rece ver hy the pipe EF. As foon, therefore, as the pifton gets into this wider part, where there is a vacancy all round it, the air of the receiver expands freely through the palfage FEE into the barrel, in which the deficent of the pitton had made a void. When the pifon is again drawn up, as foon as it gets into the cylindric part of the barrel, which it cxatly fills, it
caries up the air before it, and expels it by the top Air-pu: valve; and, that this may be done more completely, this valve opens into a fecond barrel or air-pump whofe pifon is sifing at the fame time, and therefore the valve of communication (which is the difcharging valve of the primary pump) opens with the fane facility as Mr Smeaton's pifton valve. While the piton is riting, the air in the receiver expands into the barrel ; and when the pifon defcends, the air in the barrel agsin collapres till the pifon gets again into the cillern, when the air paffes out, and fills the evacuated barrel, to be expelled by the piton as before.

No diftind account has as yet been given of the performance of this pump. We only learn that great inconveniences were experienced from the ofcillations of the mercury in the gage. As foon as the pifton comes into the ciltern, the air from the receiver immediately rufhes into the barrel and the mercury thoots up in the gage, and gets into a tiate of ofcillation. The fubfequent rife of the pifton will frequently keep time with the fecond of illation, and increafe it. The defcent of the pillon produces a downward ofcillat:on, by allowing the air below it to collapfe; and, by improperly timing the frokes, this of cillation becomes fo great as to make the mercury enter the pump. To prevent this, and a greater irregularity of working as a condenfer, valves were put in the pitton: but as thefe require force to open them, the additon feemed rather to increafe the evil, by rendering the ofcillations more dimultaneous vith the ordinary rate of working. If this could be got over, the conftuction feems very promifing.

It appears, however, of very dificult execution. It has many long, flender, and crooked paifages, which mult be drilled through broad plates of brafs, fome of them appearing fearcely practicable. It is rare to find plates and other pieces of brafs without air-holes, which it would be very difficult to find out and to clofe: and it muft be very difficult to clear it of obtructions: fo that it appears rather a fuggeftion of theory than a thing warranted by its actual performance.

Mr Lavoifier, or fome of the naturalifs who were ry ${ }_{\mathrm{L}} \mathrm{I} 5$ occupied in concert with him in the invefigation of the fier, different fpecies of gas which are difengaged from bodies in the courfe of chemical operations, has contrived an air-pump which has great appearance of fimplicity, and, being very different from all others, deferves to be taken notice of.

It condifts of two barrels $l, m$, fig. 28 , with folid $p^{i-}$ ftons $k k$. The pump-plate $a b$ is pierced at its centre $c$ with a hole which branches tow:urds each of the barrels, as reprefented by $c d$, ce. Between the plate and the barrels flides another plate $b$;, pierced in the middle with a branched hole $f d g$, and near the ends with two holes $6 h, i$, , which go from its underfide to the ends. The holes in thefe two plates are $f$, adjutted, that when the plate $/ \mathrm{i}$ is drawn fo far towards $h$ that the hole $i$ comes within the barrel $m$, the branch $d f$ of the hole in the middle plate coincides with the branch $c d$ of the uppor plate, and the holes $e, g$ are thut. Thus a commurication is eftablithed between the barrel ! and the recciver on the pump-plate, and between the barrel $m$ and the external air. In this fituation the batrel $l$ will exh.unf, and $m$ will difcharge. When the pitton of $l$ is at its mouth, and that of $m$ touches its bottom, the fliding plate is fhifted over to the other fide, fo that
ir.pump. o communicates with the receiver through the paffage gd, ce, and / communicates with the air by the pathegres b $h$.

It is evident that this fliding plate performs the office of four cocks in a very boatuful and fimple manner, and that is the piftons apply clofe to the ends of the barcls, fo as to expel ti:e whole air, the pump will be pertect. It works, indeed, againt the who!e preffure of the external air. But this may be avoided by putting valres on the holes $h, i$; and thefe can do no harm, becaufe the air remaining in them neter gets back into the barrel till the piton be at the farther end, and the exhaufion of that froke completed. Dut the belt workmen of London think that it will be incomparably more difficult to execute this cock (forit is a cock of an unufurl form), in fuch a manner that it flall be aireight and yet move with tolerable eate, and that it is much more liable to weang loofe than common cocks. No accurate accounts have been received of its performance. It mutt be acknowledged to be ingerious, and it may fuggeft to an intelligent artift n method of combining common conical cocks upor one axis fo as to anfwer the fame purpoles much more effectually; for which reafon we have inferted it here.

The laft improvement which we thall mention is that publihed by Mr Cuthberton philofophical intrumentmaker in Amllerdam. His punp las given fuch cvidences of its perfection, that we can hardly expect or wifh for any thing more complete. But we mult be allowed to obferve, beforehand, that the fame cenftruction was invented, and, in part, executed before the end of 1779 , by Dr Daniel Rutherford, now profeffor of botany in the univerfity of Edinburgh, who was at that time engaged in experiments on the production of air during the combuttion of bodies in contact with nitre, and who was vally defirous of procuring a more complete abfraction of pure aerial matter than could be effected by Mr Smieaton's pump. The compiler of this article had then an opportunity of perufing the Doctor's diflertation on this fubject, which was read in the Philofophical Society of Edinburgh. In this difiertation the Dofor appears fully apprifed of the exiftence of pure vital air in the nitrous acid as its chief ingredient, and as the catule of its moft remarkable phenomena, and to want but a Atep to the difcoveries which have ennobled the mame of Mr Lavoifier. He was particularly anxious to cbtain apart this diftinguifling ingre dient in its compofition, and, for this furpofe, to abftract completely from the veffel in which he fubjected it to examination, every particle of elallic matter. The writer of this article propefed to him to cover the bottom of Mr Smeaton's filion with fome clammy matter, which fhould take hold of the bottom valve, and fart it when the pillon was drawn up. A few days after, the Doctor thowed him a drawing of a pump, having a conical metal value in the bottom, furnifhed with a long flender wire, fliding in the infide of the pifton rod with a grentle friction, fuficient for lifting the valve, and fe-
cured agnint all chance of faibure by a fpring a to , sir pump. which took hold of a notel in the inlide of the piton:rod about a quareer of an inch trom the lower end, fo a; certainly to lift the valve during the hat quarter of an inch of the pitton's motion. Being an excellent mechanic, he had executed a valve on this principle, and was fully firfied with its penlirmince. But hawin? already confmed his doctmes nelpeanig the nisr us acidby incontrovestible experiments, his withes to im. prove the air-pump lut their incitement, and lic thought no more of it; and not long after this, the ardour of the philofophers of the Teylerian Socicty at Haerlem and Amfterdam excited the efforts of Mr Cutlbettion, their inflrument maker, to the fame perpofe, and procuced the moft perfeet air pump that has yet appeared. We tholl give a defciption of it, and an account of its leaformance, in the inventor's own word.

## Cuthbentson's's fir-purp.

Plate CCCCVIII. is a perfpective view of this fump, with its two principal gages forewed into their places. Thefe need not be ufed together, except in cafes where the utmolt exactuefs is rezuired. In common experimen:s one of them is removed, and a Hop-fcrew put in its place. When the pear-gage is u'ed, a fmall round plate, on which the receiver may finad, mutt be firft ferewed into the hole at $A$; but this hole is It upped on other nccafions with a fcrew. When all the three gages are ufed, and the receiver is exhanted, the fop-1crew 13, at the bottom of the pump, muft be unfcrewed, to admit the air into the receiver; but when they are not all nfed, either of the other ftopforew; will anfwer this purpofe.

Fig. 2. reprefents a crofs-bar for preventing the barrels from being thaken by working the pump or by any accident. Its place in fig. 1 . is reprefented by the dotted lines. It is confined in its place, and kept clore down en the barrels by two flips of wood NN, which mult be drawn out, as well as the ferews $O O$, when the pump is to be taken afunder.

Plate CCCCIX. is a fection of all the working parts of the pump, except the wheel and rack, in which there is nothing uncommon.

Fg. 1. is a fection of one of the harrele, with all its internal parts; and fig. $2,3,4$, and 5, are different parts of the piton, proportioned to the lize of the barrel (A) and to one another.

In fig. I. CD reprefents the barrel, F the collar of leathers, $G$ a hollow cylindrical veffel to contain oil, R is aifo an oil-veffel to receive the oil which is drawn, along with the air, through the hole $a a$, when the pitton is drawn upwards; and, when this is full, the oil is carried over with the air, along the tube T, into the oil-veffel G. cc is a wire which is driven upwards from the hole a a by the paffage of the air; and as foon as this has efcaped, it falls down again by its own weight, thuts up the hole, and prevents all return of the air into the barrel. At $d d$ are fixed two pieces of brafs, to keep the wire $c c$ in a vertical dinedion, that it may accurately thut the hole. H is a cylindri-
(A) The pifon and barrel are 1,65 inches in diameter, in froportion to which the feale is drawn. Figures 2 , 2. 4. 5. are, however, of dnuble fize.

Air-f ump. cal wire or rod which carries the pifton I, and is made hollow to receive a long wiregg, which opens and Hhuts the loole L ; and on the other end of the wire O is ficrewed a nut, which, by fopping in the narroweit part of the hole, prevents the wire from being diven up
Thate too far. This wire and forew are more clearly feen in
eCcCIX. fig. 2. and 6; they flide in a collar of leather $r$, fig. 2 . and 5 , in the middle piece of the pilton. Fig. 4. and 5 . are the two mean parts which compofe the pitton, and, when the pieces 3. and 6 . are added to $i t$, the whole is reprefented by lig. 2. Fig. 5. is a piece of brats of a conical ferm, with a fhoulder at the bottom. A long hollow ferew is cut in it, about $\frac{2}{3}$ of its length, and the remainder of the hole, in which there is no ferew, is of about the fame diameter with the ferewed part, except a thin plate at the end, which is of a widh exaoty equal to the thicknefs of $g \sigma$. That part of the infide of the conical brafs in which no thread is cut, is filled with oiled leathers with holes through which of ${ }^{5}$ can flide fiffly. There is alfo a male forew with a hole in it, fitted to $s g$, ferving to compuefs the leathers $r$. In fig. 4. a aad is the outlide of the piton, the infide of which is turned fo as exacly to fit the outfide of fig. 5 . $t b$ are round leathers about 60 in number, $c c$ is a circular piece of brafs of the tize of the leathers, and $d d$ is a ferew ferving to comprefs them. The fcrew at the end of fig. 3. is made to fit the ferew in fig. 5. Now if fig. 6. be pufled into fig. 5 , this into fig. 4 , and fig. 3. be ferewed into the end of fig. 5 , thefe will compofe the whole of the pitton, as reprefented ia fig. 2. Hin fig. . 1. reprefents the fame palt as H in fig. 2 , and is that to which the rack is fixed. If, therefore, this be drawn upwards, it will caufe fig. 5. to thut clofe into fig. 4, and drive out the air above it ; and when it is pulled downward, it will open as far as the thoulder $a a$ will permit and fuffer air to pafs through. AA fig. 7 . is the receiver plate, BB is a long fquare piece of brafs, fcrewed into the under fide of the plate, through which a hole is drilled correfponding to that in the centre of the receiver-plates and with three female fcrews $b, b, c$.
The rarefaction of the air in the recfiver is effeted as follows. Suppofe the pifton at the bottom of the barrel. The infide of the barrel, from the top of the pitonto $a$, contains common air. When the rod is drawn up, the upper part of the pifton flicks falt in the barrel till the conical part connected with the rod thuts the conicat hole, and its fhoulder applies clofe to it battom. The piton is now fhut, and therefore the whole is drawn up by the rack-work, driving, the air before it through the hole $a a$, into the oil-vefel at $R$, and out into the room by the tube T. The pirton will then be at the top of the barrel at $a$, and the wire $g g$ will itand nearly as reprefented in the figure juft raiied from the hole L , and prevented from riting higher by the nut $O$. Daing this motion the air will expand in the receiver, and come along the bent tube $m$ into the barrel. Thus the barrel will be filied with air, which, as the piftor rifes, will be rarefied in proportion as the capacity of the receiver, pipes, and barrel is to the barrel alone. When the piton is moved down agaia by the rack-work, it will force the conical part fig. 5 , out of the hollow part fig. 4. as far as the ihoulders $a$, ; fig. 2. will reft on aa fis. 4 , which will then be fo far open as to permit the air to pafs freely through it, while at the fame time
the end of $g g$ is forced againft the top of the hole, and Air pun thuts it in order to prevent any air from returning into the receiver. Thus the piton, moving downwards, fuffers the air to pafs out between the fides of fig. 4 . and 5. ; and, when it is at the bottom of the barrel, will have the column of air above it ; and, confequently, when drawn upwards it will fhut, and drive out this air, and, by opening the hole L at the lame time, will give a frec paffage to nore air from the receiver. This procefs bsing continued, the air of the receiver will be rarvieal as far as its expayfive power wuill permit. For in this machine there are no valves to bo forced open by the elallicity of the air in the receiver, which at lalt it is unable to effect. There is therefore nothing to prevent the air from expanding to its utmolt degree.

It may be fuppeced here, that as the air mult efcape through the difchargins pallage ac, Plate CCCCIX. fig. 1. againt the preflure of a column of oil and the weight of the wire, there will remain in this palfage at quantity of air of confiderable denfity, which will expand again into the barrel during the defeent of the pifton, and thus put a fop to the progrefs of rarefa\&tion. This is the cafe in Mr Smeaton's pump, and all which have valves in the pitton. But it is the peculiar excellency of this pump, that whatever be the denfity of the air remaining in ac, the rarefaction will tall go on. It is worth while to be perfectly convinced of this. Let us fuppofe that the air contained in $a c$ is .,. part of the common air which would fill the barrel, and that the capacity of the barrel is equal to that of the receiver and pallages, and that the air in the receiver and barrel is of the fame doufity, the piton being at the bottom of the barrel: The barrel will theref re contain
 $T \frac{1}{\square} \circ$. Now let the pifton be drawn up. No air will be difcharged at ac, becaufe it will contain the whole air which was in the barre!, and which has now collapfed into its ordinary bulk. But this dees not in the leall hinder the air of the receiver from expanding into the barrel, and diffufing itfelf equally between both. Each will now contain $0^{\frac{5}{6}}$ of their ordinary quantity when the pitton is at the top, and $a c$ will contain $r_{r=}$ as before, or $\frac{10}{\circ} \%$. Now pulh down the pilton. The hole $L$ is intantly fhut, and the air in a $c$ expands into the barrel, and the barrel now centains $\frac{1}{6} \frac{5}{6} \frac{0}{5}$. When the piton has reached tie bottom, let it be again drawn up. There wille be ${ }_{5}{ }^{\frac{s}{5}-\pi}$ difcharged through $c$, and the air in the receiver will ag:in be equaily diftributed between it and the barrel. Therefore the recciver will now contain $\frac{2 \frac{1}{2}}{1000}$. When the pifon reaches the hot12管
tom, there will be $\frac{1020}{1000}$ in the barrel. When again drawn up to the top, there will be $\frac{2 \frac{1}{1}}{1000}$ difclarged, and the receiver will contain $\frac{1}{100}$; and when the piton reaches the bottom, there will be $\frac{1 \mathrm{I}^{\prime}}{1000}$. At the next Aroke the receiver will contain only $\frac{0.4}{1000}$ \&c. \&c.
Thus it appeas, that notwithfanding the $7:{ }^{\circ} \sigma$ owhich always
19. always expands back again out of the hole ac into the barrel, the rarity of the air in the receiver will be doubled at every throke. There is therefore no need of a fubfidiary air-pump at $c$, as in the A nericinn airpump, and in the Swedith attempt to inorove Smeaion's.
In ufing this air-pump no particular directions aro necelfary, nor is any peculiar care necelfiury for keeping it in order, except that the oil-veffel A be always bept about half full of oil. When the pump has flood long without being ufed, it will be proper to draw a tablefpoontul of olive-oil through it, by pouring it into the hole in the middle of the receeiver-plate when the pifton is at the bottom of the barrel. Then by working the pifton, the oil will be drawn through all the parts of the pump, and the furplus vill be driven through the tube $T$ into the oil-veffel $G$. Near the top of the pifon-rod at $H$ there is a hole whicl lets fome oil into the intide of the rod, which gets at the collar of leathers $r r$, and keeps the wise $g g$ air-right.

When the pump is ufed for condenfation at the fame time that it rarefies, or feparately, the piece containing the bent tube T mult be removed, and fig. 8. put X. into its place, and fixed by its ferews. Fig. 8. as drawn in the plate, is intended for 2 double barreled pump. But for a fingle barrel only one piece is ufed, reprefented by $4 a a$, the double piece being cut off at the dotted line a a. In this piece is a demale ferew to receive the end of a long brafs tube, to which a bladder (if fufficient for the experiment of condenfation), or a glafs, properly fecured for this purpofe, mult b= fccrewed. Then the air which is abftracted from the receiver on the pump-plate will be forced into the bladder or glafs. But if the pump be double, the apparatus fig $\$$. is ufed, and the long brafs tube fcrewed on at $\varepsilon$.

Fig. 9. and 10. reprefent the two gages, which will be fufficiently explained aftervards. Fig. 9. is fcrewed into $c b$, or into the ferew at the other end of $c$ fig 7 . and fig. 10 . into the ferew $a b$ fig. 7.

If it be ufed as a fingle pump, cither to rarefy or condenfe, the farew $K$, which faltens the rack to the pifton-rod $H$, muft be taken out. Then turning the winch till H is deprefied as low as pofible, the machine will be fitted to exhauft as a fingle pump; and if it be required to condenfe, the cirection in $n^{\circ} 8$. mult be obferved with regard to the tube T, and fig. 3.
"I took (fays Mr Cuthbertion) two barometer-tubes of an equal bere with that fised to the pump. Thefe were filled with mercury four times boiled. They were then compared, and food excclly at the fame beight. The mercury in one of them was boiled in it four times more, without making any change in their height; they were therefore judged very perfect. One of thefe was immerfed in the cifern of the pump-gage, and faftened in a polition parallel to it, and a fliding feale of one inch was att.ached to it This fcale, when the gage is ufed, mull have its upper edge fet equal with the furface of the mercury in the boiled tube after exhaution, and the difference between the height of the mercury in this and in the other barometer tube may be obferved to the $-\frac{1}{5}=$ of an inch; and being clofe together, no error arifes from their not bcing exactly vertical, if they are only parallel. This gage will be ketter underflood by infpecting fig. io.
"I uled a fecond gage, which I flatl call a double Ar-pump* fyphon. Sea Plate CLCCIX. fig. 9. This was allo prepared with the utmolt cars. i had a fcale for meafuring the differene between the leaight of the columns in the two legio. It was an inch long, and divided as the former, and liept in a tra!y vertical polition by fufpending it from a point with a weight hung to it, as reprefented in the ligure. Upon comparing thefe two gages, 1 always found them to indicate the fame degree of rarefaction. I alfo uled a pear-gaze, though the moll inperfeat of all, in order to repeat the curious experiments of Mr Nairn and others."

When experiments require the utmoft rasefying power of the pump, the receiver muft not be pliced on leather, either oiled or forked in water, as is ufually done. The pump-plate and the edge of the receiver mult be ground very flat and true, and this with very finc emery, that no roughnefs may remain. The plate of the pump mulf thea be wiped very clean and very dry, and the receiver rubbed with a warm cloth till it become electrical. The receiver being now let on the plate, hog's lard, either alone or mixed with a little oil, which has been cleared of water by toiling, nu?f be fmeared round its outfide edge. In this condition the pump will rarefy its utmof, and what fill remsins in the receiver will be permanent air. Oira little of this compofition may be thinly dimeared on the pump-plate ; this will prevent all riks of feratching it with the ealge of the receiver. Leather of very uniform thicknefs, long dried before a fire, and well foaked in this compofition, which muft be cleared of all water by the firt boiling, will anfwer very well, and is expeditious, when receivers are to be frequently thifted. Other leathers thould be at hand foaked in a compofition containing a little rofin. This gives it a clamminefs which renders it impermeable to air, and is very proper at ali joints of the pump, and all apparatus for pneumatic experiments. As it is impofible to render the pear-gage as dry as other parts of the the apparatus, there will be generally fome variation between this and the other gages.
When it is only intended to thow the ytmolt power of the punp, without intending to afcertain the quality of the refidum, the recsiver may be fet on wet leather. If, in this condition, the air be rarefied as far as pogible, the fyphon and barometer gage will indicate a lefs degree of raretaction than in the former experimants. But when the air is let in again, the pear-gage will point out a rarefaction fome thoulands of times greater than it did betore. If the true qu:lity of permanent air after exhaultion be required, the pear.gage will be neareft th: truth : for when the air is rarcfied to a certain degree, the moiftened leather emits an expanfible fluid, which, filling the receiver, forces out the permanent air; and the two firlt gages indicate a degree of exhaptiou which relates to the whole elattic matter remaining in the receiver, viz: to the expanfible fuid tagether wittl? the permanent air ; whereas the pear-gage points out the degree of exhaultion, with relation to the permanemi air alone, which remains in the recejver; for by the pref. fure of the air almitied into the receiver, the elaftic vapour is reduced to its fornaer bulk, which is imperceptio ble.
Miany badies emit this elaflic flnid when the preflure of the air is much diminithed; a piece of leather, in its

Air-pump, ordinars domp Rate, about an inch fquare, or a bit of geen or dry wood, will fupply this for a grat while.

When fuch Auids havz been generated in any experiment:, the puinp muft be carefully cleared of them, for they remain not only in the receiver, but in the barrels and palfages, and will again expand when the exhauftion lias been carried tar.

The belt method of clearing the funup is to take a very large receiver, and, uhing every precaution to exhoult it as far as pollible. Then the expanfible matter lurking in the barrels and pafles will be diffuled through the receiver alfo, or will be carried off along with its air. It will be as much rarer than it was before, as the argregate capacity of the receiver barrels and paffes is larger than that of the two lant.

The performance of the pump may be judged of from the fout following experiments.

The two gages bing ferewed into their places, and the hole in the receiver-plate fhut up, the pump was made to exhaut as far as it could. The mercury in the legs of the fyphon was only $x^{\prime} \overline{0}$ of an irch out of the level, and that in the boiled barometer-tube s. of an inch ligher than in the one forewed to the pump. A Atndand baramcter then fond at 30 inches, and therefore the pump rarefied the permanent air 1200 times. This is twice as much as Mr N :im found Mr Smeaton's do ia its but llate. Mr Cavallo feems difpofed to give a farourable (while we mutt fuppofe it a just) account of Has and Hurter's pump, and it appeatrs never to have exceeded 600 times. Mr Cuthbertfon has often found the mercury within $\mathbb{T}^{\frac{5}{8}}$ of an inch of the level in the fyphon-gage, indicating a tarefaction of 3000 .

To one end of a glafs tube, 2 inclues diameter and 30 inches long, was fitted a brafs cap and collar of leather, through which a wise was inferted, reaching about two inches within the tube. This was connected with the conductor of an electric machine. The other end was ground flit and fet on the pump-plate. When the gages indicated a rarefaction of 300 , the light became fleady and uniform, of a pale colour, though a little tinged with purple; at 600 the light was of a pale dufky white; when $\mathbf{3} 200$ it difappeared in the middle of the tube, and the tube conducted fo well that the prime conduhor only gave diorks fo faint and ihort as to be fcarcely perceptible. After taking off the tube, and making it as dry as poliible, it was again connetted with the conductor, which was giving faarks two inches long. When the air in it was rarefied ten times, the fparks were of the fame length. Sometimes :l pencil of light darted along the tube. When the rurefacion was 20, the fpark did not exceed an inch, and light freamed the whole length of the tube. When the rarefaction was zo, the parks were lialf an inch, and the light ruthed along the tube in great Areams. When the rarefacti $n$ was 100 , the fpanks were ahout $\frac{7}{4}$ long, and the light filled the tube in an uninterrupted bocly. When 300 , the appearances were as before. When 600, the parks were - , and the light was of a fant wite colour in the middle, but tinged with furple toward the cnds. When 1200 , the lisht was liardly percoptible in the middle, and was much fainter at the ends than before, but flill iuddy. When Iqco, which wis the noll the pump could froduce, fir: inches
of the middle of the tube were quite dark, and the ends free of any tinge of red, and the fparlis did not exceed H of an inch.

We trut that our readers will not be difpleafed with the preceding hinory of the air-pump. The occafional information which it gives will be of great ufe to every perfon much engaged in pneumatic experiments, and help him in the contrivance and conftuction of the necoflary apparatus.

We may be indulged in one remark, that although this noble inftument originated in Germany, all its improvements were made in Britain. Both the mechanical and pneumatical principles of Mr boyle's con. ftrudion were extremely different from the German, and, in refpect of expedition and convenicucy, much fu. perior. The double barrel and gare by INawkefoe we:e capital improvements, and on principle ; and Mr Smeatton's method of making the pitton work in rarefied air made a complete change in the whole procefs.

Aided by this machire, we can mate experiments Utili efteblifning and illuttrating the growity and elafticity of the a the air in a much more perficuous manner than could pumg be done by the fpontaneaus phenomena of nature.

It allows us in the firft place to fhow the materiality Expe of air in a very diftinct manner. Bodies cannot move ment about in the atmofplese without difplacing it. This how requires force; and the reliltance of the air always di- utilit minithes the velocity of bodies moving in it. A heary body therefore has the velocity of its fall diminifhed; and if the quantity of air difplaced be very great, the diminution will be very confiderable. This is the reafon why light bodies, fuch as feathers, fall very flowly. Their moving force is very fmall, and can therefore difplace a great quantity of air only with a very fmall velocity. But if the fame body be dropped in vacuo, when there is no air to be difplaced, it falls with the whole velocity competent to its gravity. Fig. 29. Plate CCCCII. reprefents an apparatus by which a guinea and a downy fcather are dropped at the fame inllant by opening the forceps which holds them by means of the flip-wire in the top of the receiver. If this be done after the air has been pumped out, the guinen and the feather will be obferved to reach the botton at the fame intant.

Fig. 30. reprefents another apparatus for fhowing the fame thing. It contifs of two fets of brafs vanes put in feparate axles, in the manner of windmall fails. One fet has their edges placed in the direction of their whirling motion, that is, in a plane to valich the asis is perpendicular. The planes of the other fet pafs through the axis, and they we theretore uimmed fo as direatly to front the air throuch which they move. 'Two fprings ast upon pins projecting from the axi; ; and therr frength ortenlions are to aly fed, that when they are difengaged ins eracn, the two fets continue in motion equally long. If they are difencyaged in the air the vanes which beat the air with their rlanes will ilop long before thofe which cut it edgewife.

We can now abtract the air almot completely from a dry veffel, fo as to know the precire weight of the air which filled it. The frrit experiment wre lave of this kind, done with accurary, is that of Wr Hooke, Fcb. : 0 . 651 , when he found $11+$ pints of air to weigh
p. weigh $9+5$ grains. One pint of water was $8 \frac{7}{5} \frac{1}{2}$ ounces. This gives for the fpecific gravity of air $\frac{1}{5} \frac{0}{0}$ very nearly.
Since we are thus immerfed in a gravitating fluid, it follows, that every body preponderates only with the ex. cefs of its own weight above that of the air which it diflaces; for every body lofes by this immertion the weight of the difplaced air. A cub e fuot lofes about 521 grains in frofty weather. We fec balloons even rife in the air, as a piece of cork rifes in water. A mafs of water which really contains 850 pounds will load the feale of a balance with $8+9$ only, and will he balanced by about $8_{49}$ ! pounds of brals. 'This is evinced by a very pretty experiment, reprefented in fig. $3^{1}$. A nnall beans is fufpended withn a receiver. To one end of the beam is appended a thin glafs or copper ball, clote in every part. This is balariced by a fmall piece of lead hung on the other aim. As the air is pumped out of the recciver, the ball will gradually preponderate, and will regain its equilibrium when the air is re-admitted.

Some naturalifs have propofed, and actually ufed, a large globe of light make, fulpended at a beam, for a barometer. If its cap.acity is a cubic foot, $\mathrm{I}_{\frac{7}{8}}^{9} \mathrm{~g}$ grains will indicate the fame change that is indicated by $\frac{1}{x}$ of an inch of an ordinary barometer. But a veflel of this fize will lead a balance too much to leave it fufficiently fenlible to fmall changes of denfity. Befides, it is affected by heat and cold, and would require a very troublefome equation to correct their effects.

It may perhaps be worth while to attend to this in buying and felling precious comnodities; fuch as pearls, diamonds, filk, and fome drugs. As they are generally fold by brals or leaden weights, the buyer will have fome advantage when the air is heavy and the barometer high. On the other hand, he will have the advantage in buying gold and mercury when the air is light. It is needlefs to contine this obfervation to precious commodities, for the advantage is the fame in all in proportion to their levity.

There is a cafe in which this obervation is of conlequence to the philofopher: we mean the meafuring of time by pendulums. As the accelerating force on a pendulum is not its whole weight, but the exeefs of its weight over that of the difplaced air, it follows that a fendulum will vibrate more flowly in the airthan in $v a$ cao. A pendulum compofed of lead, inon, and brafs, may be about 8400 times heavier than the air which i : difplaces when the b.rrometer is at 30 inehes and the thermometer at $3^{\circ}$, and the accelerating force will
 pendulum to make about five vibrations lets in a day than it would do in vacuo. In order therefore to deduce the accelerative power of gravity from the length of a pendulum vibrating in the air, we muft make an allowance of $0^{\prime \prime}, i \%$, or ${ }^{\circ} \bar{\pi}$ 궁 of a fecond, per day for every inch that the barometer ftands lower than 30 inches. But we mult alfon no:e the temperature of the air ; becanfe when the air is warn it is lefs denfe when fupporting by its elafticity the fame weight of atmofphere, and we muft know how much its denfity is diminithed by an increale of temperature. The correction is fill more complicated; for the change of denfity affects the reliftance of the air, and this affects the time of the vibration, and this by a law that is not yet well
afectained. As far as we can deternine from any er. Air-pump periments that have heen made, it appears that the change arifing from the altered refift mectakes off about $\div$ of the clange produced by the alteted denfity, and that a feeond pendulum makes but there vibrations a day more in matuo than in the open ais. 'Th's is a vely unexpetcd refult ; bu* it muft be owred that the expefiments have neither been mumerons nor very nicely made.

The air-pump alfo allows us to finow the effets of the air's prelfure in a great number of amuling and inftuctive phenomena.

When the air is abftraked from the receiver, it is ExperiAtrongly preffed to the pump-plate by the incumbent nouts un atmofphere, and it fupports this great preflure in con- how de fequence of its circular form. Being equally comprefled effest at on all fides, there is no place where it fould give way tha air's rather than annther; but if it be thin, and no vory preffere. round, which is fometimes the cafe, it will be cruthed to pieces. If we take a qquare thin phial, and apply an exhaufting fyringe to its mouth, it will not fiil being erufhed.

As the operation of pumping is fomething like fucking, many of thefe phenomena are in commen difcourfe afcribed to fuction, a word much abufed; and this abufe mifleads the mind exceedingly in its contemplation of natural phenomena. Nothing is more ulual than to fpeak of the fuction of a fyringe, the fuction and draught of a chimney, \&c. The following expetiment puts the true caufe of the frong adhefion of the receiver beyond a doubt.

Place a fmall recciver or cupping.glafs on the pumpplate without covering the central hole, as reprefented in fig. 32. and cover it with a larger receiver. Exhauft the air from it; then admit it as fuddenly an pofible. The onter receiver, which after the rarefanion adhered frongly to the plate, is now loofe, and the cuppingglafs will be found tisking falt to it. While the ra: efaction was going on, the air in the fmall receiver aifo expanded, elcaped from it, and was abftracted by the pump. When the external air was fuddenly admitted, it preffed on the \{mall receiver, and forced it down to the plate, and thus fut up all entry. The finall receiver mult now adhere; and there can be no finction, for the pipe of the pump was on the outfide of the cupping-glats.

This experiment fometimes does not fucceed, becaur the air fonectimes finds a palfage under the brim of the cuping-glafs. But if the cuping-glafs be preffed down by the hand on the greafy leather or plate, every thing will be made fmooth, and the glafs will be fo little raffed by the expanfion of its air during the pumpine, that it will inftantly clap clofe when the air is readmitted.

In like manner, if a thin fquare phial be furniflied with a valve, opening from within, but flutting when preffed from without, and if this phial be put under a receiver, and the air be abfracted from the receiver, the air in the phial will expand during the rarefaction, will efcape through the valve, and be at laf in a very rarefied fate within the phial. If the air be now admitted into the receiver, it will prefs on the flat fides of the included phial and crufh it to picces. See fig. 33.

If a piece of wet ox-bladder be laid over the trp of a receiver whofe orifice is about four in:ches wide, and

Plate
cccum

Air-pump. the air be exhaufed from within it, the incumbent atmofphere will prefs duwn t!e bladder into a hollow
Mate form, and then burft it inward with a prodigious noife.
CCCCIII. See fig. दै. Or if a piece of thin fat glafs be laid over the receiver, with an oiled leather beiween them to make the juncture air-tight, the ghafs will be broken downwards. This mutt be done with cemtion, becaufe the pieces of glafs fometimes fly about vith great force.

If there be formed two hemipherical cups of brafs, with very fat thick brims, and ore of them be fitted with a neek and fopoock, as repreiented by fig. 35 . the air may $b=$ abltracted from them by forewing the neck into the hole in the pump plate. To prevent the infinuation of air, a ring of oiled leather may be put between the rims. Now unferew the fphere from the fump, and fix liooks to each, and fufpend them from a frong in iil, and hang a fcalc to the loweft. It will requive a confiderab, e weight to feparate them; namely, about 15 pounds for every íquare insh of the great circle of the phere. If this be four inches diameter, it will require near 190 pounds. This pretiy experiment was firft made by Otto Gucricke, and on a very great fcale. His fuhere was of a large fize, and, when exhauted, the hemifpheres cou'd not be drawn afunder by" 20 horfes. It was exhibited, a'org with many others equaly curious and mignificent, to the emperor of Germany and his coturt, at the bicaking up ot the diet of Ratißinin 165 .

If the loaded fyringe mentioned tis $n^{\circ} 16$. be fufpended by its pifon from the hook in the top plate of the recciver, as in fig. 36 and the air be abftracted by the pump, the fyringe will gradually delcend (becaufe the elaflicity of the air, which formerly balanced the preffure of the atmofplere, is now diminilhed by its expanflon, and is therefore no longer able to prefs the fyringe to the pifton), and it will at laft drop off. If the hir be admitted Before this happens, the fyringe will immediately rife again.

Screw a fhort brafs pipe into the neck of a tranfporter, $n^{\circ} 107$. on which is fet a tall receiver, and immerfe it into a ciftern of water. On opening the cork the preffure of the air on the furface of the water in the ciftern will force it up through the pipe, and caufe it to fpout into the receiver with a tlrong jet, becanfe there is no air within to balance by its elafticity the preffure of the atmofphere. Sce fig. 37.

It is in the fame way that the gage of the air pump performs its office. The preflure of the atmosphere raifes the mercury in the gage till the weight of the mercury, together with the remaining elafticity of the air in the receiver, are in equilibrio with the whole preffure of the atmofphere: therefore the height and waight of the mercury in the gage is the excefs of the weight of the atmofphere above the elafticity of the included air; and the deficiency of this height from that of the mercury in the Tricellian tube is the meafure of this remaining elafticity.

If a Toricellian tube be pint under a tall receiver, as fhown in fig. $3 \%$ and the air be exhaufted, the mercury in the tube will defcend while that in the gage will rife; and the fum of their heights will always be the fame, that is, equal to the height in an ordinary barometer. The height of the mercury in the receiver is the effer? and meafure of the remaining elafticity of the included air, and the height in the pumpronge is the unvanced
preffure of the atmofphere. This is a very inftructive Ait: experiment; perfecty fimilar to Mr Auzout's, mentioncd in $n^{\circ} 34$, and completely ettablithes and illuftrates the whole doctrine of atmof heric preffure.

We get a fimilar illuftration and confirmation (if Wath fuch a thing be now needed) of the canfe of the rife of it pu water in pumps, by ficrewing a fyringe into the top plate of a receiver, which fyrnge has a thort glafs pipe planging into a fmall cup of water. See fig. 39 Wher the pifton-rod is drawn up, the water ries in the glats pipe, as in any other pump, of which this is a miniature eprefentation. Dut if the air has been previoully exhaufted from the receiver, there is nothing to prefs on the water in the fittle jar ; and it will not fife in the glafs pire though the giton of the fyrming be drawn to the top.

Analarous to the rife of water in pumps is its rife and and motion in fyphons. Suppofe a pipa A BCD, fig. 40. in fy bent at right angles at $B$ and $C$, and having its two ends immerfed in the cittern's of water A and D. Let the leg CD be longer than the lerg $B A$, and let the whole be full of water. The water is prefled upwards at $A$ with a force equal to the weight of the colum of ar EA reaching to the top of the atmofphere; bat it is preffed downwads by the weight of the colamn of water BA . The water at E is preffed downwards by the weight of the coumn CD, and upwards by the neight of the column of air FD reaching to the top of the atmof here. The two columns of air differ very little in their weight, and may without any fentible error be co. fider-d as equ.1. Therefore there is a fuperiority of preffure downtards at D , and the water will A w out there. The prefline of the ain will raife the water in the leg $A B$, and thus the fiream will be kept up till the velfel $A$ is empticd as luw as the orifice of the $\operatorname{leg} B A$, provided the height of $A B$ is not greater than what the preffure of the atmonphere can balance, that is, does not exceed 32 or 33 feat for water, 30 inches for mercury, \&e.

A fyphon then will always ron from that veflel whofe furface is higheft ; the form of the pipe is indifferent, becaufe the hydroftatical preffures depend on the vertieal height only. It muft be filled with water by fome other contrivance, fuch as a funnel, or a pump ap. plied a-tep; and the fummel muft be fopped up, otherwife the air would get in, and the water would fall in both legs.

If the fyphon have equal legs, as in fig. $4^{14}$. and be turned up at the ends, it will remain full of water, and be ready for ule. It necd only be dipped into any veffel of water, and the water will then how ont at the other cnd of the fyphon, This is called the Wirlinzerg Syphos, and is reprefented in fig. 41 . Syphns will atterwardshe confidered more minutely under the title of $P_{\text {nfunatical Emgines, at the end of this article. }}$

What is called the fyphon foumtain, contructed on this principle, is thown in tig. 42. where $A B$ is a tall receiver, ttanding in a wide bafon DE , which is fopported on the pedeftal II by the hollow pillar FG. In the centre of the receiver is a jet pipe C , and in the top a ground fopper A. Near the bafe of the pillar is a cock N , and in the peileftal is another cock O .

Fill the bafon DE with water within half an inch of the brim. 'Ihe:1 pour in water at the top of the receiver (the cock $N$ being ftut) till it is about half full,
and then put in the Mopper. A little water vill run out into the velfel DE. Lut before it runs over, open the cock N , and the water will run into the ciftern H ; and by the time that the pipe $C$ appears above water, a jet will rile from it, and continue as long as water is fupplied from the bafon Dl:. The paffage into the bate ciftem may be fo t-mpered by the cock $N$ that the water within the receiver thall keep at the fame height, and what runs inte the bale may be received from the cock $O$ into ancther veffel, and returned into DE , to keep up the ftream.

This pretty philofophical toy may be confructed in the following, manner. BB, fig. $4^{2} \cdot n^{n} 2$. is the ferril or cap into which the receiver is cemented. From its centre de:cends the jet pipe $\mathrm{C} a$, floping outwards, to give room for the dif harging pipe $b d$ of larger diameter, whole lower exiremity $d$ fits tiglitly into the top of the hollow pillar $F G$.

The cpetation of the toy is eafily undernood. Sup. pofe the diftance from C to H ( $\mathrm{n}^{\circ}$ 1.) three fect, which is about $T_{T}$ of the height at which the atmofphere would fupport a column of water. The water poured into AB weuld defeend through FG (the hole A being fhu:) till the air has expanded $x_{5}$, and then it would frop. If the pipe $\mathrm{C} a$ be now opened, the prefinte of the air on the funface of the water in the ciftern DE will catie it to fo ut through $C$ to the height of three feet nearly, and the water will continue to defcend through the pipe FG. By tempering the cock N fo as to allow the wa er to pafs through it as falt as it is fupplied by the jet, the amufemeat may be continued a long time. It will ftop at laft, however; becaute, as the jet is made into rarefied air, a little air will be extricated frem the water, which will gradually accumulate in the receiver, and diminifh its rarefastion, which is the moving caufe of the jet. This indeed is an inconvenience felt in every empleyment of fyphons, fo much the more remarkably as their top ish:ghar than the furface of the water in the ciftern of fupply.

Cafes of this employment of a fyphon are not unfrequert. When water collected at A (fig. 43.) is to be conducted in a pipe to C , fituated in a lower part of the country, it fometimes happens, as between Lochend ard Leith, that the intervening ground is higher than the fountain-head as at B. A forcing pump is crected at $A$, and the water forced along the pipe. Once it runs out at $C$, the pump may be removed, and the water will continue to run on the fyphon principle, provided BD do not exceeed 33 feet. But the water in that part of the conduit which is above the horizontal plane AD, is in the fame ftate as in a receiver of rarefied air, and gives out fume of the air which is chemically united with it. This gradually accumulates in the elevated part of the conduit, and at latt choaks entirely. When this happens, the forcing pump mult again be worked. Although the elevation in the Leith conduit is only about eight or ten feet, it will feldom run for 12 hours. N. B. This air cannot be difcharged by the ulual air-cocks; for if there were an opening at $B_{1}$ the air would rolh in, and immediately fop the metion.

This combination of air with water is very ditinetly feen by means of the air-pump. If a fmall glafs containing cold water, freth drawn from the fpring be expofed, as in fig. 4+ under the recciver, and the air

Voz. SV.
Voz. is.
:arefied, fmall bubbies will Le obferved to form on the inner furface of the glals, or on the furface of any body irnmerfed in it, which will increafe in fize, and then detach themflyces fron the glafs and reach the ton. Plate as the rarcfaction advances, the whole water begins to fhow very mimnte air-bubbles rifing to the top; and this appearance will continue for a very long time, till it be completely ditengaged. Wamming the water will oceation a Rill farther feparaei on of arr, and a bailinģ heat will feparate aill that can be difengage:. The seafon affigned for the fe air-bubbles foft ippearing on the furface of the glals, sic. is, that air is attracted by bodies, and a dheres to theirfurface. This miy be fo. Dut it is $m$. re probably owing tothe atiration of the water for the ghafs, which caufes it to quit the air which it he'd in folution, in the fame manner as we fee it happen when it is mised with fpirits-of-wine, with vitri.lic acid, \&:. or when falts or fugar are diffolved $i n$ it. For if we paur out the water which has been purged of air by brailing in vacuo, and fill the glafs with freth water, we fhall obferve the fame thing, although a film of the purifed water was left adhering to the glafs. In this cafe there can be no air adhering to the glafs.

Water thus purged of air by boiling (or even without boiling) in vacuo, will again abforb air when ex. pofed to the atmofohere. The beft demonftation of this is to fill with this water a phial, leaving about tie fize of a pea not filled. Immerfe this in a veffel of water, wiih the mouth undermol, by which means the airbubble will mount up to the boitom of the phial. After fome days fanding in this condition, the air-bublie will be completely abforbed, and the veffel quite filled with water.

The air in this fate of chemical folution has loft its elafticity, for the water is not more comprefible than common water. It is alfo found that water brought up from a great depth under ground contains much more air than water at the furface. Indeed fountain waters differ exceedingly in this refpect. The viater which now comes into the city of Edinburgh by pipes contains fo much as to throw it into a confiderable ebullition in vacuo. Other liquors contain much greater quantities of elaftic fluids in this loofely combined ftate. A glafs of beer treated in the fame way will be almoft wholly converted intu froth by the efcape of its fixed air, and will have loft entirely the prickling fmartnefs which is fo agreeable, and it become quite vapid.

The air-pump gives us, in the next place, a great variety of experiments illuftrative of the air's elafticity and Arates the expanfibility. The very operation of exhauftion, as it air's elafis called, is an inftance of its great, and hitherto un. ticity and limited, expanfibility. But this is not palpably exhibited to view. The following experiments fhow it moft diftinctly.

If, Put a flaccid bladder, of which the neck is Experifirmly tied with a thread, under a receiver, and work ments the pump. The bladder will gradually fwell, and will flowing even be fully diftended. Upon readmitting the air thefe pro into the receiver, the bladder gradually collapres again pertiec. intoits former dimenfions: while the bladder is Haccid, the air within it is of the fame denfity and elafticity with the furrounding dir, and its elafticity balances the preffure of the atmofphere. When part of the air of the receiver is abftrafted, the remainder expands fo

## 114

Experi ments on as fill to fill the receiver : but by expanding, its elanti-
city is plainly diminifhed; for we fee by the fact, that the elallicity of the air of the receiver no longer balances the elafticity of that in the bladder, as it no longer keeps it in its dimenfions. The air in the bladder expands alfo: it expands till its diminifhed elanticity is again in equilibrio with the diminifhed elafticity of the air in the receiver; that is, till its denfity is the fame. When all the wrinkles of the bladder have difappeared, its air ean expand no more, although we continue to diminifh the elafticity of the air of the receiver by further rarefaction. The bladder now tends to burft and if it be pierced by a point or knife faftened to the flip-wire, the air will rufh out and the mercury defcend rapidly in the gage.

If a phial or tube be partly filled with water, and immerfed in a veffel of water with the mouth downwards, the air will occupy the upper part of the phial. If this apparatus be put under a receiver, and the air be ab. flrasted, the air in the phial will gradually expand, allowing the water to run out by its weight till the furface of the water be on a level within and withont. When this is the cafe, we muft grant that the denfity and elafticity of the air in the phial is the fame with that in the receiver. When we work the pump again, we fhall obferve the air in the phial expand fill more, and come out of the water in bubbles. Continuing the operation, we fhall fee the air continually efcaping from the phial : when this is over, it fhows that the pump can rarefy no more. If we now admit the air into the receiver, we thall fee the water rife into the phial, and at laft almof completely fill it, leaving only a very fmall bubble of air at top. This bubble had expanded fo as to fill Mate the whole phial. See this reprefented in fig. 45 .

Every one muft have obferyed a cavity at the big end of an egg between the fhell and the white. The white and yoik are contained in a thin membrane or bladder which adheres loofely to the fhell, but is detached from it at that part ; and this eavity increafes by keeping the egg in a dry place. One may form a judgment of its fize, and therefore of the freflinefs of the egg, by touching it with the tongue; for the fhell, where it is not in contad with the contents, will prefently feel warm, being quickly heated by the toxgue, while the reft of the egg will feel cold.
If a hole be made in the oppofite end of the eg5, and it be fet on a little tripod, and put under a receiver, the expanfion of the air in the cavity of the egg will force the contents through the hole till the egg be quite emptied: or, if nearly one half of the egg be taken away at the other end, and the white and yolk taken out, and the fhell be put under a receiver, and the air abftracted, the air in the cavity of the egg will expand, gradually detaching the membrane from the thell, till the air caufes it to fwellout, and gives the whole the appearance of an entire egg. - In like mannor thrivelled apples and other fruits will iwell in vacuo by the expantion of the air confined in their cavities.
If a piece of wond, a twig with green leaves, charcoal, plufter of Paris, \&c. be kept under water in vacur, a prodigious quantity of air will be extrated; and if we readmit the air into the recciver, it will force the water ino the pores of the body. In this cafe the body will not fwim in water as it did before, fhowing that the vegetable fibres are fpecififally heavier than water, It
is found, however, that the air contained in the pith and Compreff bark, fuch as cork, is not all extricated in this way; and bility, \&o that much of it is contained in reficles which have no outlet: being fecreted into them in the procefs of vegetation, as it is fecreted into the air-bladder of fithes, where it is generally found in a pretty comprefied ftate, confiderably denfer than the furr unding air. The air-blad fer of a fifh is furrounded by circular and longitudinal mufcles, by which the fifh can comprefs the air fill further; and, by ceafing to act with them, allow it to fwell out again. It is in this manner that the fifh ean fuit its fpecific gravity to its fituation in the water, fo as to lave no tendency either to rife or fink; but if the fifh be put into the receiver of an air-pump, the rarefaction of the air obliges the fifh to act more firongly with thefe contracting mufcles, in order to adjuft its fpecific gravity; and if too much air has been abftract d from the receiver, the fifh is no longer able to keep its airbladder in the proper degree of comprefliun. It becomes therefore too buoyant, and comes to the top of the wa. ter, and is obliged to ftruggle with its tail and fins in order to get down; frequently in vain. The air-bladder fometimes burfts, and the filh goes to the bottom, and ean no longer keep above without the continual action of its tail and fins. When fifhes die, they commonly float at top, their contrative action being now at an end. All this may be illultrated (but very imperfectly) by a fmall half-blown bladder, to which is appended a bit of lead, jult fo heavy as to make it fink in water; when this is put under a receiver, and the air abftracted, the bubble will rife to the top; and, by nicely adjulting the rarefaction, it may be kept at any height. Sec firs. 46.

The play-things called Cartffian devils are fimilar to this: they are hollow glafs figures, having a fmall apertuie in the lower part of the figures, as at the point of the foot; their weight is adjufted fo that they fwim upright in water. When put into a tall jar filled to the top, and having a piece of leather tied over it they will fink in the water, by preffing on the leather with the ball of the land: this, by eomprefing the rater, forces fome of it to enter into the figure and makes it heavier than the water; for which reafon it finks, but rifes again on removing the preffure of the hand. See fig. 47. $\mathrm{n}^{\circ} 1$. and 2.

If a half-blown ox-bladder be put into a box, and great wights laid on it, and the whole be put under a receiver, and the air abftrated; the air will, by expanding, lift up the weights, though above an hundred pounds. Soe fig. 48 .

By fuch experiments the great expanfibility of the Compreff air is abundantly illuftrated, as its compreflibility was bi ty and formerly by means of the condenfing fyringe. We expantib: now fee that the two fets of cxperiments form an unin- lity are in terrupted chain; and that there is no particular ftate of the air's denity where the compreffibility and expanfino fate o bility is remarkably diflimilar. Air in its ordinary ftate expands; becaufe its ordinary ftate is a fate of compreffion by the weight of the atmofphere: and if there were a pit about 33 miles decp, the air at the bottom would probably be as dcafe as water; and if it were 50 miles deep, it wonld be as denfe as grold, if it did nut become a liquid before this depth: nay, if a bottle with its mouth undermolt were immerled fix miles under water, it would probably be as denfe as water; we fay probably, for this depends on the nature of its comprefo fibility
fibility; that is, on the relation which fubfifts between the compreffion and the force which produces it.

Th:is is the circumflance of its conltitution, which we now proceed to examine ; and it is evidently a very important circumfunce. We have long ago obferved, that the great comprellibility and permanent fluidity of air, oberved in a vaft varicty of phenomena, is tutally inexplic tble, on the fuppofition that the particles of air are ine fo many balls of fponge or fo many foot-balls. Give to thofe what compreflibility you pleafe, common air could no more be fluid than a mafs of clay; it could no more be fluid than a mais of fuch balls preffed into a box. It can be demonftrated (and indeed hirdly needs a demonftration), that befire a parcel of fuch balls, juft touching each other, can be fqueezed into half their prefent dimenfions, their globular thape will bz entirely gone, and each will have become a perfect cube, touching fix other cubes with its whele furface; and thefe cubes will be ftrongly compreffed together, fo that moti $n$ could never be performed through among them by any fulid body without a very great force. Whereas we know that in this ftate air is jult as permeable to every body as the common air that we breathe. There is no way in which we can reprefent this fluidity to our imagination but by conceiving air to confift of particles, not only difcrete, but diftant from each other, and actuated by repu! five forces, or fomething analugous to them. It is an idle fubterlinge, to which fome naturalifts bave recourfe, faying, that they are kept afunder by an intervening ether, or elaftic fluid of any other name. This is only removing the difficulty a flep farther off: for the elat 'c ty of this fluid requires the fame explanation; an ! theref. ie it is neceflary, in obedience to the rules of jut reafon'ng, to begin the inquiry here; that is, to determine fr $m$ the phenomena what is the analogy between the diftances of the particles and the repulfive forces exerted at thefe diftarces, proceeding in the fame way as in the examination of planetary gravitation. We fhall learn the an alogy by attending to the analogy between the compreffing f.rce and the denfity.
For the denfity depends on the diftance between the particles; the nearer they are to each other, the denfer is the air. Suppofe a fquare pipe one inch wide and eight inches 1 ing, thut at one end, and filled with com$m \cap n$ air ; then fuppofe a plug fo nicely fitted to this pipe that no air can pafs by its fides; fuppofe this piflon thrul down to within an inch of the bottom: it is evident that the air which formerly filled the whole pipe now occupies the fpace of one cubic inch, which contains the fame number of particles as were formerly diffured over eight cubic inches.

The condenfation would have been the fame if the air which fills a cube whofe tide is two inches had been fqueezed into a cube of one inch, for the cube of two inches alfo contains eight inches. Now, in this cafe it is evident that the diftance between the particles would be reduced to its half in every direction. In like manner, if al cube whofe fide is three inches, and which therefore contains 27 inches, be fqueezed into one inch, the diftance of the particles will be one third of what it was: in genera! the diftance of the particles will be as the cuberoot of the fpace into which they are compreffed. If the face be $\frac{1}{\pi}, \frac{1}{5},{ }_{6}^{7}$, fir, ixe. of its former dimenfions, the diftance of the particles will be $\frac{2}{3}, \frac{1}{3}, \frac{1}{2}, \frac{1}{2}, \$ \mathrm{sc}$. Now the term denfty, in its Atrisi fenfe, expreffes the vicini-
ty of the particles; denfi arbores are trees artwing near Comprofieach other. The meafure of this vicinity therefore is bility, \&ec. the true me fure of the denfity; and when 27 inche: of air are c.mpreffed into one, we fhould fay that it is three times as denfe; but we fily, that it is 27 times denfer.
Denfity is therefore ufed in a fenfe difierent from its Further es. Atricteft acceptation: it expie ies the comparative number plonation. of equidiftant parti-les contuined in the fame bulk. This is alfo abund.ntly precile, when we compare bodiss of the rame kind differing in denfi'y only; but we alfo fay, that gold is is times denfer than water, bicaufe the fame bulk of it is 19 times havier. This affertion proceeds on the alfumption, or the fact, that every ultimate atom of terreftrial matter is equally heavy: a particle of gold muy contain more or fewer atoms of matter than a paticle of water. In fuch a cafe, there ore, the term denlity has little or no reference to the vicinity of the particles; and is only a term of compariocn of other qualities or accidents.

But when we fpeak of the refpective denfitics of the fame fubtance in its different ftates of comprefion, the word denfty is frictly connected with vicinity of particles, and we may fafely take either of the meafures. We fhall abide by the common acceptation, and call that air eight times as denfe which has eight times as many particles in the fame bulk, although the particles are only twice as near to each other.

Thus then we fee, that by obferving the analogy be. The analotween the comprelling force and the denfity, we thall gy betwecn difoover the analogy between the comprefing furce and the comthe diftance of the particles. Now the force which is preffing necelfary for comprefling two paticles of air to a cer- thed and tain vicinity is a prope: meafure of the clafticity of the of the fare particles correfponding to that vicinity or diftance; for tieles, \&c. it balances it, and forces which b.alance mult be efteemed equal. Elafticity is a ditinctive name for that corpufcular force which keeps the particles at that diftance: therefore obfervations made on the analogy between the compreffing force and the denfity of air will give us the law of its corpufcular force, in the fume way that obfervations on the fimultaneous deflections of the planets towards the fun give us the law of celeftial gravitation.

But the fenfible compreffing forces which we are able to apply is at once exerted on unknown th-ufands of particles, while it is the law of action of a fingle particle that we want to difcover. We mult therefore know the proportion of the numbers of particles on which the comprcfling force is exerted. It is eafy to fee, that fince the diftance of the particles is as the cube root of the denfity inverfely, the number of particles in phylical contaft with the compreffing furface mult be as the fquare of this root. Thus when a cube of 8 inches is comprefled into one inch, and the particle; are twice as near each other as they were bcfore, there mull be four times the number of particles in contact with each of the fides of this cubical inch; or, when we have pufhed down the fquare pitton of the pipe fpoken of above to within an inch of the bottom, there will be four times the number of particles innurdialely contignous to the piton, and relifing the comprefion; and in order to obtain the force really exerted on one particle, and the elalficity of that particle, we muft divide the whole comprefing foree by 4. In like manner, if we have com$\mathrm{P}_{2}$ prefled air into ${ }^{3}$ of its fommer bulk, and bronght the particles to $\frac{5}{s}$ of their former difance, we mult divide the compreffing force by 9 . In general if $d$ exprefs the dendity, $\frac{1}{{ }^{3} \sqrt{d}}$ will exprefs the diltance $x$ of the particles; $\sqrt[3]{\sqrt{d}}$, or $d^{\frac{1}{3}}$ will exprefs the vicinity or real denfity; and $d^{\frac{\pi}{3}}$, will exprefs the number of particles acting on the comprefling furface : and if $f$ exprefs the accumulated exteınal comprefling force, $\frac{f}{d^{\frac{2}{3}}}$ will exprefs the force acting on one particle; and therefore the clafticity of that particle correfponding to the diftance $x$.

We may now proceed to confider the experiment by
y 26
norefi- which the law of compreffion is to be eftablifhed.
The firft experiments to this purpofe were thofe made by Mr Boyle, publifhed in 1661 in his Defenfo Doctrince de Aeris Elatere contra Linum, and exhibited before the Royal Society the year before. Mariotte made experiments of the fame kind, which were publifhed in 1676 in his Efai fur hu Nature de l'Air and Traitédes Mouvemens des Eaun. The moft copious experiments are thofe by Sulzer (M.m. Berlin. ix.), thofe by Fontana (Opufi. Pbyico-Muib.), and thofe by Sir George Shuckbuurgh and Gen. Roy.

In order to examine the compreflibility of air that is not rarer than the atmofphere at the furface of the earth, we employ a bent tube or fyphon $A B C D$ (fig. 49.), hermetically fealed at $A$ and open at D. The fhort leg AB muft be very accurately divided in the proportion of its folid contents, and fitted with a fcale whofe units denote equal increments, not of length, but of capacity. There are various ways of doing this; out it requires the moft fcrupulous attention, and without this the cxperiments are of no value. In particular, the arched form at $A$ muft be noticed. A fmall quantity of mercury mult then be poured into the tube, and paffed backwards and forwards till it ffands (the tube being held in a vertical pofition) on a level at $B$ and C. Then we are cortain that the included air is of the fame denfity with that of the contiguous atmoSpere. Mercury is now poured into the leg DC, which will fill it, fuppofe to $G$, and will comprefs the air into a fmaller fpace AE. Draw the horizontal line EF: the new bulk of the compreffed air is evidently $A E$, meafured by the adjacent fcale, and the ad. dition made to the comprefling force of the atmofphere is the weight of the column GF. Produce GF downwards to H , till FH is equal to the height fhown by a Toricellian tube filled with the fame mercury; then the whole comprefing force is HG. This is evidently the meafure of the elaticity of the compreffed air in AE, for it balances it. Now pour in more mercury, and let it sie to $g$, comprefling the air intoA $e$. Draw the horizontal lince ef, and male $f b$ equal to $F H$; then $A$ e will be the new bulk of the compreffed air, $\frac{A B}{A}$ vill be its new dualfy, and $b s$ will be the meafure of 1., enetr elaticity. This operation may be extended as fou tos we pleafe, by lengthening the tube CD, and ta-
king care that it be ftrong enough to refift the great preffure. Great care mult be taken to keep the whole in a conflant temperature, becaufe the elalticity of air is greatly affected by heat, and the change by any increafe of temperature is different accosding to its denlity or compreffion.

The experiments of Boyle, Mariotte, Amontons, and others, were not extended to rery great compreflions, the denfity of the air not having been quadrupled in any of them; nor do they feem to have been made with very great nicety. It may be collected from them in general, that the elafticity of the air is very nearly proportioned to its denfity; and accordingly this law was almoll immediately acquiefced in, and was called the Boylean law: it is accordingly affumed by almoft all writers on the fubject as exact. Of late years, however, there occurred quettions in which it was of importance that this point fhould be more fcrupuloully fettled, and the former experiments were repeated and extended. Sulzer and Fontana have carried them farther than any other. Sulzer comprefled air into : of its former dimenfions.

Confiderable varieties and irregularities are to be ob. ferved in thefe experiments. It is extremely difficult to \&c in preferve the temperature of the apparatus, particularly thefe exp of the $\operatorname{leg} \mathrm{AB}$, which is molt hantled. A great quantity of mercury muft be employed ; and it does not appear that philofophers have been careful to have it precifely fimilar to that in the barometer, which gives us the unit of comprefling force and of elafticity. The mercury in the barometer thould be pure and boiled: If the mercury in the fyphon is adulterated with bifmuth and tin, which it commonly is to a confiderable degree, the comprefling force, and confequently the elallicity, will appear greater than the truth. If the barometer has not been nicely fitted, it will be lower than it fhould be, and the compreffing force will appear tou great, becaufe the unit is too fmall; and this error will be moft remarkable in the fmaller compreffons.

The greateft fource of error and irregularity in the Heterore experiments is the very heterngeneous nature of the air nenus naitfelf. Air is a folvent of all Aluids, all vapours, and ture of perhaps of many fulid bodies. It is highly improbable that the different compounds fhall have the fame elalticity, or even the fame law of elaficity: and it is well error. known, that air, loaded with water or other volatile bodies, is much more expanfible by leat than pure air; nay, it would appear from many experiments, that certain determinate changes both of denfity and of temperature, caufe air to let ro the vapours which it holds in folution. Cold caufes it to precipitate water, as appears. in dew; fo does rarefaction, as is feen in the receiver of an air-pump.

In general, it appears that the elafticity of air does not increafe quite fo fatt as its denlity. This will be blatticity belt feen by the following tables, calculated from the does :ot experiments of bif Salzer. The column $E$ in each fet increafe of experiments expreffes the length of the column GH, fatk us its the enit being FH , while the column D expreiles denfity. AB
$\overline{A E}$.

There appears i: thefe experiments fufficient grounds for calling in queftion the Boylean law; and the writer of this article thought it incumbent on him to repeat them with fome precautions, which probally had not been attended to by Mr Sulzer. He was particularly anxious to have the air as free as poflible from moifture. For this purpofe, having detached the flort ler of the fyphon, which was 34 inches long, he boited mercury in it, and filled it with mercury boiling hot. He took a tinplate veffel of fufficient capacity, and put into it a quantity of powdered quicklime juft taken from the kiln; and having clored the mouth, he agitated the lime through the air in the veffel, and allowed it to remain there all night. He then emptied the mercury out of the fyphon into this veffel, keeping the open end far within it. By this means the fhort leg of the fyphon was filled with very dry air. The other part was now joined, and boiled mercury put into the bend of the fyphon; and the experiment was then profecuted with mercury which had been recently boiled, and was the fame with which the barometer had been carefully filled.

The refults of the experimencs are expreffed in the following table.

| Dry Air. |  | Moilt Air. |  | Camp. A ir. |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| D | E | D | E | D | E |
| 1,0<0 | 1,000 | 1,000 | 1,000 | 1,000 | 1,000 |
| 2,000 | 1,957 | 2,000 | 1:920 | 2,000 | 1,909 |
| 3,000 | 2,548 | 3,000 | 2,839 | 3,000 | 2,845 |
| 4,000 | 3,737 | 4,000 | 3,726 | , 4,000 | 3,718 |
| 5,500 | 4,930 | 5,500 | 5,000 | ! 5,500 | 5,104 |
| 6,000 | 5,3+2 | 6,000 | 5,452 | 16,000 | 5,463 |
| 7.62 c | 6,420 | 7.620 | 6.775 | 1176 | 6,812 |

Here it appears again in the cleareft manner that the elafticities do not increafe as faft as the denlities. and the differences are even greater than in Mr Sulzer's ex. periments.

The fecond tab?e contains the refults of experimests
made in very damp air on a warm fummer's morning. Elafticity. In thefe it appears that the elaficities are almof precifely proportional to the denfities + a imall conftant quantity, nearly 0,11 deviating from this rule clieRy hetween the denfities I and 1,5 , within which limits we have very nearly $\mathrm{D}=\mathrm{E} \cdot 0017$. As this air is nearer to the conflitution of atmofpheric air thas the former, this rule may be fafely followed in cafes where atmofpheric air is concerned, as in meafuring the depths of pits by the barometer.

The third table fhows the compreffion and eiafticity of air ftrongly impregnated with the vapours of camphire. Here the Boylean luw appears pretty exad, or rather the elafticity feems to incledfe a little fufter than the denfity.

Dr Hooke examined the compreflion of air by immerfing a boule to great depths in the fea, and weighing the water which got into it without any efcape of air. But this method was liable to great uncertainty, on account of the unknown temperature of the fea at great depths.

Hitherto we have confidered only fuch air as is not Mode of rarer than what we breathe; we muft take a very dif. examining, ferent method for examining the elafticity of rarcfied air.

Let $g h$ (fig. 50.) be a long tube, formed a-top into a cup, and of fufficient diameter to receive another fiall Piate er tube af, open at firft at both ends. Let the outer tube and cup be filled with mercury, which will rife in the inner tube to the fame level. Let af now be thop. ped at $a$. It contains air of the fame denfity and elafticity with the adjoining atmorphere. Note exatly the fpace $a b$ which it occupies. Draw it up into the pofition of fig. 51. and let the mercury ftand in it at the height $d e$, while $c e$ is the height of the mercury in the barometer. It is evident that the column $d e$ is in equilibrio between the prefliure of the atmofphere and the elafticity of the air included in the face $r . d$. And fince the weight of ce would be in equilibrio with the whole preffure of the atmofphere, the weight of $c d$ is cquivalent to the elafticity of the included air. While therefore $c e$ is the meafure of the elafticity of the farrounding atmofphere, $c, d$ will be the meafure of the elalticity of the included air; and fince the air originally occupied the fpace $a b$, and has now expanded into $a d$, we have $\frac{a b}{a d}$ for the meafure of its denfity. N. B. $c e$ and $c d$ are measured by the perpendicular heish's of the columns, but $a b$ and $a d$ muft be meafured by their. folid capacities.

By railing the inner tube fill highor, the mercury will alfo rife higher, and the included air will expand. flill farther, and we obtain another ci, and another $a b$ ād ; and in this manner the relation between the denfity and elafticity of rarefied air may be difcovered.
This examination may be managed more eafly by means of the air-pump. Suppofe a tube ae (fig. 5 z.) containing a fmall quantity of air $a b$, fet up in a citern of mercury, which is fupported in the tube at the height $e b$, and let $e c$ be the height of the mercury in the barometer. Let this apparatus be fer under a tubulated receiver on the pump-plate, and let $g^{\prime \prime}$ be the pumpgase, and $n n n$ be made equal to co.
CCCIV.

Yiate

Experi~ ments on AIr. the elaficity of the air in $a b$, correfponding to the bulk ab. Now let fome air be abftracted from the recsiver. The elafticity of the remainder will be diminifhed by its expanfion ; and therefore the mercury in the tube $a e$ will defcend to fome point $d$. For the fame reafon, the mercury in the gage will rife to fome point 0 , and $m_{0} o$ wil exprefs the elaflicity of the air in the receiver. This would fupport the mercury in the tube ae at the heighter, if the fpace ar were entirely void of air. Therefore $r d$ is the effect and meafure of the elaficity of the included air when it has expanded to the bulk $a d$; and thus its elafticity, under a variety of other bulks, may be compared with its elallicity when of the bulk $a b$. When the air has been fo far abfracted from the receiver that the mercury in $a e$ defcends to $c$, then $m o$ will be the precif meafure of its claticity.

In all thefe cafes it is necellhry to compare its bulk $a b$ with its natural bulk, in which its elanicity balances the preffure of the atmofphere. Whis may be done by laying the tube ae horizontally and then the air will

210

Another ealy method may be taken for this examination. Let an apparatus $a b c d^{\prime} e f$ (fig. 53.) be made, confifting of a horizontal tube ae of even bore, a ball $d g e$ of a large diameter, and a fwan-neck tube $b f$. Let the bull and part of the tube ge $e b$ be filled with mercury, fo that the tube may be in the fame horizontal plane with the furface $d e$ of the mercury in the ball. Then feal up the end $a$, and connect $f$ with an air pump. When the air is abftracted from the furface de, the air in $a b$ will expand into a larger bulk $a c$, and the mercury in the pump-gage will rife to fome diflance below the barometric height. It is evident that this diftance, without any farther calculation, will be the meafure of the elafticity of the air preffing on the furface $d e$, and therefore of the air in $a c$.

The moft exact of all methods is to fufpend in the receiver of an air-pump a glafe veffel, having a very narrow mouth over a ciltern of mercury, and then ab. frast the air till the gage rifes to fonie determined height. The difference $e$ between this height and the barometric height determines the claficity of the air in the receiver and in the fufpended veffel. Now lower down that veffel by the flip-wire till its mouth is immerfed into the mercury, and admit the air into the receiver; it will prefs the mercury into the little veffel. Lower it fill farther down, till the mercury within it is level with that without; then fop its mouth, take it out and weigh the mercury, and let its weight be $w$. Subtract this weight from the weight of of the mercury, which would completely fill the whole velfel; then the natural bulk of the air will be $v-z v$, while its bulk, when of the claficity $c$ in the rarefied receiver, was the bull or capacity $s v$ of the veffel. Its denfity therefore, correfponding to this elafticity $e$, was $\frac{v-v u}{q v}$
And thus may the relation between the denfity and elafliticity in all cafes be cbtained.

## $27 I$

A great variety of experiments to this purpofe have been made, with different degrees of attention, according to the intereी which the philofophers hat in the refulto Thofe made by M. de Lac, General Roy, Mr Trembley, and Sir Gcorge Shuckbourgh, are by far

## A T I C S.

the moft accurate ; but they are all confined to rergimoderate rarefactions. 'The general refu!t has been, that the elafticity of rarefied air is very reaty proportional to its denfity. We cannot fay with confidencethat any regular deviat on from this law has been obferved, there beiag as many obfervations on one fide as on the other; but we think that it is not unworthy the attention of philofophers to determine it with p.ecilion in the cafes of extreme rarefaction, where the irregularities are molt remarkable. The great fource of error is a certain adlefive flurgith efs of the mercury whe the impelling forces arc very fmall; and other fluids can hardly be ufed, becaufe they either inear the infide of the tube and diminith its capacity, or they are converted into vapour, which alters the law of elaflicity.

Let us, upon the who!e, aflume the Borlcan law, viz. The is that the elanticity of the air is proportional to its denfity. an law The law deviates not in any fenfible degree from the in ger truth in th. fe cafes which are of the greateft practical importance, that is, when the donfity does not much exceed or fall thort of that of ordinary air.

Let us now fee what information this gives us with refpect to the arion of the pastucles on each other.

The invelligation is carreme'y ea y. We have feen that a force cight times greater than the preflure of the atmof here will comprefs common air into the eighth other. part of its common bu'k, and give it eight times its common denfity: and in this calie we know, that the particles are at half their former diltance, and that the number which are now actin, 5 on the furface of the piton employed to comprefs them is quadruple of the number which act on it when it is of the common denfity. Therefore, when this eightefold compreffing force is diftributed over a fourfild number of particles, the portion of it which acts on eacl is double. In like manner, when a compreffing force 27 is employed, the air is compreffed into $\frac{8}{\pi} \frac{0}{7}$ of its former bulk, the particles are at ; of their former diftance, and the force is diftributed among 9 times the number of particles; the force on each is therefore 3. In fhort, let $\frac{1}{x}$ be the diftance of the particles, the number of them in any given velfel, and therefore the denlity will be as $\mathrm{x}^{3}$, and the number preffing by their elafticity on its whole internal furface will be as $x^{2}$. Experiment thows, that the compreffing force is as $x^{3}$, which being diftributed over the number as $x^{2}$, will give the force on each as $x$. Now this force is in immediate equilibrium with he elafticity of the particle immediately contignous to the compreflirig furface. This elatticity is therefore as $x$ : and it follows from the nature of perfect fluidity, that the particle adjoining to the compreffing furface preffes with an equal force on its adjoining particles on every fide. Hence we mult conclude, that the corpufcular repulfions exerted by the adjoining particles are inverfely as their diftinces from each other, or that the adjoining panticles tend to recede from each other with forces inveríely proportional to their diltances.

Sir Ifaze Newton was the firft who reafoned in this sir ifa manver from the phenomena. Indeed he was the firlt Newth who had the patience to reflect on the phenomena with wast any preciioon. His difcoveries in gravitation naturally freafon wiw gave his thoughts this turn, and he very early hinted reaponer his fufpicions that all the charasteriftic phenomena of on this

## P N E U M A T I C S.

 And he confiders the phenomena of air as affording an escellent example of this inveltigation, and deduces from them the law which we hive now demonftraicd; and firys, that air confifts of particles which avoid the adj jining particles with forces inverfely proportional to their ditances from cacla other. From this he deduces (in the 2 d book of his lrinciples) feveral beatiful propofitions, determining the mechanical conftitution of the atmofpherc.But it muft be noticed that he limits this action to the adjoining particles: and this is a remark of immenfe confequence, though not attended to by the numerous experimenters who adopt the ldw.

It is plain that the particles are fuppofed to act at a diftance, and that this diftance is variable, and that the forces diminith as the diltances increale. A very ordinary air-pump will rarefy the air 125 times. 'The diftance of the particles is now 5 times greater than be. fore ; and yet they fill repel cach other: fur air of this denfity will fill fupport the mercury in a fyphon-gage at the height of $0,24, \operatorname{or} \frac{24}{100}$ of an inch; and a better pump will allow this air to expand twice as much, and Itill leave it elaftic. Thus we fee that wlatever is the diftance of the particles of common air, they can act five times farther off. The queftion comes now to be, Whether, in the fate of common air, they really do ast five times farther than the diftance of the adjoining particles? While the particle $a$ acts on the particle $b$ with the force 5 , does it alfo act on the particle $c$ with the force 2,5 , on the particle $d$ with the force 1,667 , on the particle $e$ with the force 1,25 , on the particle $f$ with the force 1, on the particle $g$ with the force $0,8333, \& c$.?

Sir Ifac Newton fhows in the plaineft manner, that this is by no means the cafe; for it this were the cafe, he makes it appear that the fenfible phenomena of condenfation would be totally different from what we obferve. The force necelfary for a quadruple condenfation would be eight times greater, and for a nonuple condenfation the force muft be 27 times greater. Two fpheres filted with condenfed air mult repel each other, and two flieres containing air that is raser than the furrounding air muft attradt each other, \&c. \&c. All this will appear very clearly, by applying to air the rea. foning which Sir Iface Newton has employed in deducing the fenfible law of mutual tendency of two foheres, which confift of particles attracting each other with forces proportional to the fquare of the diftance inverfels.

If we could fuppefe that the particles of air repelled each other with invariable forces at all diftances within fome fmall and infenfible limit, this would produce a compreffibility and clafticity fimilar to what we obferve. For if we confider a row of particles, within this limit, as comprelfed by an external force applied to the two extremities, the action of the whole row on the extreme points would be proportional to the number of particles, rhat is, to their dittance irverfely and to their denfity: and a number of fuch parcels, ranged in a fraight line, would confitute a row of any fenfible magnitude having the fame law of compreftion. But this law of corpuf. cular force is unlike every thing we oblerve in natulc, and to the lin degres improbable.

We muft therefore continue the limitation of this mu- Height of tual repulfion of the particles of air, and be contented tho Ammofor the prefont with having eftablifhed it as an experi- fphere. mental fact, that the adjoining particles of air are kept 213 afunder by forces inverfely proportional to their dift.ances; or perhaps it is better to abide by the fenfible law, that the denfoty of air is proportional to the compreflong force. This latw is abundantly fufficient for explaining all the fubordinate phenomena, and for giving us a complete knowledge of the mechanical conilitution of our atmofpherc.

And, in the firf place, this view of the compreffi- The ${ }^{217}$, bility of the air muft give us a very different notion of of the air the heisht of the armolphere from what we deduced on inveftigs a former occafion from our experiments. It is found, tod foom that when the air is of the temperature $32^{\circ}$ of Fahren- confidering heit's thermometer, and the mercury in the barometer fibility, \&e. ftands at 30 inches, it will defeend one-tenth of an inch if we take it to a place 87 feet higher. Therefore, if the air were equally denfe and heavy throughout, the height of the atmofphere would be $30 \times 10 \times 87$ feet, or 5 miles and 100 jards. But the loofe reatoning adduced on that occation was enough to fhow us that it mult be much higher; becaufe every ftratum as we afcend muft be fuccellively rarer as it is lefs compreffed by incumbent weighr. Not knowing to what degree air expanded when the comprellion was diminifhed, we could not tell the fucceffive diminutions of denlity and confequent augmentation of bulk and height; we could only fay, that feveral atmofpheric appearances indicated a much greater height. Clouds have been feen much higher; but the phenomenon of the twilight is the mofs oonvincing proot of this. There is no doubt that the vifibility of the lky or air is owing to its want of perfect tranfparency, each particle (whether of matter purely aerial or hitergeneneos) reflecting a little light.

Let $b$ (fig. $5+$.) be the laft particle of illuminated air which can be feen in the horizon by a fpe?ator at $A$. Which can be feen in the horizon by a fpenator at $A$. Plase
This mult be illuminated by a ray SD $b$, touching the ocuciv. earth's durface at fome point $D$. Now it is a known fact, that the degree of illumination called truilight is perceived when the fun is $18^{\circ}$ below the horizon of the fpectator, that is, when the angle E $b \mathrm{~S}$ or ACD is 18 degrees; therefore $b \mathrm{C}$ is the lecant of 9 degrecs (it is lefs, viz. about $8 \frac{1}{2}$ degrees on account of refraction). We know the earth's radius to be about 3970 miles: hence we conclude $b \mathrm{~B}$ to be about +5 miles; nay, a very fenfible illumination is perceptible much farther frem the fun's place than this, perhaps twice as far, and the air is fufficiently denfe for reflecting a denfible light at the height of neariy 200 miles.

We have now feen that air is prodigioully expanfible. None of our experiments have diftinctly fhown us any limit. But it does not follow that it is expanfible without end; nor is this at all likely. It is much more probable that there is a certain difance of the parts in which they no longer repel each other; and chis would be the diftance at which they would arrange themielves if they were not heavy. But at the very fummit of the atmofliere they, will be a very fmall matter nearer to each other, on account of their gravitation to the earth. Till we know precifely the law of this mutual repul. fion, we cannot fay what is the height of the atmofphere.

But if the air be an elaftic fluid whole denfity is al

 of the earth：and we can compare the denfity fo calcu－ lated with the denfity difcovered by olicivation：for this laft is meafured by the lecight at which it fupports mercury in the barometer．This is the direct meafure of the prifure of the external air；and as we know the law of gravitation，we can teil what would be the prel－ fure of air having the calculated denlity in all its parts：Let us therefore firpofe a prifmatic or cylindric co－ lumm of air reaching to the top of the atmofphere． Let this be divided into an indefinite number of ftrata of very fmall and equal depths or thicknefs；and let us，for greater finplicity，fuppofe at firf that a particle of air is of the fime weight at all diftances from the centre of the earth．

The abfolute weight of any one of thefe Arata will on thefe conditions be proportional to the number of particles or the gravity of arr contained in it ；and fince the depth of each flratum is the fame，this quantity of air will evidently be as the denfity of the 17 ratims：but the denfity of any fratum is as the comprefing force ； that is，as the preffure of the ftrata above it；that is， as their weight ；that is，as their quantity of matter－ therefore the quantity of air in each ftratum is pro－ portional to the quantity of air above it ；but the quan－ tity in each fratum is the diference between the co－ lumn incumbent on its bottom and on its top：there differences are thercfore proportional to the quantities of which they are the differences．But when there is a fories of quantities which are proportional to their own differences，both the quantities and their differences are in continual or geometrical progreffion：for let $a, b, c$ ， e three fuch quantities that

$$
\left.\begin{array}{rl}
b: c & =a-b: b-c, \text { then, by altern. } \\
b: a-b & =c: b-c \\
b: & a
\end{array}\right) \text { and by compof. }
$$

therefore the denfities of thefe frata decreafe in a geo－ metrical progrelion；that is，when the elevations above the contic or furface of the earth increafe，or their depths under the top of the atmofphere，decreafe，in an ari hmetical progrefion，the denfities decreafe in a geo－ metrical progreffion．

Let ARO（fig．55）reprefent the fection of the earth by a plane through its centre $O$ ，and let $m$ OAM be a vertical line，and AE perpendicular to OA will be a horizontal line through $A$ ，a point on the earth＇s furface．Let AE be taken to reprefent the denfity of the air at $A$ ；and let DH，parallel to $A E$ ，be taken to $A E$ as the denfity at 1$)$ is to the denfity at $A:$ it is cvident，that if a logitic or logarithmic curve EHN be drawn，having $A N$ for its axic，and palling through the points $E$ and $H$ ，the denfity of the air at any other point $C$ ，in this vertical line，will be reprefented by $C G$ ， the ordinate to the curve in that puint：for it is the property of this curve，that if portions $A B, A C, A D$ ， of its axis be taken in arithmetical progrefion，the or－ dinates $\mathrm{AE}, \mathrm{BF}, \mathrm{CG}, \mathrm{DH}$ ，will be in $\mathrm{g}^{2}$ cometrical pro－ greflion．
if EK or HS tonch the curve in E or H ，the fubtan－ gent AL or DS is a confant quantity．

A T I C S．
And a third fundamental property is，that the in－Heigl finitely exterded area MAEN is equ． 1 to the rectangle the A KAEL of the ordinate and fubtangent ；and，in like manner，the area MDHN is equal to $\mathrm{SD} \times \mathrm{DH}$ ，or to $\mathrm{KA} \times \mathrm{DH}$ ；confequently the area lying beyond any ordinate is proportionable to that ordinate．

Thefe gecmetrical properties of this curve are all analogous to the chief circumfances in the conflitution of the atmofphere，on the fuppolition of equal gravity． The area MCCN reprefents the whole quantity of ae－ real matter which is above C ：for CG is the denfity at C ，and CD is the thicknefs of the fratum between C and D ；and therefore CCHD will be as the quantity of matter or air in it ；and in like manner of all the others，and of their fums，or the whole area MCGN： and as each ordinate is proportional to the area above it，fo each denfity，and the quantity of air in each ftra－ tum，is proportional to the qnantity of air above it ： and as the whole area MAEN is equal to the rectangle KAE 5 ，fo the whule air of variable denlity above A might be contaised in a column liA，if，inltead of be－ ing comprefled by its own weight，it were without weight，and compreffed by an external force equal to the prefluse of the air at the furface of the earth．In this caie，ie would be of the un form denfity AE，which it has at the furface of the earth，making what welave repeatec＂，called the homogeneous atmolphere．

Hence we derive this inip rtant circumftance，that the height．of the hogeneous atme fphere is the fub－ tangent or that curve whofe ordinates are as the den－ lities of the air at different he ghts，an the fuppofition of equal gravity．This curve may with propriety be called the atmospherical logarithmic：and as the different logarithmics are all chataderifed by their fub－ tangents，it is of importance to determine this one．

It may be done by comparing the dendities of mer－ cury and air．For a column of air of uniform denfity， reaching to the top of the homogeneons atmoiphere，is in equilibrio with the mercury in the barometer．Now it is found，by the beft experiments，that when mer－ cury and air are of the temperature $32^{\circ}$ of Fahrenheit＇s thermometer，and the barometer flands at 30 inchec，the mercury is nearly 10440 times denfer than air．There－ fore the height of the homogeneous atmofphere is $1044^{\circ}$ times 30 inches，or 26100 feet，or 8700 yards，or 4350 fathonis，or five miles wanting 100 yards．

Or it may be found by obdervations on the barome－ ter．It is found，that when the mercury and air－are of the above temperature，and the barometer on the fea－hore flands at 30 inches，if we carry it to a place $88+$ feet higher it will fall to 29 inches．Now，in all logarithmic curves having equal ordinates，the portions of the axes intercepted between the correfponding pairs of ordinates are proportional to the fubtangents．And the fubtangents of the curve belonging to our common tables is 0,4342945 ，and the difference of the loga－ rithms of 30 and 29 （which is the portion of the axis intercepted between the ordinates 30 and 29），or 0,0147233 ，is to 0,4342945 as 883 is to 26058 fuet，or 8686 yards，or 4343 iathoms，or 5 miles wanting 114 yards． This determination is $1+$ yards lefs than the other，and it is uncertain which is the molt exad．It is extremely difficult to meafure the refpective deafities of mercury and air；and in meafuring the elcvation which pro－
af duces a fall of one inch in the barometer, an crrer of ir of an inch would produce all the difference. We prefer the laft, as depending on fewer circumfances.
But all this inveftigation procceds on the fuppotition of equal gravity, whercas we know that the weight of a particle of air decreafes as the fquare of its diftance from the centre of the earth increafes. In order, thercfore, that a fuperior fratum may produce an equal preffure at the furface of the carth, it muft be denfer, becaufe a particle of it gravitates lefs. The denfity, therefore, at equal elevations, mult be greater thaii on the fuppofition of equal gravity, and the law of diminution of denlity mult be different.

$$
\begin{aligned}
& \text { Mate OD:OA=OA:Od; } \\
& \text { CC:OA }=\mathrm{OA}: \mathrm{Oc} ; \\
& \text { OB:OA }=\mathrm{OA}: \mathrm{O} b, \mathrm{Ec} ;
\end{aligned}
$$

fo that $\mathrm{O} d, \mathrm{O} c, \mathrm{O} b, \mathrm{OA}$, may be reciprocals to OD , $\mathrm{OC}, \mathrm{OB}, \mathrm{OA}$; and through the points $\mathrm{A}, b, c, d$, draw the perpendiculars AE, bf, cg, dh, making them p:oportional to the denfities in $\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}$ : and let us fuppofe CD to be exceedingly fmall, fo that the denfity may be fuppofed uniform though the whole fratum. Thus we have
$\mathrm{OD} \times \mathrm{Od}=\mathrm{OA}^{2},=\mathrm{OC} \times \mathrm{O} c$
and $\mathrm{O} c: \mathrm{O} d=\mathrm{OD}: \mathrm{OC}$;
and $\mathrm{O}_{i}: \mathrm{O}_{c}-\mathrm{O}, \mathrm{l}=\mathrm{OD}: \mathrm{OD}-\mathrm{OC}$,
or $\mathrm{O}_{c}: c d=\mathrm{OD} . \mathrm{DC}$;
and $c d: \mathrm{CD}=\mathrm{O}: \mathrm{OD}$;
or, becaufe $O C$ and OD are ultimately in the ratio of equality, we have
cd $: \mathrm{CD}=\mathrm{O} c: O C=\mathrm{OA}^{2},: \mathrm{OC}^{2}$,
and $c d=\mathrm{CD} \times \frac{\mathrm{OA}^{2}}{\mathrm{OC}^{2}}$ and $c d \times c_{s}=\mathrm{CD} \times c_{g} \times \frac{\mathrm{OA}^{3}}{\mathrm{OC}^{3}}$; but $C D \times c g \times \frac{O A^{2}}{\overline{O C}^{2}}$ is as the preffure at C arifing from the abfolute weight of the fratum CD. For this weight is as the bulk, as the denfity, and as the gravitation of each particle jointly. Now CD exprelfes the bulk, of the denfity, and $\frac{\mathrm{OA}^{2}}{\mathrm{OC}^{2}}$ the gravitation of each particle. Therefore, $c d \times c g$ is as the preffure on C arifing from the weight of tree ftratum DC; but $c d \times c g$ is evidently the clement of the curvilineal area AmnE, formed by the curve $\mathrm{E} f \delta b n$ and the ordinates A E, lf, cs, ah, \&c.mn. Therefore the fum of all the elements, fuch as c dhg, that is, the area cmng below cg , will be as the whole preffure on C, arifing trom the gravitation of all the air above it ; but, by the nature of air, this whole preffure is as the denfity which it produces, that is, as cg. Therefore the curve $\mathrm{E} f a$ is of fuch a nature that the area-lying below or beyond any ordinate $c g$ is proportional to that ordinate. This is the property of the logarithmic curve, and $\mathrm{E}_{\mathrm{gn}}$ is a logarithmic curve.

Dut farther, this curre is the fame with EGN. For let D continually approach to A , and ultimately coincide with it. It is evident that the nitimate ratio of $\operatorname{lBA}$ to Al , and of BF to lf , is that of equality; and if ETK, Efl, be drawn they will contain equal angles with the ordinate AE , and will cut off equal fubtangents AK, A\%. The curves EGN, E/n are therefore the tame, but in oppufite pofitions.

Lafly, if $\mathrm{OA}, \mathrm{O} l, \mathrm{O}, \mathrm{O} d$, s.c. be taken in arithmetical progreffion decreafing, their reciprocals $\mathrm{OA}, \mathrm{OB}$,

Vos. XV.

OC, OD, \&ec will be in harmenicat progreffion increa. Height of fing, as is well known: but from the nature of the the Atmn. logarithmic curve, when $\mathrm{OA}, \mathrm{O} b, \mathrm{Oc}, \mathrm{Od}, \& \mathrm{c}$. are in arithmetic il p:ogreffion, the ordinatcs $\mathrm{AE}, b f, c \mathrm{c}, d \mathrm{~d}$, \&c. are in trometrical progrefion. Therefore when $\mathrm{OA}, \mathrm{OF}, \mathrm{OC}, \mathrm{OD}$, \&e. are in harmonical progrefion, the denfities of the air at A, B, C, D, \&c. are in geometrical progrefion; and thus may the denfity of the air at all elevations be difcovered. Thus to find the denfity of the air K the top of the homogencous atmofphere, make $O K$ : $O A=O A$ : OL, and draw the ordinate LT, LT is the dentity at K .
The celebrated Dr Halley was the firt who obferved the relation between the denfity of the air and the ordinates of the logarithmic curve, or common logarithms. This ne did on the fuppofition of equal gravity; and his difcovery is acknowledged by Sir Iraze Newton in Princip, ii. prof. 22. fobol. Haller's differtation on the fubject is in $n^{\circ} 185$ of the Phill. Tranl. Newton, with his ufual fagacity, extended the tame relation to the truc ftate of the cafe, where gravity is as the fquare of the difance inverfely; and flowed that when the diftances from the earth's centre are in harmonic progreflion, the denfities are in geometric progreffion. He fhows indeed, in gencral, what progreflion of the diftance, on any fuppofition of gravity, will produce a geometrical pregreflion of the denfities, fo as to obtain a fet of lines $\mathrm{OA}, \mathrm{O} \ell, \mathrm{O} z, \mathrm{O} d$, sic. which will be logarithms of the denfities. The fubjef was afterwards treated in a more familiar manner by Cotes in his Mydrof. Let. and in his Harmonia Mcnfurarum; alfo by Dr Brooke Taylor, Meth. Increment; Wolf in his Acrometria; Herman in his Phoronomia; \&cc. Ec. and lately by Horfley, Phil. Tranf. tom. 1xiv.

An important corollary is deducible from thefe prin. Th ${ }^{234}$ ciples, viz. that the air has a finite denfity at an in- a finite finite diftance from the centre of the earth, namely, fuch as will be reprefented by the ordinate OP drawn through the centre It may be objected to this con-rifance log the centre. It may be objected to this con- from the clufion, that it would infer an infinity of matter in the centre of univerfe, and that it is inconfiftent with the phenome- the earth, na of the planetary motions, which appear to be performed in a fpace void of all refiffance, and therefore of all matter. But this fluid mult be fo rare at great diftances, that the refiftance will beinlenfible, even though the retardation occafioned by it has been accumulated for ages. Even at the very moderate diftance of 500 miles, the rarity is fo great that a cubic inch of common air expanded to that degrec would occups a fphere equal to the orbit of Saturn; and the whole retardation which this pane would fuftain after fome millions of years would not exceed what would be occafioned by its meeting one bit of matter of half a grain weight.

This being the cafe, it is not unreafomate to fuppofe the vifible univerfe occupied by air, which, by its gravitation, will aecumulate itfelf round every body in it, in a proportion depending on thcir quantities of matter, the larger bodies attracting more of it that the fmaller ones, and thus forming an atmophere about each. And many appearances warrant this fuppofition. Jupiter, Mars, Sturn, and Venus, are evidentlf furrounded by atmofpheres. The conflitution of thefe atmofpheres may differ exceedingly from other eaufes. If the planet has nothing on its fulface which can be dififolved

Atmo. fipheres of the other Planets,
\& $\&$. 235 The ammo fthere of Mars,

236
of Jupiter,
by the air or volatilifed by heat, the atmofphere will be continually clear and tranfparent, like that of the moon.

Mars has an atmofplere which appears precifely like our own, carrying clouds, or depoliting fnows: for when, by the obliquity of his axis to the plane of lis ecliptic, he tuins his noth pole towards the fun, it is obferved to be occupied by a broad white fort. As the fummer of that region advances, this fpot gradually waftes, and fometimes vanifhes, and then the fouth pole comes in fight, furrounded in like manner with a white fpot, which undergoes fimilar changes. This is precifcly the appearance which the fnowy circumpolar regions of this earth will exhibit to an aftronomer on Mars. It may not, however, be frow that we fee; thiek clonds will have the fame appearances.

The atmofphere of the planet Jupiter is alfo very fimilar to our own. It is diverfified by ftreaks or belts parallel to his equator, which frequently change their appearance and dimenfions, in the fame manner as thofe tracks of fimilar Ky which belong to different regions of this globe. There is a certain kind of weather that more properly belongs to a partictlar climate than to any other. This is nothing but a certain general ftate of the atmofphere which is prevalent there, though with confiderable variations. This mult appear to a fpectator in the moon like a freak fpread over that climate, diftinguifhing it from others. But the moft remarkable fimilarity is in the motion of the clouds on Jupiter. They have plainly a motion from eaft to weft relative to the body of the planet: for there is a remarkable fpot on the furface of the planet, which is obferved to turn round the axis in $9 h .51^{\prime} 16^{\prime \prime}$; and there trequently appear variable and perithing fpots in the belts, which fometimes laft for feveral revolutions. Thefe are obferved to circulate in 9.55 .05 . Thefe numbers are the refults of a long feries of obfervations by Dr Herfchel. This plainly indicates a general current of the clouds weftward, precifely fimilar to what a fpectator in the moon muft obferve in our atmofphere arifing from the trade-winds. Mr Schroeter has made the atmofphere of Jupiter a fudy for many years; and deduces from his obfervations that the motion of the variable fpots is fubject to great variations, but is always from eaft to welt. 237 This indicates variable winds.
Of Venus,
The atmofphere of Venus appears alfo to be like ours, loaded with vapours, and in a flate of continual change of abforption and precipitation. About the middle of lait century the furface of Venus was pretty dininetly feen for many years chequered with irregular tpots which are deferibed by Campani, Bianchini, and wher allronomers in the fouth of Europe, and alfo by Canini at Paris, and Hooke and Towley in England. But the fpots became gradually more faint and indi. finet; and, for ne:tr a century, have difappeared. The whole furface appears now of one unitorm brilliant whitc. The atmoiphere is probably filled with a reflecting vapour, thinly diffufed throngh it, like water faintly tin ed with milk. A great depth of this mult apfear as white as a fmall depth of milk itfelf; and it appears to be of a very great depth; and to be refractive like our air. For Dr Herichel has obferved, by the help of his fine telefcopes, that the illuminated phart of Venus is confiderably more than a hemifphere, and that the light dies rradually asay to the bounding
margin. This is the very appearance that the eantli would make if furniflued with fuch an atmofphere. The fpher boundary of illumination would have a penumbra reach- the ing about nine degrees beyond it. If this be the conItitution of the atmofphere of Venus, fhe may be inlabited by beings like oufelves. They would not be dazzled by the intolerable fplendor of a fun four times as big and as bright, and fixteen times more glaring, than ours; for they would feldom or never fee him, but inftead of him an uniformly bright and white fky. They would prohably never fee a flar or planet, unlefs the dog Itar and Mercury ; and perhaps the earth might pierce through the bright haze which furrounds their planet. For the fame reafon the iuhabitants would not perhaps be incommoded by the fun's heat. It is indeed a very queftionable thing, whether the fun would caufe any heat, even here, if it were not for the chemical action of his rays on our air. This is rendered not improbable by the intenfe cold felt on the tops of the highelt mountains, in the cleareft air, and even under a vertical fun in the torrid zone.

The atmofphere of comets feems of a nature totally And different. This feems to be of inconceivable rarity, met even when it reflects a very fenfible light. The tail is always turned nearly away from the fun. It is thought that this is by the impulfe of the folar rays. If this be the cafe, we think it might be difcovered by the aberration and the refration of the light by which we fee the tail: for this light mult come to our eye with a much fmaller velocity than the fun's light; if it be reflefled by repulfive or elaftic forces, which there is every reafon in the world to believe; and therefore the velocity of the reflected light will be diminifhed by all the velocity communicated to the reflecting particles. This is almoft inconceivably great. The comet of 1680 went half sound the fun in ten hours, and had a tail at leaft a hundred millions of miles long, which turned round at the fame time, keeping nearly in the direction oppofite to the fun. The velocity neceffary for this is prodigious, approaching to that of light. And pertiaps the tail extends much farther than we fee it, but is vifible only as far as the velocity with which its particles recede from the fun is leis than a certain quantity, namely, what would leave a fufficient velocity for the reflected light to enable it to allect our eyes. And it may be demonftrated, that although the real form of the vifible tail is concave on the anterior fide to which the cumet is moving, it may appear convex on that fide, in confequence of the very great aberiation of the light by which the remote parts are feen. All this may be difcovered by properly contrived obfervations; and the conjedure merits attention. But of this digreflion there is enough ; and we reurn to our fubject, the conftitution of our air.

We have fhown how to determine $\dot{a}$ frior $i$ the denfity The of the air at different flevations above the furface of the met earth. But the denfities may be dife wered in all accef- in tip fible elevations by experiments; namely, by obferving heig the heights of the mercury in the barometer. This is a direat meafure of the preflure of the incumbent atmofphere; and this is proportional to the denfity which it produces.

Therefore, by means of the relation fubfifting between the denfitics and the elevations, we can difcover the elevations by obfervations made on the denfities by means
nieter. of the barometer ; and thus we may meafurc elevations by moans of the barometer; and, with very little trouble, take the level of any catenfive track of country: Of this we have an illuftrious crample in the feation .which the Abbé Chappe 1)' Auteroche has given of the whole country between Breft and Lkaterinenburgh in Siberia. This is a fubject which deferves a minute confideration : we flall therefore prefent it under a very fimple and familiar form; and trace the method through its various ftcps of improvement by De Luc, Roy, Shuckbourgh, sce.

We have already obferved oftener than once, that if the mercury in the barometer ftands at 30 inches, and if the air and mercury be of the temperature $32^{\circ}$ in Fahrenheis's thermonmeter, a column of air 87 feet thick -has the fime weight with a column of mercury ${ }^{1}$ 's of on inch thick. Therefore, if we carry the barometer to a higher, place, fo that the mercury finks to 29.9 , we have afcended 87 feet. Now, fuppofe we carry it fill higher, and that the mercury fands at 29.8 ; it is required to : now what:height we have now got to? We have evidently afcended through another fratum of equal weight -with the former: 'but it mult be of greater thicknefs, - becaule the air in it is rarer, being lefs compreffed. We may call the denfity of the firft Atratum 300, meafuring the denfity by the number of tenths of an inch of mercury which its elafticity proportional to its denfity enables it to fupport. For the fame reafon, the denfity of the fecond ilratum mult be 299: but when the weights are equal, the bulks are inveriely as the denfities; and when the baies of the frata are equal, the bulks are as the thicknefles. Therefore, to obtain the thicknefs of this fecond tratum, fay 299: $300=87: 87,29$; and this fourth term is the thicknefs of the fecond flratum, and we have afcended in all 174,29 feet. 'In like manner we may rife till the barometer thows the denfity to be 298: then fay, $298: 30=87: 87,584$ for the thicknefs of the third ftratum, and 261,875 or $26 \mathrm{I}_{1}$ for the whole afcent; and we may proceed in the fame way for any number ( $f$ mercurial heights, and make a table of the correfponding elements as follow: where the firt column is the height of the mercury in the barometer, the fecond column is the thicknefs of the fratum, or the elevation above the preceding ftation; and the third column is the whole clevation above the firft fation.

| Bar. | Strat. | .Elev, |
| :--- | :---: | ---: |
| 30 | 00,000 | 00,000 |
| 29,9 | 87,000 | 87,000 |
| 29,8 | 87,291 | 174,291 |
| 29,7 | 87,584 | 261,875 |
| 29,6 | 87,879 | 349,754 |
| 29,5 | 88,176 | 437,930 |
| 29,4 | 88,475 | 526,405 |
| 29,3 | 88,776 | 615,181 |
| 29,2 | 89,079 | 704,260 |
| 29,1 | 89,384 | 793,644 |
| 29 | 89,691 | 883,335 |

Having done this, we can now meafure any elevation within the limits of our table, in this manner.

Obferve the barometer at the lower and at the upper fations, and write down the correfponding elevations. Subtract the one from the other, and the remainder is the height required. Thus fuppofe that at the lower
fation the mercurial height was- 20,0 ; and that at the upper fation it was $2 \mathrm{y}, \mathrm{t}$.

$$
\begin{array}{ll}
20,1 & 793,64 \div \\
20,8 & 174,291 \\
& 619,353=\text { Eicvation. }
\end{array}
$$

We may do the fame th:ner with volerable accuracy without the table, by taking the medium $\%$ of the mercurial heights, ind their difference $d$ in tenths of an inch ; and then lay, is $m$ to 300 , fo is $87 d$ to the lici-hth requircd $b:$ or $h=\frac{300 \times 87 d}{m}=\frac{26100 d}{m}$. Thus, in the foregoing example, $m$ is 294,5 , and $d$ is $=7$; and the: $c-$ fore $b=\frac{7 \times 26100}{294,5}=620,4$, differing only onc-foot.from the former value.

Either of thefe methods is fufficientiky accurate for moft purpofes, and even in very great elerations will not produce any error of confequence : the whole error of the clevation 883 feet 4 inches which is the extent of the above table, is only ${ }_{4}^{2}$ of an inch.

But we need not confine ourfelves to methods of approximation, when we have an accurate and fcientific method that is equally cafy. We have feen that, no the fuppofition of equal gravity, the denfities of the air are as the ordinates of a logarithmic curve, having the line of elevations for its axis. We have alfo feen that, in the true theory of gravity, if the diftances from the centre of the earth increafe in a harmonic progreflion, the logarithm of the denfities will decreafe in an arithmetical progreflion; but if the greateft elevation above the furface be bnt a few miles, this harmonic progreflion will hardly differ from an arithmetical one. Thus, if $\mathrm{A} b, \mathrm{~A}_{c}, \mathrm{Ad}$, are 1,2 , and 3 miles, we fhall find that the correfponding elevations $A B, A C, A D$ are fenfibly in arithmetical progreffion alfo: for the earth's radius AC is nearly 4000 miles. Hence it plainly follows, that $\mathrm{BC}-\mathrm{AB}$ is $\frac{1}{4000 \times 4001}$, or $\frac{1}{16004000}$ of 2 mile, or $\frac{1}{250}$ of an inch; a quantity quite infignificant. We may therefore affirm without hefitation, that in all accefible places, the elevations increafe in an arithmetical progreflion, while the denfities decreafe. in a geomitrical progreflion. Therefore the ordinates are proportional to the numbers which are taken to meafure the denfities, and the portions of the axis are proportional to the logarithms of thefe numbers. It follows, therefore, that we.may take fuch a fcale for nieafuring the denfities that the logarithms of the numbers of this fcale fhall be the very portions of the axis; that is of the vertical line in feet, yards, fathoms, or what meafure we plcafe: and we may, on the other hand, choofe fuch a fale for meafuring our elevations, that the logarithms of our fcale of denfities fhall be parts of this feale of clevations; and we may find either of thcfe fcales fcientifically. For it is a known property of the logarithmic curves, that when the ordinates are the fame, the intercepted portions of the abfciffe are proportional to their fultangents. Now we know the fubtangent of the atmofpherical logarithmic: it is the height of the homogeneous atmofphere in any meafure we pleafe, fuppofe fathoms: we find this beight by comparing the gravities of air and mercury, when

Earometcr, both are of fome determined denfity. Thus, in the temperature of $32^{\circ}$ of Fahrenheit's thermometer, when the barometer flands at 30 inches, it is known (by many experiments) that mercury is 10423,068 times heavier than air; therefore the height of the balancing column of homogeneous air will be 10423,068 times 30 inches; that is 4342,945 Englifh fathoms. Again, it is known that the fubtangent of our common logarithmic tables, where 1 is the logarithm of the number 10 , is 0,4342945 . Therefore the numler 0,4342945 is to the difference 1) of the logarithms of any two barometric heights as 4342,945 fathoms are to the fathoms F contained in the portion of the axis of the atmofpherical logarithmic, which is intercepted between the ordinates equal to thefe barometrical heights; or that $0,4342945: D$ $=434^{2,945: F}$, and $0,4342,945: 4342,945=\mathrm{D}: \mathrm{F}$; but 0,4342945 is the ten-thoufandth part of 4342,945 , and therefore D is the ten-thoufandth part of F .
244.

And thus it happens by mere chance, that the logarithms of the denfities, meafured by the inches of mercury which their elafticity fupports in the barometer, are jult the ten-thoufandth part of the fathoms contained in the correfponding portions of the axis of the atmolpherical logarithmic. Therefore, if we multiply our common logarithms by 12000 , they will exprefs the fathoms of the axis of the atmofpherical logarithmic; nothing is more eafily done. Our logarithms contain what is called the index or characteriftic, which is an integer and a number of decimal places. Let us juft remove the integer-place four figures to the right hand: thus the logarithm of 60 is 1.7781513 , which is one integer and $\frac{7781513}{10000000}$. Multiply this by 10,000 , and we obtain $\frac{513}{1001} 17781,513$, or $17781 \frac{513}{1000}$.

The prattical application of all this reafoning is obrious and eafy : oblerve the heights of the mercury in the barometer at the upper and lower fations in inches and decimals; take the logarithms of thefe, and fubtrast the one from the other: the difference between them (accounting the four firft decimal figures ags integers) is the difference of elevation of fathoms.

## Example.

Merc. Height at the lower flation 29,8 1.4742163 upper ftation 29,1 $1.463893^{\circ}$

Diff. of Log. $\times 10000$
0.6103,233
or IC3 fathoms and $\frac{233}{1000}$ of a fathom, which is 619,392 feet, or 619 feet $4_{4}^{3}$ inches; differing from the approxi. mated valne formerly found about 's an inch.

Such is the general nature of the barometric meafurement of heights firft fuggetted by Dr Halley; and it has been verified by numberlefs comparifons of the heights calculated in this way with the fame height meafured geometrically. It was indeed in this way that the precife fpecific gravity of air and mercury was molt accurately determined; namely, by obferving, that when the temperature of air and mercury was 32 , the difference of the logarithms of the mercurial heights were precifely the fathoms of clevation. But it requires many cor-
rections to adjuft this method to the circumflances of the cafe ; and it was not till very lately that it has been fofar adjufted to them as to become ufeful. We are chiefly indebted to Mr de Luc for the improvements. The great elevations in Switzerland cnabled him to make an immenfe number of obfervations, in almolt every variety of circumftances. Sir George Shuckbourgh alfo made a great number with moft accurate inftruments in much greater elevations, in the fame country; and lie made many chamber experiments for determining the laws of variation in the fubordinate circumfances. General Roy alfo made many to the fame purpofe. And to thefe two gentlemen we are chiefly obliged for the coırections which are now generally adopted.

It is cafy to perceive that the method, as already ex- tt depet preffed, cannot apply to every cafe: it depends on the fecific gravity of air and mercury, combined with the fuppofition that this is affected only by a change of preffure. But fince all bodies are expanded by heat, and as there ry. is no reafon to fuppofe that they are equally expanded by it, it follows that a change of temperature will change the relative gravity of mercury and air, even although both fuffer the fame change of temperature: and fince the air may be warmed or cooled when the mercury is not, or may change its temperature independent of it, we may expect fill greater variations of fpecific gravity.

The general effect of an augmentation of the fpecific gravity of the mercury muft be to increafe the fubtangent of the atmofpherical logarithmic ; in which cafe the logarithms of the denfaties, as meafured by inches of mercury, will exprefs meafure that are greater than fathoms in the fame proportion that the fubtangent is increafed; or, when the air is more expanded than the mercury, it will require a greater height of homogeneous atmofphere to balance 30 inches of mercury, and a given fall of mercury will then correfpond to a thicker fratum of air.

In order, therefore, to perfeft this method, we muft learn by experiment how much mercury expands by an increafe of temperature ; we mult allo learn how much the air expands by the fame, or any change of temperature; and how much its elafticity is affected by it. Both thefe circumftances muft be confidered in the cafe of air ; for it might happen that the elafticity of the air is not fo much affected by heat as its bulk is.

It will, therefore, be proper to ftate in this place the experiments which have been made for afcertaining thefe two expanfions.

The moft accurate, and the beft adapted experiments Gener ${ }^{24}$ for afcertaing the expanfion of mercury, are thofe of Rey's General Roy, publifhed in the 67th volume of the perime Philofophical Tranfactions. He expofed 30 inches of mercury, actually fupported by the atmofphere in a barometer, in a nice apparatus, by which it could be made of one uniform temperature through its whole length ; and he noted the expanfion of it in decimals of an inch. Thefe are contained in the following table; where the firft column expreffes the temperature by Fahrenheit's thermometer, the fecond column expreffes the bulk of the mercury, and the third column the expanfion of an inch of mercury for an inereafe of one degree in the adjoining temperatures.

Table A.

| mp | Bul | Ex |
| :---: | :---: | :---: |
| $212^{\circ}$ | 30,5117 | 0,0000763 |
| 202 | 30,4888 | 0,0000787 |

| $\bigcirc$ | 29,8901 |  |

the true meafure of the denfity of the air of the flandard temperatute. In order that we may obtain the exact temperature of the mercury, it is proper that the obfervation be made by meins of a thermometer attached to the barometer-frame, fo as to warm and cool along with it.

Or, this may be done without the help of a table, and with fufficient accuracy, from the circumftance that the expanfion of an inch of nercury for one degree diminifhes very nearly $\frac{{ }^{\frac{T}{0}}}{0}$ th part in cach fucceeding degree. If therefore we take from the expanfion at $32^{\circ}$ its thoufandth part for each degree of any range above it, we obtain a mean rate of expanfion for that range. If the obferved temperature of the mercury is below $32^{\circ}$, we mult add this correction to obtain the mean expanfion. This rule will be made more exact if we fuppofe the expanfion at $32^{\circ}$ to be $=0,0001127$. Then inultiply the obferved mercurial height by this expanfion, and we obtain the correction, to be fubtracted or added according as the tem. perature of the mercury was above or below $32^{\circ}$. Thus to abide by the former example of $72^{\circ}$. This exceeds $32^{\circ}$ by 40 : therefore take 40 from 0,0001127 , and we have 0,0001087 for the medium expantion for that range. Multiply this by 40 , and we have the whole expanfion of one inch of mercury, $=0,004348$. Muitiply the inches of mercurial , height, viz. 29,2 , by this expanfion, and we have for the correction 0,12606 ; which being fubtracted from the obferved height leaves 29,07304, differing from the accurate quantity lefs than the thoufandth part of an inch. This rule is very eafily kept in the memory, and fuperfedes the ufe of a table.
This correction may be made with all neceflary ex. actnefs by a rule fill more fimple; namely, by multiplying the obferved height of the mercury by the difference of its temperature from $32^{\circ}$, and cutting of four cyphers before the decimals of the mercurial height. This will feldom err $\mathrm{T}^{\frac{1}{8} \pi}$ of an inch. We even believe that it is the molt exaf method within the range of temperatures that can be expected to occur in meafuring heights: for it appears, by comparing many experiments and obfervations, that General Roy's meafure of the mercurial expanfion is too great, and that the expanfion of an inch of mercury between $20^{\circ}$ and, 0 of Fahrenheit's thermometer does not exceed 0,000102 per degree. Having thus corrected the obferved mercurial heights by reducing them to what they would have been if the mercury had been of the ftandard temperature, the logarithms of the corrected heights are tzken, and their difference, multiplied by 10000 , will give the difference of elevations in Englifh fathoms.

There is another way of applying this correction, fully more expeditious and equally accurate. The dfference of the logarithms of the mercurial hsights is the meafure of the ratio of thofe heights. In like manner the difference of the logarithms of the obferved and corrected heights at any Itation is the meafure of the ratio of thofe heights. Therefore this laft difference of the logarithms is the meafure of the correction of this ratio. Now the obferved height is to the corrected height nearly as 1 to 1,000102 . The logarithm of this ratio, or the difference of the logarithms of I and 1,000102 , is 0,0000444 . This is the correction for each degree that the temperature of the mercury differs from 32. Therefore multiply 0,0000444 by the difference of the mercurial temperatures from 32 , and the

This table gives rife to fome reflections. The fcale of the thermometer is conftructed on the fuppofition that the fucceflive degrees of heat are meafured by equal increments of bulk in the mercury of the therm smeter. How comes it, therefore, that this is not accompanied by equal increments of bulk in the mercury of the column, but that the correfponding expanfions of this column do continually diminith? General Roy attributes this to the gradual detachment of elaftic matter from the mercury by heat, which preffes on the top of the column, and therefore fhortens it. He applied a boiling heat to the racuum a-top, without producing any farther depreffion; a proof that the barometer had been carefully filled. It had indeed been boiled through its whole length. He had attempted to meafure the mercurial expanfion in the ufual way, by filling 30 inchcs of the tube with boilcd mercury, and expoling it to the heat with the open end uppermoft. But here it is evident that the expantion of the tube, and its folid contents, muft be taken into the account. The expanfion of the tube was found fo exceedingly irregular, and fo incapable of being determined with precifion for the tubes which were to be employed, that he was obliged to have recourfe to the method with the real barometer. In this no regard was neceffary to any circumftance but the perpendicular height. There was, befides, a propriety in examining the mercury in the very condition in which it was ufed for meafuring the preflure of the atnoofphere; becaule whatever complication there was in the refults, it was the fame in the barometer in actual ufe.

The moft obvious manner of applying thefe experiments on the expanfion of mercury to our purpofe, is to reduce the obferved height of the mercury to what it would have been if it were of the temperature $3^{2}$. Thns, fuppefe that the obferved mercurial height is 29,2 , and that the temperature of the mercury is $72^{\circ}$ make $30,1302: 30=29,2: 29,0738$. This will be

257
The tem. perature of theairmuft alfon be attended to.

Baroneter. products will be the corresions of the refpedive loga...... rithms.

But there is fill an cafier way of applying the 10 garithmic correstion. If both the mercurial temperatures are the fame, the diferences of their logarithms will be the fame, although each may be a good deal above or below the ftandard temperature, if - the expanfinn be very nearly equable. The correction will be necefiary only when the temperatures at the rwo lat tions are different, and will be proportional to this difference. Therefore, if the difference of the mercurial temperatures be nultiplied by 0,0000444 , the product will be the correstion to be made on the difference of the logarithms of the mercurial heights.

But farther, fince the differences of the logarithms of the mercurial heights are alfo the differences of clevation in Englif fathoms, it follows that the correction is alfo a differcuce of elevation in Englifh fathoms, or that the correction for one degree of difference of mercurial temperature is ${ }_{7}^{4.4 .4}$ of a fathom, or 32 inches, or 2 feet 8 inches.
This correction of 2.3 for every degree of difference of temperature mult he fubtracted from the elevation found by the general rate, when the mercury at the upper ftation is colder than that at the lower. For when this is the cafe, the mercurial column at the upper ftation will appear too fhort, the preffure of the atmofphere too fmall, and therefore the elevation in the atmoffhere will appear greater than it really is.

Therefore the rule for this correction will be to multiply $0,00004+4$ by the degrees of difference between the mercurial temperatures at the two ftations, and to add or fubtract the product from the elevation found by the general rule, according as the mercury at the upper ftation is hotter or colder than that at the lower.

If the experiments of General Roy on the expanfion of the mercury in a real barometer be thought molt deferving of attention, and the expanfion be confidered as variable, the logarithmic difference correfponding to this expanfion for the mean temperature of the two barometers may be taken. Thefe logarihmic differences are contained in the following tabte, which is carried as far as $112^{\circ}$, beyond which it is not probable that any obfervations will be made. The number for each temperature is the difference between the logarithms of 30 inches, of the temperature 32 , and of 30 inches expanded by that temperature.

Table $B$

| Temp. | l.eg. diff. | Uec. of | Ft. In. |
| :---: | :---: | :---: | :---: |
| $112{ }^{\circ}$ | $0.0000+27$ | ,427 | 2.7 |
|  | $0.000043^{6}$ | , 436 | 2.7 |
| 92 32 | 0.0000444 | ,444 | 2.8 |
|  | . 0.0000453 | ,453 | 2.9 |
| 6 | 0.0000160 | ,460 | 2.9 |
|  | 0.0000468 | ,468 | 2.10 |
| 52 42 | 0.0000475 | 4775 | 2.10 |
| 32 | 0.0060482 | , 482 | 2.11 |
| 22 | 0.0000489 | ,489 | 2. 11 |
| 12 | 0.0000497 | ,497 | 3.0 |
| 0 | 0.0000504 | ,504 | 3.0 |

mercury. The relative gravity of the two, on which the fubtangent of the logarithmic curve depends, and confequently the unit of our fcale of clevations, is much more effected by the heat of the air than by the heat of the mercury.
This adjuftment is of incomparably greater difficulty than the former, and we can hardiy hope to make it perfect. We flall narrate the chief experiments which have been made on the expanfion of air, and deduce from them fuch rules as appear to be neceffary confequences of them, and then notice the circumflances which leave the matter ftill imperfect.

Genéral Roy compared a mercurial and an air ther- Comparimometer, each of which was graduated arithmetically, fon of a that is, the units of the fcales were equal bulks of mer- mercurial cury, and equal bulks (perhaps different from the for- thermome mer) of air. He found their progrefs as in the follow- ter. ing table.

$$

$$

It has been eftablifhed by many experiments that equal increments of heat produce equal increments in the bulk of mercury. The differences of temperature are therefore expreffed by the fecond column, and may be confidered as equal; and the numbers of the third column mult be allowed to exprefs the fame temperatures with thofe of the firft. They directly exprefs the bulks of the air, and the numbers of the fourth column exprefs the differences of thefe bulks. Thefe are evidently unequal, and fhow that common air expands moft of all when of the temperature 62 neanly.

The next point was to determine what was the nifual $T_{T o}{ }^{260}$ increafe of bulk by fome known increafe of heat. For mine an this purpofe he took a tube, having a narrow bore, and acual ina ball at one end. He meafured with great care the creare of capacity of both the ball and the tube, and divided the bulk from tube into equal fpares which bore a determined pro- increafe, portion to the capacity of the ball. This apparatus heat.
was fet in a long cylinder filled with frigorific mixtures or with water, which could be uniformly heated up to the boiling temperature, and was accompanied by a nice thermometer. The expanfion of the air was meafired by means of a column of mercury which rofe or funk in the tube. The tube beidg of a fniall bore, the mercury did not drop out of it; and the bore being chofen as equable as poffible, this column remained of an uniform lengtl, whatever part of the tube it chanced to occupy. By this contrivance he wals able to examine the expanfibility of air of various denfities. When the column of mercury contained only a fingle drop or two, the air was nearly of the denfity of the external air. If he wilhed to examine the expanfion of air twice or thrice as denfe, he ufed a column of 30 or 60 inches long:
and to cramine th: ex 2, n nion of air that is rarer than denfity is of much greater confequence than that of the and to examine the ex, an nion of air that is rarer than
roneter, the external ain, he phaced the tube with the ball uppermoft, the open end coming through a hole in the bottom of the velfel containing the mixtures or water. By this pofition the column of mercury was hanging in the tube, fupported by the preflure of the atmofphere ; and the elafticity of the included air was meafured by the difference between the fufpended colunm and the common barometer.

The following table contains the expanfion of rooo parts of air, nearly of the common denfity, by heating it from o to 212. The firft column contains the height of the barometer ; the fecond contains this height augmented by the fmall column of mercury in the tube of the manometer, and therefore exprefles the denlity of the air examined; the third contains the total expantion of 1000 parts; and the fourth contains the expantion for $I^{\circ}$, fuppoting it uniform throughout.

Table D.

| Barom. | Denfiry of Air examinted | Expaufion of 1000 pts by $212^{\circ}$. | Expanfion by $1^{\circ}$. |
| :---: | :---: | :---: | :---: |
| 29,95 | 35,52 | 483,89 | 2,2825 |
| 30,07 | 30,77 | 482,10 | 2,2741 |
| 29,48 | 29,90 | 480,74 | 2,2676 |
| 29,90 | 30,73 | 485,86 | 2,2918. |
| 29;96 | 30,92 | 489,45 | 2,3087 |
| 29,90 | 30,55 | 476,04 | 2,2455 |
| 29,95 | 30,60 | 487,55 | 2,2998 |
| 30,07 | 30,60 | 482,80 | 2,2774 |
| 29,48 | 30,00 | 489,47 | 2,3087 |
| Mean | 30,62 | $4^{88} 4,2 \mathrm{E}$ | 2,2840 |

Hence it appears, that the mean expanfion of 1000 parts of air of the denlity $3^{\circ} ; 6 z$ by one degree of Fahrenheit's thermometer is 2,284 , or that rooo becomes roo 2; 294.

If this expanfion be fuppofed to follow the fame rate that was obferved in the comparifon of the mercurial and air thermometer, we fhall find that the expanfion of a thonfand parts of air for one degree of heat at the different intermediate temperatures will beas in the following table.

Table E.

| Temp. | Total <br> Exparfion, | Expanfion <br> for $1^{\circ}$ |
| :---: | :---: | :---: |
| 2122 | $48+, 210$ |  |
| 192 | 444,011 | 2,0099 |
| 172 | 462,452 | 2,0080 |
| 152 | 359,503 | 2,1475 |
| 132 | 315,193 | 2,2155 |
| 112 | 269,513 | 2,2840 |
| 92 | 222,006 | 2,3754 |
| 82 | 197,795 | 2,4211 |
| 72 | 172,671 | 2,5124 |
| 62 | 147,090 | 2,5581 |
| 52 | 121,053 | 2,6037 |
| 42 | 95,929 | 2,5124 |
| 32 | 71,718 | 2,4211 |
| 22 | 48421 | 2,3297 |
| 12 | 26,038 | 2,3383 |
| 0 |  | 2,1698 |

If we would have a mean expanfion for any particular range, as between $12^{0^{\circ}}$ and $92^{\circ}$, which is the moft likely to comprehend all the geodxtical obfervations, we need only take the difference of the bu'ks 26,038 and $222,006=195,968$, and divide this by the interval of temperature $80^{\circ}$, and we obtain 2,4496 , or 2,45 for the mean expanfion for $I^{\circ}$.

It would perhips be better to adapt the table to a mafs of 1000 parts of air of the ftandard temperature $32^{\circ}$; for in its prefent form it fhows the expanfibility of air originally of the temperature 0 . This will be done with fufficient accuracy by faying (for $212^{n}$ ) $107,718: 1484,210=1000,13849$, and fo of the reft. Thus we thall conftruct the following table of the expanfion of 10,000 parts of air.

## Table F.

| T Cmp . | Bulk. | Differ. | Expanf: for $1^{0}$. |
| :---: | :---: | :---: | :---: |
| 212 | 13489 |  |  |
| 192 | 13474 | 387 | 18,7 |
| 172 | 13087 | 387 392 | 18,3 19,6 |
| 152 | 12685 | 392 413 | 19,6 |
| 132 | 12272 | 426 | 21,3 |
| 112 | 11846 | 443 | 22, 1 |
| 92 82 | 11403 | 226 | 22,6 |
| 82 | 11177 10942 | 235 | 23.5 |
| 72 62 | 10942 10704 | 238 | 23,8 |
| 52 | 10461 | $2+3$ | 24,3 |
| 42 | 10226 | 235 | 23,5. |
| 32 | 10000 | 226 | 22,6 |
| 22 | 9783 | 217 | 21,7 |
| 12 | 9574 | 209 | 20,9 |
| $\bigcirc$ | 9331 | 243 | 20,2 |

This will give for the mean expanfion of 1800 parts of air between $1 \cdot 2^{\circ}$ and $92=2,29$.

Although it camnot happen that in meafuring the General differences of elevation near the earth's furface, we flall Rey'sexhave occafion to employ air greatly exceeding the com- periments mon denfity, we may infert the experiments made by on air General Roy on fuch airs. They are expreffed in the common folluwing table; where column firft contains the den- denfity, fities meafured by the inches of mercury that they will fupport when of the temperature $32^{\circ}$; column fecond is the expanfion of roco parts of fuch air by being heated from oto 212 ; and column third is the mean expanfon for $\mathrm{I}^{\circ}$.

Table G.

| Derfity. | Expanfion <br> for 212 | Expanf. <br> for $1^{\circ}$ |
| :---: | :---: | :---: | :---: |
| 101,7 | 451,54 | 2,130 |
| 92,3 | 423,23 | 1,996 |
| 90,5 | 412,09 | 1,944 |
| 54,5 | 439,87 | 2,075 |
| 49,7 | 443,24 | 2,091 |
| 75,7 | 434 | 2,047 |

We have much more frequent occafion to opcrate in Aud on air air that is rarer than the ordinary flate of the fuperficial below that
atmo. denfity.
: iaromoter. atmofphere. General Roy accordingly made many experiments on fuch airs. He found in general, that their expanfibility by heat was analogous to that of air in its ordinary denfity, being greatelt about the temperature 6 $0^{\circ}$. He found, too, that its expanfibility by heat di. minifhed with its denfity, but he could not determine $\frac{1}{2}$ the law of gradation. When reduced to about $\frac{1}{5}$ of the denfity of common air, its expanfion was as follows.

## Table H.

| Temp. | liulk. | Differeqce. | Expanf. <br> for $1_{0}$ |
| :---: | :---: | ---: | ---: |
| 212 | 1141,504 | 7,075 | 0,354 |
| 192 | 1134,429 | 12,264 | 0,613 |
| 172 | 1122,165 | 14,150 | 0,708 |
| 152 | 1108,015 | 14,151 | 0,708 |
| 132 | 1093,864 | 14,228 | 0,711 |
| 112 | 1079,636 | 14,937 | 0,747 |
| 92 | 1064,699 | 20,911 | 1,045 |

|  | Mean expanfion | 0,786 |  |

206 Air of orAir of or- perimert, it is evident that the expanfibility of air by
dinary den- heat is greateft when the air is about its ordinary dendinary den- heat is greatelt when the air is about its ordinary denfity tepands meft, ¿.

From this very extenfive and judicions rangre of exfity, and that in frnall denfitics it is greatly diminifhed. It appears alfo, that the law of comprefion is altered; for in this fpecimen of the rare air half of the whole exof ordinary denfity at $105^{\circ}$. This being the cafe, we see that the experiments of Mr Amontons, narrated in, the Memoirs of the Academy at Paris 1702, \&c. are not inconfiftent with thofe more confpicuous experiments of General Roy. Amontons found, that whatever was the denfity of the air, at leaft in cafes much denfer than ordinary air, the change of $180^{\circ}$ of temperature increafed its claflicity in the fame proportion: for he found, that the column of mercury which it fupported when of the temperature 50 , was increafed $\frac{1}{3}$ at the temperature 212. Hence he haftily concluded, that its expanfibility was increafed in the fame proportion; but this by no means follows, unlefs we are ceriain that in every temperature the elaflicity is proportional to the denity. This is a point which ftill remains undecided; and it merits attention, becaufe if true it eftablifhes a remarkable law concerning the action of heat, which would feem to go to prove that the elaflicity of fluids is the property of the matter of fre, which it fuperinduces on every body with which it combines in the form 267. of vapour.

The height After this account of the expanfion of air, we fee which procuces a given fall that the height through which we muft rife in order to a given fall
in the the the barometer, tenth of an inch of mereury, muft increafe with the exisucreafes with the air's expanfien. panfion of air; and that if $\frac{2,29}{1000}$ be the expanfion for one degree, we muft mult ply the excefs of the temperature of the air above $32^{\circ}$ by 0,0022 , and multiply the produt by $8_{7}$, in order to obtain the thicknefs of the

Aratum where the barometer Anands at 30 inches: or
whatever be the elevation indicated by the difference of whatever be the elevation indicated by the difference of the barometrical heights, upon the fuppofition that the air is of the temperature $3^{2}$, we mut multiply this by $0,00229 \mathrm{fcr}$ every degree that the air is warmer or colder than 32. The product mult be added to the elevation in the firtt cafe, and fubtracted in the latter.
Sir George Shuckbourgh deduces 0,0024 from his experiments as the mean expanfion of air in the ordinary cafes: and this is probably nearer the truth; becaufe General Roy's experiments were made on air which was freer from damp than the ordianry air in the ficlds; and it appears from his experiments, that a very minute quantity of damp increafes its expanfibility by heat in a prodigiou's degree.
The great difficulty is how to apply this correction; or rather, how to determine the temperature of the air in thofe extenfive and deep ilrata in which the elevations are meafured. It feldorn or never happens that the Aratum is of the fame temperature throughont. It is commonly much colder aloft ; it is alfo of different conflitutions. Below it is warm, loaded with vapour, and very expanfible; above it is cold, much drier, and lefs expanfible, both by its drynefs and its rarity. The currents of wind are often difpofed in Atrata, which long retain their places; and as they come from different regions, are of different temperatures and different conftitutions. We cannot therefore determine the expanfion of the whole fratum with precifion, and muft content ourfelves with an approximation: and the belt approximation that we can make is, by fuppofing the whole fratum of a mean temperature between thofe of its up. per and lower extremity, and employ the expanfion correfponding to that mean temperature.

This, however, is founded on a gratuitous fuppofition, that the whole intermediate ftratum expands alike, and that the expantion is equable in the different intermediate temperatures; but neither of thefe are warranted by experiment. Rare air expands lefs than what is denfer; and therefore the gencral expanfion of the whole ftratum renders its denfity more uniform. Dr Horfley has pointed out fome curious confequences of this in Phil. Tranf. Vol. LXIV. There is a particular elevation at which the general expanfion, inflead of diminifhing the denlity of the air, increafes it by the fuperior expanfion of what is below; and we know that the expanfion is not equable in the intermediate temperatures: but we cannot find out a rule which will give us a more accurate correction than by taking the expanfion for the mean temiperature.
When we have done this, we have carried the method of meafuring heights by the barometer as far as it can go; and this fource of remaining error makes it needleis to attend to fome other very minute equations which theory points out. Such is the diminution of the weight of the mercury by the change of dillance from the centre of the earth. This accompanies the diminution of the weight of the air, but neither fo as to compenfate it, nor to go along will it pari partu.

After all; there are found cafes where there is a regular deviation from thofe rules, of which we cannot give any very fatisfactory account. Thus it is found, that in the province of Ruito in Peru, which is at a sreat elcyation above the furface of the occan, the heights obtzined by tnefe rules fall confiderably fort of

## 1 $\mathrm{N} \quad \mathrm{E}$ U M

arometer. the real heights; and at Spitflergen they co fiuterably exceed tham It appears that the air in the circumpolar regions is denfer than the air of the temperate climates when of the fame heat and under the lame preffure; and the contrary feems to be the cafe with the air in the tor rid zone. It would feem that the fpecific gravity of air to mercury is at Spithergen about I to 10224, and in Peru about 1 to 13100 . This difference is with great probability afribed to the greater drynefs of the circumpolar air.
This fource of error will always remain; and it is combined with another, which thould be attended to by all who practife this method of meafuring heights, namely, a difference in the fpecific gravity of the quickfilver. It is thought fufficiently pure for a barometer when it is cleared of all calcinable matter, fo as not to drag or fully the tube. In this ftate it may contain a conliderable portion of other metals, particularly of filver, bifmuth, and tin, which will diminifh its fpecific gravity. It has been obtained by revivification from cimnabar of the fpecific gravity 14,229 , and it is thought very hne if 13,65 . Sir George Shuckbourgh found the quickfilver which agreed precifely with the atmofpherical obfervations on which the rules are founded to have the ipecific gravity $19,6 \mathrm{r}$. It is feldom obtained fo heavy. It is evident that thefe variations will change the whole refults; and that it is abfolutely neceffary, in order to obtain precifion, that we know the denfity of the mercury employed. The fubtangent of the atmospherical logarithmic, or the height of the homogeneous atmofphere, will iacreafe in the fame proportion with the denfity of the mercury; and the elevation correfponding to $\therefore$ of an inch of barometric height will change in the fame proportion.

We muft be contented with the remaining imperfections: and we can readily fee, that, for any purpofe that can be anfwered by fuch meafurements of great heights, the method is fufficiently exact; but it is quite inadequate to the purpofe of taking accurate levels, for directing the conftruction of canals, aqueducts, and other works of this kind, where extreme precifion is abfolutely neceffary.

We fhall now deduce from all that has been faid on this fubject fets of ealy rules for the practice of this mode of meafurement, illuftrating them by an example.

1. M. de Luc's Method.
I. Subtract the logarithm of the barometrical height at the upper flation from the logarithm of that at the lower, and count the index and four firt decimal figures of the remainder asfathoms, the reft as a decimal fraction. Call this the e'evation.
II. Note the different temperatures of the mercury at the two fations, and the mean temperature. Multiply the logarithmic expanfion correfponding to this mean temperature (in Table B, p. 126.) by the difference of the two temperatures, and fubtract the product from the elevation if the barometer has been coldelt at the upper flation, otherwife add it. Call the difference or the fum the approximated elevation.
III. Note the difference of the temperatures of the air at the two ftations by a detached thermometer, and alfo the mean temperature and its difference from $32^{\circ}$. Mulliply this difference by the expanfion of air for the mean temperature, and multiply the approximate eleva-
tion by $1=-=$ this product, according as the air is abnve Meafuring or beow $32^{\circ}$. The prozutt is the correat elevation in Herghts. fathoms and decimals.

## Example.

Suppofe that the mercury in the barometer at the lower Itation was at 29,4 inches, that its temperature was $50^{\circ}$, and the temperature of the air was 45 ; and let the height of the mer:ury at the upper ftation $b=$ 25,19 incles, its temperature 46 , and the temperature of the air 39. Thus we have.
そ̧al Hts. Temp. 九. Mean. Temp. Air. Mean.

| 29,4 | 50 | 48 | 45 | 42 |
| :--- | :--- | :--- | :--- | :--- |

| Product $=$ | elevation | 68 |

## 2. Sir George Shucrbourgh's Method.

I. Reduce the barometric heights to what they would And arbe it they were of the temperature $32^{\circ}$. cording ta
II. The difference of the logarithms of the reduced Shuckbarometrical heights will give the approximate eleva- buurgh. tion.
III. Correct the approximated elevation as before.

## Same Example.

I. Mean expanfo for $1^{\circ}$ from Tab. A, P. 125 is $0,000111$.

| $18{ }^{\circ} \times 0,000111 \times 29,4=$ |
| :--- |
| Subtract this from |

- $\quad . \quad$| 0,059 |
| :--- |
| 29,4 |

Reduced barometric height

Expanf. from Tab. A, p. 125. is 0,000111.

Remark 1. If 0,000101 be fuppofed the mean ex- Reniarks panfion of mercury for $I^{\circ}$, as Sir Genrge Shuckbourgh on this medetermines it, the reduction of the barometric heights thod. will be had fufficiently exact by multiplying the obfer-

R
ved

Baremeter. ved heights of the mercury by the difference of its temperatures from 32 , and cutting off four more decimal places; thus $29,4 \frac{\times 18}{10000}$ gives for the reduced height 29,347 , and $25,19 \times \frac{14}{10000}$ gives 25,155 , and the dif. ference of their logarithms gives 669,4 fathoms for the approximated elevation, which differs from the one given above by no more than 15 inches.

Remark 2. If 0,0024 be taken for the expanfion of air for one degree, the correction for this expanfion will be had by multiplying the approximated elevation by 12 , and this product by the fum of the differences of the temperatures from $3^{\circ}$, counting that difference as negative when the temperature is below 32, and cutting
off four places; thus $669,196 \times 12 \times \overline{13+07} \times \frac{1}{10000}=$ 16,061 , which added to 669,196 gives 685,257 , ditfering from the former only 9 inches.

From the fame premifes we may derive a rule, which is abundantly exact for all geodxtical purpofes, and which requires no tables of any kind, and is ealily remembered.

1. The height through which we muft rife in order to produce any tall of the mercury in the barometer is inverfely proportional to the denfity of the air, that is, to the height of the mercury in the barometer.
2. When the barometer ftands at 30 inches, and the air and quickfliver ase of the temperature 32, we muft rife through 87 fcet , in order to produce a depreflion of Jo of an inch.
3. But if the air be of a different temperature, this 87 feet mult be increafed or diminifhed by 0,21 of a foot for every degree of difference of the temperature from $32^{\circ}$.
4. Every degree of difference of the temperatures of the mercury at the two ftations makes a change of 2,833 feet, or 2 feet 10 inches in the elevation.

Hence the following rule.

1. Take the difference of the barometric lieights in tenths of an inch. Call this $d$.
2. Multiply the difference $a$ between 32, and the mean temperature of the air by 21 , and take the fam or difference, of this pr duct and 87 feet. This is the height through which we mult rife to caute the barometer to fall from 30 inches to 29,9. Call this height $b$.

Let $m$ be the mean between the two barometric heights. Then $\frac{30 d b}{m}$ is the approximated elevation very nearly.

Multiply the difference s of the mercurial tempera. tares by 2,83 feet, and add this product to the approximared elcuation if the upper barometer has been the warmef, otherwife fubtract it. The refult, that is, the fum or difference, will be the corrected elevation.

$$
\begin{aligned}
& \text { Same Example. } \\
& d=294 \quad 251,9=42,1 \\
& b=87+10 \times 0,21,=89,1 \\
& m=\frac{29,4+25 \cdot 19}{2}=27,29
\end{aligned}
$$

## A T I C S.

Approx. elevation $=\frac{30 \times 42,1 \times 89, t}{27,29},=4 \mathrm{t} 23,24$ feet. Corr. for temp. of mercury, $=4 \times 2,83 \quad 1132$
Corrested elevation in feet - 4111,92
Ditto in farhoms - - 685,32
Differing from the former only 15 inches.
This rule may be expreffed by the following fimple and eafly remembered formula, where $a$ is the difference between $3^{\circ}$ and the mean temperature of the air, $d$ is the difference of barometric heights in tenths of an inch, $m$ is the mean barometric height, $\delta$ the difference between the mercurial temperatures, and $\mathbf{E}$ is the correct elevation. $\mathrm{E}=\frac{30(87 \rightleftharpoons 0,21 a) d}{m} \Longrightarrow \overbrace{}^{2} 2,83$.

We fhall now conclude this fubject by an account of Heights ${ }^{277}$ fome of the molt remarkable mountains, \&c. on the the moft earth, above the furface of the ocean, in feet.

This laft is fo fingular, that it is neceffary to give the authority on which this determination is founded. It is deduced from nine years obfervations with the barometer at Aftrachan by Mr Lecre, compared with a feries of obfervations made with the fame barometcr at St Peterßurgh.

298
This employment of the barometer has caufed it to Improved become a very interefting infrument to the philofopher barometer and to the traveller; and many attempts have been with a dimade of late to improve it, and render it more portable. Heription The improvements have cither been directed to the ell- Hoolse's.
largement.

## 

?arometer. largement of its range, or to the more accurate meafurement of its prefent fcale. Of the lirlt kind arc Hooke's wheel barometer, the diagonal barometer, and the horizontal, barometer, defcribed in a formcr volume of this work. See Barometer. In that place are alfo deffribed two very ingenious contrivances of Mr Rownings, which are evidently not portable. Ot all the barometers with an enlarged fale the beft is that invented by Dr Hooke in 1668, and defcribed in the Phil. Tranf. NO 185. The invention was alfo claimed by Huyghens and by De la Hire; but Hooke's was publifhed long before.
It confills of a compound tube ABCDEFG (fig. 56.), of which the parts $A B$ and DE are equally wide, and EFG as much narrower as we would amplify the fcale. The parts $A B$ and EG mult alfo be as perfectly cylindrical as poffible. The part HBCDI is filled with mercury, having a vacuum above in AB. IF is filled with a light fluid, and FG with another light.fluid which will not mix with that in IF. The cittern $G$ is of the fame diameter as $A B$. It is eafy to fee that the range of the feparating furface at $F$ mult be as much greater than that of the furface I as the area of $I$ is greater than that of $F$. And this ratio is in our choice. This barometer is free from all the bad qualities of thofe formerly defcribed, being mon delicately moveable; and is by far the fitteft for a chamber, for amufement, by obfervations on the changes of the atmofpheric preffure. The flighteft breeze caules it to rife and fall, and it is continually in motion.

But this, and all other contrivances of the kind, are inferior to the common barometer for meafurement of heights, on account of their bulk and cumberfomenefs: nay, they are inferior for all philofophical purpofes in point of accuracy; and this for a reafon that admits of no reply. Their feale muft be determined in all its parts by the common barometer; and therefore, notwithfanding their great range, they are fuiceptible of no greater accuracy than that with which the fcale of a common barometer can be obferved and meafured. This will be evident to any perfon who will take the trouble of confidering how the points of their fcale mult be afcertained. The moft accurate method for graduating fuch a barometer as we have now defcribed would be to make a mixture of vitriolic acid and water, which fhould have $\boldsymbol{T}_{\mathbf{T}}$ of the denfity of mercury. Then, let a long tube fand vertical in this fluid, and conneet its upper end with the open end of the barometer by a pipe which has a branch to which we can apply the mouth. Then if we fuck through this pipe, the fluid will rife both in the barometer and in the other tube; and 10 inches rife in this tube will correfpond to one inch defcent in the common barometer. In this manner may every point of the fcale be adjufted in due proportion to the reft. But it fill remains to determine what particular point of the fale correfponds to fome determined inch of the common barometer. This can only be done by an actual comparifon; and this being done, the whole becomes equally accurate. Except therefore for the mere purpofe of chamber amufement, in which cale the barometer laft defcribelt has a decided preference, the comm barmmeter is to be preferred; and our atten. tion fould be entirely directed to its improvement and portability,

For this purpofe it fhould be furnifhed with two microfeopes or magnifying glaffes, one of them fationed
at the beginning of the fcale; which Mould cither be movealle, fo that it may always be brought to the furface of the mercury in the cillern, or the ciltern llould be fo contrived that its furface may always be brought to the beginning of the fc:lle. The glafs will enable us to fee the coincidence with accuracy. The other microfcope mult be movable, fo as to be fet oppofite to the furface of the mercury in the tube; and the fcale fhould be furnifhed with a vernier which divides an inch into 1000 parts, and be made of materials of which we know the expanfion with great precifion.

For an account of many ingenious contrivances to make the inftrument accurate, portable, and commodious, confult Magellan, Difer. de diverfes Inflr. de Phyf.; Phil. Tranf. 1xvii. Petrop. Nov. ii. 202. viii.

Thus we have given an elementary account of the ditinguifhing properties of air as a heavy and compreffible fluid, and of the general phenomena which are immediate confequences of thefe properties. This we have done in a fet of propofitions analogous to thofe which form the doArines of hydroftatics. It remains to confider it in another point of view, namely, as moveable and inert. The phenomena confequent on thefe propertics are exhibited in the velocities which air acquires by preffure, in the refiftence which bodies meet with to their motion through the air, and in the impreffion which air in motion gives to bodies expofed to its action.

We fhall firt confider the motions of which air is fufceptible when the equilibrium of preffure (whether arifing from its weight or its elafticity) is removed; and, in the next place, we fhall confider its action on folid bodies expofed to its current, and the refiftance which it makes to their motion through it.

In this confideration we thall avoid the extreme of ge- Doutrine of nerality, which renders the difcuffion too abitraat and air in acdifficult, and adapt our inveftigation to the circum. centible fiflances in which compreffible fluids (of which air is lyations as taken for the reprefentative) are moft commonly found. equal ond We fhall confider air therefore as it is commonly found equal and We fhall confider air therefore as it is commonly found parallel
in acceffible fituations, as acted on by equal and parallel gravity gravity ; and we fhall confider it in the fame order in which water is treated in a fy ftem of hydraulics.

In that fcience the leading problem is to determine Anal ${ }^{2 S_{3}}$ with what velocity the water will move through a given to the orifice when impelled by fome known preffure ; and it doarine of has been fousid, that the belt form in which this moft watcr in difficult and irt ticate propofition can be put, is to determine the velocity of water flowing through this orifice when impelled by its weight alone. Having determined this, we can reduce to this cafe every queftion which can be propofed; for, in place of the preffure of any pifton or other mover, we can always fubfitute a perpendicular colum of water or air whofe weight thall be equal to the given preflire.
The firt problem, therefore, is to determine with a vuiks into bs what velocity air will rufh into a void when impelled its by 1 R 2
by weighe,

Air in by its weight alone. This is evidently analogous to the
Motion. Iydraulic problem of water flowing out of a veffel. hydraulic problem of water flowing out of a velfel.

And here we mult be contented with referring our readers to the folutions which have been given of that problem, and the demonfration that it flows with the velocity which a heavy body would acquire by falling from a height equal to the depth of the hole under the furface of the water in the velfel. In whatever way we attempt to demonftrate that propofition, every ftep, nay, every word, of the demonitration applies equally to the air, or to any fluid whatever. Or, if our readers fhould wifh to fee the connection or analogy of the cafes, we only defire them to recollect an undoubted maxim in the fcience of motion, that when the moving force and the matter to be moved vary in the fame proportion, the velocity nuill be the fane. If therefore there be fimilar veffels of air, water, oil, or any other fluid, all of the height of a homogeneous atmofphere, they will all run through equal and fimilar holes with the fame velocity; for in whatever proportion the quantity of matter moving through the hole be varied by a variation of denfity, the preffure which forces it out, by acting in circumItanees perfectly fimilar, varies in the fame proportion by the fame variation of denfity.

We mult therefore affume it as the leading propofition, that air rubbes from the atmofphere into a void zuith the velocity aubich, a beavy body would acquire by falling from the top of a bomogeneous atmofphere.

It is known that air is about 840 times lighter than water, and that the preflure of the atmofphere fupports water at the height of 33 feet nearly. The height therefore of a homogeneous atmofphere is nearly $33 \times 840$, or 27720 feet. Moreover, to know the velocity acquired by any fall, recollect that a heavy body by falling one foot aequires the veloeity of 8 feet per fecond; and that the velocities aequired by falling thro' different heights are as the fquare roots of the heights. Therefore, to find the velocity correfponding to any height, expreffed in feet per fecond, multiply the fquare root of the height by 8 . We have therefore in the prefent inftance $V=8 \sqrt{27220}=8 \times 166,493,=1332$ feet per fecond. This therefore is the velocity with which common air will rufh into a void; and this may be taken as a flandard number in pneumaties, as 16 and 32 are flandard numbers in the general fcience of mechanics, exprefling the action of gravity at the furfaee of the earth.

It is eafy to fee that greater preeifion is not neceffary in this matter. The leight of a homogeneous atmofphere is a variable thing, depending on the temperature of the air. If this reafon feems any objection againt the we of the number 1332, we may retain $8 \sqrt{ } \mathrm{H}$ in place of it , where H exprefles the height of a homogeneous atmofphere of the given, temperature. A variation of the barometer makes no ehange in the velocity, nor in the height of the lomogeneous atmofphere, becaufe it is accompanied by a proportional variation in the denfity of the air. When it is increaled $\mathrm{t}_{\mathrm{i}}$ for inftance, the denfity is allo inereafed $r^{*}$; and thus the expelling force and the matter to be moved are changed in the fame proportion, and the velocity remains the fime. N. B. We do not here confider the velocity which the air acquires after its iffuing into the void by its continual expanfion. 'This may be afcertained by
the $39^{\text {th }}$ prop. of Newton's Principia, b. i. Nay, which appears very paradoxical, if a cylinder of air, communicating in this manner with a void, be compreffed by a pifton loaded with a weight, whieh preffes it dow $n$ as the air flows out, and thus keeps it of the fame denfity, the velocity of efflux will Aill be the fame however great the preffure may chance to be: for the firft and immediate effect of the load on the piton is to reduce the air in the cylinder to fuch a denfity that its elafticity flall exactly balance the load; and beeaufe the elafticity of air is proportional to its denfity, the denfity of the air will be inereafed in the fame proportion with the load, that is, with the expelling power (for we are neglecting at prefent the weight of the included air as too inconfiderable to have any fenfible effect.) Therefore, fince the matter to be moved is increafed in the lame propartion with the preffure, the velocity will be the fame as before.

It is equally eafy to determine the velocity with which the air of the atmofphere will rufh into a fpace containing rarer air. Whatever may be the denfity of this air, its elafticity, which follows the proportion of its denfity, will balance a proportional part of the preffure of the atmofphere ; and it is the excefs of this laft only which is the moving force. The matter to be moved is the fame as before. Let D be the natural denfity of the air and $\delta$ the denfity of the air contained in the veffel into which it is fuppofed to run, and let $P$ be the preffure of the atmofphere, and therefore equal to the foree which impels it into a void; and let $\pi$ be the foree with whieh this rarer air would run into a void. We have $D: \delta=P: \pi$, and $\pi=\frac{P_{\delta}}{D}$ Now the moving force in the prefent inftance is $\mathrm{P}-\mathrm{m}_{\pi}$, or $\mathrm{P}-\mathrm{P}_{\mathrm{f}}$. Laftly, let $V$ be the velocity of air rufhing into a void, and $v$ the velocity with which it will rufh into this rarefied air.

It is a theorem in the motion of fluids, that the preffures are as the fquares of the velocities of efflux. Therefore $P: P-\frac{P_{\Lambda}}{D}=V^{2}: \vartheta^{2}$. Hence we derive $w^{\prime}=\mathrm{V} \cdot \times \overline{\mathrm{I}-\frac{\delta}{D^{\prime}}}$ and $\left.v=\mathrm{V} \times \sqrt{\sqrt{1}-\frac{\delta}{\mathrm{D}}} \right\rvert\,$. We do not here conlider the refiftance which the air of the atmoiphere will meet with from the inertia of that in the veffel which it muft difplace in its motion.

Here we fee that there will always be a current into the velfel while $\delta$ is lefs than $D$.

We alfo learn the gradual diminution of the velocity as the veffel fills; for \& continually increafes, and therefore $I-\frac{\delta}{D}$ continually diminifhes.

It remains to determine the time $t$ expreffed in feconds, in which the air of the atmofphere will A w into this veffel from its fate of vacuity till the air in the veftel has acquired any propofed denfity o.

For this purpofe let $H$, expreffed in feet, be the height through which a heavy body muft fall in order to acquire the velocity $V$, exptetied alio in feet per fecond. This we thall exprefs more bricfly in future, by calling it the height producing the volocity $V$. Let C reprefent the capacity of the veffel, expreffed in cubic

## 285 And the

 And thevelocity with which it ruflics into a fpace containing rarcr airp

## P N E U M A T C I S.

feet, and $O$ the area or fection of the orifice, expreffed in fuperficial or fquarc feet ; and let the natural denfity of the air be D .

Since the quantity of acrial matter contained in a veffel depends on the capacity of the veffel and the denfity of the air jointly, we may exprefs the air which would fill this velfel by the fymbol CD when the air is in its ordinary flate, and by $\mathrm{C} \delta$ when it has the denfity o. In order to obtain the rate at which it fills, we muft take the fluxion of this quantity $\mathrm{C} \delta$. This is $\mathbf{C} \delta$; for C is a conftant quantity, and $\delta$ is a variable or flowing quantity.

But we alfo obtain the rate of influx by our knowledge of the velocity, and the area of the orifice, and the denfity. The velocity is V , or $8 \sqrt{ } \mathrm{H}$, at the firft inftant; and when the air in the veflel has acquired the denfity $\delta$, that is, at the end of the time $t$, the velocity is $8 \sqrt{ } \mathrm{H} \sqrt{1-\frac{\delta}{D}}$, or $8 \sqrt{ } \mathrm{H} \sqrt{\frac{D-\delta}{D}}$,
or $8 \sqrt{ } H^{\sqrt{1}-\sqrt{D}}$.
The rate of influx therefore (which may be conceived as meafured by the little mafs of air which will enter during the time $t$ with this velocity) will be
 plying the velocity by the orifice and by the denfity.

Here then we have two values of the rate of influx. By fating them as equal we have a flusionary equation, from which we may obtain the Huents, that is, the time $t$ in feconds neceffary for bringing the air in the vellel to the denfity $\delta$, or the denfity o which will be produced at the end of any time $t$. We have the equation $8 \sqrt{ } \mathrm{HO} \sqrt{ } \mathrm{D} \sqrt{\overline{\mathrm{u}-\delta} i}=\mathrm{C} \dot{\delta}$. Hence we derive $i=\frac{C}{8 \sqrt{H U \sqrt{D}}} \times \frac{\delta}{\sqrt{D-}}$; Of this the fluent is $t=\frac{C}{4 \sqrt{H O \sqrt{ } D}} \times \sqrt{D-\delta}+A$, in which $A$ is a conditional conitant quantity. The condition which determines it is, that $t$ mult be nothing when $\delta$ is nothing that is, when $\sqrt{\bar{D}-\delta}=\sqrt{\bar{D}}$; for this is evidently the eafe at the beginning of the motion. Hence it follows, that the conitant quantity is $\sqrt{\bar{D}}$, and the complete fluen:, fuited to the cafe, is
$\frac{C}{4 \sqrt{ } \mathrm{HU} \sqrt{D}} \times \sqrt{\overline{\mathrm{D}}-\sqrt{\mathrm{D}-\delta}}$
The motion ceafes when the air in the veffel has ac. quited the denfity of the external air; that is, when $\delta=D$, or when $t=\frac{C}{4 \sqrt{H O \sqrt{ } D}} \times \sqrt{ } D,=\frac{C}{4 \sqrt{ } \mathrm{HO}}$.
Therefore the time of completely filling the veffel is $\frac{\mathrm{C}}{4 \sqrt{\mathrm{HO}}}$.

Let us illuftrate this by an example in numbers.
Suppofing then that air is 840 times lighter than water, and the height of the homageneous atmorphere 27720 feet, we have $4 \sqrt{ } \mathrm{H}=666$. Let us further fuppofe the velfel to contain $S$ cubic feet, which is nearly a wine hoghead, and that the hole by which the air of the ordinary derfity, which we fhall make $=1$, enters is an inch fquare, or $\frac{1}{34 \pi}$ of a fquare foot. Then
the time in feconds of completcly filling it will be $\frac{8^{\prime \prime}}{r^{5} 7666^{\prime}}$ or $\frac{1152^{\prime \prime}}{606}$ or $1,7297^{\prime \prime}$. If the hole is only ris of a fquare inch, that is, if its fide is $\therefore$ of ineh, the time of completely filling the hogfhead will be $173^{\prime \prime}$ very nearly, or fomething lefs than three minutes.

If we make the experiment with a hole cut in a thin plate, we thall find the time greater nearly in the proportion of $6_{3}$ to roo, for reations obvious to all who have fludied hydraulics. In like manner we can tell the time necelfary for bringing the air in the velfel to $\frac{3}{4}$ of its ordinary denfity. 'The only variable part of our fluent is the coeffieient- $\sqrt{\overline{1}-\delta}$, or $\sqrt{1-\delta}$. Let $\delta$ be $=\frac{3}{5}$, then $\sqrt{1^{1-8}}=\sqrt{1}=\frac{1}{2}$, and $1-\sqrt{1-1}=;$ and the time is $86_{\dot{z}}^{\prime \prime}$ very nearly when the hole is "of an inch wide.

Let us now fuppofe that the air in the veffel ABCD (fig. 64.) is compreffed by a weig!t aating on the cover AD, which is moveable down the veffel, and is thus expelled into the external air.

The immediate effect of this external preffure is to comprefs the air and give it another denfity. The denfity D of the external air correfponds to its preflure impuls of P. Let the additional preffure on the eover of the a weight veffel be $p$, and the denfity of the air in the veffel be $d$. We fhall have $\mathrm{P}: \mathrm{P}+p=\mathrm{D}: d$; and therefure $p=\mathrm{P} \times \frac{d-\mathrm{D}}{\mathrm{D}}$. Then, becaufe the preffure which expels the air is the difference between the foree which compreffes the air in the veffel and the foree which compreffes the external air, the expelling force is $p$. And becaufe the quantities of motion are as the forces which fimilarly produce them; we fhall have $\mathrm{P}: \mathrm{P} \times \frac{d-\mathrm{D}}{D}=\mathrm{MV}: m v$; where M and $m$ exprefs the quantities of matter expelled, $V$ expreffes the velocity with which air rufhes into a void, and $\boldsymbol{0}$ expreffes. the velocity fought. But becaufe the quantities of aerial matter which ilfue from the fame orifice in a moment are as the denfities and velocities jointly, we thall have MV : $m v=\mathrm{DVV}: d v v,=\mathrm{DV}^{2}: d v^{2}$. Therefore $\mathrm{P}: p \frac{d-\mathrm{D}}{D}=\mathrm{DV}^{3}: d v$. Hence we deduce $v=\mathrm{V} \sqrt{\left.\frac{\overline{d-D}}{d} \right\rvert\, .}$

We may have another expreffion of the velocity without conlidering the denfity. We had $\mathrm{P}: \mathrm{P}+p=\mathrm{D}: d$ : therefore $d=\frac{\mathrm{D} \times \overline{\mathrm{P}+p}}{\mathrm{P}}$, and $d-\mathrm{D}=\frac{\mathrm{D} \times \overline{\mathrm{P}+p}}{\mathrm{P}}-\mathrm{D}$, $=\frac{\mathrm{D} \times \overline{\mathrm{P}+p}-\mathrm{DP}}{\mathrm{P}}$, and, $\frac{d-\mathrm{D}}{d}=\frac{\mathrm{D} \times \overline{\mathrm{P}+p}-\mathrm{DP}}{\mathrm{D} \times \mathrm{P}+p}$, $=\frac{\mathrm{P}+p-\mathrm{P}}{\mathrm{P}+p},=\frac{p}{\mathrm{P}+p}$, thercfore $v=\mathrm{V} \times \sqrt{\left.\frac{p}{\mathrm{P}+p} \right\rvert\,}$, which is a very fimple and convenient exprefion.

Hitherto we have confidered the in tion of air as The en:et produced by its weight only. Let us now confider the of the air's effect of its elafticity.

Let ABCD (fig. 64.) be a veffel containing air of any denfity D. This air is in a fate of compreflio 1; and if the comprefing foree be removed, it will expand, and its elafticity will diminifh along with its denfitv.

Air in
Motion.

Piate cecv. 287 The velocity of air with the additional a weight moving veffel.

Air in Motion.

Its elafticity in any ftate is meafured by the force which keeps it in that ftate. The force which keeps common air in its ordinary denfity is the weight of the atmofphere, and is the fame with the weight of a column of water 33 fect high. If therefore we fuppofe that this air, inftead of being confined by the top of the veffel, is preffed down by a moveable pifton carrying a column of water 33 feet high, its elallicity will balance this preffure as it balances the preffure of the atmofphere; and as it is a fluid, and propagates through every part the preffure exerted on any one part, it will prefs on any little portion of the veffel by its elafticity in the fame manner as when loaded with this column.
The confequence of this reafoning is, that if this fmall portion of the veffel be removed, and thus a paffage be made into a void, the air will begin to flow out with the fame velocity with which it would flow when impelled by its weight alone, or with the velocity acquired by falling from the top of a homogeneous atmofohere, or 1332 feet in a fecond nearly.

But as foon as fome air has come out, the denfity of the remaining air is diminithed, and its clafticity is diminithed; therefore the expelling force is diminifhed. But the matter to be moved is diminifhed in the very fame proportion, becaule the denfity and elalticity are found to vary according to the fame law; therefore the velocity will continue the fame from the beginning to the end of the efllux.
This may be feen in ancther way. Let P be the pref. fure of the atmofphere, which being the counter-balance and meafure of the initial elalticity, is equal to the expelling force at the firf inflant. Let D be the initial denfity, and V the initial velocity. Let $d$ be its denfity at the end of the time $t$ of eflux, and $v$ the contemporaneous velocity. It is plain that at the end of this time we fha!l have the expelling force $\pi=\frac{\mathrm{P} d}{\mathrm{D}}$; for D : $d=\mathrm{P}: \pi\left(=\frac{\mathrm{P} d}{\mathrm{D}}\right)$.

Thefe forces are proportional to the quantities of motion which they produce; and the quantities of motion are proportional to the quantities of matter $M$ and $m$ and the velocitics $V$ and $v$ jointly : therefore we have $\mathrm{P}: \frac{\mathrm{P} d}{\mathrm{D}}=\mathrm{MV}: m v . \quad$ But the quantities of matter which efcape through a given orifice are as the denfities and velocities jointly; that is, $\mathrm{M}: m=\mathrm{DV}: d v$ : therefore $\mathrm{P}: \frac{\mathrm{P} d}{\mathrm{D}}=\mathrm{DV}^{2}: d v^{2}$, and $\mathrm{P} \times d v^{2}=\frac{\mathrm{P} d \mathrm{DV}}{\mathrm{D}}{ }^{2}=\mathrm{P} d \mathrm{~V}^{2}$, and $\mathrm{V}^{2}=v^{3}$, and $\mathrm{V}=v$, and the velocity of efflux is conte.nt. Hence follows, what appears very unlikely at firlt fight, that however much the air in the veffel is condenfed, it will always iffue into a void with the fame 289 velocity.
Quavety In order to find the quantity of aerial matter which of ari iflu- will iffue during any time $t$, and confequently the deniny moto a void ina giventime and the deaisty a: the ellid ot that tuace fity of the remaining air at the end of this time, we munt get the rate of efflux. In the element of time itnerce ifiues (by what has been faid above) the bulk $8 \sqrt{\mathrm{HO}} t$ (for the velocity V is contant) ; and therefure the quar tity $8 \sqrt{ } \mathrm{HO} \cdots i$. On the other hand, the quanti $y$ of air it $t e b z$ imning was $C D, C$ being the capaci $y$ of the velicl; and when the air has dequired the deming $d$, the quantity is $\mathcal{C} d$, and the quantity
run out is $\mathrm{CD}-\mathrm{C} d$ : therefore the quantity which has run out in the time ; mult be the fluxion of $\mathrm{CD}-\mathrm{C} d$, Air or- $\mathrm{C} \dot{d}$. Therefore we have the equation $8 \sqrt{ } \mathrm{HOd} i=$ $-\mathrm{C} \dot{d}$, and $\dot{i}=\frac{-\mathrm{C} \dot{d}}{8 \sqrt{\mathrm{HO} d}} ;=\frac{\mathrm{C}}{8 \sqrt{\mathrm{HO}} \times-\frac{\dot{d}}{d} .}$
The fluent of this is $t=\frac{\mathrm{C}}{8 \sqrt{\mathrm{HO}}} \log . d$. This fluent mutt be fo taken that $t$ may be $=0$ when $d=\mathrm{D}$. Therefore the correct fluent will be $t=\frac{\mathrm{C}}{8 \sqrt{\mathrm{HO}}} \log \cdot \frac{\mathrm{D}}{d}$, for $\log \cdot \frac{D}{D}=\log \cdot 1,=0 . \quad$ We deduce from this, that it requires an infinite time for the whole air of a veffel to flow out of it into a void. N. B. By log. $d, \& \mathrm{c}$. is meant the hyperbolic logarithm of $d, \& c$.

Let us next fuppofe that the veffel, inftead of letting Whe ${ }^{2}$ out its air into a void, emits it into air of a lefs den- veffel fity, which remains conftant during the efflux, as we it int may fuppofe to be the cafe when a veiel containing rer a condenied air emits it into the furrounding atmofphere. Let the initial denity of the air in the veffel be 8 , and that of the atmofphere D. Then it is plain that the expelling force is $P-\frac{\mathrm{r} D}{\delta}$, and that after the time $t$ it is $\frac{\mathrm{Pd}}{\delta}-\frac{\mathrm{PD}}{\delta}$. We have therefore $\mathrm{P}-\frac{\mathrm{PD}}{\delta}$ $: \frac{\mathrm{Pd}}{\delta}-\frac{\mathrm{PD}}{\delta}=\mathrm{MV}: m v,=\delta \mathrm{V}^{2}: d v^{2}$. Whence we derive $v=V \sqrt{\frac{\delta \overline{d-D}}{d \overline{\delta-1}}}$

From this equation we learn that the motion will be at an end when $d=\mathrm{D}$ : and if $\delta=\mathrm{D}$ there can be no efllux.

To find the relation between the time and the den- Rela ${ }^{2}$ fity, let H as before be the height producing the velo. hetw city $V$. The beight producing the velocity of efllux the $v$ muft be $\mathrm{H} \times \frac{\delta \overline{d-D}}{d \delta \bar{D}}$, and the little parcel of air whel $i$ which will flow out in the time $i$ will be $=8 \sqrt{ } \mathrm{HO} d t$ void $\sqrt{\frac{s^{d} d-1}{d s-1}}$. On the other hand, it is $=-C \dot{d}$

Hence we deduce this flluxionary equation $i=$ $C \sqrt{\partial-1}-\dot{d}$
$8 \sqrt{H \cup \sqrt{ } \delta} \times \sqrt{\sqrt{d^{2}-\bar{d}} d}$. The fluent of this, corrected fo as to make $t=\mathrm{O}$ when $d=\delta$, is $t=\mathrm{C} \sqrt{-D}$ $\times \log \cdot\left(\frac{\delta-\mathrm{D}+\sqrt{-D})^{\delta}}{d-\sqrt{d-D}}\right)$. And the time of completing the eflux, when $d=\mathrm{D}$, is $t=\frac{\mathrm{C} \sqrt{-1}}{8 \sqrt{ } \mathrm{HO}}$ $\times \log \cdot\left(\frac{\delta-10+\sqrt{-1) \delta}}{\nu}\right)$.

Lafly, let ABCD, CFGH (fig. 65.) be two veffels $\stackrel{\text { CP }}{\text { P }}$ containing ars of different denities, and communicating by the orifice C , there will be a current from the vellel containing the denfer air into that containing the rarer: fuppofe from $A B C D$ into CFGH.

Let $P$ be the elatic force of the air in $A B C D, Q$
its denfity, and $V$ its velocity, and $D$ the denfity of the air in CFGH. And, after the time $t$, let the denfity of the air in ABCD be $q$, its velocity $v$, and the denfity of the air in CFGH be $\delta$. The expelling force from $A B C D$ will be $P-\frac{P D}{Q}$ at the firft inflant, and at the end of the time $t$ it will $\mathrm{be} \frac{\mathrm{P} q}{\mathrm{Q}}-\frac{\mathrm{P}_{\delta}}{\mathrm{Q}}$. Therefore we thall have $P-\frac{P D}{Q}: \frac{P q}{Q}-\frac{P_{d}}{Q}=Q^{2}: q v^{2}$, which gives $v=V \times \sqrt{\frac{Q(q-\delta)}{q(Q-D)}}$, and the motion will ceaie when $\delta=q$.

Let $A$ be the capacity of the firft veffel, and $B$ that of the fecond. We have the fecond equation $=A(Q-q)+B D$. $\mathrm{AQ}+\mathrm{BD}=\mathrm{A} q+\mathrm{B}$ dand therefore $\delta=\frac{\mathrm{A}(\mathrm{Q}-q)}{\mathrm{B}}$ Sulftituting this value of sin the former value of $v$, we have $\left.v=V \times \sqrt{\frac{Q[B(q-D)-A(Q-q) j}{q B(Q-D)}} \right\rvert\,$, which gives the relation between the velocity $v$ and the denfity $q$.

In order to alcertain the time when the air in $A B C D$ has acquired the denfity $q$, it will be convenient to abridge the work by fome fublitutions. Therefore make $Q(B+A)=M, B Q D+B Q^{2}=N, B Q-$ $\mathrm{BD}=\mathrm{R}$ and $\frac{\mathrm{N}}{\mathrm{M}}=m$. Then, proceeding as before, we obtain the fluxionary equation $8 \sqrt{\mathrm{H} O} \frac{\sqrt{ } \frac{\sqrt{M_{q}}-\bar{N}^{t}}{\sqrt{\mathrm{~K}}}=}{\sqrt{ } q}$. $\overline{A Q-A q}=-A ;$ whence $i=\frac{A \sqrt{ }}{8 \sqrt{ } H O \sqrt{M}} \times \frac{\dot{q}}{\sqrt{q^{2}-m q}}$ of which the fluent, completed fo that $t=0$ when $=\mathrm{Q}$, is $t=\frac{\mathrm{A} \sqrt{ } \mathrm{R}}{8 \sqrt{ } \mathrm{HO} \sqrt{\mathrm{M}}} \times \log \cdot\left(\frac{\mathrm{Q}-m+\sqrt{ }\left(\mathrm{Q}^{2} m \mathrm{Q}\right)}{q-m+\sqrt{\left(q^{2} m q\right)}}\right)$
some of thefe queflions are of difficult folution, and ufual applications of the doctrines of pneumatics, at leaf in their pretent form. The cafes of greateft ufe are when the air is expelled from a veffel by an external force, as when bellows are worked, whether of the ordinary form or confiling of a cylinder fitted with a moveable pitton. This latt cafe merits a particular confideration; and, fortunately, the inveftigation is extremely eafy.

Let AD fig. 64 . be confidered as a pifton meving downward with the uniform velocity $f$, and let the area of the pifton be $n$ times the area of the hole of efflux, then the velocity of efflux arifing from the motion, of the piltun will be $n f$. Add this to the velocity $V$ produced by the elaflicity oi the air in the firf queftion, and the whole velocity will be $\mathrm{V}+n f$. It will be the fame in the others. The problem is alfo freed from the cundideration of the time of efllux. For this depends now on the velocity of the pifton. It is till, however, a very intricate problem to afcertain the relation between the time and the denity, even though the pifton is moving uniformly; for at the beginning of the motion the air is of common denfity. As the pifton defcends, it both expels and compreffes the air, and the denfity of the air in the veffel varies in a very intricate manner, as alfo its refiftance or reation on the pitton. For this reafon, a piton which moves uniformly by means
of an external force will never make an uniform blaft by fucceffive frokes; it will always be weaker at the beginning of the itroke. The beft way for fecuring an uniform blalt is $t$, employ the external furce only tor lifing up the pilon, and then to let the pifton defernd by its own weight. In this way it will quickly link down, comprefling the air, tillits denlity and correfponding elaflicity exactly balance the weight of the pifton. Af. ter this the pifton will defcend equably, and the blaft will be uniform. We fhall have occafion to conlider this more particularly under the head of Peevalaqicat Machines. Thefe obfervations and theorems will ferve to determine the initial velocity of the air in all important cafes of its expulfion. The philofopher will learn the rate of its efflux out of one veffel into another; the chemif will be able to calculate the quantities of the different gafes which are employed in the curious experiments of the ingenious but unfortunate Lavoifier on Combuftion, and will find them extremely different from what he fuppofed ; the engineer will learn how to proportion the motive force of his machine to the quantity of aerial matter which his bellow, mult fupply. But it is not enough, tor this purpofe, that the air besin to iffue in the proper quantity; we mult fee whether it be not affected by the circumitances of its fubiequent paffage.

All the modifications of motion which are obferved in water conduits take place alfo in the palfage of ait through pipes and holes of all kinds. There is the fame diminution of quantity paffing througb a hole in a thin plate that is obferved in water. We know that (abating the fmall effect of friction) water ilfues wi:h the velucty acquired by falling from the furface; and yet if we calculate by this velocity and by the area of the orifice we fhall find the quantity of water deficient nearly in the proportion of 63 to 100 . This is owing to the water preffing towards the o ifice from all fides, which occations the contraction of the jet. The fame thing happens in the efflux of air Alfo the motion of water is greatly impeded by all contractions of its paffage. Thefe oblige it to accelerate its velocity, and there:ore require an increafe of preffure to force it thr ugh them, and this in proportion to the fquares of the velocities. Thus, if a machine working a pump caufes it to give a certain number of Atrokes in a minute, it will deliver a determined quantity of water in that time. Should it happen that the paffage of the water is contracted to one half in any part of the machine (a thing which frequently happe:s at the valves), the water muft move through this comtraction with twice the velocity that it has in the reft of the paffage. This will require four times the force to be exerted on the pilton. Nay (which will appear very odd, and is never fufpected by engineers), if no part of the paflage is narrower than the barrel of the pump, but on the contrary a part much wider, and if the conduit be again contracted to the width of the barrel, an additinnal force muft be applied to the pifton to drive the water through this paff ge, which would not have been neceffary if the palfage had not been widened in any part. It will requirc a force equal to the weight of a column of water of the height neceffary for communicating a velocity the fquare) $t$ which is equal to the difference of the fquares of the velucities of the water in the wide and the narrow part of the conduit.

## P N E. U M $\Lambda$ T I C S.

Air in motion.
295 Air fuffers the fame retardariou along pipes as water, and the and the difappoin ed in their expectations of the quantity of necefity of air which will be delivered by long pipes. Its extreme atterding mobility and liphtnefs hindered them from fufpecting to this.

The fame thing takes place in the motion of air, and therefore :lll contrastions and diatations mult be carefully avoided, when we want to preferve the velocity unimpaired.
Air allo fuffers the fame retardation in its motion along pipes. By not knowing, or not attending to that, engineers of the fill reputation have been prodigioully that it would fuffer any fenfible retardation. Dr Pa- pin, a moit ingenious man, propofed this as the mof effectual method of transferring the action of a moving power to a great diftance. Suppofe, for initance, that it was required to raife water out of a mine by a wa-ter-machine, and that there was no fall of water nearer than a mile's diftance. He employed this water to drive a pition, which fhonld comprefs the air in a cylinder communicating, by a long pipe, with another cylinder at the mouth of the mine. This fecond cylinder had a piton in it, whofe rod was to give motion to the pumps at the mine. He experted, that as fonn as the pifoa at the water-machine had compreffed the air fufficiently, it would caufe the air in the cylinder at the mine to force up its pifton, and thus work the pumps. Dottor Hooke made many objections to the method, when laid before the Royal Society, and it was much debated there. But dynamics was at this time an infant frience, and very little underfood. Newton had not then taken any part in the bufinel's of the lociety, otherwife the true objections would not have elcaped his fagacious mind. Notwithftanding Papin's great reputation as an eagineer and mechanic, he could not bring his fcheme into ufe in England; but afterwards, in France and in Germany, where he fettled, he got fome perfons of great fortunes to employ him in this project; and he erected great machines in Auvergne and Weftphalia for draining mines. But, fo far from leing effective machines, they would not even begin to move. He attributed the failure to the quantity of air in the pipe of communication, which mult be condenfed before it can condenfe the air in the remote yliuder. This indeed is truc, and he fhould have thought of this earlier. He therefore diminifled the fize of this pipe, and made his water machine exhauft inftend of condenfing, and had no doubt but that the immenfe velocity with which air rufles into a void would make a rapid and effectual communication of power. But he was equally difappointed here, and the machine at the mine nood fillas before.
Near a century after this, a vcry intelligent engineer attempted a much more feafible thing of this kind at an iron-foundery in Wales. He erefted a machine at a powerful fall of water, which worked a fet of cylinder bellows, the blow-pipe of which was conducted to the diftance of a mile and a half, where it was applied to a blat furnace. But notwithtandiag every care to make the conducting pipe very air tight, of great fize, and as fmooth as polfible, it would hardly blow out a candle. The failure was afcribed to the impolfibility of making the pipe air-tight. But, what was furprifing, above ten minutes elapfed after the action of the piftons in the bellows before the leaft wind could be perceived at the end of the pipe; whereas the engineer expected an interval of 6 feconds only.

No very difinet theory can be delivered on this fubject; but we may derive confiderable affitance in underfanding the caufes of the obfriuction to the motion | A |
| :--- |
| $\stackrel{\mathrm{A}}{1}$ | of water in long pipes, by confidering to the motion to air. The etafticity of the air, and its great com-theor preflibility, have given us the diftinsteft notions of flui- thisfil dity in general, fhowing us, in a way that can hardly be contruverted, that the particles of a fluid are kept at a diftance from each other, and from other bedies, by the corpufcular forces. We fhall therefore take this opportunity to give a view of the fubject, which did not occur to us when treating of the motion of water in pipes, referving a further difculion to the articles River, Water.Works.

The writers on hydrodynamics have always confider- How ed the obftruction to the motion of fuids along canals of any kind, as owing to fomething like the friction by which the motion of folid bodies on each other is obAtructed ; but we cannut form to ourfelves any difinct notion of refemblance, or even analogy between them. The fact is, however, that a fluid running along a ca$\mathrm{n}_{\mathrm{A}}$ has its motion obfructed; and that this obftruction is greatef in the immediate vicinity of the folid canal, and gradually diminifies to the middle of the fream. It appears, therefore, that the parts of fluids can no more move among eacla other than amony folid bodies, without fuffering a diminution of their motion. The parts in phyfical contact with the fides and bottom are retarded by thete immoveathe bodies. The particles of the next Atratum of fuid cannot preferve their initial velocities without overpaffing the particles of the firft Itratum; and it appeas from the fact that they are by this means retarded. They retard in the fame manner the particles of the third ftratum, and fo on to the middle fratum or thread of fluid. It appears from the fact, therefore, that this fort of friction is not a confequence of rigidity alone, but that it is equally competent to fluids. Nay, fince it is a matter of fatt in air, and is even more remarkable there than in any other fluid, as we thall fec by the experiments which have been made on the fubject; and as our experiments on the compreffion of air thow us the particles of air ten times nearer to each other in fome cafes than in others (viz. when we fee air a thoufand times denfer in thefe cafes), and therefore force us to acknowledge that they are not in contact ; it it is plain that this obltruction has no analogy to fiction, which fuppofes roughnefs or inequality of furface. No fuch inequality can be fuppofed in the furface of an aerial particle; nor would it be of any fervice in explaining the obfruction, fince the particles do not rub on each other, but pafs each other at fome fmall and imperceptible difance.

We muft therefore have recourfe to fome other mode of explication. We fhall apply this to air only in this place; and, fince it is proved by the uncontrovertible experiments of Canton, Zimmerman, and others, that water, mercury, oil, \&c. are alfo compreffible and perfecty elaftic, the argument from this principle, which is conclufive in air, muft equally explain the fimilar, phenomenon in hydraulics.

The moft highly polifhed body which we know muft be conceived as baving an uncven furface when we compare it with the fmall fpaces in which the corpufcular forces are exerted; and a quantity of air moving

want of
perfed flu.
idsty.
neceffary for changing the direction alfo; and this is in addition to the torce necelfary for producing the undulations fo minutely treated of. The conlequence of this mult be, that an additional force will be neceffary for preferving a given progreflive motion in a longer olftruting pipe, and that the motion produced in a pipe of greater length by a given force will be lefs than in a florter one, and the eflux will be diminifled.

There is another confideration which mult have an influence here. Nothing is more irrefragably demonftrated than the neceffity of an additional force for producing an cfllux through any contraction, even though it fhould be fucceeded by a dilatation of the palfage. Now both the inequalities of the fides and the undulations of the motions of each particle are equivalent to a fucceflinn of contractions and dilatations; although each of thefe is next to infinitely fmall; their number is alfo next to infinitely great, and therefore the towl effeet may be fenfible.

We have hitherto fuppofed that the abfolute velocity of the particles was not diminifhed : this we did, having allumed that the interval of each undulation of the lides was without inequalities. But this was gratuitous: it was alfo gratuitous that the fides were only undulated. We have no reafon for excluding angular afperitie: Thefe will froduce, and molt certainly often produce, real diminutions in the velocity of the contiguous particles; and this mult extend to the very axis of the canal, and produce a diminution of the fum total of motion: and in order to preferve the fame fenfible progreffive motion, a greater force mult be employed. This is all that can be meant by faying that there is a refiftance to the motion of air through long pipes.

There remains another caufe of diminution, viz. the want of pertect fluidity, whether arifing from the diffemination of folid particles in a real flud, or from the vifcidity of the fluid. We thall not infift on this at prefent, becaufe it cannot be fhown to obtain in air, at leaft in any cafe which deferves confideration. It feems of no importance to determine the motion of air hurrying along with it foot or duft. The effect of fogs on a particular modification of the motion of air will be conlidered under the aticle Sound. What hus been faid on this fubject is fufficient for our purpofe, as explaining the prodigious and unexpected obltruction to the pallage of air throurg long and narrow rips. We are able to collest an important maxim from it, viz. that all pipes of communication fhould be made as wide as circumtances will permit: for it is plain that the obftugtion depands on the internal fusface, and the fore to overcome it mut be in proportion to the mais of matter which is in motion. The firt increaies as the diameter of the pife, and the lat as the fquare. The obftruction mut therefore bear a ghteater propostion to the whole motion in a fmall pipe than in a large one.

It were very defirable to kn w the law by which the reterdation exteads from the axis to the bides of the canal, ind the proportion which fubfilts between the lengtis of canal and the forces aeceffary for overcoming the obtrustions when the velocity is given; as alio whether the proportion of the oblluction to the whole motion varies with the velocity: but all this is uaknown. It dues not, however, feem, a defperate cafe in air: wo how pretty dittinely the liw of action among its par-
ticles viz. that their mutual repulfions are inverfely as their diltances. This promifes to enable us to trace the progref: of undulation from the fides of the canal to the axis.

We can fee that the retardations will not increafe fo It will faft as the fquare of the velocity. Were the fluid in- increafe compreffible fo that the undulatory path of a particle were invariable, the deflecing forces by which each indivilual particle is made to defcribe its undulating path would be precifely fuch as arife from the path itfelf and the motion in it; for each particle would be in the fitualtion of a body moving along a fixed path. Lut in a very compreflible fluid, fuch as air, each particle may be confidered as a folitary body, actuated by a projectile and a tranfverfe force, ariting from the action of the adjoining particles. Its motion muft depend on the adjuftment of thefe forces, in the fame manner as the elliptical motion of a planet depends on the adjultment of the force of projection, with a gravitation inverfely proportional to the fquare of the diltance from the focus. The tranfverfe force in the prefent cafelas its origin in the preffure on the air which is propelling it along the pipe : this, by fqueczing the particles together, brings their mutual repulfion into action. Now it is the property of a perfeet fluid, that a preflure exerted on any part of it is propagated equally through the whole fluid, therefore the tranfverfe forces which are excited by this preffure are proportional to the preffure itfelf: and we know that the preffures exerted on the furface of a fluid. fo as $t \alpha$ expel it through any orifice, or along any canal, are proportional to the fquares of the velocities which they produce. Therefore, in every point of the undulatory motion of any particle, the tranfverfe force by which it is deflected into a curve is proportional to the fquare of its velocity. When this is the cafe, a body would continue to defcribe the fame curve as before; but, by the very comprelfion, the curvatures are increafed, fuppofing them to remain fimilar. This would require an increafe of the tranfverfe forces; but this is not to be found : therefore the particle will not defcribe a fimilar curve, but one which is lefs incurvated in all its parts; confequently the progreflive velocity of the whole, which is the only thing perceivable by us, will not be fo much diminifhed; that is, the obftructions will not increafe to falt as they wonld otherwife do, or as the fquares of the velocitics.

This reafoning is equally applicable to all fluids, and is abund antly confirmed by experis ents in hydraulics, as we fhall fee when conlideting the motion of rivers. We have taker this opportunity of delivering our notions on this fubject ; becaule, as we have often laid, it is in the avowed difcrete conftisution of air that we fee molt d: ftinctly the operation of thofe natural powers which conftisute fluidity in general, onftiute fluidity in general,
We whuld beg leave to mention a form of experiment M.tiofl
30, for difcovering the law of retardation with conliderable experi. accuracy. Experiments have been made on p pes and canals. Mr Boniut, in his Hydrodynamique, has given a veiy beautful fet made on pipes of an inch and two inches diameter, and 200 feet long: but although thefe experiments are very influtive, they do not give us any rule by which we can extend the refult to prpes of greater length and different diameters.

Let a fmooth cylinder be fet upright in a very large Pla vellel or pond, and be movenble round its axis: let it be ccec

 turned
lity of turned round by means of a whecl and pulley with an uniform motion and determined velocity. It will excrt the fame force on the contiguous water which would be exerted on it hy water turning round it with the fame velocity: and as this water would have its motion gradually 1 ctarded by the fixed cylinder, to the moving cylinder will gradualiy communicate motion to the furrounding water. We fleculd obferve the water gradually dragged round by it ; and the vortes would extend farther and farther from it as the motion is comtinued, and the velocities of the parts of the vortex will be lefs and let's as we recede from the axis. Now, we apprehend, that when a point of the furface of the cylinder has moved over 200 feet, the motion of the water at different diffances from it will be fimilar and propertional to, if not precifely the fame with, the returdutions of water flowing 200 feet at the fame difance from the fide of a canal : at any rate, the two are fufceptible of an accurate comparifon, and the law of retardation may be accurately deduced from obfervations made on the motions of this vortex.
Air in motion is a very familiar object of obfervation; and $i t$ is interefting. In all languages it has got a name ; we call it wind: and it is only upon reflection that we confider air as wind in a quiefcent ftate. Many perfons hardly know what is meant when air is mentioned; but they cannot refufe that the blaf from a bellows is the expulfion of what they contained ; and thus they learn that the wind is air in motion.

It is of confequence to know the velocity of wind; but no good and unexceptionable method has been contrived for this purpofe. The beft feems to be by meafuring the fpace pafled over by the fhadow of a cloud; but this is extremely fallacions. In the firft place, it is certain, that although we fuppofe that the cloud has the velocity of the air in which it is carried along, this is not an exact meafure of the current on the furface of the earth; we may be almolt cert in that it is greater: for air, like all other fluids, is retarded by the fides and bottom of the channel in which it moves. But, in the next place, it is very gratuitous to fuppofe, that the veloclty of the cloud is the velucity of the fratum of air between the cloud and the earth; we are almoft certain that it is not. It is abundantly proved by Dr Hutton of Edinburgh, that clouds are always formed when two parcels of air of different temperatures mix together, cach containing a proper quantity of vapour in the flate of chemical folution. We know that different ftrata of air will frequently flow in different directions for a long time. In I 781 while a great fleet rendezvouzed in Leith Roads during the Dutch war, there was a brifk eaflerly wind for about five weeks; and, during the laff fortnight of this period, there was a brifk weflerly current at the height of abnut $\frac{3}{4}$ of a mile. This was diffinctly indicated by frequent fleecy clouds at a great diftance above a lower ftratum of there clouds, which were driving all this time from the eaftward. A gentleman who was at the fiege of Quebec in 1759, informed us, that one day while there blew a gale from the weff, fo hard that the huips at anchor in the river were obliged to ftrike their topmafts, and it was with the utm fifficulty that fome well manned boats could row againft it, carrying fone artillery fores to a pof above the town, feveral thells were thrown from the town to deftroy the boats: onc of the fhells burft in the air near the top of its flight, which was about half a
mile high. The fmoke of this bomb remained in the Velucity of fime fot fur above a quarter of an hour, like a great Whad. round hall, and gradually difipated by diffufion, without removing many yards from its place. When, there. fore, two llrata of air come from different quarters, and one of them flows over the other, it will be only in the contiguous furfuces that a precppitation of vafour will be made. This will form a thin flecey cloud; and it will have a velocity and direcion "hich weither belongs to the upper nor to the lower firatum of air which produced it. Should one of thefe ftrata ceme from the ealt and the other from the wefl will equal velocities, the clond formed between them will have no motion at all; thould one corne from the eaf, and the other from the north, the cloud will move from the north.ealt with a greater velocity than either of the frata. So uncertain then is the information given by the clouds either of the velocity or the direction of the wind. A thick fmoke from a furnace will give us a much lefs equivecal meafure: and this, combined with the effects of the wind in impelling bodies, or deflecting a loaded plane from the perpendicular, or other effects of this kind, may give us mealines of the different currents of wind with a precifion fufficient for all practical ufes.

The celebrated engineer Mr John Smeaton has given, The refale in the 51 ft volume of the Philnfophical Tranfactions, the of Snica-
 tions in our language. Thefe are frunded on a great frvation number of obfervations made by himfelf in the courfe of had. his practice in erecting wind-mills. They are contained in the following table.

| Miles per hour. | Feet per fecond, | Names. |

See alfo fome valuable experiments by him on this fubject, Philofophical Tranfactions : 760 and 1761 .

311
One of the moft ingenious and convenient methods Account of for meafuring the velocity of the wind is to employ its Dr Lynd's preffure in fupporting a column of water, in the fame way as Mr Pitot meafures the velocity of a current of water. ter. We believe that it was firft propofed by Dr James Lynd of Windior, a gentleman eminent for his great knowledge in all the branches of natural ficience, and tor his ingenuity in every matter of experiment or practical application.

His anemometer (as there inftruments are called) con- Phate fifts of a glafs tube of the form $A B C D$ ( fig. 66.), open cocev.

Velocity of at both ends, and having the branch AB at right anWind. gles to the branch CD. This tube contains a few inches of water or any fluid (the lighter the better) ; it is held with the part CD upright, and $A B$ horizontal and in sthe direction of the wind; that is, with the mouth A fronting the wind. The wind acts in the way of preffure on the air in AB, compreffes it, and caufes it to prefs on the furface of the liquor; forcing it down to $F$, while it rifes to $E$ in the other leg. The velocity of the wind is concluded from the difference $\mathrm{E} f$ between the heights of the liquor in the legs. As the wind does not generally blow with uniform velocity, the liquor is apt to dance in the tubc, and render this obfervation difficult and uncertain : to remedy this, it is proper to contract very mnch the communication at C between the two legs. If the tube has half an inch of diameter (and it fhould not have lefs), a hole of $i=$ of an inch is large enough; indeed the hole can hardly be too fmall, nor

This inftrument is extremely ingenious, and will undoubtedly give the proportions of the velocities of different currents with the greatelt precifion; for in whatever way the prefure of wind is produced by its motion, we are certain that the different preffures are as the fquares of the velocities : if, therefore we can obtain one certain meafure of the velecity of the wind, and obferve the degree to which the preflure produced by it raifes the liquor, we can at all other times obferve the preffures and compute the velocities from them, making proper allowances for the temperature and the height of the mercury in the barometer ; becaufe the velocity will be in the fubduplicate ratio of the denfity of the air inverfely when the preffure is the fame.

It is ufually concluded, that the velocity of the wind is that which would be acquired by falling from a height which is to $\mathrm{E} f$ as the wcight of water is to that of an equal bulk of air. Thus, fuppoling air to be $\delta_{40}$ times lighter than watter, and that $\mathrm{E} f$ is $\frac{9}{1 n}$ of an inch, the velocity will be about $\sigma_{3}$ feet per fecend, which is that of a very hard gale, approaching to a Itorm. Hence we fee by the bye, that the fale ol this inftrument is extemely fhort, and, that it would be a great improvement of it to make the leg CD not perpendicular, but very much floping; or perhaps the following form of the infrument will give it all the perfection of which it is capable. Let the horizontal branch AD (igg. 67.) be contracted at B , and continued hoisontally for feveral inches BG of a much fmaller bore, and then turned down for two or three inches GC, and then upwards with a wide bore. To ufe the inftrument, hold it with the part DC perpendicular; and (having fheltered the mouth A from the wind) pour in water at D till it advances along GB to the point B ; which is made the begimning of the feale; the water in the upright branch landing at $f$ in the fame horizontal line with $B G$. Now, tum the month $A$ to the wind; the air in $A B$ will be compreffed and will force the water al,ng BG to F , and caufe it to rife from $f$ to E ; and the $130 \mathrm{ge} f \mathrm{E}$ will be to the range EF on the fale as the fection of the tube $B G$ to that of $\mathrm{CD}, \mathrm{T} h_{i 1}$, if the widita of DC be $\frac{1}{2}$ an inch, and that of BG $\therefore$, we thall have 25 inches in the feale for ore inch of ral preflize E $f$.

But it has not been cemonfrated in a very fatisfactory manner, that the velocity of tl.ce wind is that acquircd by falling through the height of a column of air whofe

## $\Lambda \quad \mathrm{T} \quad \mathrm{I} \quad \mathrm{C} \quad \mathrm{S}$.

weight is equal to that of the column of water $\mathrm{E} f$. Ex-Velucity periments made with Pitot's tube in currents of water Wud thow that feveral corrections are necellary for concluding the velocity of the current from the elevations in the tube : thefe corrections may however he made, and fifely applied to the prefent cafe; and then the inftrument will enable us to conclude the velocity of the wind immediately, without any fundamental comparifon of the elevation, with a velocity actually determined upon other principles. The chief ufe which we have for this information is in our employment of wind as an impelling power, by which we can actuate machinary or navigate fhips. Thefe are very important applications of pueumatical doctrines, and merit a particular confideration; and this naturally brings us to the lat part of our fubject, viz. the confideration of the impulfe of air on bodies expofed to its action, and the reffitance which it oppofes to the paffage of bodies through it.

This is a fubject of the greatelt importance; being Thisful the foundation of that art which has done the greatell honour to the ingenuity of man, and the greateft fervice to human fociety, by connecting together the moll diftant inhabitants of this globe, and making a communication of benefits which would otherwife have been impolfible; we mean the art of Navigation or Seamanfhip. Of all the machines which human art has conftusted, a fhip is not only the greateft and moft magnificent, but alfo the mof ingenious and intricate; and the clever feaman poffeffes a knowledge founded on the moft difficult and abitrufe doetrines of mechanics. The feaman probably cannot give any account of his own fcience ; and he poffeffes it rather by a kind of intuition than byany procefs of reafoning : but the fuccefs and efficacy of all the mechanifm of this complicated engine, and the propriety of all the manœuvres which the fesman prac. tifes, depend on the invariable laws of mechanics; and a thorough knowledge of thefe would enable an intelligent perfon not only to underftand the machine and the manner of working it, but to improve both.

Unfortunately this is a lubject ef very great difficulty ; and although it has employed the genius of Newten, and he has coclidered it with sreat c..re, and his followers have adled more to his labou's on this fubject than on any other, it Atill remains in a very imperfect fate.

A minute difculfion of this fuhject cannot therefore be expected in a work like this: we moft content ourfelves with luch a general ftatenient , $f$ the mof approved docwine on the fubject as fhill enable our readers to conceive it diflinctly, and judre with intciligence and confidence of the praitial deduct:ons which may be made from it.

It is evidently a branch of the general theory of the impulfe and retilance of fluids, which fhould have been treated of under the atticle Hydraylics, but was then deterred till the mechanical pinferties of compreffible Huids thould alfo t.e comfidered. It was thought very reafonable to fuppofe that the circumnarees of elafticity would introduce the feme changes inithe impulfe and refifance of fluids that it does in folid bodies. It would greatly divelt the attention from the diltinctive properties of air, il ve fhould in this place enter on this fubject, which is buth extenfive and dificuli. We reckon it beiter therefore to take the whole togetler: this we thall do under the article Resistance of Fluids, and confinc ourdelves at prefent to what relates to the impulie

## $P$ N $\quad \mathrm{E}$ U M A T I C.

$\sqrt{\text { a ity of impulfe and refiftance of air alonc ; anticipating a few of }}$ irid.
montration, in order to underfand the applications which may be made of it.

Suppore then a plane furface, of which a C (fig. 68.) is the fection, expoled to the action of a llreans of wind blowing in the direction QC , perpendicular to a C . The motion of the wind will bic obltructed, and the furface a C preffed forward. And as all impulfe or prelinre is exerted in a direction perpendicular to the furface, and is refifted in the oppofite direction, the furface will be impelled in the direction CD , the continuation of QC. And as the mutual actions of bodies depend on their relative motions, the force acting on the furface $a \mathrm{C}$ will be the fame, if we fhall fuppoie the air at reft, and the furface moving equally fwift in the oppofite direction. The refiftance of the air to the motion of the body will be equal to the impulfe of the air in the former cafe. Thus retiftance and impulfe are equal and contrary.

If the air be moving twice as faft, its particles will give a double impulfe; but in this cafe a double number of particles will exert their impulfe in the fame time: the impulfe will therefore be fourfold; and in general it will be as the fquare of the velocity: or if the air and body be both in motion, the impulie and refiftance will be proportional to the fquare of the relative velocity.

This is the firf propofition on the fubject, and it appears very confonant to reafon. There will therefore be fome analogy between the force of the air's inipulie or the refiftance of a body, and the weight of a column of air incumbent on the furface: for it is a principle in the action of fluids, that the heights of the columns of fluid are as the fquares of the velocities which their preffures produce. Accordingly the fecond propofition is, that the abfolute impulic of a Atream of air, blowing perdendicularly on auy furface, is equal to the weight of a column of air which his that futace for its bafe, and for its height the fpace through which a body muft fall in order to acquire the velocity of the air.

Thirdly, Suppofe the turface AC equal to $a \mathrm{C}$ no longer to be perpendicular to the Aream of air, bur inclined to it in the angle ACD, which we thall call the angle of incidence; then, by the refolution of forces, it follows, that the acion of each particle is diminithed in the proportion of radius to the line of the angle of incidence, or of $A C$ to $A L$, AL being perpendicular to CD.

Again: draw AK parallel to CD. It is plain that no air lying farther from CD than KA is will ftrike the plane. The quantity ot impulfe therefore is diminithed till farther in the proportion of $a \mathrm{C}$ to KC , or of AC to AL . Theref re, on the whole, the abfolute impulfe is cimninibed in the proportion of $\mathrm{AC}^{\cdot}$. to $\mathrm{AL}^{\prime}$ : hence the propolitio:, that the impulfe and reffance of a given furlace are in the preportion of the fquare of the line of the angle of incidence.

Fourthly, 'This impulfe is in the direction PL, perpendicular to the impelled furface, and the furface tends to move in this directim: but fuppole it moveable only in fome other clirection PO, or that it is in the direction PO that we wifh to employ this impulic, its action is therefore obl que; and if we wilh to know the intenfity of the impulfe ia this dirction, it muld be diminifhed fill fanther in the proportion of radius to the cotine of the
angle LPO or fine of CPO. Hence the general pro. Velce'ty of pofition: The eflifive impulfe is as the furface, as the Wind. Square of the velocity of the evin:d, as the Square of the fine of the angle of incidence, and as the fine of the obliguity. jointly, which we may exprefs by the fymbol $R=S \cdot V^{\circ}$. $\mathrm{fin}^{\prime}$, $\mathrm{I} \cdot \mathrm{fin}$. O ; and as the impulfe depends on the denfity of the impelling fluid, we maly take in every circumfance by the equation $R=S \cdot D \cdot V^{\cdot} \cdot \operatorname{Jin}^{2} \mathrm{I} \cdot \operatorname{fin}$. O . If the impulfe be eltimated in the direction of the fream, the angle of obliquity ACD is the fame with the angle of incidence, and the impulfe in this dircation is as the furface, as the fquare of the velocity, and as the cube of the angle of incidence jointly

It evidently follows from thefe premifes, that if ACA be a wedge, of which the bafe AA is perpendicular to the wind, and the angle ACA' bifected by its direction, the dired or perpendicular impulfe on the bafe is to the oblique impulfe on the fides as radius to the fquare of the line of the half angle ACA'.
The fame mult be affirmed of a pyramid or cone ACA', of which the axis is in the direction of the wind.
If ACA' (fig. 69.) reprefent the fection of a folid, produced by the revolution of a curve line APC round the axis CD, which lies in the direction of the wind, the impulfe on this body may be compared with the direct impulfe on its bafe, or the refiftance to the motion of this body through the air may be compared with the direct refiftance of its bafe by refolving its furface into elementary planes $\mathrm{P} p$, which are coincident with a tangent plane PR, and comparing the impulfe on $P P$ with the direct impulfe on the correfponding part $\mathrm{K} k$ of the bafe.

In this way it follows that the impulfe on a fphere is one half of the impulfe on its great circle, or on the bale of a cylinder of equal diameter.

We flatl conclude this iketch of the doctrine with a Impurtan: very important propofition to determine the moft ad- iuference vantageous potition of a plane furface, when required to move in one direction while it is impelled by the wind blowing in a different direction. Thus,
Let AB (fig. 70.) be the fail of a thip, CA the direction in which the wind blows, and AD the line of the fhip's courfe it is required to place the yard $A C$ in fuch a polition that the impulfe of the wind upon the fail may have the greateft effect poffible in impelling the fhip along AD.

Let $\mathrm{AB}, \mathrm{A} b$, be two pofitions of the fail very near the beft pofition, but on oppofite fides of ir. Drav BE, be, perpendicular to CA , and $\mathrm{BF}, \mathrm{f} f$, perpendicular to $A D$, calling $A B$ radius, it is evident that $B E, B F$, are the fines of impulfe and obliquity, and that the effegive impulfe is $\mathrm{BE} \times \mathrm{BF}$, or $b c^{2} \times b f$. This mult be a maximum.

Let the points $\mathrm{D}, \mathrm{b}$, continually apfroach and ultimately coincide; the chord $b B$ will ultimately coincide with a fraight line CBD touching the circle in B; the triangles CBE, cbe are fimilar, as allo the tiangles $\mathrm{DBF}, \mathrm{D} b f$; thercforc $\mathrm{BE}^{\cdot}$ : $l_{\varepsilon}=\mathrm{EC} \cdot: b c^{\circ}$, and $\mathrm{BF}: b f=\mathrm{BD}: 6 \mathrm{D}$; and $\mathrm{BE} \times \mathrm{BF}: b e^{2} \times b f=\mathrm{CE}^{2} 2<$ $\mathrm{BD}: c b^{2} \times 6 \mathrm{D}$. Therefore when Al is in tie belt pofition, fo that $\mathrm{BE} \cdot \times \mathrm{BF}$ is greater than $b e^{\circ} \times \dot{f} f$, we
 is allo a maxinum. This we know to be the cafe when $\mathrm{CB}=2 \mathrm{~B}, \mathrm{D}$ : the efore the fail mut be fo places that

Velocity of the tangent of the angle of incidence fhall be double of Wind. the tangent of the angle of the fail and keel.

In a common windmill the angle CAD is neceffarily a right angle; for the fail moves in a circle to which the wind is perpendicular: therefore the belt angle of the fail and axle will be $54^{\circ} .44$ nearly.

Such is the theory of the refiftance and impulfe of the air. It is extremely fimple and of eafy application. In all phyfical theories there are affumptions which depend on other principles, and thofe on the judgment of the naturalif; fo that it is always proper to confront the theory with experiment. There are even circumItances in the prefent cafe which have not been attended to in the theory. When a fream of air is obltructed by a folid body, or when a folid body moves along in air, the air is condenfed before it and rarefied behind. There is therefore a preffure on the anterior parts arifing from this want of eqquilibrium in the elafficity of the air. This muft be fuperadded to the force arifing from the impetus or inertia of the air. We cannot tell with precifion what nay be the amount of this condenfation; it depends on the velocity with which any condenfation difufes itfelf.

Alfo, if the motion be fo rapid that the preffure of the atmefphere cana:ot make the air immediately occupy 317 fure on its forepart to be adaed to the other forces.
Account of Experiments on this fubject are by no means numc. the princi- rous; at lealf fuch experiments as can be depended on palexperi- for the fumdation of any pratical application. The ments on
this fub- firt that have this characer are thofe publifhed by Mr this ruhjcit.
the fquare of the velocity by 500 , and we obtain the Velocity impulfe in pounds. Mr Roufe of Leicefterhire made Wird. many expcriments, which are mentioned with great approbation by $\mathrm{Mr}_{\text {, Smeaton. His great fagacity and ex- }}$ perience in the erection of windmills oblige us to pay a confiderable deference to his judgment. Thefe experiments coufirm our opinion, that the impulfes increafe fater than the furfaces. The following table was calculated from Mr Roufe's obfervations, and may be confidered as pretty near the truth.

| Velosity <br> in feet. <br> 0 | Impulic on a <br> Foot in pounds, |
| :---: | :---: |
| 10 | 0,000 |
| 20 | 0,129 |
| 30 | 0,915 |
| 40 | 2,059 |
| 50 | 3,560 |
| 60 | 5,718 |
| 70 | 8,234 |
| 80 | 11,207 |
| 90 | 18,638 |
| 100 | 22,872 |
| 110 | 27,675 |
| 120 | 32,926 |
| 130 | 38,654 |
| 140 | 44,830 |
| 150 | 51,462 |

If we multiply the fquare of the relocity in feet by 16, the product will be the impulie or refitance on a fquare foot in grains, according to Mr Roufe's numbers.

The greatelt deviation from the theory occurs in the oblique impulfes. Mr Robins compared the refitance of a wedge, whofe angle was $90^{\circ}$, with the refiftance of its bafe; and inflead of funding it lefs in the proportion of $\sqrt{2}$ to 1 , as determined by the theory, he found it greater in the proportion of 55 to 63 nearly; and when he formed the body into a pyramid, of which the fides had the fame furface and the fame inclination as the fides of the wedge, the refiftance of the bafe and face were now as 55 to 39 nearly : fo that here the fame furface with the fame inclination had its refifance reduced from 68 to 39 by being put into this form. Similar deviations occur in the experiments of the Chevalier Borda; and it may be collected from both, that the refifances diminifh more nearly in the pruportion of the fimes of incidence than in the proportion of the fquares of thofe fines.

The irregularity in the refitance of curved furfaces is as great as in plane furfaces. In general, the theory gives the oblique impulfes on plane furfaces much too imall, and the impulfes on cnrved furfaces too great. The reliftance of a fphere does not exceed the fomth part of the efiftunce of its great circle, inftead of being itshalf; but the anomaly is fuch as to leave hardly any room for calculation. It would be very defirable to have the experiments on this fubject repeated in a greater variety of cafes, and on larger furfaces, fo that the errors of the experiments may be of lefs confequence. Till this matter be reduced to fome rule, the art of working hips muft remain very imperfect, as mult alfo the conltrution of "indmills.

The cafe in which we are molt interefted in the know.
knowledge of the refiftance of the air is the motion of bullets and thells. Writers on artillery have long been fentible of the great effect of the air's refillance. It feems to hare been this confideration that chiefly engiged Sir Iface Newton to condider the motions of bodies in a refifting medium. A propofition or two wonld have fufficed lor thowing the incompatibility of the planetary motions with the fuppofition that the cetettial fpaces were filled with a fluid matter ; but he has with great folicitude confidered the motion of a body projected on the furlace of the earth, and its deviation from the parabolic track afligned by Galileo. He has beftowed more pains on this problem than any other in his whole work; and his inveltigation has pointed out almolt all the improvements which have been made in the application of mathematical knowledge to the ftudy of nature. Nowhere does his fagacity and fertility of refource appear in fo ftrong a light as in the fecond book of the Principia, which is almof wholly occupied by this problem. The celebrated mathematician John Bernouilli engaged in it as the fineft opportunity of difplaying his fuperiority. A miftake commited by New. ton in his attempt to a folution was matter of triumph to him; and the whole of his performance, though a piece of elegant and elaborate geometry, is greatly hurt by his continually bringing this miftake (which is a mere trifle) intc view. The difficulty of the fubject is fo great, that fubfequent mathematicians feem to have kept aloof from it; and it has been entirely overlooked by the many voluminons writers who have treated profeffedly on military projectiles. They have fpoken indeed of the refiftance of the air as affecting the flight of fhot, but have faved themfelves from the tafk of inver. tigating this effef (a tak to which they were unequal), by fuppofing that it was not fo great as to render their theories and practical deductions very erroneous. Mr Robins was the firf who ferioully examined the fueject. He thowed that even the Newtonian theory (which had been corrected, but not in the fmalleft degree improved or extended in its principles) was fufficient to fhow that the path of a cannon ball could not refemble a parabola. Even this theory fhowed that the refiftance was more that eight times the weight of the ball, and thould produce a greater deriation from the parabola than the parabola deviated from a fraght line.

This fimple but fingular obfervation was a ftrong pro f how fanlty the profetfed writers on artillery had been, in rather amuling themfelves with elegant but ure. lefs applications if eafy geumetry, than in endeavouring to give their readers any ufeful information. He added, that the difference between the ranges by the Newtonian theory and by experiment were fo great, that the refiftance of the air mult be valtly fuperi r to what that theory fuppofed. It was this whicly furgefted to him the neceflity of experiments to afcertain this point. We have feen the refult of thete experiments in moderate velocities; and that they were fufficient for calling the whole theory in queltion, or at leaft for rendering it ufelefs. It became neceffary therefore io fettle every point by means of a diredt experiment. Here was a great difficulty. How fhall we meafure either thefe sreat velucities which are obferved in the motions of cannon thot, or the refiftance which thefe enor--mous velocities occafion? Mr Robins had the ingenuiif to do both. The method which he took for mea-
furing the velocity of a muket-ball was quite original; Refifance, and it was fufceprible of great accuracs. We hrve al. of Air in ready griven an account of it under the article Gus. Gunnery, kers. Having gained this peint, the other was nut difficult. In the moderate velocities he lad detcrmined the refilances by the forces which balanced them, the weights which kept the refifted body in a itate of uniform motion. In lhe great velocities, he propofed to determine the reliftances by their imnmediate effects, by the retardations which they occafoned. This was to be done by firt afcertaining the velocity of the ball, and then meafuring its velocity after it had palled thro' a certain quantity of air. The difference ot thefe velocities is the retardation, and the proper mealure of the refiftance; for, by the initial and final velocitics of the ball, we learn the time which was employed in paffing through this air with the medium velocity. In this time the air's refftance diminifhed the velocity by a certain quantity. Compare this with the velocity which a body projected directly upwards would lofe in the fame time by the refiftance of gravity. The two forces muft be in the proportion of their effects. Thus we learn the proportion of the refiftance of the air to the weight of the ball. It is indeed true, that the time of pafling through this fpace is not accurately had by taking the arithmetical medium of the initial and final velocities, nor does the refintance deduced from this calculation accurately correfpond to this mean velocity; but both may be accurately found by the experiment by a very troublefome compntation, as is frown in the 5 th and 6th propofitions of the fecond book of Newton's Principia. The difference between the quantities thus found and thofe deduced from the fimple procets is quite trifling, and far within the limits of accuracy attainable in experiments of this kind; it may therefore be fafely neglected.

Mr Robins made many experiments on this fubjec ; but unfortanately he has publifhed only a very few, fuch as were fufficient for afecrtaining the point he had in view. He intended a regular work on the fubjeer, in which the gradual variations of refiftance correfponding to different velocities fhould all be determined by experiment: but he was then newly engaged in an important and laborious employment, as chief engizeer to the Eaf India Company, in whofe fervice he went out to India, where he died in lefs than two years. It is to be regretted, that no perfon has profecuted thefe experiments. It would be neither laborious nor difficult, and would add more to the improvement of attillery than any thing that has been done fince M: Robins's death, if we except the profecution of his experiments on the initial velocities of cannon fhot by Dr Charles Hutton royal profeffor at the Woolwich Academy. It is to be hoped that this gentleman, after having with fuch effect and fuccefs extended Mr Robins's experiments on the initial velocities of mifkerfhot to cannon, will take up this other fuiject, and thus give the art of artillery all the fientific foundation which it can receive in the prefent fate of our mathematical knowled ge. Till then we mutt content eurfe'ves with the practical rules which Rebins has deduced from his own experiments. As he has not given us the mode of dedution, we mult compare the refults wi:h experiment. He has indeed given a very extelıfive conpar:fon with the numerous expe: iments made both in Britain

Refilance, and on the continent ; and the agreement is very great. of Air in His learne $\$$ commentator Euler has been at no pains to Gunaery. inveftigate thefe rules, and has employed himfelf chiefly in detecting errors, moft of which are fuppofed, becaule he takes for a finithed work what Mr Robins only gives to the public as a halty but ufeful fketch of a new and 328 vety dificult branch of fience.
General re- The generd refult of Robins's experiments on the fult of
them, \&c. retardation of malket flot is, that althourh in moderate velocities the refiftance is fo nearly in the duplicate proportion of the velocities that we cannot oblerve any deviation, yet in velocities exceeding 200 feet per fecond the retardations increafe falter, and the deviation from this rate increafes rapidly with the velocity. Hie afcribes this to the caufes already mentioned, viz. the condenfation of the air belore the ball and to the rarefaction behind, in confequence of the air not immediately occupying the fpace left by the bullet. This inereafe is to great, that if the refillanee to a ball moving with the velocity of 1700 fect in a fecond to be eomputed on the rappofition that the refiftance obferved in moderate velocities is increafed in the duplicate ratio of the velocity, it will be found hirdly one-third patt of its real quantity. He found, for inflance, that a ball moving thro' 1670 feet in a fecond loft about 125 feet per fecond of its velocity in pafing through 50 feet of air. This it muf have done in the $y^{\prime}$ of a fecond, in which time it would have lof one foot if projected directly upwards; from which it appears that the refiltance was about 125 times its weight, and more than three times greater than if it had increafed from the refiftance in fmall velocities in the duplicate ratio of the velocities. Herelates other experiments which flow fimilar refults.

But he alfo mentions a fingular circumfance, that till the veloeities exceed inoo feet per fecond, the refiltances inereafe pretty regularly, in a ratio exceeding the duplicate ratio of the velocities; but that in greater veloeities the refiftances become fuddenly triple of what they would have been, even aceordiug to this law of increafe. He thinks this explicable by the vacuum which is then left behind the ball, it being well known that air rufhes into a vacuum with the velocity of 1132 feet

## 322

 'arely con troverted by Euler, but withont fufti. cient grounds. per fecond nearly. Mr Euler controverts this conclufion as inconfiftent with that gradation which is obferved in all the operations of nature; and fays, that althongh the vacuum is not produced in fmaller velocities than this, the air behind the ball muft be fo rare (the face being but imperfectly filled), that the preffure on the anterior part of the ball muft gradually approximate to that preflure which an abfolute vacuum would produce; but this is like his other criticifms. Robins does nowhere affert that this fudden change of refiftance hap. pens in the tranfition of the velocity from 1132 feet to that of 113 I feet 11 inches or the like, but only that it is very fudden and very great. It may be ftrictly demonltrated, that fuel a change muft happen in a narrow enough limit of velocities to juflify the appellation of fudden : a fimilar fact may be obferved in the motion of a folid through water. If it be gradually accelerated, the water will be tound nearly to fill up its place, till the veloeity arrives at a certain magnitude, correfponding to the immerfion of the body in the water; and then the fmalleft augmentation of its motion immediately produces a void belind it, into which the waterrufhes in a violent manner and is dafhed into froth. A Refinane gentleman, who has had many opportuni.ies for fueh ob. of Air $i$ fervations, affures us, that when Itanding near the line of Guant direction of a eannun difcharging at bll with a large allotment of powder, fo that the initial velocity certainly exceeded 1100 feet per fecond, he always obferved a very fudden dim:nution of the noife which the bullet made during its paflage. Although the ball was coming towards him, and therefore its noife, if equable, would be continually increafing, he obferved that it was loudeft at firt. That this continued for a fecond or two, and fuddenly diminilhed, changing to a found which was not only wealeer, bat differed in kind, and gradually increafed as the ballet approached him. He laid, that the firt noife was like the hifling of red hot iron in water, and that the fublequent noilc rather refembled a hazy whitling. Such a change of found is a necellary confequence of the different agitation of the air in the two cafes. We know alfo, that air rufhing into a void, as when we break an eshaulled bottle, makes at report like a mulket.

Mr Robins's affortion therefore has every argument for its truth that the nature of the thing will admit. But we are not left to this vague reafuning : his experiments flow us this diminution of refiltance. It clearly appears from them, that in a velocity of 1700 feet the refiftance is more than three times the refiftance determined by the theory which he fuppofes the common one. When the velocity was 1065 feet, the actual re. filtance was $\stackrel{1}{7}$ of the theoretical; and when the velocity was 400 feet, the actual refiftance was about $\frac{4}{3}$ of the theoretical. That he alfumed a theory of refiftance which gave them all too fmall, is of no confequence in the prefent argument.

Mr Robins, in fumming up the refults of his obfervations on this fubject, gives a rule very cafily remem-Rohins bered for compliting the refiflances to thofe very rapid oomputi motions. It has been already mentioned in the article Gunnery, but we repeat it here, in order to aceommodate it to the quantities which have been determined in fome degree by experiment.

$$
A \quad C \quad B \quad D
$$

Let $A B$ reprefent the velocity of a 700 feet per fecond, and $A C$ any other velocity. Make $B D$ to $A D$ as the refiltance given by the ordinary theory to the refiftance actually obferved in the velocity 1700 : then will CD be to AD as the refiftance affigned by the ordinary theory to the velocity $A C$ is to that which really correfponds to it.

To aecommodate this to experiment, reeollen * that a *ee G fphere of the fize of a 12 pound iron flot, moving 25 feet nery, $n^{\circ}$ in a fecond, had a refiltanee of ir of a pound. Augment \&c. this in the ratio of $25^{\circ}$ to $1700^{\circ}$, and we obtain 210 nearly for the theoretical refiftance to this velocity; but by comparing its diameter of $4 \frac{1}{5}$ inches with ${ }_{8}^{3}$, the diameter of the leaden ball, which had a refiftance of at leaft it pounds with this velocity, we conclude that the iz pound thot would have had a refiftance of 396 pounds : therefore $\mathrm{BD}: \mathrm{AD}=210: 396$, and $\mathrm{AB}: \mathrm{AD}=186:$ 396 ; and $A B$ being ${ }^{1700}, \mathrm{AD}$ will be 3613 .

Let $\mathrm{AD}=a, \mathrm{AC}=x$, and let R uc the reliftance to a 12 pound iron fhot moving one foot per fecond, and $r$ the refiftance (in pounds) wanted for the velocity $x$;

$R=\frac{1}{13750}$ very nearly. This gives $R a=0,263235$, which is nearly one-fourth. Thus our formula becomes $r=\frac{0,26,3235 x^{\circ}}{3613-x}$, or very nearly $\frac{x^{\circ}}{4\left(3612-x^{\circ}\right)}$, falling Short of the truth :about , th part. The fimplicity of the formula recommend, it to our ufe, and when we incroare its rcfult $\therefore$, it is incomparably nearer to the true refult of the theory as corrected by Mr Robins than we c.m hope that the thenry is to the astual refifance. We call cillily fie that Mr Robins's correction is only a fazacious approximation. If we fuppofe the velocity 3613 feet, a very poffible thing, the relatance by this formula is irfinite, which camot be. We may even fuppofe that the refiftance given by the formula is near the trut' only infuch velocities as do not esreatly exceed $\mathbf{7} 700$ feet per fecond. Nin military projectile exceels 2200 , and it is great folly to make it fo great, beciulue it is recuced to i;co almolt in an inftant, by the enormous refiftance.
The relifance to other balls will be made by takitug them in the duplicate ratio of the diameters.

It has been already wblerved, that the firte mathematicians of Europe have lately emploged themfelves in improvin this theory of the motion of bodies in a remiting medium; but their difcufions are fuch as icw artilierifts can undertand. The problem can only be folved by approximation, and this by the quadrature of very complicited curves. They have not been able therefore to deduce from them any practical rules of eafy application, and have been cbliged to compute tables finited to different cafes. Of theie performances, that of the Chevalier Borda, in the Memoirs of the Academy of Sciences in 1769 , feems the beft adapted to military readers, and the tables are undoubtedly of confiderable ufe; but it is not too much to fay, that the fimple rules of Mr Robins are of as much fervice, and are more eafily remembered : befides, it mult be obferred, that the nature of military fervice does not give room for the application of any very precife rule. The only advantage that we can derive from a perfect theory would be an improvement in the confruction of pieces of ordnance, and a more judicious appropriation of certain velocities to certain purpofes. The fervice of a gun or mortar muft always be regulated by the eyc.

There is another motion of which air and other elaftic fluids are fufceptible, viz, an internal vibration of their particles, or undulation, by which any extended portion of air is diftributed into alternate parcels of condenfed and ruretied air, which are continually changing their condition without changing their places. By this change the condenfation which is produced in one part of the air is gra fually transforred along the mafs if air to the greatert diftances in all directions. It is of iniportan:e to have fome difinet conception of this motion. It is found to be by this means that dirana bodies froduce in us tha fenfation of found. See Soend, Acousfics. Sir Ifara Newton treated this finject with his accufomed ingenuty, and has given us a theory of it in the end of the fecond book of his Princigia. This theory has been objected to with refpeet to the condut of the argument, and other explanations have been given by the moot eminent mathematicians. Though they appear to differ from Newton's, their refults are precifely the fame; but, on a cloie examiVoc. XV.
nation, thacy differ noo more than John Eerncuilli's theo. Uniculation reml of centripetal forces differs from Newton's, viz. the one being expreffed by gcometry and the other by literal analyfis. The celebrated De la Grange reduces Newton's invelfigation to a tautological propofition or identical equation, but Mr Young of Trimity College, Dublin, has, by a different turn of expreffion, freed Newton's method from this objection. We flatl not repeat it here, but refer our mathematical readers to the article Acnustics, it not being our bulinefs at prefent 10 contider its conneation with found. '1 his will make the fubject of a diftinet article.

But fince Newton publifled this theory of aerial un. Has heen dulations, and of their propagation along the air, and ufed to exfince the theory has been fo corrected and improved as plain a vato be reccived by the moft accurate philofophers as a ricry of nabrauch of natural philofophy fufceptible of rizid de- nomicna. monftration, it has been freely reforted to by many writers on other parts of natural fcience, who did not profef's to be mathenaticidins, but made ufe of it for explaining phenomena in their own line on the authority of the mathematicians themflves. Learning from them that this vibration, and the quaquaverfumb propagation of the puifes, were the neceflary properties of an claftic fluid, and that the rapicity of this propagation had a certain affignable proportion to the elafticity and denfity of the fluid, they freely made ufe of thefe conceffions, and have introduced elaftic vilurating fluids into many facts, where others would furpeat no fucla thing, and have attempted to explain by their means many abfirufe phenomena of nature. Fthers are every where introduced, endued with great clafticity and tenuity. Vibrations and pulfes are fuppofed in this $x$ ther, and thefe are offered as explanations. The doetrines of animal fpirits and nervons fluids, and the whole mechanical fy fem of Hartley, by which the operations of the foul are faid to be explained, have their fourdation in this theory of aerial undulations. If thefe fancied fuids, and their internal vibrations, really operate in the phenomena afcribed to them, any explanation that can be given of the phenomena from this principle mult be nothing elfe than flowing that the legitimate confequences of thefe undulations are fimilaz to the phenomena; or, if we are no more able to fee the laft itep than in the cafe of found (which we know to be one confequence of the aerial undulations, although we cannot tell how), we mult be able to point out, as in the cafe of found, certain conflant relations between the general laws of thefe undulations and the general laws of the phenomena. It is only in this way that we think ourfeives intitled to fity that the acrial undulations are caufes, though not the crly caufes, of found; and it is becaule there is no fuch relation, but, on the contrary, a total difimilarity, to be nbferved between the i.tws of elatic undulations and the laws of the propagation of light, that we affert with confidence that ethereal undulations are not the calles of vilion.

Explenations of this kind fuppefi, thercfore, in the But the apfirf Flace, that the phiofopher who propofes them un- plication dentands precifely the nature of thete undulations; in not beine the next phace, that he makes his reader fenfible of made with thofe circumfances of them which are concerned in the effect to be explaincd; and, in the third place, that he makes the re:ader undertand how this circumfance of the vibrating fluid is conncted with the phenomenon, either by thowing it to be its mechanical caufe, T

## 146

Undulation as when the philofopher explains the refounding of a of Air.

## $\underbrace{-}$

 tone : cord to a flute or pipe which gave the fame dulation always accompanies the phenomenon, as when the philufopher thows that 233 vibrations of air in a fecond, in whatever manner or by winatever caure they are produced, always are followed by the fenfation of the tone C in the mildle of the harpfichord.But here we mult obferve, that, with the exception of Euler's unfucceffful attempt to explain the optical phenomena by the undulations of ether, we have met with no explanation of natural phenomenia, by means of elaficic and vibrating fluids, where the author lias fo much as attempted any one of thefe three things, fo indifpenfably requifite in a logical explanation. They have talked of vibrations without defribing them, or giving the reader the lealt notion of what kind they are; and in no inflance that we can recollest have they fhowed how fuch vibrations could have any influence in the phenomenon. Indeed, by not defcribing with precifion the undulations, they were freed from the talk of lhowing them to be meclanical caufes of the phenomenon; and when any of them fhow any analogy between the general haws of elaft:c undulations and the general haws of the phenomenon, the analogy is fo vague, indiftinct. or partial, that no perion of common prudence would receive it as argument in any cafe in which he was mucla interefted.

We think it our duty to remonftrate againt this flovenly way of writing : we would even hold it up to reprobation. It has been chiefly on this faithlefs foundation that the blind vanity of men has raifed that degrading fyitem of opinions called Materialism, by which the affections and faculties of the foul of man have been refolved into vibrations and pulfes of ether.

We alfo think it our duty to give fome account of this motion of elaftic fluids. It miff be fuch an account as flall be underfood by thofe who are not mathematicinns, becaufe thofe only are in dater of being milled by the improper application of them. Mathematic.ll difcultion is, however, unavoidable in a fubject purely mathematical ; but we thall introduce nothing th.it may not be eafily underitood or co fided in ; and we truit that mathematical readers will excule us for a mode of reafoning which appars lax and inelegant.

The firt thing incumbent oa us is to thow how elatic fluids differ from the unelaltic in the propagation of any agitation of their parts. When a long tube is filied with water, and any one part of it pulihed out of its place, the whole is intantly moved the a folid mafs. But this is not the cafe with air. If a door be fuddenly thut, the window at the father end of a long and clole room will rattle ; but fome tima will clapie between the fhating of the door and the motion of the window. If iome light dut be lying on a brace 1 drum, and another be violensly beat at a litule diftance from it, at attentive oblerver will fee the duft dance up from the puchment ; but this wili be at the inft unt he hears the fiund of the froke c.n the other drunn, and a enfible time aftre the Atro':e. Miny fuch familiar facts thow thut the ag tution is gradually commmuicated ahong the air; :nd therefore that when one particle is agitated, by any fentible motion, a finite time, however fmall, mutt elupfe before the adjoi. ing particle is agitated, in the fanc manuer. This would not te the cale in water
if water be perfectly incompreffible. We think that this Uadulat may be made intelligible with very little trouble.

B6 C
D

Let $A, B, C, D, \& c$. be a row of aerial particles, at fuch diftances that their elafticity juft balances the prellure of the atmoiphere; and let us fuppofe (as is deducible from the obferved denfity of arr being proportional to the comprefling force) that the elatticity of the particles, by which they keep each other at a diftance, is as their diftances inverfely. Let us farther fuppole that the particle A has been carried, with an uniform motion, to a by fome external force. It is evidant that $B$ camnot remain in its prefent flate; for being now nearer to $a$ than to $C$, it is propelled towards C by the excefs of the elaflicity of A above the natural clafticity of C . Let E be the natural elafticity of the particles, or the force corre!ponding to the difance BC or DA, and let F be the force which impels E towards C , and let $f$ be the force exerted by A when at $a$. We have

$$
\begin{aligned}
& \mathrm{E}: f=\mathrm{B} a: \mathrm{BC},=\mathrm{B} a: \mathrm{BA} ; \\
& \text { and } \mathrm{E}: f-\mathrm{E}=\mathrm{B} a: \mathrm{B} A-\mathrm{B} a=\mathrm{B} a: \mathrm{A} a ; \\
& \text { or } \mathrm{E}: \mathrm{F}=\mathrm{B} a: \mathrm{A} a
\end{aligned}
$$

Now in fig. 71. let $A B C$ be the line joining three plat particles, to which draw FG, PH parallel, and IAF, CCCC HBG perpendicular. Take IF or HG to reprefent the elafticity correfponding to the diftance $A \mathrm{D}$. Let the particle A be fuppofed to have been carried with an uniform motion to $a$ by fome external force, and draw KaM perpendicular to RG , and make $\mathrm{FI}: \mathrm{RM}=\mathrm{B} a: \mathrm{BA}$. We fhall then have $\mathrm{FI}: \mathrm{PM}=$ $\mathrm{Ba}: \mathrm{A} a$; and PM will reprefent the force with which the particle B is urged towards C. Suppote this conftruction to be made for every point of the line AB , and that a point M is thus determined for each of them, mathematicians know that all thefe points M lie in the curve of a hyperbola, of which FG and GH are the afymptotes. It is alfo known by the elements of mechanics, that fince the motion of $A$ along $A B$ is uniform, A a or IP may be taken to reprefent the time of defcribing $A \quad u$; and that the area IPM reprefents the whole velocity which B bas acquired in its motion towards C when A bas come to $a$, the force urging B being always as the portion PMI of the ordiate.

Take GX of any length in HG produced, and let GX reprefent the velocity which the uniform action of the natural elafticity IF could conımunicate to the particle $B$ during the time that $A$ wwind unformly defcrise AB. Make GX to GY as the rectangle IFGH to the hyperbolic face IFRM, and draw is cutting $M$ produced in S , and draw FX cutting MR in T. It is known to the mathematicians that the point $S$ is in a curve line FSs called the logarithmic curve; of which the leading property is, that any line RS paralel to GX is to GX as the retangle IFGH is to the Hyperboiic fpace IFRM, and that PX touches the curve in F .
This being the cafe, it is plain, that becaufe RT increafes in the fume proportion with FR, or with the rectangle IFRP, and RS increates in the proportion of the fuace IFRM, TS increafes in the proportion of the face IPM. Therefore T'S is proportional to the velocity of $\mathbf{B}$ when $A$ has reached $a_{2}$, and $\mathbb{Z} T$ is

## P N E U M

Julation proportional to the velocity which the uniform aation Air. of the natural claficity would communicate to 13 in the fame time. 'lhen fince PT is as the time, and T'S is as the velocity, the area ETS will be as the fpace defcribed by $B$ (urged by the varmble force PM); while $A$, arged by the extern.l fore, deferibes $A$ a; and the triangle $\mathrm{FR}^{\prime} \mathrm{l}^{\prime}$ will repretent the fpace which the uniform action of the natural elallicity would caufe I to defribe in the fame time.

And thus it is plain that thefe three metions can be compared together: the uniform motion of the agitated particle $A$, the uniformly accelerated motion which the natural elafticity would communicate to B by its confant attion, and the motion produced in B by the agitation of $A$. But this comparifon, requiring the quadrature of the hipeibola and lngarithmic curve, would iead us into moft intricate and tedious computations. Of thefe we need only give the refult, and make fome other comparifons which are palpable.

Let Aa be fuppofed indefinitely fmall in comparifon of $A B$. The fpace defcribed by $A$ is therefore indefinitely fmall; but in this cafe we know that the ratio of the pace FR'T to the rectangle IFRP is indefinitely fmall. There is thereforeno comparifen between the agitation of $A$ by the external force, and the agitation which ratural elaflicity would preduce on a fingle particle in the fame time, the latl being incomparably fraller than the firlt. And this face FRT is incomparably greater than FTS; and therefore the fpace which B would decribe by the uniform action of the na. tural elafticity is incomparably greater than what it would defcribe in confequence $\cdot$-f the agitation of $A$.

From this reafoning we fee evidently that $A$ muft be fenfibly moved, or a finite or meafurable time mult elapfe before B acqุuires a meafurable motion. In like manner B mult move during a meafurable time before C acquires a meafurable motion, sce. ; and therefore the agitation of $A$ is communicated to the diftant particles in gradual fuccellion.

By a farther comparifon of thefe fpaces we learn the time in which each fucceeding particle acquires the very agitation of $A$. If the particles $B$ and $C$ only are confidered, and the motion of C neglected, it will be found that $B$ has acquired the motion of $A$ a little before it has defcribed $\frac{2}{3}$ of the fpace deferibed by $A$; but if the motion of $C$ be conlidered, the acceleration of $B$ mult be increafed by the retreat of $C$, and $B$ muft defribe a greater fpace in proportion to that defcribed by A. By computation it appears, that when both $B$ and C have- acquired the velocity of $A, B$ has defcribed nearly ; of A's motion, and C more nearly '. Extendmg this to D , we fhall find that D has deferibed ftill more nearly : of A's motion. And from the nature of the computation it appears that this approximation goes on rapidly: theretore, finpofing it accurate from the very firlt particle, it follows from the equable motion of $A$, that each fucceeding particle moves throngh an equal fpace in acquiring the motion of $A$.

The conclution which we mutt draw from all this is, that when the agitation of A has been fully communicated to a particle at a fenfible diflance, the intervening particles, all moving forward with a common velocity, are equally comprefed as to fenfe, except a very few of the firlt particles; and that this communication, or this propagation of the original agitation, foes on with an uniform velocity.

## A T I C S.

Thefe computations need not be altenced to by fucl Undulations as do not with for an accurate knowledge of the 1 recife agitation of cach particle. It is enough for fuch reaters to fec clevly that time mufl eflape between the agitation of $A$ and that of a diffant particle; and this is abundantly manifef from the incomparability (excule the term) of the nafcent rectangle IF RP with the nafeent triangle FPT, and the incomparability of FRT uith FTS.

What has now been houn of the communicetion of any fenfible motion $A$ a muft hold equally with refpect to any change of this motion. Therefore, if a tremulous motion of a body, fuch as a fpring or bell, fhould agitate the adjoining particle $A$ by pufhing it forward in the direction AB , and then alloving it to come back again in the direction $B A$, an agitation fimilar to this will take place in all the particles of the row Newton's one after the other. Now if this body vibrate accord- demmitraing to the law of motion of a pendulum vibrating in a fubject ;uft cycloid, the neighbouring particle of air cuill of nccoffy as far as it vibrate in the fame manner; and then Newton's demon-goes; Atration in art. Acoustics needs no apology. Its only deficiencr was, that it jeemed to prove that this would be the way in which every particle would of necenity vibrate; which is not true, for the fuccefine parcels of air will be differently agitated according to the original agitation. Newton onfy wants to prove the unforra propagation of the agitations, and he feleets that form which renders the proof eafieft. He proves, in the moft unexceptionable manner, that if the particles of a pulfe of air are really moving like a cycloidal pendu. lum, the forces acting on each particle, in confequence of the compreftion and dilatation of the different parts of the pulfe, are precifely fuch as are neceflary for continuing this motior, and therefore no other forces are required. Then fince each particle is in a certain part of its path, is moving in a certain direction, and with a certain velocity, and urged by a determined force, it mufl move in that very manner. The objection farted by John Bernonilli againft Newton's demonftration (in a fingle line) of the elliptical motion of a body urged by a force in the inverfe duplicate ratio of the difance from the focus, is precifely the fame with the objection againft Newton's demonftration of the progrefs of acrial undulations, and is equally futile.

It mutt, however, be cbferved, that Newton's demonftration proceeds on the fuppofition that the linear agitations of a particle are incomparably fmaller than the extent of an undulation. This is not Arinly the cafe in any inftance, and in many it is far from being true. In a pretty frong twang of a harpfichord wire, the agitation of a particle may be near the 50 th part of the exent of the undulation. This mut difturb the regularity of the motion, and caufe the agitations in the remote undulations to differ from thofe in the firf pulfe. In the explotion of a cannon, the breaking of an exhaufted bottle, and many intances which may be given, the agiations are ftill greatcr. The commentators on Newton's Principia, Le Sueur and Jucquier, have fhown, and Euler more clearly, that when the originai agitations are very violent, the particles of air will acquire a fubordinate vibration compounded with the regular cycloidal vibration, and the progrefs of the pulfes will be fomewhat more rapid; but the iatricacy of the calculus is fo great, that they have not been abie to determine with any tolerable precifion what the change of velocity will be.

## i $N$ E U M

Undulation of Air.
${ }_{5} 33$ It is
fienythened by comparing the found of a cannon near and at a diffance,

All this, however, is fully confirmed by experiment on founds. The found of a cannon at 10 or 20 miles diftance does not in the leaft refemble its found when near. In this cafe it is a loud inftantaneous crack, to which we can afign no mufical pitch: at a diftance, it is a grave found, of which we can tell the note; and it begins fuftly, fwells to its greatelt loudnefs, and then dies away growling. The fame may be faid of a clap of thunder, which we hnow to be a loud fnap of fill lefs duration. It is highly probable that the appreciable tone which thofe diflant founds afford are produced by the continuance of thefe fubordinate vibrations which are added together and fortified in the fucceflive pulfes, though not perceptible in the firf, in a way fomewhat refembling the refonance of a mufical chord. Newton's explanation gathers evidence therefore from this circumftance. And we muft further obrerve, that all elaftic bodies tremble or vibrate almolt precifely as a pendulum fwinging into a cycloid, unlefs their vibrations are uncommonly viclent; in which eafe ther are quickly reduced to a moderate quantity by the refiftance of the air. The only very loud founds which we can produce in this way are from great bells; and in thefe the utmoft extent of the vibration is very fmall in comparifon with the breadth of the pulfe. The velocity of thefe founds has not been compared with that of cannon, or perhaps it would be found lefs, and an objection againft Newton's determination removed. He gives 969 feet per fecond,
334 Experiment 1142.

The agitation in all probability in the fuccefive pulfes arfumes a cyclodial form,

But it is alfo very probable, that in the propagation through the air, the agitation gradually and rapidly approaches to this regular cycloidal form in the fincceflive pulfes, in the fame way as we obferve that whatever is the form of agitation in the middle of a fmooth pond of water, the foreading circles are always of one gentle form without afperities. In like manner, into whatever form we throw a ftretched cord by the twang which we give it, it almolt immediately makes fimooth undulations, keeping itfelf in the fhape of an elongated trochoid. Of this laft we can demonftrate the necenlity, becaufe the eafe is fimple. In the wave, the inveltigation is next to impofible; but we fee the fact. We may therefore prefume it in air. And accerdingly we know that any noife, however abrupt and jarring, near at hand, is fmooth at a diftance. Nothing is more rough and harth than the feream of a heron; but at half a mile's diftance it is foft. The ruffle of a drum is allio fmocth at a diftance.

## Plate

ccccul.
Fig. 72. Ahows the fucceffive fituations of the particles of a row. Each line of the figure fhows the fame particles marked with the fame letters; the firt particle a being fuppofed to be remnved fucceffively from its quicfcent fituation and back to it again. The niark $x$ is put on that part of each line where the agitated particles are at their natural diftances, and the air is of the natural denfity. The mark 1 is put where the air is molt of all compreffed : and, where it is moft of all dilated; the curve line crawn through the loweit line of the figure is intended to reprefent the denfity in every point, by drawing ordinates to it from the ftraight line: the ordinates below the line indicate a rarity, and thofe above the line a denfity, greater than common.

It appears that when a has come back to its natural fituation, the part of greater denfity is between the particies $i$ and $k$, and the greatef rarity between $c$ and $c$. We have only to add, that the velocity of this pro-

## A T I C S.

pagation depends on the elafticity and denfity of the Undulation fluid. If thefe vary in the fame proportion, that is, if the fluid has its elafticity proportional to its denfity, the velocity will remain the fame. If the elalticity or dentity alone be changed, the velocity of the undulations will change in the direct fubduplicate ratio of the elaflicity and the inverfe fabduplicate ratio of the denfity; for fhould the elafticity be quadrupled, the quantity of motion produced by it in any given time will be quadrupled. This will be the cafe if the velocity be doubled; for there would then be double the number of particles doubly agitated. Should the denfity be quadrupled, the elafticity remaining the fame, the quantity of motion mult remain the fame. This will be the cafe if the velocity be rednced to one half; for this will propagate hall the agitation to half the difance, which will communicate it to trice the number of particles, and the quancity of motion will remain the fame. The fame may be faid of other proportions, and therefore $V=\frac{\sqrt{E}}{\sqrt{D}}$. Therefore a change in the barometer will not affect the vel city of the undulations in air, bus they will be accelerated by heat, which diminifhes its denfity, or increales its elalticity. The velocity of the pulfes in inflammable air muft be at lealt thrice as great, becaufe its denfity is but one-tenth of that of air when the elafticity of both are the fame.

Let us now attend a little to the propagation of Further aerial pulfes as they really happen; for this hypothefis confideraof a fingle row of particles is nowhere to be obferved.

Suppofe a fphere A, fig. 73. filled with condenfed air, and that the veffel which contains it is fuddenly an- realy nihilatch. The air muft expand to its natural dimen- cur. fions, fuppofe BCD. But it cannot do this without profling afide the furrounding air. We have feen that in any fingle row of particles this cannot be at once diffufed to a diftance, but muft produce a condenfation in the air adjoining; which will be gradually propagated to a diftance. Therefore this phere BCD of the common denlity will form round it a thell, bounded by EFG, of condenfed air. Suppofe that at this inftant the inner air BCD becomes folid. The thell of condended air can expand only outwards. Let it expand till it is of the common denlity, occupying the thell HIK. This expanfion, in like manner, muft produce a fhell of condenfed air withoat it: at this inftant let HII become folid. The furrounding fhell of condenfed air can cxpand only outward, condenfing another flell without it. It is plain that this mult go on continually, and the central agitation will be gradually propagated to a ditance in all di. ections. But, in this procefs, it is not the fame numerical particles that go to a difarce. Thofe of the original fphere go no further than BCD, thole of the next fhell go no further than HIK, \&c. Farther, the expanfion outwards of any particle will be more moderate as the difufion advances; for the whole motion of each fhell cannot exceed the original quantity of motion; and the number of particles in each fuccefive thell increafes as the furface, that is, as the fquare of the diftance flom the centre: therefore the agitation of the particles will decreafe in the fame ratio, or will be in the inverfe duplicate ratio of the diftance from the centre. Each fuccelfive fhell, therefore, contains the fame quantity of motion, and the fuccetive agitations of the particles of any
rtion row out from the centre will not be equal to the original does not affeet the velocity of the propagation, becaure all agitations are propagated ecqually fât.
We fuppofed the air A to become folid as foon as it acquired the common denfity ; but this was to facilitate the ennception of the diffufien. It does rot fop at this bull: ; for while it was denfer it had a tondency to expand. Therefore each particle has attained this diftance with an accelerated motion. It will, therefore, continue this motion like a pendulum that has patied the perpendicular, till it is brought to reft by the air without it ; and it is now rater than common air, and collaples again by the greater elafticity of the air without it. This nutward air, therefore, in regaining its matural denfity, muft expand both ways. It expands towards the centre following the coliapfiry of the air within it; and it exp.nds outwa:ds, condenfing the air beyond it. By expanding inward, it will again condene the air within it, and this wi'l again expand; a fimilar motion hapeens in all the ontward fhells; and thus there is propagated a fuccefion of condenfed and rarefied fiells of air, which gradually fiwell to the greatef diftance.

It may be demonatrated, that when the central dir has for the fecond time acquired the natural denfity, it will be at reft, and be difturbed no more; and that this will happen to all the fhells in fucceffion. But the demonftration is much too intricate for this place; we mult be contented with pointing out a fact perfeclly analogous. When we drop a fnall pebble into water, we fee it produce a leries of circular waves, which go along the furface of fmooth water to a great diftance, becoming more and more gentle as they recede from the centre ; and the middle, where the agitation was firft produced, remains perfectly fmooth, and this fnioothnefs extends continually; tlaze is, each wave when brought to a level remains at reft. Now thefe waves are produced and propagated by the deprellion and elevation made at the centre. This elevation tends to diffufe itfelf; and the force witls which each particle of water is actuated is a force ading directly up and down, and is proportional to the elevation or dcprefion of the particle. This hydrofatical preflure eperates precifely in the fame way as the condenfation and rarelation of the air: and the mathemalical inveftigation of the propagation of the circular undulations on fmooth water is fimular in every fen to that of the fropagation of the fpherical rraves in till air. For this we appeal to Newton's Primcipia, or to Euler's Oprfiula, where he gives a icry beautiful inveltigation of the vel city of the aerial pulfes; and to fome memoirs of de la Grange in the collections of the ac:ademies of Berlin and Turin. Thefe two laft authors have made the invertigation as fimple as feems pofible, and have freed it from every objection which can be fated againf the geometrical one of their great teacher Newton.
Having faid this much on the fimilarity between the waves on water and the aenial undulations, we fhall have recourie to them, as affording us a very fenfible object to reprefent many affections of the other which it would be extremely difficult to explain. We neither fee nor feel the aerial undulations; and they behoved, therefure, to be defcribed very abftrictedly and imperiectly: In the watery wave there is no permanent progreflive motion of the water from the centre. Throw a fmall bit of
cork on the furface, and it will be obferved to popple Undulatio ${ }^{11}$ up and down without the leaft motion outwards. In like of Air. manner, the particles of air are only agitated a very little outwards and inwards; which motion is communicated to the particles beyond them, while they themfulves come to reft, unlefs agitated afre? $h_{1}$; and this agitation of the particles is inconceivably frnall. Even the explotion of a cannon at no great difance will but gently agitate a feather, giving it a fingle impulfe outwards, and immediately after another inwaids or towards the cannon. When a harpficord wire is forcibly twanged at a few feet diftance, the agitation of the air is next to infenfible. It is not, however, nothing ; and it differs from that in a watery wave by being really cutwards and inwards. In confequence of this, when the condenfed fhell reaches an elaftic body, it innpels it flightly. If its elatlicity be fuch as to make it acquire the oppofite fhape at the inftant that the nest agitation and condonfed flell of air touches it, its agitation will be cloubled, and a third agitation will increare it, and in on, till it acquire the agitation compatent to that of the flell of air which reathes it, and $i t$ is thrown into fenfile vibration, and gives a found extremely fant indeed, becaute the agitation which it acquires is that correiponding to a thell of air confiderably removed from the original ftring. Hence it happens that a mulical chord, pipe, or bell, will caufe another to refound, whofe vibrations are ifochronous with its own ; or if the vibrations of the one coincides with every fecond, or third or fourth, \&cc. of the other; juft as we can put a very heavy pendulum into fenfible motion by giving it a gentle puff with the breath at every vibration, or at every fecond, third, or fourth, \&ंc. A drum Itruck in the neighbourhood of another drum will agitate it very fenfilly; for here the flroke deprefles a very confiderable furface, and produces an agitation of a confiderable mafs of air: it will even agitate the furface of ftagnant wate:. The explofion of a caunon will even break a neighbouring window. The fhell of condenfed air which cemes againft the glat's has a great furface and a great agitation : the beft fecurity in this cafe is to throw up the fafh; this admits the condenfed air into the room, which aits on the infide of the window, balancing part of the extermal impulfe.

It is demonftrated in every elementary treatife of na- For tural philofophy, that when a wave on water meets any waves of plane obftacle, it is reflected from it by a centre equal- water of ly removed behind the olvitacle; that waves radiating in many from the focus of a parabola are reflected in waves per- refpees pendicular to its axis; that waves radiating from one very finifocus of an ellipfe are made to converge to the other har. focus, \&c. \&x. All this may be affirmed of the aerial undulations; that when part of a wave gets through a hole in the obfacle, it becomes the centre of a new feriss of waves; that waves bend round the extremities of an obltacle: all this happeris in the aerial undulations. And lafly, that when the furface of water is thrown into regular undulations by one agitation, another agitation in another place will produce ocher regular waves, which will crofs the former without difturbing them in the fmalleft degree. The fame thing happens in air; and experiments may be made on water which will illuftrate in the moft perfet namer many other affections of the aerial pulfes, which we thould otherwife conceive very imperfectly. We would

Undulation recommend to our curious readers to make fome of
$\underbrace{\text { of air. }}$
$\square$

339
Cuntion to the fup. porters of athels,ar.imal fipirits, \&ic. ing to fuch unknewn fubfances
thefe experiments in a large veffel of milk. Take a long and narrow plate of lead, which, when fet on the bottom of the veffel will reach above the furface of the milk; bend this plate into a parabola, elliptical or other cut ve. Make the undulations by dropping milk on the focus from a finall pipe, which will caufe the agitations to fucceed with rapidity, and then all that we have faicl will be moll diftinetly feen, and the experiment will be very amufing and infrnctive, efpecially to the mufical reader.
We would now requett all who make or read explanations of natural phenomend by means of vibrations of ethers, animal fpirits, nervous fluids, \&c. to fix their attertion on the nature of the agitation in one of thefe undulations. Let him confider whether this can produce the phenomenon, ading as any matter muft act, by impulfe or by prefurc. If he fees that it can produce the phenomenon, he will be able to point out the very motion it will produce, both in quantity and direslion, in the fame manncr as Sir Ifaac Newton has pointed out all the irregulatities of the moon's motion produced by the difturbing force of the fun. If he cannot do this, he fails in giving the firlt evidence of a mechanical explamation by the ation of an elaftic vibrating 1luid. l.et him then try to point ont fome palpable connection between the general phenomena of elaftic undulations and the phenomenon in queftion; this would thow in accompaniment to have at laft fome probability. It is thus only we learn that the undulations of air produce found: we cannot tell how they affect the mechanifm of the ear; but we fee that the phenomena of found always accompany them, and that certain modifications of the one are regularly accompaniecl by certain modifications of the other. If we cannot do this neither, we have derived neither explanation nor illu?ration from the elaftic fluid. And lafly, let him remember that cuen if he floould be able to fhow the competency of this fluid to the production of the phenomenon, the whole is fill an hypothefis, becaufe we cio not know that fuch a fluid exifts.
We will venture to fay, that whoever will proceed in this prudent manncr will foon fee the futility of moft of the explanations of this kind which have been given. They are unfit for any but confummate mathematicians: for they alone really undertand the mechanifm of aerial undulations, and even they fpcak of them with hefitation as a thing but imperfectly underRood. But even the unlearned in this fcience can fee the incompatibility of the hypoihefis with many things which they are brought to explain. To take an intance of the conveyance of fenfation along the nerves; an elaftic fluid is fappofed to occupy them, and the undulat tions of this fluid are thought to be propagated along the nerves. Let us juft think a little how the undulations would be conveyed along the furface of a canal which was completely filled up with reeds and bulrufhes, or let us make the experiment on fuch a canal : we may reft affured that the undulations in the one cafe will refemble thofe in the othcr; and we may fee that in the canal there will be no regular or fenfible propagation of the waves.

Let thefe obfervations have their influence, along with others which we have made on other occafions, to wean our readers from this fabionable pronenefs to in.

## A T I C S.

troduce invifible fluids and unknown vibrations into our Air's p phyfical difcuflions. They lave done immenfe, and we fure fear irreparable, mifclief in fcience; and there is but one phemomenon that lras ever received any explanation by their means.

This may fuffice for a loofe and popular account of acrial undulations; and with it we conclude our account of the motion, impulfe, and refiftance of air.

We fhall now explain a number of natural appearances, depending on its preflure and clafticity, appearances not fufficiently general, or too complicated for the purpofes of argument, while we were employed in the inveftigation of thefe properties, but too important to be paffed over in filence.

It is owing to the preffure of the atmof finere that The two furfaces which accurately fit each other cohere with proflur fuch force. This is a fact familiarly known to the glafs- cafiono grinders, polilhers of marble, \&c. A large lens or fpe- chh fio culum, ground on its tool till it become very fmoath, fave fur as requires mure than any man's ftrength to feparate it di- rat. Iy 1 rectly from the tool. If the furface is only a fquare ting ea inch, it will require 15 pounds to feparate them perpen- othert dicularly, though a very moderateforce will make them flide along each other. But this chetion is not obferved unlefs the furfaces are wetted or fmeared with oil or greafe ; otherwife the air gets between them, and they feparate without any trouble. That this colefion is owing to the atmofpheric preflure, is evident from the care with which the plates may be feparated in an exhauted receiver.

To the fame caufe we muft afcribe the very frong And ${ }^{34}$ adhefion of frails, periwinkles, limpets, and other uni- the ad valve flells, to the rocks. The animal forms the tim from of of its fhell fo as to fit the fhape of the rock to which it frails, intends to cling. It then fills its fhell (if not already filled by its own body) with water. In this condition it is evident that we mult act with a force equal to 15 pounds for every fquare inch of touching lurface before we can detach it. This may be illullrated by filling a drinking glaifs to the brim with water; and having covered it with a piece of thin wet leather, whelm it on a table, and then try to pull it fraight up; it will require a confiderable force. But of we expofe a fnail adhering to a ftone in the exhanted receiver, we thall fee it drop off by its own weight. In the fame manner do the remora, the poiypus, the lamprey, and many other animals, adhere with fuch firmnefs. Boys frequently amufe themfelves by pulling out large fones from the pavement by means of a circle of fuif wetted leather faftered to a fring. It is owing to the fame caufe that the bivalve fhell filles keep themfelves fo firmly thut. We think the mufcular force of an oy fer prodigious, becaufe it requires fuch force to open it; but if we grind off a bit of the convex fhell, fo as to make a hole in it, though without hurting the fifl in the fmalleft degree, it opens with great eafe, as it does allo in vacto.

The prefure of the air, operating in this way con-other tributes much to the cohefion of bodics, where we do feas of not fufpect it influence. The tenacity of our mortars air's and cements would frequently be ineffectual withont this afiftance.

It is owing to the preflure of the atmofiphere that a cafk will not 1 un by the cock unlefs a hole be opened in fome other part of the calk. If the cafk is not quite
fiumple of their firits. It confits of a lone tinplate tube AB (fig. 57 .), open a-tup at $A$, and chding in a fmall hole at $B$. The end $B$ is dipped into the ppirits, whech rifes into the tube; then the thumb is clapt on the mouth $A$, and the whole is lifted out of the calk. The feirit remains in it till the thumb be taken off; it is then allowed to run into a glafs for examination.

It feems principally owing to the prelfure of the air that frofts immediately occalion a feantinefs of water in our fountains and wells. This is crroneoufly accounted for, by fuppofing that the water freezes in the bowels of the earth. But this is a great miftake: the moft intenfe froll of a Siberian winter would not freeze the ground two feet deep; but a very moderate froft will confolidate the whole furface of a conntry, and make it impervious to the air; efpecially if the froft has been preceded by rain, which has foaked the furface. When this h:lppens, the water which was filtering through the ground is all arrefted and kept fufpended in its capillary tubes by the preffure of the air, in the very fame manner as the fpilits are kept fufpended in the infrument jult now defcribed by the thumb's thutting the hole A. A thaw melts the fuperficial ice, and allows the water to run in the farse manner as the finits run when the thumb is removad.

Common air is neceltary for fupporting the lives of moft animals. If a fmall animal, inch as a moufe or bird, be put under the receiver of an air-pump, and the air be exhaufted, the animal will quickly be thrown into convulfions and fall down dead; if the air he immediately readmitted, the animal will fometimes revive, efpecially if the raretaction has been britkly made, and has not been very great. We do not know that any breathing animal can bear the air to be reduced to $\frac{1}{4}$ of its ordinary denfity, nor even $\frac{1}{3}$; nor have we good evidence that an animal will ever recover if the rarcfaction is puthed very far, although continued for a very flort time.

But the mere prefence of the air is by no means fufficient for preferving the lite of the animal; for it is found, that an animal thut up in a vellel of air canmot live in it for any length of time. If a man be thut up in a box, containing a wine longthead of air, he cannot live in it much above an hour, and long before this he will find his beathing very unfatisfactory and uneafy. A gallon of air wiil fupport him abont a minute. A box EF (fig. 58.) may be made, having a pipe AB inferted into its top, and titted with a very light valve at li, opening upwards. This pipe fends off a lateral, branch $a \mathrm{D} d \mathrm{C}$, which enters the box at the bottom, and is allo fitted with a light valve at $C$ epening upwards. If a perfon breathe through the pipe, keeping his noftrils fhut, it is evident that the air which he expires will not euter the boy by the he'e $\mathrm{B}_{2}$ nor return
through the pipe $\mathrm{C} d \mathrm{D}$; and by this coritrivance lic 1 ficds if will gradually employ the whole air of the box. With di-'sprelthis apparatus experiments can be made withont any furce. rill: or inconveniency, and the quantity of air neceffary for a given time of cafy breathing may be accurately afecrtained.

How the air of our atmofplece produces this effect is a quettion which docs not belong to mechanical philofophy to inveltigate or determine. We can, however, afirm, that is meither the preffure nor the elafticity of the air which is immediately concerned in maintaining the animal functions. We know that we can live and breathe with perfect freedom on the tops of the higheft mountains. The valley of Quito in Perv, and the country round Gondur in Abyffum, are fo far elivated above the furface of the ocean, that the preffure and the elatticity of the air are one-third lefs than in the low conntries; yet thefe are populous and healthy places. And, on the other hand, we know, that when an animal has breathed in any quantity of air for a certain time without renewal, it will not only be fufocated, but another animal put into this air will die immediatcly; and we do not find either the preffure or elaficity of the air remarkably diminifhed: it is indeed diminifhed, but by a very fmall quantity. Refloring the former prefline and elalticity has not the fmalleft tendency to prevent the deatla of the animal: for an animal will live no longer under a receiver that has its mouth inverted on water, than in one fet upon the pump-plate covered with leather. Now when the receiver is fet on water, the preffure of the atmofphere adts completely on the included air, and preferves it in the fame Itate of elati. city.

In fhort, it is known that the air which has already The nature ferved to maintain the aninial functions has its chemical of air and alimentary propertics completely changed, and is no when it has longer fit for this purpofe. So much of any mais of air maintained as has really been thus employed is changed, into what animal is calied fored air by Dr Black, or carbonic acid by the chemifts of the Lawoilierian fchorl. Any perfon may e be convinced of this by breathing or blowing through a pipe inmerfed in lime water. Every expiration will produce white clouds on the water, till at the lime which it contains is precipitated in the form of pure chalk. In this cafe we know that the lime has combined with the fixed air.

The celebrated Dr Stephen Hales made many expe- Hale's exriments, with a view to clear the air from the noxious periments, vapour which he fuppofed to be emitted from the lungs.

He made ufe of the apparatus which we have bean juf now mentioning ; and he put feveral diaphragms ff, ff, sce. of thin woullen Itulf into the box, and noiftened them with various liquids. He found nothing fo efficacious as a folution of potafl. We now underftand this perfectly. If the folution is not already faturated with fixed air, it will take it up as fan ats it is produced, and thus will purify the air: a folution of cantic alkali therefore will have this effect till it is rendered quite mild.

Thefe experiments have been repeated, and varied in How it 348 many circumfances, in orier to wifertain whether this comes to fi:ed air was really emitted by the lungs, or whether be changea the infired air was in part changed into fixed air by by breathits combination with forime other lulstance. This is a ing: and quedion which comes properly in our way: and which of inpuran
the tion, \&f:

Iffects of the doctrines of pretrmatics enable us to anfwer. If Air's pref- the fixed air be emitted in fubfance from the lungs, it fure.
docs not appear how a renewal of the air into which it
is emitted is necelfary; for this does not hinder the fubfequent emifion; and the bulk of the air would be increafed by breathing in it, viz. by the bulk of all the fixed air emitted ; but, on the contrary, it is a little diminified. We muft therefore adopt the other opinion ; and the difooveries in modera chemiftry enable us to gave a pretty accurate account of the whole procefs. Fixed air is acknowledged to be a compennd, of which one ingredient is found to conftitnte about $\frac{3}{8}$ of the Whole atmofpheric Huids; we mean vital air or the oxygene of Lavoifier. When this is combined with phlogifon, according to the doctrine of Stahl, or with charcoal, according to Lavoifier, the refult is fixed air or carbonic acid. The change therefore which breathing makes on the air is the folution of this matter by vital air; and the ufe of air in breathing is the carrying off this noxious principle in the way of folution. When therefore the air is already fo fir faturated as not to dif. fulve this fubftance as faft as it is fecreted, or muft be fecreted in the lungs, the animal fuffers the pain of luffocation, or is otherwife mortally affceted. Suffucation is not the only coniequence; for we can remain for a number of feconds without breathing, and then we begin to feel the true pain of fuffocation; but thofe who have been inftantaneoufly ftruck down by an infpiration of fixed air, and afterwards recovered to life, complained of no fuch pain, and feemed to have finfered chiefly by a nervous affection. It is faid (but we will not vouch for the truth of it), that a perfon may fafely take a full infpration of fixed air, if the paffages of the nale be thut; and that unlefs thefe nerves are itimulated by the fixed air, it is not inftantaneouly mortal. But thefe are queftions cut of our prefent line of inquiry. They are queftions of phyfiology, and are treated of in cther places of this work. See Ansitomy and Physiology; fee alio Lungs and Respiration. Our bufinels is to explain in what manner the prellure and elafticity of the air, combined with the ftructure and mechanifm of the body, operate in producing this necerfury fecretion and removal of the matter difcharged from the lungs in the aet of breathing.

It is well afcertained, that the fecretion is made from the mafs of blood during its paffage through the lungs. The blood delivered into the lungs is of a dark blackilh colour, and it is there changed into a florid red. In the lungs it is expofal to the action of the air in a prodigiouny extended furface: for the lungs confitt of an inconceivable number of imall vefiels ur bladders, commonicating with each other and with the windvipe. Thefe are flled with air in every infpiration. Thefe veifels are every-where in contact with minute blood. velfels. The blood does not in tato come into immecliate contact with the air; and it would feem that it is only the thin ferous part of it which is anted on by the air at the months of the veffels or pores, where it ftands by carillary attraction. Dr Pieftley found, that venous blood incloled in thin bladders and other membranes was rendeled florid by leeping the bladders in contact with abundance of pure vital air. We know alfo, that breath is moilt or damp, and muf lave acquired this moifure in the lungs. It is immaterial whether this fecretion of water or lymph (as the anatomilts call it)
be furnified by merc exudation through fimple pores, Effeets or by a vafcular and organic fecretion; in either cafe, Air'spris fome ingredient of the blood comes in contant with air fure. in the lungs, and there unites with it. This is farther confirmed, by obferving, that all breathing animals are warmer than the furrounding medium, and that by erery procefs in which fixed air is formed from vital air heat is produced. Hence this folution in air of fomething from the blood has been affigned by many as the fource of animal heat. We touch on tl.cfe things in a very tranfitory way in this place, only in order to prove that, for the fupport of animal life, there mut be a very ex. tenfive application of air to the blood, and that this is made in the lungs.

The quedtion before us in this place is, How is this brought about by the weight and elafticity of the air? This is d ne in two ways; by the action of the mufcles of the ribs, and by the action of the diaphragm and other mufcles of the abdomen. The thorax er cheft is a great cavity, completely filled by the lungs. The fides of this cavity are formed by the ribs. Thefe are crooked or arched, and each is moveable round its two ends, one of them being inverted into the vertebre, of the back, and the other into the fernum or breaft-bone. The rib turns in a manner repmbling the handle of a drawer. The infpection of fig. 59. will illuftrate this matter a little. Suppofe the curves ace, bkf, clg, ixc. to reprefent the ribs moveable roand the extremities. Each fucceeding rib is mure bent than the one above it, and this curvature is both in the vertical and horizontal diration. Supprife cach fo broad as to project a little over its inferior like the tiles of a roof. It is evident, that if we take the lower one by its middle, and draw it out a little, moving it round the line $n p$, it will bring ou: the next $d m$ ib along with it. Alfo, becaule the diftance of the middle point ofrom the axis of motion $n p$ is greater than the difance of $m$ from the axis $d h$, and becaufe o will therefore defcribe a portion of a larger circle than $m$ does, the rib $n o p$ will flide up a little under the rib $l m b$, or the rib $d$ in $b$ will overlap nop a little more than before; the diftance o $m$ will therefore be diminithed. The fame mult happen to all the fuperior ribs; but the change of diftance will be lefs and lefs as we go upwards. Now, inftead of this great breadth of the ribs overlapping each other, fuppofe each inferior rib conncted with the one above it by threads or fibres fufceptible of contraction at the will of man. The articulations $e, a$, of the dift or upper rib with the fpine and fternum are fo broad and firm, that this rib can have little or no morion romen the line a $e$; this rib therefore is as a fixture for the ends of all the con. tracting fibres: therefore, whenever the fibres which connest the fecond rib with the firft rib erntraft, the lecond muit rile a little, and allo go outward, and will cary the lower ribs along with it ; the third rib will rife fill farther by the concraction of the mufcles which conned it with the fecond, and fo on: and then the whole ribs are raicd and thrown outward (and a little forward, becaufe the articulation of each with the foine is conflearably higher than that with the fternum), and the capacity of the thurax is cnlarged by the contraction of it: mufcular covering. The direction of the mufcular fibres is very oblique to the direction of the circular motion which it produces; from which circumfance it follows, that a very minute contraction of the
mufcles produces ail the motion which is recelfary: This inceed is not grcat ; the whole motion of the loweft ribs is lefs than an inch in the nolt violent infpiration, and the whole contraction of the muteles of the 12 sibs does not eaceed the cighth phitt of an inch, even fuppoting the intercoftal muceces at right angles to the ibs; and beng ablique, the contration is thill lefs (fic Morrlli, Sabatier, Munro, \&ic.) It would fecin, that the intentity of the contragive power of a mulcular fibre is ealily obtained, but that the face through which it can be exerted is very limited; fur in molt cales nature places the mufiles in fituations of great mcchanical difadvantage in this refpect, in order to procure ather conveniences.
But his is not the whole effect of the contraction of the interco? al nuffles : fince the compound abtion of the two fets of mufcles, which crofs cach other from rib to rib like the letter $X$, is nearly at right angles to the rib, bu: is oblique to its plane, it tends to pufh the ribs clofer on their articulations, and thus to prefs out the two pillas on which they are articulated. Thus, fup. pofing af (lig. Co.) to reprefent the fection of one of the ventebix of the fpine, and $c d$ a fection of the thernum, and $a b c$, $f e d$, two oppofite ribs, with a lax thread be connerting them. If this thread be pulled upwards by the raiddle $g$ till it is tight, is will tend to pull the points $b$ and $e$ nearer to each other, and to prefs the vertebra a $f$ and the fernum cd outwards. The fine being the chief pilliar of the body, may be confidered as imnoveable in the prefent intlance. The fersum is fufficiently fufceptible of motion for the prefent purpofe. It remains alnoff fixed a-top to its articulation with the firf rib, but it gradually yields below; and thus the capacity of the thurax is enlarged in this direstion alfo. The whole enlargement of the diameters of the thorax during infpiration is very fmall, not exceeding the fiftieth part of an inch in ordinaty cafes. This is eatily calculated. Its quiefcent capacity is about two culic feet, and we never draw in more than 15 inches. Two fplicres, one of which holds 2 cubic feet and the other 2 feet and 15 inches, will not differ in diameter above the fiftie: $h$ part of an inch.

The other meth $d$ of enlarging the capacity of the thorax is very different. It is feparated from the abcomen by a Arong mufcular partition called the diaphragm, which is attached to firm parts all around. In its quiefcent or relaxed ftate it is confiderably convex upwards, that is, towards the thorax, rifing up into its cavity like the botom of an ordinary quart bnttle, only not io regular in its thape. Many of its fibres tend froni its midale to the circumference, whare they are inferted into firm parts of the body. "Now fuppofe thefe fibres to centract. This mult draw down its midedie, or make it fiatter than before, and this enlarge the capacity of the thorax.
Phyfioogits are not well agreed as to the fhare which each of theie adtins lias in the oparation of cnlarging the thorax. Many refufe all tharc of it to the intercoftal mufcles, and fay that it is performed by the diaphragm alunc. But the fact is, that the ribs are really obferved to rife even while the perfon is alleep; and this cannot peflibiy be produced by the diaphragm, as thele anatomills affert. Such an epinion thows either ignorance or neglect of the laws of puenmatics. If the capacity of the thorax were enlarged only by drawing down the Voz. XV.
diaphrigm, t!e prefiuse of the ait: would comprefs the ribs, nide mat:e them defeend. And the fimpie lav" if mechanics muke it as evident as any propuftion in geomstry, tiat ile contration of tic intercoftal mufcis; midf prociuce on chratican of the ribs and cnlargencen: of the thorax: ard it is one of the mefl beautiful contrivane's of naturc. It depends much on the will of the animal what ihare cach of thefe ations fhall lave. In general, the greateft part is done by the diaphragm; and :my perfon can breathe in fuch a manner that his tibs fhall remain notinalets; and on the centrary, he can breathe almoft entive by railing his cheft. In the firt mehod of breathing, the belly ifes during infpira. tion, becaufe the contraction of the diaphragm completfes the upper part of the bovels, and therefore fqueezes then outwards; fo that an ignorant perfon would be aft to think that the breathing was performed by the belly, and that the belly is inflated with the air. The Itrait lacing of the women impedes the motion of the ribs, and clanges the natural habit of breathing, or brings on an unnatural habit. When the mind is deprefled, it is oberved that the breathing is more performed by the mufcles of the thorax ; and a deep figh is always made in this way.

Theie obfervations on the manner in which the capacity of the cheft can be enlarged were neceflary, before we can acquire a jut notion of the way in which the mechanical properties of air operate in applying it to the mafs of blood during its paflage through the lungs. Suppofe the thorax quite empty, and communicating with the external air by means of the trachea or windpipe, it would then refemble a pair of bellows. Raiing the boards correfponds to the raifing of the ribs; and we might imitate the adion of the diaphragm by forcibly pulling outwards the folded leather which unite. them. Thus their capacity is enlarged, and the air rufhes in at the nozzle by its weight in the fame manner as water would do. The thorax differs from bellows only in this refpect, that it is filled by the lungs, which is a vaft collection of little bladders, like the holes in a piece of fermented bread, all communicating with the trachea, and many of them with ench nther. When the cheft is enlarged, the air rufhes into them all in the fame manner as into the fingle cavity of an empty tho. rax. It cannot be faid with propriety that they are inflated: all that is done is the aliowuing the air to come in. At the fame time, as their membranous covering muft have fome thicknefs, howercr fmall, and fone elalticity, it is not unlikely that, when compreffed by expiration, they tend a little to recover their former thape, and thus aid the voluntary astion of the mufcles. It is in this manner that a fmall bladder of caoutchonc fivells again after compreflin, and fills itfelf with air or water. But this cannot happen except in the moft minute veficles: thofe of fenfible bulk have not elxficity enough for this purpoie. The lungs of birds, however have fome very large bladders, which have a very confiderable elaticity, and recover their fhape and fize with great force after comprefion, and thus fill themfelves with air. The refpiration of thefe animals is confilerably different from that of land animals, and their nafules act chiefly in expiration. This will be explained hy and by as a curious variety in the rneumatic inftrument.
This account of the manner in which the lungs are
filed

## 154

Iffect of filled with air does not feem agreeable to the notions

Air's pref. fure.
349
We take in
air not by
-ur nwn
astion, but
by external prature. we entertain of it. We feem to fuck in the air; but althongl it be true that we act, and exert force, in crder to get air into our lungs, it is not by our action, but by external preffure, that it does come in. If we apply our mouth to the top of a bottle filled with water, we find that no draught, as we call it, of our chelt will fuck in any of the water; but if we fuck in the very fame manner at the end of a pipe immerfed in water, it follows immediately. Our intereft in the thing makes us connect in imagination our own action with the effect, without thisking on the many fteps which may intervene in the train of natural operations; and we confider the action as the immediate caule of the air's reception into the lungs. It is as if we opened the door, and took in by the hand a perfon who was really pufhed in by the crowd without. If an incifion be made into the fide of the thoras, fo that the air can get in by that way, when the animal acts in the ufual manner, the air will really come in by this hole, and fill the fpace between the lungs and thorax; but no air is.fucked into the lungs by this procefs, and the animal is as completely fuffocated as if the windpipe were thut up. And, on the other hand, if a hole be made into the lungs without communicating with the thorax, the animal will breathe through this hole, though the windpipe be Ropped. This is fuccefsfully performed in cafes of patients whofe trachea is thut up by accident or by inflammation; only it is neceffary that this perforation be made into a part of the lungs where it may meet with fome of the great pulmonary paffages ; for if made into fome remote part of a lobe, the air cannot find its way into the rell of the lungs through fuch narrow paffages, obllucted too by blood, \&c.

We have now explained, on pneumatical principles, the procefs of infpiration. The expiration is chiefly performed by the natural tone of the parts. In the act of infpiration the ribs were raifed and drawn outwards in oppolition to the elafticity of the folids themfelves; for although the ribs are articulated at their extremities, the articulations are by no means fuch as to give a free and eafy motion like the joints of the limbs. This is particularly the cafe in the articulations with the fernum, which are by no means fitted for motion. It would feem that the motion really produced here is chiefly by the yielding of the cartilaginous parts and the bending of the rib; when therefore the mufcles which produced this effect are allowed to relax, the ribs again collapfe. Perhaps this is affifted a little by the action of the long mufcles which come down acrofs the ribs without being inferted into them. Thefe may diaw them together a little, as we comprefs a loofe bund!e by a ftring.

In like manner, when the diaphragm was drawn down, it compreffed the abdomen in oppofition to the elafticity of all the vifcera contamed in it, and to the elafticity and tone of the teguments and mufcles which forround it. When therefore the diaphragm is relaxed, thefe parts pufh it up again into its natural fituation, and in doing thi, expel the air from the lungs.
It requires no fifurt.

If this be a juft account of the matter, cxppiration fould be perlormed without any effort. This accordingly is the cafe. We feel that, after having made an ordinary eafy infpiration, it requires the continnance of the effort to keep the thorax in this enlarged tate, and
that all that is neceffary for exfpiration is to ceafe to act. No perfon feels any difficulty in emptying the lungs; but weak people often feel a difficuity of infpiration, and compare it to the feeling of a weight on their breaft; and exfpitation is the laft motion of the thorax in a dying perion.

But nature has alfo given us a mechanifm by which we can exfpire, namely, the abdominal mufcles; and when we have finithed an ordinary and eafy exfpiration, we can fill expel a confiderable bulk of air (nearly half of the contents of the lungs) by contracting the abdominal mufcles. Thefe, by comprefling the body, force up its moveable contents againlt the diaphragm, and caufe it to tife further into the thorax, acting in the fame manner as when we expel the fæces per anum. When a perfon breathes out as much air as he can in this manner, he may obferve that his ribs do not collapfe during the whole operation.

There feems then to be a certain natural uncontrained trate of the veficles of the lungs, and a certain quantity of air neceflary for keeping them of this fize. It is probable that this ftate of the lungs gives the freell mon faryt probable that this tate of the $c$ en the then then then tion to the blond. Were they more compreffed, the of an blood-veffels would be compreffed by the adjoining fize. veficles; were they more lax, the veffels would be more crooked and by this means obftructed. The, frequent infpirations gradually change this air by mixing frefh air with it, and at every exfpiration carrying off fome of it. In catarrls and inflammations, efpecially when attended with fuppuration, the fmall paflages into the remote veffels are obftructed, and thus the renewal of air in them will be prevented. The painful feeling which this occafions caufes us to expel the air with violence, fhutting the windpipe till we have exerted frongly with the abdominal muicles, and made aftrong compreflion on the lower part of the thorax. We then open the pallage fuddenly, and expel the air and obilmeting matter by violent coughing.

We have faid, that birds exhibit a curious variety in the procefs of breathing. The mufcles of their wings being fo very grat, required a very extentive infertion, and this is one ufe of the great brealt bone. Another ufe of it is, to form a firm part tion to hinder the adion of thefe mufcles from comprefling the thorax in the act of flying: therefore the form of their cheft does not admit of alternate enlargement and contraction to that degree as in land animals. Moreover, the mufcles of their abdomen are allo very fmall; and it would feem that they are not fufficient for projucing the comprelfion on the bowels which is necellary for carrying on the procefs of concostion and dizellion. Intead of aiding the lungs, they receive help, from them.

In an oftrich, the lungs confift of a flefhy part $A, A$ (fig. 6 r.), compoled of velicles like thofe of land ani- CCC mals, and, like theirs, ferving to expofe the blood to the adion of the air. Befides thefe, they have on each fide four large bags $\mathrm{B}, \mathrm{C}, \mathrm{D}, \mathrm{E}$, each of which has an orifice $G$ communicating with the trachea; but the fecond, C, has alfo an orifice H , by which it communicates with another bag $F$ fitnated below the reft in the abdomen. Now when the lungs are compreffed by the action of the diaphragn, the air in $C$ is partly expelled by the trachea through the orifice $G$, and partly driven through the orifice $H$ into the bag $F_{\text {, }}$
which
which is then allowed to receive it ; becaufe the fame atcion which eomprefles the lungs enlarges the abdomen. When the thorax is enmrged, the bag $C$ is partly fupplied with freth air thourgh the trachea, and partly from the bag $E$. As the lungs of other animals refemble a common bellows, the lungs of birds reemble the fnith's bellows with a partition; and anatomits have dicovered pafliges from this part of the lungs into their lollow bones and quills. We do not know all the ufes of this contrivance; and only can obferve, that this altornate action muft aflift the mufcles of the abdomen in promoting the mution of the fuod along the almentary canal, \&er. We can ditinetly obferve in birds that their belly dilates when the cheit coll ipfes, and rice verfi, contiary to what we foe in the land animals. Another ufe of this d uble p. fi.ge may be to produce a circulation of air in the lungs, by which a compenfation is made for the fmaller furface of action on the blood: for the number of fmall velicles, of equal capacity with thele large bags, gives a much more extenlive furface.

If we try to raife mercury in a pipe by the action of the chell alone, we cannot rai.c it above two or thrce inches; and the attempt is both paintul and hazardous. It is painful chiefly in the brealt, and it provokes coughing. Probably the fluids ooze through the pores of the veficles by the preflure of the furrounding parts.

On the other hand, we can by exfpiration fupport mercury about five or fix inches high: but this alfo is very painful, and apt to produce extravafation of bloo'. 'This feems to be done entirely by the abdominal mufcles.

The operation properly termed sucking is totally diferent from breathing, and refembles exceedingly the action of a common pump. Suppofe a pipe held in the mouth, and its lower end immerfed in water. We fill the month with the tongue, bringing it forward, and applying it clofely to the teeth and to the palate; we then draw it back, or bend it downwards (behind) from the palate, thus leaving a void. The preflure of the air on the cheeks immediately depreffes them, and applies them elofe to the gums and teeth; and its preffure on the water in the veflei caufes it to rife through the pipe into the empty part of the mouth, which it quickly fills. We then puih forward the tip of the tongue, below the water, to the teeth, and apply it to them all round, the water being above the tongue, which is kept much depreffed. We then apply the tongue to the palate, beginning at the tip, and gradually going backwards in this application. By this means the water is gradually forced backward by an operation fimilar to that of the gullet in fwallowing. This is done by contracting the gullet above and relaxing it below, juft as we would empty a gut of its contents by drawing our clofed hand along it. By this operation the mouth is again completely occupied by the tonrruc, and we are leady for repeating the operation. Thus the mout h and tongue refemble the barrel and pitton of a pump; and the application of the tip of the tungue to the teeth performs the office of the valve at the bottom of the barrel, preventing the return of the water into the pipe. Although ulual, it is not abfolutely neceffary, to withdraw the tip of the tongue, making a void before the tongue. Sucking may be performed by merely feparating the tongue gradually from the
palate, beginning at the root. If we vithdraw the tip of the tongue a very minute quantity, the water gets i: and Hows back above the tongue.

The action of the congus in this operation is ray powerful; fome perfons can raiue mercury 25 inclies: Lut tais flong exertion is very fatiguing, and the foft parts are prodigioully livelled by it. It caules the blacd to ooze plentitully through the pores of the tongue, fauces, and palate, in the lame manner as if a cupring glafs and fyringe were applied to them; and, when the mfide of the invuth is exconiated or tender, as is frequent with intant;, even a very moderate exertion of th s kiad is accompanied with extravalition of blood. When children fuck the nuries breatt, the milk follows their exerci n br the preffure of the air on the brealt ; and a weak child, or che that withholds its exertions on account of pain from the above-mentioned caule, may be affifted by :t sentle preffure of the hand on the brealt: the infint pujil of nature, without any knowledge of pneumatics, irequently helps itfelf by prefling its face to the yielding bieatt.

In the whole of this operation the breathing is performed through the noltrils; and it is a prodigious diftrefs to an infant when this paffage is obftueted by mucus. We beg to be forgiven for obferviag by the way, that this obltruction may be almoft certainly removed for a little while, by rubbing the child's nofe with any liquid of quick evaporation, or even with water.

The operation in drinking is not very different from that in tucking: we have indeed little occafion here to fuck, but we mult do it a little. Dogs and fome other animals cannot drink, but only lap the water into la therr mouths with their tongue, and then fwallow it. The gallinaceous birds feem to drink very imperfeetly; they feem merely to dip their head into the water up to the eyes till their mouth is filled with water, and then holding up the head, it gets into the gullet by its weight. and is then iwallowed. The elephant drinks in a very complicated manner; he dipshis trunk into the water, and fills it by making a void in his mouth : this lie does in the contrary way to man. After having depreffed his tongue, he begins the application of it to the palate at the root, and by extending the application forward, he expels the air by the mouth which came into it from the trunk. The procefs here is not very unlike that of the condenling fyringe without a pifton valve, defcribed in $n^{\circ}{ }_{5} 8$, in which the external air (correfponding here to the air in the trunk) enters by the hole $F$ in the fide, and is ex. pelled through the hole in the end of the barrel; by this operation the thunk is filled with water: then he lifts his trunk out of the water, and bringing it to his mouth, pours the contents into it, and fwallows it. On confidering this operation, it appears that, by the fame procet's by which the air of the trunk is talien into the mouth, the water could alro be taken in, to be afterwards twallowed : but we do not find, upon inquiry, that this is done by the elephant; we have always obferved him to drink in the manner now deferibed. In either way it is a double operation, and cannot be carried on any war but by alten nately fucking and fwallowing, and while one operation is going on the cther is interrupted; whercas man can do both at the fame time. Nature feems to delight in exhibiting to rational obfervers her inexhanftible varicty of refource; for many infects, which drink with a trunk, drink without interruption; yet we
F. Tiects of Alr'sprif-

Effees of do not call in queftion the truth of the aphorifm, Natura Air's pres- naxame fimplex et femper fibi confona, nor doubt but that $\underbrace{\text { fure- }}$ if the zubole of her purpofe were ieen, we flould find that her procefs is the fimpleft poffible: for Nature, or Nature's God, is wife above our wifeft thoughts, and fimplicity is certainly the choice of wifdom : but alas! it is generally but a fmall and the moft obvious part of her purpofe that we can obfive or appreciate. We feldom fee this fimplicity of mature fated to us, except by fome fyftem-maker who has found a principle which fomehow tallies with at confiderable varicty of phenomena, and then cries out, Fruffra fit per plura quod fieri poteft per
sequing up which many find a great difficulty in acquiring, vi, a continucd keeping up a continued blaft with a blow-pipe. We Laft with a would defire our chemical reater to attend minutely to
ticularly to the way in which the tip of the tongue performs the office of a valve, preventing the retum of the water into the pipe: the fame pofition of the tongue would hinder air from coming into the mouth. Next let him obferve, that in fiwallowing what water he has now got lodged abore his tongue, he continues the tip of the tongue applied to the teeth; now let him thut his mouth, keeping his lips firm together, the tip of the tongue at the teeth, and the whole tongue forcibly kept at a diftance from the palate; bring up the tonguc to the palate, and allow the tip to fcparate a little from the teeth; this will expel the air into the fpace between the fauces and checks, and will blow up the cheeks a little: then, acting with the tip of the tongue as a valve, hinder this air from getting back, and deprelfing the tongue again, more air (from the nofrils) will get into the mouth, which may be expelled into the fpace without the teeth as before, and the cheeks will be more inflated : continue this operation, and the lips will no longer be able to retain it, and it will ooze through as long as the operation is continued. When this has become familiar and eafy, take the blow-pipe, and there will be no difficulty in maintaining a blaft as usiform as a fmith's bellows, breathing all the while through the noftrils. The only difficutly is the holding :he pipe : this fatigues the lips but it may be removed by giving the pipe a convenient fhape, a pretty flat oval, and wrapping it round with leather or thredd.

Another phenomenon depending on the principles already eftablifhed, is the land and fea-breeze in the

357
Nature of
the Jan!
and fua
breeze in
wasm

- ounlries warm countries.

We have feen that air expands excecdingly by heat; therefore heated air, being lighter than an equal bulk of cold air, muft rife in it. If we lay a hot fone in the funfhine in a room, we fhall obferve the fhadow of the flone furrounded with a fluttering fhadow of differcnt degrees of brightnefs, and that this flutter rifes rapidly in a column above the flone. If we holl an estinguifhed candle near the fone, we fhall fee the fmoke move towards the fone, and then afcend up from it. Now, fuppofe an inand receiving the firf rays of the fun in a pericelly calm morning ; the ground will foon be warmed, and will warm the contiguous air. If the ifland be mountainous, this effect will be more remarkable; beeare the inclined fides of the hills will reeeive the light grose direolly : the midland air will therefore be moft
warmed: the heated air will rife, and that in the Effeus, middle will rife fafteft ; and thus a current of air upwards Air's pro will begin, which mult be fupplied by air coming in from all fides, to be heated and to rife in its turn; and thus the morning fea-breeze is produced, and continues all day. This current will frequenty be reverfed during the night, by the air cooling and gliding down the fides of the hills, and we thall have the land-breeze.

It is owing to the fame caufe that we have a circula. Circulat ticn of air in mines which have the months of their of air in fhafts of unequal heights. The tenperature underground nimes. is pretty conitant through the whole year, while that of the atmofphere is extremely variable. Now, fuppofe a mine having a long horizontal drift, communicating between two pits or thafts, and that one of thefe thafts terminates in a valley, while the other opens on the brow of a hill perhaps 100 feet higher. Let us further fuppofe it fummer, and the air heated to $65^{\circ}$, while the temperature of the earth is but $45^{\circ}$; this laft will be alfo the temperature of the air in the flafts and the drift. Now, fince air expands nearly 24 parts in 10000 by one degree of heat, we fhall have an odds of preffure at the boltom of the two flafts equal to nearly the 2oth part of the weight of a column of air 100 feet high (roo feet being fuppofed the difference of the heights of the ilafts.). This will be about lix ounces on every iquare foot of the fertion of the thaft. If this preffure could be continued, it would produce a prodigious current of air down the long fhaft, along the drift, and up the fhort flaft. The weight of the air acting through 100 feet would communicate to it the velocity of so feet per fecond : divide this by $\sqrt{20}$, that is, by 4,5 , and we thall have 18 feet per feer nd for the velocity: this is the velocity of what is called a brik gale. This preflure quould be continued, if the warm air which eaters the long fhaft werc cooled and condenfed as falt as it comes in; but this is not the cafe. It is bovever coo'ed and condenfed, and a current is produced fufficient in make an abundant circulation of air along the whole paliage; and care is taken to difpofe the thatts and conduct the paffiges in fuch a mamer that no part of the mine is out of the circle. When ary new hiteral drift is made, the renewal of air at it extremity becomes more' imperfeet as it advances; and when it is carried a certain length, the air ftagnates and becomes fuffocating, till either a communication can be made with the reft of the mine, or a fhaft be made at the end of this dritt.

As this current depends entirely on the difference of temperature between the air below and that above, it mult ceafe when this difference ceafes. Accordingly, in the fipring and autunath, the miners complain much of dlagnation; but in fummer they never want a current from the deep pits to the fhallow, nor in the winter a current from the thallow pits to the deep oncs. It frequently happens alfo, that in mineral countrics the chemical changes which are going on in different parts of the earth make differences of temperature fuficient to produce a fenfible current.

It is eafy to fee that the fame caufes muft produce a current duwn our chimncys in fummer. The chimney is colder than the fumneer air, and muft therefore condenfe it, and it will come down and run out at the doors and windows.
And this naturdlly leads us to confider a very important effer of the expanfion and conferquent afent of air

## P N E U M A T I C S.

E:H of by heat, namely the drawing (as it is called) of chim. tspref. neys. 'The air which has contributed to the burring ure. of fucl muft be intenfely heated, and will rife in the atmofphere. This will alfo be the cale with much of the furrounding air which has come very near the fire, allhough not in contact with it. If this heated air be made to rife in at pipc, it will be kept together, and therefore will not foon cool and collapfe : thus we fhall obtain a long column of light air, which will rife with a force fo much the greater as the column is longer or more heated. Therefore the taller we make the chimney, or the hotter we make the firc, the more rapid will be the current, or the draught or fuction, as it is injudicioufly called, will be fo much the greater. The aicenfional force is the difference between the weight of the column of heated air in the funnel and a column of the furrounding atmofphere of equal leight. We increafe the draught, therefore, by increating the perpendicular height of the chimney. Its length in a horizontal direction gives no increafe, but, on the contrary, diminifhes the draught by cooling the air before it gets into the effective part of the funnel. We increafe the draught alfo by obliging all the air which enters the chimney to come very near the fuel; therefore a low mantle piece will produce this effect; alfo filling up all the fpaces on each fide of the grate. When much air gets in above the fire, by having a lofy mantlepiece, the general mafs of air in the chimney cannot be much heated, Hence it muft happen that the greatelt draught will be produced by bringing down the mantlepiece to the very fuel; but this converts a firc-place into a furnace, ard by thus fending the whole air through the fuel, caufes it to burn with great rapidity, producing a prodigious heat; and this producing an increafe of afcenfional force, the current becomes furionfly rapid, and the heat and confumption of fuel im. menfe. If the fire-place be a cube of a foot and a half and the front clofed by a door, fo that all the air mult enter through the bottom of the grate, a chimney of 15 or 20 feet high, and fufficiently wide to give palifage to all the expanded air which can pafs through the fire, will produce a current which will roar like thunder, and a heat fufficient to run the whole infide into a lump of glafs.
All that is neceffry, however, in a chamber fireplace is a current fufficiently great for carrying up the fmoke and vitiated air of the fnel. And as we want alfo the enlivening flutter and light of the fire, we give the chimney piece both a much greater height and width than what is merely neceffary for carrying up the faoke, only withing to have the current fufficiently determinate and theady for counteranting any occafional tendency which it may fometimes have to come into the room. By allowing a greater quantity of air to get into the chimney, heated only to a moderate degree, we produce a mure rapid renewal of the air of the room: did we oblige it to come fo much nearer the fire as to produce the fame renewal of the air in confequence of a more rapid current, we fould produce an inconvenient heat. But in this country, where pit-coal is in general fo very cheap, we carry this indulgence to an extreme; or rather we have not thudied how to get all the delired adran:ages with economy. A much finaller renewal of air than we common!y produce is abundantly wholefome and pleafint, and we may bave
all the pleafure of the light ard flame of the fuel at much lefs expence, by contracting greatly the pallage into the vent. 'The ben way of doing this is by contracting the brick-work on cach fide belind the mantlepiece, and reducing it to a parrow parallelogram, havirg the back of the vent for one of its long lides. Make an iron plate to fit this liole, of the fame lengeth, but breader, fo that it may lie floping, its lower edze being in contad with the firefide of the holc, and its upper edge leaning on the back of the vent. In this pofition it fhuts the hole entircly. Now le: the plate have a hinge along the front or lower edge, and fold up like the lid of a cheft. We flall thus be able to erlarge the parage at pleafure. In a fire place fit for a room of 24 feet by 18 , if this plate may be about 18 inches long from fide to fide, and folded back withon an inch or an inch and a half of the wall, this will allow paffage for as much air as will kecp up a very cheerful fire; and by raifing or lowering thi, Reg:ster, the fire may be made to burn mnee or lefs ralpidly. A free palliage of balf an incla will be fufficient in weather that is not immoderately cold. The frinciple on which this confrudtion produces its cfieet is, that the air which is in the front of the fre, and manch warmed by it, is not allowed to get into the chimncy, where it would be immediately hurried up the vent, but rifes up to the ceiling and is diffufed over the whole room. This double motion of the air may be difinctly obferved by opening a little of the donr and holding a candle in the way. It the candle be held mear the floor, the flame will be blown into the room; but if held near the top of the door, the flame will be blown outward.

But the moft perfect method of warming an apart. Deficryment in thefe temperate climates, where we can indulge tion of a in the cheerfulnefs and fiweet air produced by an • perz fre, is what we call a fove-grate, and our neighbours on the continent call a chapelle, from its retemblance to the chapels or oratories in the great churches.

In the great chimney-piece, which, in this cafe, may be made cven larger than ordinary, is fet a fraller one fited up in the fame file of ornament, but of a fize no greater than is fufficient for holding the fuel. The fides and back of it are made of iron (calt iron is. preferable to hammered iron, becaufe it docs not fo readily calcine), and arckept at a fmall diflance from the fides and back of the main chimney-place, and are continued down to the hearth, fo that the afh-pit is alfo feparated. The pipe or chimney of the Aove grate is carried up behind the omaments of the mantle.piece till it rifes above the mantle-piece of the main chim-rey-piece, and it is fitted with a regiter or damper-plate turning round a traniverle axis. The beft form of this regiftes is that which we have recommended for an ordinary fire-place, having its axis or joint clofe at the front; fo that when it is open or turned up, the burnt air and fmoke ftriking it obliquely, are direeted with certainty into the vent, without any life of reverberating and coming out into the room. All the relt of the vent is fhut up by iron plates or brick-work out of. fight.

The effer of this contruction is very obvious. The Effects ". fuel, being in immediate contact with the lack and its confides of the grate, heat them to a great degree, and liructian they heat the air centiguous to thim. This heated

Lifeds of air camot get up the vent, becaufe the paffages above Air'spref- thefe fpaces are thut up. It therefore comes out into furc. the room; fome of it goes into the real fire place and is carnied up the vent, and the reft rifes to the ceilng and is diffulued over the room.

It is furprifing to a perfon who does int c nfider it with fkill how powerfully this grate wams a room. Lefs than one-fourth of the fuel confumed in an ordinary fire-place is fufficient; and this with the fame checrtul blazing hearth and salutary renewal of air. It cven requires attention to keep the room cool enough. The heat communicated to thofe parts in contant with the fuel is needlefsly great ; and it will be a confiderable improvement to line this part with very thick plates of call irou, or with tiles made of fire-clay which will not crack with the heit. Thefe, being very bad conductors, will make the heat, ultimately communicated to the air, very moderate. If, with all thefe precantions, the heat fhould be found too great, it may be Lrought under penfert management by opening pafiages into the vent from the lateral paces. Thefe may be valves or trap doors moved by rads concealed behi..d the ornaments.

Thus we have a fire-place under the mof complete regulation, where we can always have a cheerful fire without being for a quarter of an hour incommoded by the heat; and we can as quickly raife our fire, when too low, by hanging on a plate of iron on the front, which fhall reach as low as the grate. This in five minutes will blow up the fire into a glow; and the plate may be fent out of the room, or fet behind the llovegrate ont of fight.

The propriety of inclofing the afh-pit is not fo obvious; but if this be not done, the light aftes, not finding a ready paffage up the chimney, will come out into the room along with the heated air.

We do not confider in this place the various extraneous circumflances which impel the current of air in cur chimneys and produce fmoky houfes: thefe will be treated sf, and the methods of removing or remedying them, under the article smoke. We confider at prefent only the theory of this motion in general, and the modifications of its operation arifing from
$3^{62}$ the various purpofes to which it may be applied.

Under this head we thall next give a general ac. count and defeription of the method of warming apantments by foves. A Stove in general is a fire-place thut up on all fides, having onlya paffage for admitting the air to fupport the fire, and a tube for carrying off the vitiated air and fmoke; and the air of the room is warmed by coming into contaft with the oulfide of the fove and flue. The general principlect conftruction, therefore, is very fimple. The air mult he made to come into as clofe contact as pr fable with the fire, or even to pafs through it, and this in fuch quantities as juft to confume a quantity of fuel fufficient fur producing the heat required; and the flove mult be fo con. ftructed, that both the burning fuel and the air which has been heated by it hall be applied to as extenfive a furface as pofible of furnace all in contad with the air of the rorm ; and the heated air wichin the fove mount not be all'rwed to get into the funnel whith is to camy it off till it is too much cooled to produce any ecnfiderable heat on the outlide of the Itove.

In the temperate climates no great ingenuity is ne-

## A T I C S.

ceffary for warming an ordinary apartment; and noves are made rather to pleafe the the eye as furniture than as economical fubflitutes for an open fire of equal calorific power. But the inhabitants of cold countries, and efpecially towards the north, where the cold of winter is intenfe and fuel very dear, have beftowed much attention on their conitiuction, and have combined ingenious economy with every elegance of form. Nothing can be handfomer than the foves of Fayencerie that are to be feen in French Flanders, or the Rufian foves at St Peterfburgh, fuifiked in flucco. Our readers will not therefore, be difpleafed with a defcription of them. In this place, however, we thall only conlider a fove in general as a fubject of pneumatical difcuffina, and we refer our readers to the article Stove for an account of them as articles of domeftic accommodation.

The general form, therefore, of a fove, and of which all others are only modifications adapted to circumAtances of utili:y or talte, is as follows:

MIKL (fig. 62.) is a quadrangular box of any fize in the directions MIqIK. The infide widtls from frunt to back is pretty conftant, never lels than ten inches, and rarely extending to 20 ; the included ipace is divided by a great many partitions. The luwelt chamber AB is the receptacle for the fuel, which lies on the bottom of the tove without any grate: this fire-place has a door AO turning on hinges, and in this door is a very fmall wicket P ': the r of of the fire-place extends to within a very few inches of the fa:ther end, leaving a narrow paffage B for the flume. The next partition $c \mathrm{C}$ is about eight inches higher, and reaches almoft to the other end, leaving a narrow paffage for the flame at C . The partitions are repeated above, at the diltance of eight inches, leaving paffiges at the ends, alternately difpofed as in the figure; the laft of them H communicates with the room vent. This -nmmunication may be regulated by a plate of iron, . in can be flid acrofs it by means of a rod or handle winai. comes through the fide. The more ufual way of thutting up this paffage is by a fort of pan or bowl of earthen ware, which is whelmed over it with its brim refting in fand enntained in a groove formed all round the hole. This damper is introduced by a door in the front, which is then thut. The whole is fet on low pillars, fo that its hottom may be a few inches from the floor of the room: it is ufially placed in a corner, and the apartments arc fo difpofed that their chimneys can be joined in ftacks as with us.

Some Atraw of wond-fhavings are firf burnt on the hearth at its farther end. This warms the air in the fove, and creates a determined current. The fuel is then laid on the hearth clofe by the door, and pretty much piled up. It is now kindled; and the current being already directed to the vent, there is no danger of any imoke coming out into the room. Effectually to prevent this, the door is fhut, and the wicket $P$ opened. The air fupplied by this, being directed to the middle or bottom of the fucl, quickly kindles it, and the operation gnes on.

The aim of this conftution is very obvious. The Aim hame and heated air arevetained as long as poffible effect risc within the body of the flove by means of the long paff this c frges; and the narrownefs of theie pallinges olliges the flame to come in contact with cyery particle of foot, fo as to confume it completely, and thus convert the whole combuftible

As of combuntible matter of the fucl into heat. For want of this a very conliderable portion of our fuel is walted by our open fires, even under the very beft management: the foot which flicks to our vents is very inflammatble, and a pound weight of it will give as much if not more heat than a pound of coal. And what ficks to our vents is very inconfiderable in comparion with what efcapes unconfumed at the chimney top. In fires of green wood, peat, and fome kinds of pit-coal, nearly $\frac{1}{5}$ of the fuel is loft in this way; but in thcfe foves there is hardly ever any mark of foot to be feen; and even this fmall quantity is produced only alter lighting the fires. The volatile inflammable matters are expelled from parts much heated indeed, but not fo hot as to burn; and fome of it charred or half-burnt cannot be any further confumed, bcing inveloped in flame and air already vitiated and unfic for combultion. But when the fove is well heated, and the current brifk, no part of the foot efcapes the action of the air.

The hot air retained in this mamer in the body of the tove is applied to its fides in a very extended liurface. To increare this ftill more, the ltove is made narrower from front to back in its upper part; a certain breadh is neceflary below, that there may be room fur fuel. If this breadth were preferved all the way up, much heat would be loft, becaure the heat communicated to the partitions of the Hove does no good. By diminilhing their breadth, the proportion of uleful furface is increafed. The whole body of the theve may be confidered as a long pipe folded up, and its effects would be the greateft poflible if it really were fo; that is, if each partition $c \mathrm{C}$, $d \mathrm{D}$, $\& \mathrm{c}$. were fplit into two, and a free paflage allowed between them for the air of the ronm. Something like this will be obferved afterwards in fome German ftoves.

It is with the fame view of making an extenfive application of a hot furface to the air, that the flove is not built in the wall, nor even in contact with it, nor with the floor: for by its detached fituation, the air in contact with the back, and with the botom (where it is hotteft), is warmed, and contributes at leaft one half of the whole effect; fir the great heat of the bottum makes its effect on the air of the room at lealt equal to that of the two ends. Sometimes a fove makes pats of the wall between two fmall rooms, and is found fufficient.

It mult be remarked, on the whole, that the effect of a fove depends much on keeping in the room the air already heated by it. This is fo remaikably the cale, that a fmall open fire in the fame room will be fo far from increafing its heat, that it will greatly diminith it: it will even draw the warm air from a fuit of adjoir ing ap.rtments. This is diftincly obferved in the houtes of the Englifh merchants in St Peterfuure: their habits of life in Britain make them uneafy without an open fire in their fitting rooms; and thi oblizes them to heat all their Itoves twice a day, and their houfes are cooler than thofe of the Rulians who heat them only once. In many German hufes, efpecially of the lower clafs, the fire-place of the fove does inot open into the room, but into the yard or a lobby, where all the fires are lighted and tenderl; by this means is avoided the expence of warm air which mula have been carred off by the ff ve: but it is evident, that this muft be very unpleafant, and cannot be wholefome. We mult breathe the fame quantity of itagnant ais loaded wih all the va-
pours and exhalations which muft be produced in every inhabited place. G. ins into one of thele houfes irm the open air, is like purting one's hend into a llew-pan or under a piecru?, and quiekly nanleates us who are accultomed to heith air and cieanlinets. In thefe conntries it is a matter almoft of neceffity, to fumigate the ronms with lrantincenfe and other gums burnt. The cenfer in ancient worlhip was in all probability an utenfil introluced by neceflity for fwectening or rendering tolerable the air of a crouded place: and it is a comitant practice in the Rullian houles for a fervant to go round the room after dinner, waving a cenfer with fome gums burning on bits of charcoal.

The account now given of foves for lieating rooms, and of the circumftances which mutt be attended to in their conftruction, will equally apply to hot walls in gardening, whecher within or without doors. The only new circumitance which this employment of a fue introduces, is the attention which mult be paid to the equability of the hear, and the gradation which mult be ohferved in different parts of the building. The heat in the flue gradually diminifhes as it recedes irom the fire-place, becaufe it is continually giving out heat to the flue. It muit therefore be fo conducted through the building by frequent returns, that in every part there may be a mixture of warmer a d cooler branches of the flue, and the final chimey fhould be clofe by the fire place. It would, however, be improper to run the flue from the end of the floor up to the ceiling, where the fecond horizontal pe would be placed, and then return it duwnward again and make the third horizontal flue adjoinng to the firt, \&c. This would make the middle of the wal 1 the coldelt. If it is the flue of a greenhoufe, this would be highly impioper, becaufe the upper part of the wall can be very little employed; and in this cafe it is better to allow the flue to proceed gradually up the wall in its different reurns, by which the lowef. part would be the wa melt, and the heated air will afcend among the pots and plants; but in a hot wall, where the trees are to receive heat by contact, Inme approximation to the above method may be as ufetul.
In the hypocaulta and fudaria of the Greeks and Romans, the flue was conducted chiefly under the floors.

Malt-kilns are a fipectes of flove which ment our attention. Many attempts have been made to improve them on the prini,iple of lue iteves; but they have been unfuccefsful, becaufe heat is not what is chiefly wanted in malting : it is a copions current of very dry air to carry off the moifture. We mut refer the examination of this fubject aifo to the article Store, and procced to confider the current of heated air in the chicf varieties of furnaces.

All that is to be attended to in the different kinds of of the curs melling furnaces is, that the current of air be fufficiently rent of air: rapid, and that it be applied in as extenlive a furface as it mentting poffible to the fubftance to be melted. The more rapid the current it is the hotter, becaufe it is confuming more fuel; and therefore its effect increafes in a higher proportion than its rapidity. It is dubly effectnal if twice as hot; and if it then be twice as rapid, there is twice the quantity of dubly hot air applied to the fubject ; it would therefore be four times more powerful. Thrs is procured by raifing the chimney of the furnace to a greater height. The clofe application of it to the fubject can hardly be laid down in gencral terms, be.

fure.
368 In reverbe. satory fur. maces. cale.
In reverneratory furnaces, fuch as refining furnaces for gold, filver, and copper, the fiame is made to play over the furface of the melted metal. This is produced entirely by the furm of the furnace, by making the arch of the furnace as low as the circumfances of the mani- pulation will allow (See IURnace, 1. 509). Experience has pointed out in gencral the chief circumflances of their conftuction, viz. that the fuel fould be at one end on a grate, through which the air enters to maintain the fire; and that the metal fhould be placed on a level flone between the fuel and the tall chimney which produces the current. But there is no Lind of furnace more vaiiable in its efcet, and almoft every place has a fmall peculiarity of conftrudion, on which its preeminence is refted. This has occationed sany whimleal varieties in their form. This uncertainty feems to depend mucio on a circumfance rather foreign to our prefent purpefe; butas we do not obferve it taken notice of by nineralogical writers, we beg leave to mention it here. It is not heat alone that is wanted in the refining of filver by lead, for intance. We mult make a continual application to its furface of air, which has not contributed to the combution of the fuel. Any quantity of the hottelt air, already faturated with the fuel, may play on the furface of the metal for ever, and keep it in the Atate of molt perfeet fuftm, but without refining it in the leaft. Now, in the ordinary conftruction of a furnace, this is much the cafe. If the whole air has come in by the grate, and paffed through the middle of the fuel, it can hardly be otherwife than nearly faturated with it ; and if air be allo admitted by the docr (which is fenerally done or fi mething equivalent), the pure air lies abore the ritiated air, and during the faflige along the horizontal part of the furnace, and along the furface of the metal, it fill keeps above it, at leaft there is nothing to promote their mixture. Thus the metal does not come into contact with air fit to act on the bafe metal and calcine it, and the operation of refining goes on flwwly. Trifing circumftances in the form of the arch or canal may tend to promote the jumbling of the airs together, and thus render the operation more expeditions; and as thefe are but ill underfood, or perlaps this circumfance not attended to, no wonder thist we fee thefe confidered as fo many nof. trums of great importance. It vere therefore worth while to try the effed of changes in the form of the roof directed to this very circumftance. Ferhaps fome little prominence down from the arch of the reverberatory would have this effeet, by fuddenly throwing the current into confufion. If the addition al length of paffarge do not cool the air too much, we fhould think that if there were interpofed between the fuel and the refining foor a paffige twitted like a cork-fcrew, makirg jult half a turn, it would be mof effectual : for we imagine, that the two airs, keping each to their reapective fides of the pallige, would by this mems be tumed upfide down, and that the pure fratum would now be in contact with the metal, and the vitiated air would be 36) abnve it.

And in the The glafshoufe furnace cxhibits the chicf variety in glafo houfe the management of the current of heated air. In this
it is nocelfary that the bole at which the workman dips his fipe into the pot thall be as hot as any part of the
furnace. This could never be the cafe, if the furnace Effets had a chimney fituated in a part above the dipping- Air's pi liole; for in this cale cold air would inmediately rulh in at the hole, play over the furface of the pot, and go up the chimney. To prevent this the hole itfelf is made the chimney; but as this would be too Mort, and would produce very little current and very little heat, the whole furnace is fet under a tall dome. Thus the heated air from the real furnace is confined in this dome, and contitutes a high columa of very light air, which will therefore rife with great force up the done, and efcape at the top. The dome is therefure the chmmey, and would produce a draught or current propostioned to its height. Sune are raifed above an hundred teet. When all the doors of this houfe are thut, and thus no fupply given except through the fire, the current and heat become prodigious. This, however, camot be donc, bectufe the worhmen are in this chimney, and muft have refpirable air. But notwithllanding this fupply by the houfe-doors, the drau fit of the real furnace is vaftly increafed by the dome, and a heat produced fufficient for the worl, and which could nothive been produced without the dome.

This has been applied with great ingenuity and effect Improveto a furnace for melting iron from the ure, and an ir $n$ finery, both without a blaft. The comm n blat iroa furnace is well known. It is a tall cone wher the apex undermont. The ore and fluxes are thrown into this cone mine incimately with the fuel till it is full, and from the blat of mott powerful bellows is direfted into the bottom of this cone through a hole in the fide. 'the air is thrown in with fuch force, that it makes its way
through the mafs of matter, kindles the fuel in its pafair is thrown in with fuch force, that it makes its way
through the mafs of matter, kindles the fuel in its paffare, and fluxes the materials, whech then drop down into a receptacle below the blaft-hole, and thus the paffage for the air is kept unobltrutted. It was thought im. polfibie to produce or maintain this current without bel-
lows; but Mr Cotterel, an ingenious iounder, tried poffibie to produce or maintain this current without bel-
lows; but Mr Cotterel, an ingenious ionder, tried the effect of a tall dome placed over the mouth of the furnace, and though it was not half the height of many glaishoule domes, it had the defired effect. Confiderglaishoufe domes, it had the defired cffect. Confider-
able dificulties, however, occuried; and he had not furmounted them all when he left the neighbourhood of Edinburgh, nor have we heard that he has yet brought the invention to perfection. It is extremely difficult to place the holes below, at which the air is to enter, nt
fuch a precife height as neither to be choked by the place the holes below, at which the air is to enter, at
fuch a precife lheight as neither to be choked by the melted matter, nor to leave ore and fones below them unmeited ; but the invention is very ingen:ous, and will be of immenfe fervice if it can be perfected; for in ma-
ny places iron ore is to be found whare water cannot be be of immenfe fervice if it can be perfected; for in ma-
ny places iron ore is to be found whare water cannot be had lor vorking a blaff furnace.

The laft application which we fhall make of the cur- 378 The lant application which we fhall make of the cur- Currents
rents produced by heating the air is to the frecing mines, air applie thips, prifons, \&c. from the damp and nosious vapours to free which irequently infeit them.

Achirequently infeit them.
As a dift or work is caried on in the mine, let a fins, pritrunk of dale boards, about 6 or 8 inches fquare, be laid of noxiou along the bottom of the drift, communicating with a air. trunk carried up in the corner of one of the flafts. Let the top of this latt trunk open into the ath-pit of a fmall furnace, having a tall climney. I.et fire be kindled in the furnacs; and when it is :oll heated, fhut the fire-place and a!h-pit doors. There being no other fupply for the curcent produced in the chimney of this furnace,
mines,

Efies of furnace, the air will flow into it from the tronk, and Air's pref. will bring along with it all the offenfive vapours. This fure.

## 374

 Airnecef- management of air in farnaces and common fires, we Sary for the have frecquently mentioned the immediate application of combuntion air to the buming fuel as neceflary for its combullion. of fuel. This is a general tact. In order that any inflammable body may be really infamed, and its combuttible matter confumed and afhes produced, it is not enough that the body be made hot. A piece of charcoal inclofed in a hox of iron may be kept red-hot for ever, without walt. ing its fubitance in the fmalletl degree. It is farther neceflary that it be in contact with a particular fpecies of air, which conltitutes about ${ }^{3}$ the of the air of the attmofphere, viz. the vital air of Lavoifier. It was called empyreal air by Schecle, who firlt oblerved its indifpenfable ufe in ma:ntaining fire: and it appears, that, in contributing to the combuition of an inflammable body, this air combines with forse of its ingredients, and becomes fixed air, fuffering the fame change as by the breathing of animals. Combuftion may therefore be confidered as a folution of the inflammable body in air. This doctrine w.is firlt promulgated by the celebrated Dr Hooke in his Micrographia, publithed in 166c, and afterwards improved in his treatife on Lamps. It is now completely eftablifhed, and conlidered as a new difcovery. It is for this reafon that in fire-places of all kinds we have directed the conftruction, fo as to produce a clofe application of the air to the fuel. It is quite needlefs at this day to enter into the difcuffions which formeriy occupied philofophers about the manner in which the preffure and elinficity of the air promoted combultion. Many experiments were made in the laft century by the firft members of the Royal Society, to difcover the office of air in combultion. It was thought that the flame was extinguifhed in rare air for want of :t preffure to keep it together; but this did not explain its extinction when the air was not renewed. Thefe experiments are fill retained in courfes of experimental philofophy, as they are injudicioully ftyled; but they give little or no information, nor tend to the illultration of any pneumatical doctrine; they are therefore omitted in this place. In fhort, it is now fully eftablifhed, that it is not a mechanical but a clemical phenomenon. We can only inform the chemill, thite is candle will confume fatter in the low countries than in the elcvated regions of Quito and Gondar, becaute the air is ncarly one half denfer below, and will aft pro. portionally fafter in decompoling the candlc.Curious ef- We fhall conclude this part of our fubject with the fiels of the explanation of a curicus phenomenon oblerved in many far's pref- places. Certain fprinss or fountains are obferved to

Let ABCD (fig. 63.) reprefent a carcen, into which Pnucnatic water is brought by the fubterrateous patrage $O^{\prime}{ }^{\prime \prime}$. I. .et Engines. it have an octlet MN1, of a crooked form, with its Mate highe! part N confiderably raifed above the botom of ceece. the cavern, and thence floping downward, into lower ground, and terminating in an open well at P. Let the dimenfons of this canal be fuch that it will dilcharge much more water than is fupplied by TO. All this is very natural, and may be very common. The elfect of this arrangement will be a remitting furing at $P$ : for when the cavern is filled higher than the point $N$, the canal MNP will act as a fyphon; and, by the condision; allimed, it will difcharge the water fafter than 'TO fupplies it; it will therefore run it dry, and then the foring at ${ }^{\prime}$ ' will ce:ufe to furnith water. After fome time the cavern will again be filled up to the height $N$, and the flow at $P$ will recommence.

If, befldes this fupply, the well P alfs receite water from a conftant fource, we fhall have a reciprecating fpring.

The fituation and dimenfions of this fyphon canal, and the fupply of the fecder, may be fuch, that the efllux at P will be conftant. If the fupply increafe in a cortain degres, a reciprocation will be prodaced at I? with very flort intervals; if the fupply diminthes confiderably, we flall have another kind ot reciprocation with great intervals and great differences of water.

If the cavern has another fimple outlet $R$, newr varieties will be prosluced in the fpring $P$, and $R$ will afford a curious fpring. Let the mouth of $R$, by which the water enters it from the cavern, be lower than $N$, and let the fupply of the feeding fpring be no greater than $R$ can dilcharge, we fhall have a conltant ipring from $R$, and $P$ will give no water. But fuppore that the main feeder increafes in winter or in rainy feafons, but not fo much as will fupply both $P$ and $R$, the cavern will fill till the water gets over $N$, and $R$ will be running all the white; but foon after $P$ has begun to flow, and the water in the cavern finks below $\mathrm{R}_{\text {, }}$ the Itream from $R$ will Itop. The cavern will be emptied by the fyphon canal MNP, and then P will ftop. The cavern will then begin to fill, and when near full $R$ will give a little water, and foon after $P$ will run and R Aop as before, \&c.

Defaguliers iliows, Vol. II. p. 177, \&c. in what manner a prodigious varicty of periodical ebbs and flows may be produced by underground canals, whichare extremely fimple and probable.

We fhall conclude this article with the detcriptions 374 of fome pneumatical machines or engines whiclathe not fonse pncus been particularly noticed under their names in tle for- matic enmer volumes of this work.

Bellows are of molt extenfive and important ure ; and it will be of fervice to defribe fuch as are of uncommon conRruction and great power, fit for the great operations in metallurgy.

It is not the impulfive force of the blaft that is wanted in moft cates, but merely the copions fupply of air, to produce the rapid combultion of inflammable matter; and the fervice would be better performell in general if this could be done with moderate veiocities, and an extended furface. What are called dir-fumaices, where a confiderable furface of inflammable mater is afted onat once by the current which the mete heat of X the

Pncumatic the expended air has produced, are found more operaEngincs. tive in rroportion to the air expended than blatt fur-
races aninated by bellows ; and we doubt not but that the method propofed hy Mr Cotterel (which we have already mentioned) of increafing this current in a melting furnace by means of a dome, will in time fuperfede the blaft furnaces. There is indeed a great impulfive furce required in fome cafes; as for blowing off the fcorix from the furface of filver or copper in refining furnaces, or for keeping a clear paffage for the air in the great iron furnace.

In general, lowever, we cannot procure this abundamt fupply of ar any other way than by giving it a great velocity by means of a great preffure, fo that the feneral conftruction of bellows is pretty much the fame in all kinds. The air is admitted into a very large cavity, and then expelle fr $m$ it through a fmall hole.

The furnaces at the mines having been greatly enlarged ; it was nectifary to enlange the bellows alfo: and the leathern beilows becoming exceedingly expenfive, wooden enes were fublituted in Gernany about the beginning of laft century, and from them became general through Europe. They confift of a wooden box fides flat or lraight, and the end BAEe formed into an arched or cylindrical furface, of which the line FP at the other end is the axis. This box is open below, and receives within it the flallow Lox KHGNML (fig. B), whicls exally falls it. The line FP of the one coincides with FP of the other, and along this line is a fet of hinges on which the upper box turns a, it rifes and finks. The lower box is made faft to a frame fixed in the ground. A pipe $O Q$ proceeds from the end of it, and terminates at the furnace, where it ends in a fmall pipe called the fezur in tuyere. This lower box is open above, and has in its bottom two large valves $\mathrm{V}, \mathrm{V}$, opening inwards. The conducting pipe is fometimes furnilhed wilh a valve opening outwards, to prevent burning coals from being lucked into the bollows when the upper bos is drawn up. The joint along PF is made tight by thin leather nailed alcng it. The fides and ends of the lixed box are made to fit the fides and rurved end of the upper box, fo that this laft can be railed and $1 /$ wered sound the juint $F P$ without fenfible fiiftion, and yet without fuffering much air to effape: but as this would not be fufficiently air-tight by reafon of the fluinhing and warping of the wood, a farther matrirance is adopted. A flender lath of wood, divided ine feveral joints, and covered on the outer edge with very foft leather, is laid along the upper edges of the fides and ends of the lewer bex. This lath is fo broad, that when its inner edge is even with the intide of the box, its outcr edge piojects about aul inch. It is kept in this potition by a number of fleel wires, which are driven into the botom of the box, and fand up tonching the fides, as repref nted in figure $D$, where $a b=$ are the wire, and $c$ the lath, projesting over the outhe of the has. By this contrivance the laths are preffied cle fe to the fides and curved end of the moveable bon, and the frring wires yelld to all their inequalities. A bur of rood RS is fixed to the upper bard, by Which it is ci:her raifed by machinery, to fink again by i.s own weight, having an additional load laid on it, or it is forced downward by a erank or wiper of the machiizery, and afterwards raircd.

The operation here is precifeiy fimilar to that of Preumatik blowing with a chamber-bellows. When the board is Engines, lifted up, the air enters by the valves $\mathrm{V}, \mathrm{V}$, and is expelled at the pipe OQ by depreffing the boards. There is therefore no occation to infift on this point.

Thefe bellows are made of a very great lize, AD being 16 feet, AB five feet, and the circular end AE afo five feet. The rife, however, is but about 3 or 35 feet. They expel at each Aroke alnut go cubic feet of air, and they make about 8 Atrokes Fer minute.

Such are the bellows in gencral ufe on the continent. They have adopted a different form in Britain, which feems much preferable. They ufe an iron or wooden cylinder, with a pifton fliding along it. This may be made with much greater accuracy than the wooden boxes, at lefs expence, if of wood, becaufe it may be of coopers work, held together by hoops; but the great advantage of this form is its being more eafily made airtight. The pifon is furrounded with a broad Itrap of thick and foft leather, and it has around its edge a deep groove, in which is lodged a quantity of wool. This is called the packing or fuffing, and keeps the leather very clofely applied to the inner furface of the cylinder. Iron cylinders may be very neatly bored and fmoothed, fo that the pifon, even when very tight, will flide along it very fmoothly. To promote this, a quantity of black lead is ground very fine with water, and a little of this is fneared on the infide of the cylinder from time to time.

The cylinder has a large valve, or fometimes two, in the bottom, by which the atmofpheric air enters when the piton is drawn up. When the piton is thunt down, this air is expelled along a pipe of great diameter, which terminates in the furnace with a mall orifice.

This is the fimpleft form of bellows "hich can be conceived. It differs in nothing but fize from the bellows ufed by the rudeft nations. The Chinefe fmiths have a bellows very fimilar, being a fquare pipe of wood ABCDE (fig. 75.), with a fquare board $G$ which exadty fits it, movel by the handle TG. At the farther end is the blaf pipe HK, and on each file of it a valve in the end of the fquare pipe, opening invards. The pifton is fufficiently tight for their purpofes withont any leatherin:

The piton of this cylinder bellows is moved by machinery. In fome blaft engines the piflon is limply raifed by the machine, and then let $\mathrm{g} \cap$, and it defeends by its own weight, and compreffes the air below it to fuch a degree, that the veloci:y of eflux becomes conItant, and the pifton defcends uniformly: for this purpofe it muat be loaded with a proper weight. 'I'his produces a very unform blaft, except at the very beginning, white the pifton falls futdenly and comprefies the air: but in meft engines the pifton rod is forced down the cylinder with a determined motion, by means of a beam, crank, or orher contrivance. This gives a more unequal blat, becaufe the motion of the pifon is neceffarily flow in the beginning and end of the froke, and quicker in the middle.

But in all it is plain that the blat muft be defintory. It ceafes while the pifton is rifing; for this reafon it is wiala to have two cylinders, as it was formerly uftal to have two bellows which worked alternately. Sometimes three or four are ufed, as at the Carron iron works. This makes a blat abundantly uniferm.

Imsunatic Tut an uniform blaft may be made with a fingle cy Engines linder, by making it deliver its air into :nother cylinder, which has a pilton exactly fitted to its bore, and loaded with a fufficient weight. The blowing eylinder
Prate ABCD (fig. 7 (6.) has its pilton 1 'worked by at rod cuccev. NP, conneded by domble chains with the arched head of the working beam NO, moving round a gadgeon at R. The other end $O$ of this beam is connected by the rod $O P$, with the crank $P Q$ of a whel machine; or it may be conneated witl the piftom of a ftean engine, \&ec. S.c. The blowing ey linder has a valve or valves $E$ in its bottom, opening inwards. There procceds from it a large pipe CF, which cuters the regulating ey linder GHKL, and has a valve at top to prevent the air from getting back into the blowin $\begin{gathered}\text { cy } \\ \text { cy linder. It is evi- }\end{gathered}$ dent that the dir forced into this cylinder muft raife its fitton L, and that it muft afterwards defeend, while the cher pition is rifing. It muft defcend uniformly, and make a perfectly cquable blant.

Obferve, that if the pifton I, be at the bottom when the machine begins to work, it will be at the bottom at the end of every ftroke, if the tuyere T emits as much air as the cylinder ABCD furnithes; nay, it will lie a while at the bottom, for, while it was riiling, air was illining through $T$. This would make an interrupted blaft. T'o prevent this, the orifice T' muft be lefliened; but then there will be a furplus of air at the end of each troke, and the pifton L will rife continually, and at laft get to the top, and allow air to efeape. It is juft pofible to adjuf circumftances, fo that neither fhall happen. This is done eafier by puting a fop in the way of the pifton, and putting a valve on the pifton, or on the conduating pipe KST, loaded with a weight a little fuperior to the intended elafticity of the air in the cylinder. Therefore, when the pifton is prevented by the flop from riling, the finifting valve, as it is called, is forced open, the fupertluous air efcapes, and the blaft preferves its uniformity.

It may be of ufe to give the dimenfions of a machine of this kind, which has worked for fome years at a very great furnace, and given fatisfaction.

The diameter of the blowing cylinder is 5 feet, and the length of the froke is 6 . Its pifun is loaded with $3^{\frac{1}{2}}$ tons. It is worked by a fleam-engine whofe cylinder is 3 fect 4 inches wide, with a fix feet Aroke. The regulating cylinder is 8 feet wide, and its pifon is loaded with 8 s tons, making about 2,63 pounds on the fquare inch; and it is very nearly in equilibrio with the load on the pifton of the blowing cylinder. The conducting pipe KS' ${ }^{\prime}$ is 12 inches in diameter, and the orifice of the tuyere was $1 \frac{5}{f}$ inches when the engine was crested, but it has gradually enlarged by reafin of the intenfe heat to which it is expofed. The fnifting valve is loaded with 3 pounds on the fquare inch.

When the engine worked brifkly, it made is ftrokes per minute, and there was ahways much air difcharged by the fuifting valve. When the engine made 15 frokes per minute, the fnifting valve opened but feldom, fo that things were nearly adjufted to this fupply. Each ftroke of the blowing cylinders fent in 118 cubic feet of common air. The ordinary preffure of the air being fuppofed $1+\frac{3}{3}$ pounds on an inch, the denfity of the air in the regulating cylinder murt be $\frac{14,76+2.63}{1,75},=1,178_{3}$, the natural denfity being 1 .

This machine gives an opportunity of compazing the leseratis expence of air with the theory. It munt (at the rate Eng, mes. of 15 tinokes) expel 30 cubice Cect of air in a feemd through a hole of inches in diameter. Thris gives a velocity of rear 2000 fcet per feenn, and of mene thin $\mathbf{1}$ Goo feet for the condenfed air. This is valtiy greater than the theory can give, or is indeed ponithe: for air dees not rulh into a void with fograt velecity. It fhows with gercit eridence, that a vall quanties if air mult efcape round the two pithons. Their urited circumferences amount to abont 40 feet, and they mue in a dry cylinder. It is impofible to prevent a very great lnfs. Accordingly, a candle beld near thic cugc of the pitton L has its thame very much diaturbed. This cafe, therefore, gives mo hl:! for a caluulation; and it fuggefts the lwopricty of attempting to dim'rifh this gre.t wathe.

Thi, has been very ingenioufy done (in part at leaft) at fome other furnaces. At Omoah foundery, neat Glafyow, the blowing cylinder (alio worked by a feam enginc) delivers its air intn a cheft without a bottom, which is immerfed in a lurge ciften of water, and fupported at a fmall hicight from the bottom of the cillern, and has a pipe from its top leading to the tuycre. The water ftands about five feet above the lower brim of the regulating air-cheft, and by its preflure gives the mon perfect uniformity of blaft, withont allowing a particle of air to get ofi by any other pafiage belides the tuyere. This is a very effectual regulator, and mult produce a great faving of power, becaufe a fmaller blowing cylinder will thus fupply the blaft. We have not learned the dimenfions and performance of this engine. We muft obferve, that the lofs round the pilton of the biowing cylinder remains undiminifhed.
A blowing machine was erected many years ago at Chaftillon in France on a principle conliderably differ. ent, and which muft be perfecly air-tight thrninghout. Two cylinders A, B (fig. 77.), loaded with great weights, were fufpended at the ends of the lever CD CCCuVI moving round the gudgcon E . From the top F , C of each there was a large flexible pipe which united in H, from whence a pipe KT led to the tuycte T. There were valves at $F$ and $G$ opening outwards, or into the flexible pipes ; and other valves L, M, adjoin. ing to them in the top of each cylinder, opening inwards, but kept flut by a flight fpring. Motion was given to the lever by a machine. The operation of this blowing machine is evident. When the cylinder A was pulled down, or allowed to defcend, the water, entering at its bottom, comprefled the air, and forced it along the paflage FHKT. In the mean time, the cylinder 13 was rifing, and the air entered by the vaive M. We fee that the blaft will be very unequal, increafing as the cylinder is immorfed deeper. It is needlefs to defcribe this machine more particularly, becaute we flall give an account of one which we think perfect in its kind, and which leaves hardly any thing to be defired in a machine of this fort. It was invented by Mr John Laurie, land-furveyor in Edinhurgh, about 15 years ago, and inproved in fome refpeas fince his death by an ingenions perfor of that city.

ABCD (fig. 78 .) is an iron cylinder, truly boted within, and cvafated a top like a cup. FIGH is another, truly turned both without and withis, and a fmall matter lefs than the inner diameter of the firlt cylinder.

Pneumatic This cylinder is clofe above, and hangs from the end Lingines, of a lever moved ly a machine. It is alfo loaded with weights at N. KILM is a third cylinder, whofe
outfide diameter is fomewhat lefs than the infide diameter of the fecond. This inncr cylinder is tixed to the fame bottom with the outer cylinder. The midalle cylinder is loofe, and can move up and down between the outcr and inner cylinders without rubbing on either of them. The inner cylinder is perforated from top to botiom by three pipes OQ, SV, PR. The pipes $O Q, P R$ have valves at their upper ends $O, P$, and communicate with the external air below. The pipe sV has a horizontal part VW, which again turns upwards, and has a valve at top X. This upright part WX is in the midulle of a ciffern of water $f b \mathrm{~kg}$. Into this ciftern is fixed an air-cheft $a \mathrm{YZ} b$, open below, and having at top a pipe $c$ de etermiuating in the tuyere at the furnace.

When the machine is at reft, the valves $\mathrm{X}, \mathrm{O}, \mathrm{P}$, are fhut by their own weights, and the air-chef is full of water. When things are in this fate, the middle cylinder EFGH is drawn up by the machinery till its lower brims $F$ and $G$ are equal wich the top RM of the inner cylinder. Now pour in water or oil between the outer and middle cylinders: it will run down and fill the fpace between the outer and inner cylinders. Let it come to the top of the inner cylinder.

Now let the loaded middle cylinder defcend. It camnot do this withcut comprefling the air which is between its top and the top of the inner rylinder. This air being compreffed will caufe the water to defcend between the inner and middle cylinders, and rife between the middle and outer cylinders, fpreading into the cup; and as the middle cylinder advances downwards, the water will defeend firther within it and rife farther without it. When it has got fo far down, and the air has been fo much compreffed, that the difference between the furface of the water on the infide and outfide of this cylinder is greater than the depth of water between $K$ and the furface of the water $f$ of, air will go out by the pipe SVW, and will lodge in the air chett, and will remain there if $c$ be fhut, which we fhall fuppofe for the prefent. Pufling down the middle cylinder till the partition tonch the top of the inner cylinjer, all the air which was formerly between them will be forced into the air-cheft, and will drive out water from it. Draw up the middle cylinder, and the extemal air will open the valves $\cap, \mathrm{P}$, and again fill the fpace between the middle and inner cylinders; for the valve X will fhut, and prevent the regrefs of the condenied air. By pufhing down the middle cylinder a fecond time, more air will he forced into the air-cheft, and it will at lan efcape hy getting out between its brims Y , $Z$ and the bottom of the ciftern; or if we open the paffage $c$, it will pars along the conduit $c d e$ to the tuyere, and form a b'at.
The operation of this machine is fimilar to Mr Haf!ins's quickfilver pump defcribed by Defaguliers at tise en l of the fecond volume of his Experimental Philofophy. The force which condenfes the air is the load in the midule cyiinder. The ufe of the water between the inner and outer cylinders is to prevent this air from etcaping; and the inner cylinder thus performs the office of a pifon, having no friction. It is necelfary that the length of the outer and middle cylinders be gicater

## A T I C S.

thas the depth of the regulator-ciftern, that there Preumatic may be a fufficient height for the water to rife between Engives: the midulle and outer cylinders, to balance the comprefied air, and oblige it to go into the air-cheft. A large blat-furnace will require the regulator-cittern five feet deep, and the cylinders about lix or feven feet long.

It is in fact a pump without friction, and is perfealy air-tight. The quichnefs of its operation depends on the fmall fpace between the middle cylinder and the twe others; and this is the only ufe of thefe two. Without thefe it would be fimilar to the engine at Chaft llon, and operate more unequally and flowly. Its only imperfection is, that if the cylinder begin its motion of afcent or defeent rapidly, as it will do when worked by a feam-engine, there will be fome danger of water dafling over the top of the inner cylinder and getting imto the pipe SV; but fhould this happen, an iffue can ealily be contrived for it at $V$, covered with a linaded valve $v$. This will never happen if the cylinder is moved by a crank.

One blowing cylinder only is reprefented herc, hut two may be ufed.

We do not hefitate in recommending this form of bellows as the moft perfect of any, and fit for all uites where flanding bell, ws are required. They will be cheaper than any other fort for common purpofes. For a conmon fmith's forge they may be made with fquare wooden boxes inftead (.f cylinders. They are alfo eafily repaired. They are perfeolly tight; and lhey may be made with a blaft almof perfectly uuifurm, by making the ciltern in which the air-cheft flands of cunfiderable dimentions. When this is the cafe, the height of water, which regulates the blaft, will vary very little.

This may fuffice for an account of blat machines. The leading farts of their conftruction have been defrribed as far only as was necefliary for underfanding their operation, and enablirg an engineer to ereat them in the moft commodious manuer. Views of complete machines mi hat have amufed, but they would nut have added to our reajer's information,

But the account is impe: feat unlefs we fhow how their parts may be fuproportioned that they thall perform what is exfected from them. The engineer thould know what fize of bellows, and what load on the board or pifton, and what fize of tuyere, will give the blant which the fervice requires, and what force muit be employed to give then the neceffary degree of motionWe thall accomplifh thefe purpofes by confidering the efflux of the comprefied air through the tuyere. The propofitions fumenly delivered will enable us to afcertain this.

That we may proportion every thing to the power employed, we maft recollea, that it the pifton of a cylinder empleyed for expclling air be preffed down with any force $p$, it mult beconfidered as fuperadded to the atmofpheric prellire $P$ on the fame $p$.fton, in order that we may compare the velocity vo of eflux with the known velocity V with which air rufles into a void. By what has been formerly delivered, it appears that this velocity $v=\mathrm{V} \times \sqrt{\frac{p}{\mathrm{P} \times p}}$, where P is the prefure of the atmo. fphere on the piton, and $p$ the additional load laid on it. This velocity is expreffed in feet per fecond ; and, when multiolie,

## N E U M A T I C S.

Pucumatic multipied by the area of the orifice (alfo expreffed in $\underbrace{\text { Engines. fquare feet), it will give us the cubical feet of conden- }}$ fed air expelled in a fecond : but the bellows are alway's to be filled again with common air, and therefore we want to know the quantity of common air which will be expelled; for it is this which determines the number of Atrokes which mult be made in a minute, in order that the proper fupply may be obtained. Therefore iecoller thit the quantity expelled from a given orifice with a given velocity, is in the proportion of the denfity; and that when D is the denfity of common air produced by the preffure P , the denfity $d$ produced by the preffure $\mathrm{P}+p$, is $\mathrm{D} \times \frac{\mathrm{P}+\hat{P}}{\mathrm{P}}$; or it D be made I , we have $d=\frac{\mathrm{P}+\mathrm{p}}{\mathrm{P}}$.

Therefore, calling the area of the orifice expreffed in fquare feet $O$, and the quantity of common air, or the cubic feet expelled in a fecond $Q$, we have $Q=V \times O \times$ $\sqrt{\frac{p}{P+p}} \times \frac{P+p}{P}$

It will be fufficiently exact for all practical purpofes to fuppore P to be 15 pounds on cery fquare inch of the pifton; and $p$ is then conveniently exprefled by the pounds of additional load on every fquare inch : we may alfo take $\mathrm{V}=1332$ feet.

As the orifice through which the air is expelled is generally very fmall, never exceeding three inches in diameter, it will be more convenient tio exprefs it in fquare inches; which being the $\frac{1}{4} \frac{1}{4}$ of a fquare foot, we thall have the cubic feet of common air expelled in a fecond. or $\mathrm{Q}={ }^{1332} \mathrm{O} 44^{\frac{p}{\mathrm{P}+1}}\left|\times \frac{\mathrm{P}+p}{\mathrm{P}}=0 \times 9,25 \times \sqrt{\frac{p}{\mathrm{P}+1}}\right|$ $\times \frac{P+p}{P}$; and this fuems to be as fimple an expreffion as we can obt in.

This will perhaps be illuftrated by taking an example in numbers. Let the area of the piton b: fonr fquare feet, and the area of the round hole through which the air is expelled be two inches, its diameter being 1,6 , and let the load on the pitton be 1728 pounds: this is three pounds on every fquare inch. We have $\mathrm{P}=15$, $p=3, \mathrm{P}+p=1 \mathrm{~S}$, and $\mathrm{O}=2$; therefore we will have $R=2 \times 9,\left.25 \times \sqrt{\frac{3}{18}} \right\rvert\, \times \frac{18}{15},=9,053$ cubic feet of com. mon air expelled in a fecoud. This will however be diminithed at lealt one third by the contraction of the jet; and therefore the fupply will not exceed fix cubic feet pir fecond. Suppofing therefore that this blowing machine is a cylinder or prim of this dimenfion in its fection, the pitton fo loaded would (after laving comfreiled the air) defend about 15 inches in a lecond: It would firt fink $:$ of the whole length of the cylinder gretty fuddenly, till it had reduced the air to the denlity $\therefore \frac{1}{5}$, and would then defcend uniformly at the above rate, expelling fix cubic feet of comonair in a fecond.

The computation is made much in the fame way for bellows of the common form, wih this additional circumilance, that as the loaded board moves round a hinge at one end, the preflure of the load mult be calcu. lated accordiagly. The computation, however, becomes a little intricate, when the form of the loaded buard is not retangular; it is almoft utelefs when the bellows
have flexibic fides, either like fmith's bellows or like Preunatic organ bellows, becuufe the change of figure during their Engincs. motion makes centinual variation on the comprefing powers. It is thenefore chicfly with refpect to the great wooden bellows, of which the upper board flides down between the fides, that the above calculation is of fervice.
The propriety however of this piece of information is cvident: we do not how precifely the quantity of air necellary for animating a furnace; but this calculution telis us what force muft be employed for expelling the air that may be thought necelfary. If we have fixedon the firength of the olaft, and the diameter of the cylinder, we learn the weight with which the pifton inult be loaded; the length of the cylinder determines its capacity, the above calculation tells the expence per fecond; hence we have the tinie of the pifton's coming to the bot:om. This gives us the number of Itrokes fer minute : the load mult be lifted up by the machine this number of times, making the time of afeent precifely equal to that of defcent; otherwife the machine will cither catch and flop the defcent of the piltun or allow it to lic inactive for a while of each ftrok. Thefe circumftances determine the labour to be performed by the machine, and it mult be conftructed accordingly. Thus the engineer will not be affronted by its failure, nor will he expend needlefs power and colt.

In machines which force the pifton or bellows-board with a certain determined motion, different from what arifes from their own weight, the computation is estrenely intricate. When a piliton moves by a crank, its motion at the beginning and end of each ftroke is flow, and the comprefion and efflux is continually changing: we can however approximate to a flatement of the force required.

Every time the pifton is drawn up, a certain face of the cylinder is filled again with air of the common denfity; and this is expelled daring the defeent of the pifton. A certa n number of cubic feet of common air is therefore expelled with a velocity which perhaps continual!y varies; but there is a medium velocity with which it might have beeis uniformly expelled, and a preflure cerrefponding to this velocity. To find this, divile the area of the pifton by the area of the blatt-hole (or rather by this area multiplied by $0,61_{3}$, in order to take in the eifect of the contracted jet), and multiply the length of the ftroke per formed in a fecond by the quotient arifing from this divifion; the produef is the medium velocity of the air of the (natural denfity). Then find by calculation the height through which a heavy body muft fall in order to acquire this velocity; this is the height of a column of homogeneous air which would expel it with this velocity. The weight of this column is tie lealt force that can be exerted by the engine: but this force is too fmall to overcome the refifance in the middle of the froke, and it is too great even for the end of the froke, and much too great for the beginning of it. But if the machine is turned by a very heavy waterwheel, this will act as a recgulator, accumulating in itfelf the fuperfluous force during the too favourable fotitions of the crank, and exerting it by it, ris i.ffia during the time of greateft effort. A force not greatly exceeding the weight of this column of air will theretcre fiffice. On the other hand, if the ffrength of the blatl be determined, which is the general late of the problem, this
lneumatic de:ermines the degree of condenfation of the air and the nngincs
luad on the fquare inch of the pifton, or the mean force
which the machine muft exert on it. A table, which will be given prefently, determines the cubic feet of common" air expelled in aliecond, contefponding to this load. This conbined with the propoted dimentions of the cylinder, will give the defcent of the piton or the lengrh of the froke.

Thefe general obfervations apply to all furms of belJows; and without a knowledge of them no perfon can erect a machine for working them, without total uncertainty or fervile imitation. In order, therefore, that they may be ufeful to fuch as are not accuitomed to the management of even thefe fimple formulx, we infert the following fhort table of the velocity and quantity of air difcharged from a cylinder whofe piton is loaded with the pounds contained in the firt column on every fquare inch. The fecond column contains the velocity aith which the condenfed air ruthes out through any finull hole; and the third column is the cubic feet dif clarged from a hole whofe area is a tquare inch; colum fouth contains the mean velocity of air of the common denfity; and column fifth is the cubic feet of commonair cifcharged; the fixth column is the height in inches at which the force of the blaft would fupport a column of water if a pipe were inferted into the lide of the cylinder. 'This is an extremely proper addition to fuch machines, flowing at all times the power of the machines, and teaching us what intenlity of blath is employed for different purpofes. The table is computed from the fuppofition that the ordinary preffure of the air is 15 pounds on a fquare inch. This is fomewhat ton great, and therefore the velocities are a little too finall; but the quantities difcharged will be found about; too great (without affecting the velocities) on account of the convergency of the itream.

This table extends far beyond the limits of crdinary ure, very few blaft-furnaces having a force exceeding Go inches of water.

We fhall conclucle this account of blowing machines with a defrciption of afmall one for a blow ripe. Fig. 79.
Plate ABCD , is a veffel containing water, about two feet CcCCVII. deep. EFGH is the air-box of the blower open below, and having a pipe ILK rifing up from it to a con. venient height; an arm ON which groups this pipe carries the lamp $N$; the blow-pipe LM comes from the top of the upright pipe. PKQ is the feeuing pipe te.aching near to the bottom: of the velfel.

Water being poured into the vefel below, and its cower
being put on, which fits the upright pipe, and touches two Ituds $a, a$, projecting from it, blow in a quantity of air by the feeding pipe PD ; this expels the water from the air-box, and occafions a preffure which pros duces the blaft through the blow-pipe M.

In $n^{\circ} 54$. of this article, we mentioned an application whicla has been made of Hero's fountain, at Chemnitz in Hungary, for raifing water from the bottom of a mine. We flall now give an account of this very ingenious contrivance.

In fig. 80. B reprefents the fource of water elevated above the month of the pit $13^{6}$ feet. From this there is laid a pipe $B / C D$ four inches diameter. Tlis pipe enters the top of a copper cylinder $b c d c, 8$; feet ligh, five feet diameter, and two inches thick, and it reaches to within four inches of the bottom; it has a cock at C. This cylinder lias a cuck at 1 , and a very large one at E. From the top $b c$ proceeds a pipe GHH two inches in diameter, which goes down the pit 96 feet, and is inferted into the tup of another brats cylinder $f g b i$, which is 6 : feet h.gh, fur feet diameter, and wo inches thick, containing $\$_{3}$ cubic feet, which is very nearly one half of the capacity of the other, viz. of 170 cubic feet. There is anuther pipe NI of four inches diameter, which rifes from withm four inches of the bottom of this lower cylinder, is foldered into its top, and rifes to the trough NO, which carries off the water fiom the mouth of the pit. This lower cylinder communicates at the bottom with the water L which coilects in the drains of the mine. A large cock K ferves to admit or exclude this water; another cock M , at the top of this cylinder, communicates with the ex. ternal air.
Now fuppofe the cock C fhut, and all the refl open ; the upper cylinder will contain air, and the lower cylinder will be filled with water, becaufe it is fuak fo deep that its top is below the ufual furface of the minewaters. Now fhut the cocks F, E, M, K, and open the cock C . The water of the foruce B mult run in by the orifice D , and rife in the upper cylinder, comprefling the air above it and along the pipe GHH, and thus acting on the furface of the water in the lower cylinder. It will therefore caufe it to rife gradually in the pipe 1 N , where it will always be of fuch a height that its Feeight balances the elafticity of the comprefled air. Suppofe no iflue given to the air from the upper cylinder, it would be compreffed into $\frac{6}{5}$ th of its bulk by the column of 136 feet high; for a column of 34 feet nearly balances the ordinary elallicity of the air. Therefore, when there is an iffite given to it through the pipe GHH, it will drive the compreffed air along this pipe, and it will expel water from the lower cylinder. When the upper cylinder is full of water, there will be 34 culic feet of water expelled from the lower cylinder. If the pipe IN had been more than 135 feet long, the water would have rifen 136 feet, being then in equilibrio with the water in the feeding pipe $\mathrm{B} b \mathrm{CD}$ (as was flown in $n^{\infty} 5^{2}$ ), by the intervention of the elaltic air; but no more water wonld have been ex. pelled from the lower cylinder than what fills this pipe. But the pipe being only 96 feet high, the water will be thrown out at $N$ with a very great velocity: If it were not for the great obifruations which water and air mult meet with in their paffage along pipes, it would iffue at $N$ with a velocity of more than 50 feet per fecond. It

## P N E U Mi A T I Ci S.

Pneunatic iffues much more flewly, and at latt the upper cylin$\underbrace{\text { Engines. }}$ der is full of water, and the water would enter the
pipe GH and enter the lower cylinder, and without difplacing the air in it, would rife through the difcharging pipe IN, and run off to wafte. To prevent this there hangs in the pipe HG a cork ball or double cone, by a brafs wire which is guided by holes in two crofs pieces in the pipe HG. When the upper cylinder is filled with water, this cork plugs up the orifice G , and no watcr is waited: the influx at D now ftops. But the lower cylinder contains compreffed air, which would balance water in a difcharging pipe 136 feet high, whereas IN is only 96 . Therefcre the water will continue to How at N till the air has fo far expanded as to balance only 96 feet of water, that is, till it occupies : of its ordinary bulk, that is, $\frac{5}{f}$ of the capacity of the upper cylinder, or $42^{2}$ icuhic feet. Therefore $42 \frac{1}{5}$ cubic feet will be expelled, and the efllux at N will ccafe; and the lower cylinder is about $\frac{2}{2}$ full of water. When the attending workman obferves this, he fhuts the cock C . He might have done this before, had he known when the orifice $G$ was itopped; but no lofs enfues from the delay. At the fame time the attendant opens the cock E , the water ifues with great violence, being preffed by the condenfed air from the lower cylinder. It therefore iffues with the fum of its own weight and of this comprellion. Thefe gradually decreate together, by the efflux of the water and the expantion of the air; but this efflux ftops before all the water has flowed out; for there is 42 ; feet of the lower cylinder occupied by air. This quantity of water remains, therefore, in the npper cylinder nearly: the workman know's this, becaufe the difharged water is rereived firlt of all into a velfel containing ${ }^{3}$ of the capacity of the upper cylinder. Whenever this is filled, the attendant opens the cock $K$ by a long rod which goes down the theft ; this allows the water of the mine to nill the lower cylinder, all ws the air to get into the upper cylinder, and this allows the remaining water to run cut of it.

And thus every thing is brought into its firf condition; and when the attendant fees no more watcr come out at E, he thmts the cocks E and M, and opens the cock $C$, and the operation is repeated.

There is a very furpriting appearance in the working of this engine. When the efflux at $N$ has floppul, if the cock $F$ be opened, the water and air sufh out together with prodigious violence, and the drops of water are changed into hail or lumps of ice. It is a fight unally thown to Atrangers, who are delired to hold their hats to receive the blatt of air: the ice comes out with fuch violence as frequently to pierce the hat like a piftol bullet. This rapid congelation is a remarkable inftance of the general fact, that air by fuddenly erpanding, generates cold, its capacity for heat being increafed. Thus the peafant cools his broth by blowing over the fpcon, cene from warm lungs: a fream of air from a pipe is always cooling.

The above account of the fricecture in working this engine fhows that the efilux both at $N$ and $E$ becomes very flow near the cnd. It is found convenient therefore not to wait for the complete dilcharges, but to turn the cocks when about 30 cubic teet of water have been dif: charged at N : more work is done in this way. A gentleman of great accuracy and knowledge of thefe fubjects
took the trouble, at our defire, of noticing particuiarly the performance of the macline. He obforved that each itroke, as it may be called, took up about three minutes and ; and that 32 cubic feet of water were difcharged at $N$, and 66 were expencied at $E$. The expence therefore is 66 feet of water falling 136 feat, and the performance is 32 vaiced 96 , ind they are in the proportion of $66 \times 136$ to $32 \times 96$, or of 1 to 0,3422 , or nearly as 3 to 1. Th's is fupetior to the performarice of the moit perfect underfhot mill, even when all friction and irregular obftructions are negle?ed; and is not much inferior to any overfhot pump-mill that has yet been erected. When we reflect on the great obftructions which water meets with in its palfage through long pipes, we may be affured that, by doubling the fize of the feeder and difcharger, the performance of the machine will be greatly improved; we do not hefitate to fay, that it would be increafed ; it is true that it w:ll expend more water ; but this will not be nearls in the fame proportion; for mot of the deficiency of the machine arifes from the needlefs velocity of the firf efflux at $N$. The difcharging pipe onght to be ito feet high, and not give fenfibly lefs water.

Then it mult be confidered how inferior in original expence this fimple machine mult be to a mill of any kind which would raife to cubic feet 96 feet high in at minute, and how fmall the repairs on it need be, when compared with a mill.

And, laftly, let it be noticed, that fuch a machine can be ufed where no mill whatever can be put in motion. A fmall ftream of water, which would not move any kind of whee!, will here raife $\frac{f}{5}$ of its own quantity to the fame height; working as falt as it is fupplied.

For all thefe retions, we think that the Hungarian machine eminently deferves the attention of mathematicians and engineers, to bring it to its utmof perfection, and in:o general ufe. There are fituations where this kind of machine may be very ufeful. Thus, where the tide rifes 17 feet, it may be ufed for comprefling air to of its bulk; and a pipe leading from a very large veffil inverted in it, may be ufed for raifing the water fiom a veffel of 's its capacity 17 feet high; or if this veffe! has only $T^{\prime}$, of the capacity of the large one fet in the tideway, two pipes may be led from it; one into the frall veffel, and the other into an equal veffel i 6 feet higher, which receives the water from the firft. Thus $\frac{3}{T} \frac{1}{3}$ of the water may be raifed 34 feet, and a finaller quantity to a fill greater hcight; and this with a kind of power that can hardly be applied in any other way. Ma. chines of this kind are defcribed by Schottus, Sturmins, Leupold, and other old writers; and they thould not be forgotien, becaufe npportunities may offer of making them highly oieful. A gentleman's houre in the country may thus be fupplied with water by a machine that will coft little, and hardly go out of repair.

The laft pneumatical engine which we fall feata' of at prefent is the cnmmon fanners, uted for winnowing grain, and for drawing air out of a room : and we have but few obdervations to make on them.

The wings of the fanners are inclofed in a cylinder or drum, whofe circular lides have a large opening BDE (fig. 83.) round the centre to admit the air. By turning the wings rapidiy round, the air is hurried round alon's with them, and thus acquires a centrifugal tendency, by which it preffes firongly on the outer rim of the dram:
neumatic $\underbrace{\text { Engine }}$

Pneumatic
Engines. terminated in a trunk $1 H G F$, which goes off in a and
tan gential direction : the air thercfore is driven along this paltage.

If the wings were difpofed in planes paffiner through the axis C , the comprelion of the air by their anterior furface woald give it fome tendency to cfeape in every diretion, and would obftruct in tome degree the arrival of more air throngh the fide holes. They are therefore reclined a litule backward, as reprefented in the figure. It may be fhown that their beft form would be that of a hyperbolic Spisal abc; but the ftraight form approaches fufficienty near to the moft perfect thape.

Macli labour is loft, lowever, in carrying the air
round thofe parts of the drum where it cannot efcape. P The fanners would either draw or difcharge almoit twice as much air if an opening were made all round one fide. This could be gradually contracted (where required for winnowing) by a furrounding cone, and thus directed againf the falling grain: this has been verifed by atual trial. When uled for drawing air out of a room for ventilation, it wrould be much better to romove the nuter fide of the drum entirely, and let the air fly freely off on all fides; but the flat lides are necelfary, in order to prevent the air from arriving at the fanners any other way out through the central holes, to which trunks thould be fitted leading to the apartment which is to be ventilated.

PiNeUMONIA. See Medicine, no 183 .

PNEUNIONLCS, in phamacy, medicines proper in difeafes of the lungs, in which ef piation is affected.

YO, a large and celebrated river of Italy, which has its fource at mount Vifs in Piedmont, and on the contines of Daphiny. It mons through Piedmont, Nontferme, the Milancte, and duchy of Mantua ; fron thence it runs to the borders of the Purmezan, and a part of the Modenefe; and having cntered the Ferarefe, it begins to divide at Ficheruolo, and proceeds to difcharge itelf into the Gulph of Venice by four principal mouths. As it paffes along, it receives feveral rivers, and often overfows its banks, doing a great deal of mifchief: the reafon of which is, that mof of thole rivers defcend from the $A l p s$, and are increafed by the melting of the fnow.

POA, meadow-grass: A genus of the digynia order, belonging to the pentandria clafs of plants; and in the natural method ranking wider the fourth order, Gramina. The calyx is bivalved and multiflorous; the fpicula or partial fpike is ovate, with the valvules fcarious and a littie tharp, or thin on the margin. There are 20 fpecies; moft of them graftes, and very agreeable food for cattle; for one fpecies, which grows in marfhes, the cattle will frequently go fo deep as to endanger their lives. This is called the aquatica, or water recdgra/s. It is the largeft of the Britilh gralles, growing to the height of five or fix feet. The leaves are fmooth, and half an inch wide or more. The panicle is eight or ten inches long, greatly branched, and decked with numerous fpicula: thefe are of a reddith brown colour intermixed with green, of a comprefled lanceclate form, imbricated with about lix flowers for the molt part, but varying from five to ten.

## POCHETT'I. See Barbatell.

POCOCKE (Dr Edward), one of the moft learned men in the oriental tongues in Europe, was the eldeft fon of the Rev. Eiluard Pococke; and was born at Oxford in 160.5 , where he was alfo bred. In 1628 he was adnitted probationer-fellow of his college, and about the fame time had prepared an edition of the Sccond Epitle of St Peter, the Second and Thitd of St John, and that of St Jude, in Syriac and Greek, with a Latin Trandation and Notes. In 1629 he was ordaired prieft, and appointert chaplain to the Englith merchnts at Alepro, where he continued five or fix:

## POD

jears; in which time he diftinguifhed limfelf by his fortitude and zeal while the plague raged there. At length returning to England, he was in 1636 appointed reader of the Arabic lectures founded by Archbifhop Laud. Three years after he went to Conitantinople, where he profecuted his Atudies of the eaftern tongues, and procured many valuable manuferipts: After near four years itay in that city, he embarked in 1640 ; and taking Paris in his way, vifited Gabriel Sionita the famous Maronite, and Hugo Grotius. In $1 \sigma_{43}$ he was prefented to the refory of Childrey in Berks; and about three years after married the daughte: of Thomas Burdett, Efq. About the middle of $16+7$ he obtained the reftitution of the falary of his Arabic lecture, which had been detained from him about three years. In 1648 king Charles I. who was then prifoner in the ifle of Wight, nominated Mr Pococke to the profeffurfhip of Hebrew, and the canonry of Chritt-church annexed to it; but in 1650 he was ejected from his canonry for refufing to take the engagement, and foon after a vote paffed for depriving lim of his Hebrew and Arabic lectures; but feveral governors of houfes, Sc. prefenting a petition in his favour, he was futfered to enjoy both thefe places. He had fome years before publifhed his Spicimen Hiforic Arabum; and now appeared his Porla Mofls : and foon after the Englifh Polyglot edition of the Bible, to which he had largely contributed, and alfo Eutychius's Annals, with a Latin verfion. At the Reforation, he was reftored to the canonry of Chrifchurch, and alfo received the degree of doctor of divi. nity. He then publifhed his Arabic verfion of Grotius's Treatife of the Truth of the Chritian Reigion; and an Arabic poem intitled Lamiaio'l Ajam, with a Latin tranflation and notes. Soon after he publifhed Gregory Abul Pharajius's Hiforia Dynafiarum. In 1674 he publifhed an Arabic verfion of the chief parts of the Liturgy of the Church of England; and a few years after his Commentary on the Prophecies of Micah, Maiachi, Hofea, and Joel. This great man died in 1691 , atter having been for many years confeffedly the firit perfon in Europe for eaftern learning; and was no lefs warthy of admiration for his uncommon modefty and humility, and all the virtues that can adorn a Chrittian. His theological works were republifhed at London in 1740 , in tiro volumes in filin.

iste CCCCI/.

PODALIRIUS, fon of Aifulapins and Epinne, was one of the pupils of the Centaur Chiron, under whom he made himfelf tuch a m:ther of medicine, that during the Tiojan war the Grecksinvited lim to their camp to fop a peftilence which hat bafled the fkill of all thecir phyficians. Some fuppofe, however, that he went to rhe Trojan war, not in the capacity of a phylician in the Grecian army, but as a warrior, attended by his hrother Machaon, in 30 thips, with foidiess from Cehalia, Ithome, and Trica. At his return Podalirius was thip. wrecked on the coalt of Caria, where he cured of the falling ficknels a daughter of the king of the place. He fixet his habitation there ; and buile two towns, one of which he called Syrna, after his wife. The Carians, on his death, built him a temple, and paid lim divine honours.
PODEX, in anatomy, the fime with finus.
PODGRAJE. Sce Asista.
PODOLIA, a province of Poland, bounded on the eaft by Y'chinia and the river Ukrain; on the north and north-ealt, by Budfiac Tatary; on the fouth eaft, by the river: Niefter, which feparates it from Beflarabia and Moldavia in European Turkey on the fouth-well ; and by the province of Red Rumia on the norm-wef. It is uftully divided into the Upper and Lower. In the Upper, which is the weftern part, the chief town in Kanicck, the capital of Podolia, and of a palatinate. In the Lower or eaflem part of Podolia, the chief town is Dracklaw, the capital of a palatinate.

PODOPHYLLUM, in botany: A genus of the monogynia order, belonging to the polyandria clafs of plants and in the natural method ranking under the 27 th order, Rbacede. The corolla has nine petals; the calyx triphyllous; the berry unilocular, crowned with the fisma.

PODURA, or spring tail, in zoology, a genus of infeds of the order of aptera. Limn. Syf. Nat. p. 1O13. They have fix feet formed for running; two eyes compofed of eight facets; a tail forked, hent under the body, elanic, and asting like a fpring; the antenne are lons and fetaceous. "This genns is diftinguifhed (fiys Barbut) into feveral fpecies. Some inhabit thill waters, leaping and walling with eufe on the furface of that element. They affemble in troops in the morning, on the ban's of pools, fifl-ponds, and refervoirs; others are found in damp places, under leaves, bark, and fones; others among heaps of rotten wood, mufluooms, and in melon-beds. In Lapland, they are feen running upon the finow, but when it begins to melt they perifh. The pectura, by its elaticity, eludes the eager gratp of the naturalif. Its hard forky tail is a kind of fiping, by means of which the body of the animal is thrown up into the air." The podura villofa is one of the largeft fpecies found in $\mathrm{B}_{1} \mathrm{i}-$ tain, and appears to be of a brown footy coloar, thongh it is really of a yellow brown, interfiperfed throughout with black-coloured fpots and ftreaks. The head and thorax are hairy, and ftick to the fingers when touched: the abdomen is Imonth : the antenne, confifing of four articulations, are as long as two-thirds of the body. It is commonly found under fones.

POE-BIRD, in ornitholgy, is an inhabitant of fome of the South Sea illands, where it is held in great efteem and yeneration by the matives. It goes by the name of logo in New Zealand; but it is better known by that of poie. bisd. It is fomewhat lefs than our blackbird. The Vol. XV.
feathers are of a fine mazarinc biuc, except thofe of i:s neck, which are of a molt banutiful filecr grey, and two or three thort white encs which are on the pinion-joint of the wing. Under its throat hang twon lute tuits of curled frow. white feathars, called its pues ( the Otaleite $1: 2$ word for carrours) ; which occafoned the name of p $\quad$ : bird being given to it. It is remarkeble for the fuestnefs of its note, as well as the beauty of its plamage Its hefla is allo delicate food.

FCECILE was a famous portico at Atlens, whels received its name from the variety ( oroviros) of puinting; which it contained. Zeno kept his fchool there; athe there alfo the floics received the lefions, whence then: name, isoo, a porch. The Pecile was adorncd, aniong many others, with a pieture of the fiese and facking or Troy the battle of Thefeus againft the Amazons, and the fight between the Lacedemorians and Athenians at Enoe in Argolis. The only reward which Miltialle, obtained after the battle of Marathen was to have his picture drawn more confpicunus than that of the reft of the officers that fought with him, in the reprefentation which was mat te of the engasement, and which was hung up in the Puecile in commemoration of that celebrated yittory.

## POEM, a poctical compofition. See Poetry.

POESTCM, or Posidonia, an ancient city of Grecia Magna, now part of the kingdom of Naples. It was founded by one of thofe colonies from Greace which in the early ages eftablifhed themfelves in Italy; and it flourifled before the foundation of Rome itfelf. It was deftroyed by the Goths on the decline of the Roman cmpirc, who in their barbarous zeal for the Chriftian religion overturned every place of Pagan worfhip which was expofed to their ravages. Since that time it has been in ruins; and the?e ruins were unknown till they were difcovered in the following manner: "In the year 1755 (fays the author of the Antiquities, Hiftory, and Vicses of Poeffunt, an apprentice is a painter at Naples, who was. on a vifit to his friends at Capaccio, by accident trok a walk to the momtains which furround the territory of Poeftum. The oniy habitation he perccived was the cottage of a farmer, who cu'tivatcd the belt part of the ground, and referved the reft for palture. The ruins of the ancient city made a part of this view, and particularly fruck the cycs of the youns painter; who, approaching nearer, faw with afonithment walls, towers, gates, and temples. Upon his return to Capaccio, he confulted the neigt:bouring poople about the crigin of thefe monuments of antiquity. He could only learn, that this part of the country had been uncultivated and abandoned during ilacir memory; tian about ten years before, the farncr, whof habitation he had noticed, efablifhed himfolf there; and that haviag dug in many places and fearched among the ruins thit lay round him, he had found tre fures iefficient to cmable him to purchafe the whole. At the painter's return to Naples, he informed his maller of thefe particulars, whofe curiofity was fo greatly excited by the defcription, that he took a journey to the p'ace, and made drawings of the principal views. Thefe were thown to the king of Naples, who ordered the guins to be clcared, and Poeftum arofe frem the obicurity in wh:ch it had remaincd for upwards of 700 years, as little known to the neighbouring inlabitants as to travellers."

Our author gives the following defuription of it in

Incuic
Pocfum.

## FOE

Fcefun. its prefeat tate. It is, fays he, of an oblong figure about two miles and a half in circumference. It has four gates, which are oppofite to each other. On the key-ftone of the arch of the north gate, on the outfide, is the figure of Neptune in baffo relievo, and within a hippocimpus. The walls which flill remain are compoted of very large cubical ftones, and are extremely thick, in fome parts 18 feet. That the walls have re mained unto this time is owing to the very exact manacr in which the ftones are fitted to one another (a circumftance obferved univerfally in the mafonry of the ancients), and perhaps in fome meafure to a falactical concretion which has grown over them. On the walls here and there are placed towers of different heights; thofe near the gates being much higher and larger than the others, and evidently of modern workmanthip. He obferves, that, from its fituation among marfies, bituminous and fulphureous fprings, Poeftunn muft have been unwholefome; a circumitance mentioned by Strabo, Murbofam eann facit fluviuss in paludes diffufus. In fuch a fituation the water mult have been bad. Hence the inhabitants were obliged to convey that neceffary of life from purer fprings by means of aqueducts, of which many veftiges fill remain.

The principal monuments of antiqnity are a theatre, an amphitheatre, and three temples, The theatre and amphitheatre are much ruined. The firlt temple is hexaliylos, and amphiprofylus. At one end the pilafters and two columns which divided the cella from the pronaos are lill remaining. Within the cella are two rows of fmaller columns, with an architrave, which fupport the fecond ordcr. This temple our author takes to be
of that kind called by Vitruvius lyphothros, and fupports his opinion by a quotation from that author. The fecond temple is alfio amphiproftylos: it has nine columns in front and 18 in flank, and feems to be of that kind called by Vitruvius ffrudodipteras. The third is likewile amphiprofylos. It has fix columns in front and 13 in flank. Vitruvius calls this kind of temple feripteres. "The columns of thefe temples (fays our author) are of that kind of Doric order which we find employed in works of the greatelt, antiquity. They are hardly five diameters in height. They are without bafes, which alfo has been urged as a proof of their antiguity; but we do not find that the ancients ever ufed bafes to this order, at lealt till very late. Vitruvius makes no mention of bafes for this order: and the only intance we have of it is in the firforder of the colifeum at Rome, which was built by Vefpafian. The pillars of thefe temples are fluted with very fhallow flutings in the manner defrribed by Vitruvius. The columan diminifh from the bottom, which was the mon ancient method almolt univerfally in all the orders. The columns have altrarals of a vers lingular form; which fhow's the error of thofe who imagine that that this member was firlt invented with the Ionic order, to which the Greeks gave an aftrayal, and that the Romans were the firf who applied it to the Doric. The echinus of the capitol is of the fame form with that of the temple of Curinth defcribed by Le Roy." See Swinburne's Travels in the two Sicilies, vol. ii. p. ${ }^{131-1} 40$.

$$

AMIDST thofe thick clouds which envelope the firt ages of the world, reafon and hiftory throw fome lights on the origin and primitive employment of this divine art. Reafon fuggetts, that before the invention of letters, all the people of the earth had no other method of tranfmitting to their defcendants the principles of their worthip, their religious ceremonies, their laws, and the renowned actions of their fages and hernes, than by poetry; which included all thefe objects in a kind of hymns that fathers fung to their children, in urder to engrave them with indelible Arokes in their hearts. Hiftory not only informs us, that Mofes and Miriam, the firt authors that are known to mankind, fiung, on the borders of thee Red Sea, a fong of divine praife to celebrate the deliverance which the Almighty vouchfafed to the people of Ifrael, by opening a pailiage to them through the waters; but it has allo tranimitted to us the fong iffelf, which is at once the moft ancient tomument and a mafter-piece of poetic compofition.
The Greeks, a people the moll ingenious, the moft aninated, and in evcry fenfe the moft accomplifhed, that the woild ever produced-Atrove to ravith from the Helifews the precious gift of poetry, which was vouchlafed them by the Supreme Author of all nature, that they might alcribe it $t$ their falfe deities. According to
thicir ingenious fiaions, Apollo became the god of poethcir ingeniows fiations, Apollo became the god of poetry, and dwelt on the hills of Phocis, Patnalius, and pocrene, of which each mortal that ever drank was
feized with a facred delirium. The immortal fwans floated on its waves. Apollo was accompanied by the Mufes-thofe nine learned fifters-the daughters of Memory : and he was conftantly attended by the Graces. Pegafus, winged courfer, tranforted him with a rapid flight into all the regions of the univerfe. Happy emblems! by which we at this day embellifh our poetry, as no one has ever yet been able to invent more brilliant images.
The literary annals of all nations afforl veltiges of poetry from the remoteft ages. They are found among the moft favage of the ancient barbarians, and the molt defolate of all the Americaus. Nature afferts her rights in every country and every age. 'Tacitus mentions the verfes and the hymns of the Germans, at the time when that rough people yet inhabited the woods, and while their mamers were fill fivage. The firf inhabitants of Runnia, and the other northern countries, thofe of Grul, Albion, Iberia, Aufonia, and other nations of Europe, had their poetry, as well as the ancient people of Afia, and of the known borders of A. frica. But the fimple productions of nature have conftantly fomething unformed, rongh, and favage. The Divise TVifdom appears to have placed the ingenions and polifhed part of mankind on the earth, in order to refine that which comes from her bofom rude and imperfect : and thus art has polifhed poetry, which iffaed quite naked and favage from the brains of the firt of mankind. But what is Poctry ? It would be to abridge the
limits of the poetic empire, to contract the fphere of on this divine art fhould we tay, in imitation of all the y. diftionaries and other treatifcs on verffication, 'That poctry is the art of maling verfes, of lines or periods that are in rlyme or metre. 'This is rather a grammatical explanation of the word, than a real definition of the thing, and it would be to degrade poetry thus to definc it. The father of criticifm has denominated poe-
 jult in itfelf, is too gencral for a definition as it does not difriminate poetry from other arts which depend equally on imitation. The juftert definitiun feems to of be that given by Baron Biellield *, That foetry is the sud. att of exprefling our thoughts by fition. In fact, it is af. ter this manner (if we reflect with attention) that all the metaphors and allegories, all the various kinds of fistion, form the firlt materials of a poetic edifice: it is thus that all inazes, all compatifons, allufions, and figures, efpecially thofe which perfonify moral fubjeets, as virtues and vices, concur to the decorating of fuch a Itructure. A work, therefore, that is filled with invention, that inceffan tly prefents images which render the reader attentive and affected, where the author gives inturelling fentiments to every thing that he makes fpeak, and where he makes fpeak by fenfible figures all thofe ebjects which would affect the mind but weakly when clothed in a fimple profaic fyle, fuch a work is a prem. While that, though it be in vere, which is of a didictic, dogmatic, or moral nature, and where the objects are prefent in a manner quite fimple, without fiction, with ut images or onnaments, cannot be called poctry, but merely it work in verfe; for the art of reducing thoughts, maxims, and periods into rhyme or metre, is very different from the art of poetry.

An ingenious fable, a lively and interefting romance, a comedy, the fublime narrative of the actions of a hero, fuch as the Telemachus of M. Fenelon, though written in profe, but in meafuned profe, is therefore a work of foetry; bec:ufe the foundation and the fuperftructure are the productions of genius, as the whole procceds from fiction; and truth itfelf appears to have employed an innocent and agreeable deception to inftruct with efficacy. This is fo true, that the pencil alro, in order to pleafe and affer has recourfe to fiction; and this part of painting is called the poctic compofution of a pidure. It is therefore by the aid of fiction, that poetry fo to
fipeak, paints its cxpreflions, that it gives a body and a mind to it thoughts, that it animates and exalts that which would otherwife have remained aid and infentible. It is the peculiar privilege of poetry to exalt insnimate things into animals, and abfleat ideas into perfons. The fomer licence is fo common, that it is now conlidered as nothing more than a characterittical dialest appropriated by the poets to dillingu th themfeives frome the writers of profe; and it is at the fame tine fo effential, that we queftion much if this fpecies of compolition could fubfift without it : for it will perhaps, upon examination, be found, that in every pnetical defeription fome of the qualities of Animal Nature are afcribed to things not having life. Every work, therefore, where the thoughts are expreffed by fistions or images, is poetic ; and every work where they are exfrefled rathrally, fimply, and without ornament, although it be in verfe is profaic.
Verfe, however, is not to be regarded as forcign or fuperfluous to poetry. To reduce thofe images, thofe fictions, into verfe, is one of the greatent difficulties in poetry, and one of the greatelt merits in a poem : and forthefe reafons, the cadence, the harmony of founds. particularly that of thyme, delight the ear to a high degree, and the mind infenfibly repeats them while the eye reads them. There refults therefore a pleafore to the mind and a Atong attachment to thefe ornaments: but this pleafure would be frivolous, and even childilh, if it were not ittended by a real utility. Verfes were verfe, ${ }^{3}$ invented in the firlt ages of the world, merely to though not aid and to frengthen the memory: for cadence, har- tifential to mony, and efpecially rhyme, afford the greateft affitance poetry, ore to the memory that art can invent; and the images, of celtencice. or poetic fictions, that thrike our fenfes, aflift in graving them with fuch deep traces in our minds, as even time itelf frequently cannot efface. Huw many excellent apophthegms, fentences, maxims, and precepts, would have been buried in the aby fs of oblivion, if poctry had not preferved then by its harmony? To give more efficacy to this lively impreffion, the firf poets fung their verfes, and the words and phrafes muft neceffarily have been reduced, at leaf to cadence, or they could not have been fufceptible of mutical expreffion. One of the great excellencies, therefore, though not a neceffary conflitucnt, of poetry, confits in its being e:prefled in verié. See Part III.

## Part I. GENERAL PRINCIPLES of the ART.

## Sect. I. Of the Effence and End of Poetry.

THE effence of Polite ARTS in general, and confcquently of poetryin particular, confifs in exprefion; and we think that, to be poetic, the expreffion muft neceffarily arife from ficion, or invention. (See the arof ticle Art, particularly from $\mathrm{n}^{0}$ 12. to the end.) This invention, whic: is the fruit of happy genius alone, arifes, 1. From the fubject itfelf of which we undertake to treat: 2. From the manner in which we treat that fubject, or the fpecies of writing of which we make ufe: 3. From the plan that we propofe to follow in conformity to this manner; and, 4 . From the method of executing this plan in its full detail. Our firft guides, the ancients, afford us no light that can elucidate all thefe objects in general. The precepts which Ariftotle
lays down, relate to epic and dramatic poetry only: and which, by the way, confirms our idea, that antiquity itfelf made the effence of poetry to confift in fiction, and not in that fipecies of verfe which is deftitute of it, or in that which is not capable of it. But fince this att has arrived to a great degree of perfection; and as poetry, like electricity, communicates its fire to crery thing it touches, and animates and embellifhes whatever it treats; there feems to be no fubject in the univerfe to which poetry cannot be applied, and which it camnot render equally brilliant and pleafing. From this univerfality of poetry, from its peculiar property of expreflion by fition, which is applicable to all fubjects, have arifen its different fpecies, of which a particular defcription will be given in the fecond part.

Horace, in a well-known verfe, has been fuppofed to
declare
of declare the chit of poetry to be twofold, to pleale, or to Invention.

leatt
chap. i,

## Aut prodefore velunt, ant dictare fatie.

But Dr. Bcattie * maintains, that the ultimate end of this art is to pleafe; inftruction being only one of the reans (and not always a neceffary one) by which that uhimate end is to be accomplifhed. 'The palfage rightly mondenflood, he obferves will not appeat to contain any thing inconliftent with this dostrine. The author is there fating a comparion between the Greek and Roman witers, with a view to the poetry of the ftage ; and, after commending the former for their corrednefs, and frr the liberal fjirit viherwith they conducted their literary labours, and blaming his countrymen for their inaccuracy and avarice, he proceeds thus: "The ends propored by cur dramatic poets (or by pocts in greneral) are, to pleafe, to inftruet, or to do both. When inftrution is your am, let your moral fentences be expreffed with brevity, that they may be seadily underfood, and long remembered: where you mean to pleafe, let your fictions be comfurmable to truth, or probability. The elder part of your audience (or readers) have no relifh for poems that give plafure only without intruction; nor the younger for fuch writings as give infration without pleafure. He only can ie. cure the univerfal fufarge in his favour, who blends the uleful with the agreeable, and delight; at the fame time that be inftructs the reader. Such are the works that bring money to the bookfeller, that pafs into forcign countries, and perpettate the author's name

+ Hor. Ar. through a long firceffion of ages $t$."--Now, what is loet. $333^{-0}$ the meaning of all this? What, but that to the perfection 347.

1 Hor.
Carm, piayiul genins of Anacreon $\ddagger$, -two authors tranfen. ose 9 . 4 denty fiveer, but not remarkably inftuctive. We are § Hor, $s-t$. were, in Horas, and harmony, and elevated linguage, lib i. fat 4. of the ee teceres and ver. 40 . is the end, who confiders that the moit inftructive books in the werld are written in plain profe.

In thort, cur author has endenroured by many ingenious arguments and illuftrations to eftablifh it as a truth in criticifm, that the end of poetry is to plafe. Vories, if pleafing, may be poetical, though they con. rey little or no inftrnction; but verfes, whofe fole merit it is that they convey intruction, are not poetieal. Infrugtion, however, he almits, efpecially in poen of of lagth, is neceftary to their perfection, becaufe they womld $n$ t be perfedily agrecthbe without it.

## EEct. 1I. Of the Stardard of Polical Inventivn.

l'netich T'inmer's beautiful defciption of the heavens and invention e:rhb, as they appear in a calias evening by the light of is be retc u- the tur oa and thars, concludes with this circumitance, - Heat, \& "A An! lle heant of the thepleed is glad of." Midame s. s3s. Dacher, from the turn fiegives to the paflage in ber bltion feemsta think, ind Pope, in order perhaps to
make out his couplet, infinuates, that the gladnefs of the fhepherd is owing to his fenfe of the utility of thofe luminaries. And this may in part be the cafe: but this is not in Homer; nor is it a neceflary confideration. It is true, that, in contemplating the material univerfe, they who difcern the caufes and effects of things muft be more rapturoufly entertained than thofe who perceive Deatie's nothing but thape and fize, colour and motion. Yet, Effags, in the mere outfide of Nature's works, there is a fplendor and a magnificence to which even untutored minds cannot attend without great delight.

Not that all peafants or all philofophers are equally fufceptible of the le charming impreffions. It is Arange to oblerve the callouinefs of tome men, before whom all the glories of heaven and earth pafs in daily fucceffio without'touching their hearts, elevating their fancy, $n$, leaving any durable remembrance. Even of thofe who pretend to fenfibility, how many are there to whom the luftre of the rifing or fetting fun; the fparkling concave of the midnight $\mathbb{N} y$; the mountain-foreft tolfing and roaring to the ftorm, or warbling with all the melodies of it fummer-cvening ; the fweet interchange of hill and dale, fluade and finfhine, grove, lawn, and water, which an extenfive landicape offers to the view; the fcenery* of the ocean, fo luvely, fo majeftic, and fo tremendous; and the many pleafing varieties of the animal and vegetable kingdoms, could never afford fo much real fatisfaction, as the deams and noife of a ball-room, the infipid fiddling and fqueaking of an opera, or the vexations and wranglings of a card-table!

But fome minds there are of a different make: who, even in the early part of life, receive from the contemplation of Nature a fpecies of delight which they would hardly exchange for any other, and who, a avarice and ambition are not the infirmities of that period, would, with equal fincerity and rapture, exclaim,

I care not, Fortune, what yon me deny ;
You cannot rob me of free Nature's rrace;
You cannot flut the windows of the ilky,
Throngh which Aurora hows her bright'ning face ;
You camot bar my contant fect to tiace
The woods and lawns by living fream at eve.

## Cafle of Inciolence.

Such minds have always in them the feeds of true talte, and frequenly of imitative gerius. At leaf, though their en'hufialtic or vifionary turn of nind (is the man of the world vould call it) thould not always incline them to practife poety or painting, we need not fruple to atiorm, that withour fone portion of this enthufi:fm. no perfon ever beeame a true poet or painter. For he who would imitute the works of nature, mult firit accuraccly obferve them; and accurate obervation is to be expested from thode only who take great pleafure in it.
'to a mind thus difpofed no pat of creation is in diffrent. In the crowded city and lowling wildernefs; in the cultivated frovince and folitary ine ; in the flowery lawn and ctagegy mountain: in the murmur of the rivulet and in the uproar of the ncean; in the radance of fummer and floom of winter: in the thunder of heaven and in the whiper of the breese; he ftill finds fomething to rouze or to foothe his imagination, to draw forth his alfections, or to employ his underfanding. And from every mental chergy that is not
attended with pain, and even from fornc of thofe that are, ans moderate terror and pity, a found mind derives fatisfaction; exercife being equally neceflary to the body and the foul, and to both equally produative of health and pleafure.

This happy fenfibility to the be:uties of nature fhould be cherithed in younts perfons. It engages them to contemplate the Creator in his wonderful works; it purines and harmonizes the foul, a ci prepanes it for moral and intellectual ditcipiine; it fupplies an ondlefs fource of amufement; it contaibutes (ycn to bedily, heallh: and, as a frict analogy fubfits between material and moaal beauty, it leads the heart by an caly tranfition from the one to the other; and thus recommends vintue for its tranicendant loveiinefs, and makes vice appear the cbjer of contempt and abomination. An intimate acquaintance with the beft defciptive poets, Spenfer, Mil. ton, and Thomfon, but above all with the divine Georgic, joined to fome practice in the art of drawing, will plomote this amialle fenfibility in early years: for then the face of nature has novelty fuperadded to its other charms, the paltions are not pre-engaged, the heart is free from care, and the imagination warm and romantic.

But not to infill longer on thofe ardent emotions that of are peculiar to the enthufiaftic difciple of nature, may it not be affirmed of all men, without exception, or at leaft of all the enlightened part of mankind, that they are gratified by the contemplation of things natural, as oppofed to unnatural? Monftrous fights pleafe but for a moment, if they fleafe at all ; for they derive their charm from the beholder's ama...ment, which is quiekly over. We read indecd of a man of rank in Sicily*, who choofes to adorn his villa with picture and fatues of mof unnatural deformity: but it is a fingular inflance ; and one would not be much more furprifed to hear of a perfon living without food, o: growing fat by the ufe of poiton. To fay of any thing, that it is contrary to nature, denotes cenfure and difaut on the p.rt of the fpeaker; as the epithet notural intimates an agrecable ouality, and fcems for the mott part to imply, thata thing is as it ought to be, fuitable to our own taite, and congenial with our own confituzion. Think with what fentinecnts the fhould perufe a poem, in which nature was totally mifrepreferted, and princirles of thought, and of operation fuppofed to take place, repugnant to evers thing we had feen or heard of:-in which, for example, ayarice and coldnefs were aferibed to youth, and prodigality and paffierate attachment to the old; in which men were made to act at random, sometimes according to character, and fometimes contray to it; in which cruelty and envy were productive of love, and beneficence and kind affestinn of hatred; in which beauty was invariably the olject of diflike, and uglinefs of delire; in which fociety was rendered bappy by atheifm and the promifcucus perpetration of crimes, and juflice and fortitnde were held in univerfal contempt. Or think, how we thonld relift a panting, whese no regard was had to the proportions, colours, or any of the phy fical laws, of Natu:e:- where the ears and eyes of animals were placed in their thoulders; where the iky was green and the crafs crimfon; where irees grew with their branches in the carth and their roots in the air ; where men were feen fighting afer their hea!s were cut off, neips failing on the land, lions entargled in cob-
webs, flicep preying on dead carcafes, fifhes fporting in the woods, and clephans walking on the fea. Could fuch figures and cembinations give pleafure, or merit the appellition of fublime or beautiful? Should we heft.te to pronounce their author mad? A nd are the abfurdities of mordmen proper fubjects either of amufement or of imitation to re:lfonable beings?

Let is be remarled, ton, that though we diftinguifl our in ernal powers by different mames, becimie otherwic we could not fpeat of them io as to be underfood, they are all but fo many energies of the fame individual mind ; and therefore it is not to be fuppofed, that what contradiâs any ore leading faculty thould yield permanent delight to the reft. That cannot be agreable to reafon, which confcience difapproves; nor can that gratify imagination, which is repugnant to reafon.--Betides, bclief and acquisfence of mind are pleafant, as cifuuf and difbelief are painful : and therefore, that only can give folid and general fatisfaction, which has foniething of plautibility in it; fomething which we conctive it poffible for a rational being to believe. But no rational being can aequiefce in what is obvioufly contrary to matue, or implies palpable abfur dity.
Poetry, thercfore, and indeed every art whofe end is to pleafe, munt be natural ; and if fo, mult exhibit re:al matter of fact, or fomething like it; that is, in other words, mult be either according to truth or according to verifimilitude.

And tho' every part of the material univerfe abounds in objetts of pleafurable contemplation, yet nothing in nature fo powerfully touches our hearts, or gives io great varisty of exercife to our moral and intellectal facul. ties, as man. Human affairs and human feslings are univel fally ifterefing. There are many who have no great relith for the poetry that delincates only irrationa! or inanimate beings; but to that which exhibits the fortunes, the charadters, and the condust of men, there is haraly any perfon who does not liften with fympathy and delight. And hence, to imitate human action, is confidered by Arifotle as eflential to this art ; ard mu't be allowed to be effential to the noot pleafing and mont inftruative part of it, Epic and Dramatic compolition. Mere deferiptions, however beantiful, ard moral reflections, however juft, become tirefonie, whene our pallions are not cocationaliy awal:ened by fome event that concerns our fellow men. Do zot all readers of tafe receive reculiar pleatine from thofe little tales or epifodes with which Thomfon's defriptive poom on the Seafons is here and there cmivened? and are they not fenible, that the thunder-form would not have been half fo interefling without the tale ol the two lovers (Summ. V. 1171) ; nor the havelt.fene, withont that of Palemon and Lavinat (Aut. v. 1/7.) ; mor the driving hows, without that exquifite piture of a man perifhing among them (Winter, v. 276.) ? It is much to be regretted, that Yound did not employ the fame artifice to animate his Night-Thoughts. Sentiments and deferiptims may be regarded ats the pilatters, carvings, gildings, and nther decorations of the foetical fibric: Lhit huran actions are the columns and the rafters that give it flability and clevation. Or, chonging the metaphor, we may conider thefe as the forl which informs the levely frame; while thofe are little more than the orvaments of the body.
Whether the pleafure we thke in things maturn, and

10
Fiction fuf. ficiently conformable to astur: when it accords with received
our diflike to what is the reverfe, be the effeet of habit or of conttitution is not a material enquiry. There is rothing abfurd in fuppofing, that between the fonl, in its firft formation, and the reft of nature, a mutual harmony and fympachy may have been eltablifhed, which experience may indeed confirm, but no perverfe labits cunld entitely fubdue. As no fort of education could make man believe the contrary of a felf evident asiom, or reconcile lime to a life of perfect folitude; fo we fhould imagine, that our love of nature and regularity might fill remain with us in fome degree, though we had been boin and bred in the Sicilian villa abovementioned, and never heard any thing applauded but what deferved cenfure, nor cenfured but what merited applaufe. Yet habit muft be allowed to liave a powerful influence over the fentiments ind feelings of manlund: for objects to which we have been long accuftomed, we are apt to contract a fondues: we conceive them read ly, ind contemplate them with pleafure; nor do we quit our uld tracts of fpeculation or pracrice without relufance and pain. Hence in part arifes our attachment to cur own profelions, our old acquaintance, our native foil, our homes, and to the very hill, freams, :and rocks in our neightourbood. It would therefore be frange, if man, accuftomed as he is from his earlieft days to the regulanity of rature, did not contrast a liking to her producions and principles of operation.

Yet we neithor expect nor defire, that every human invention, where the end is only to pleafe, thould be an exact tranfeript of real cxiftence. It is enough, that the mind aequiefec in it as piobable or plaufible, or fuch as we think might happen without any dired oppoftion to the laws of nature :-Or, to fpeak more accurately, it is enouoh that it be confiftent, either, firft, with general experience; or, fecondly, with popular opinion; or, thirdiy, that it be confiftent with itfelf, and connected with probable circumftances.

Firlt: If a human invention be confiltent with general experience, we aequiefce in it as fufficiently probable. Particular experiences, however, there may be, fo uncommon, and fo little expeeted, that we fhould not admit their probability, if we did not know them to be tue. No man of fenfe believes, that he has any likelhood of being enriched by the difcovery of hidden treafure; or thinks it probable, on purchafing a lotteryt.cket, that he fhall gain the finf prize: and yet great wealth has actually been acquired by fu h good fortune. But we fhould look upon thele as poor expedients in a play or romance for bringing about a happy cataftrophe. We expect that fiction fhould be more confonant to the general icnor of human affains; in a word, that not pofitbility, but probability, thould be the ftandard of poetical invention.

Secondly: Fiction is admitted as conformable to this ftandard, when it accords with received opinions. Thefe may be erroneous, but are not olten apparcul'y repug. nant to nature. On this account, and becaufe they arc familiar to us from our infaney, the mind reatily ae-

## P O E T R Y.

nucl as he can with probable circumftances, and make t appear in a feries of events confiftent with iteelf.
Fur (thirdly) if this be the cafe, we flall admit hifory as probable, or at leaft as natural, and confequently ee interelted in it, even though it be nut warranted by reneral experience, and derive but flender authority from opular opinion. Calyban, in the Tempeft, would have hocked the mind as an improbability, if we had not been nade acquainted with his origin, and feen his charaker lifiajed in a feries of confiftent tehaviour. But when ve are told that he fprung from a witch and a demon, a :onneat in not contrary to the laws of nature, as they vere undertood in Shakefpeare's tinse, and find his nanners conformable to his defeent, we are eafily recon:iled to the fistion. In the fame fenfe, the Lillputians of Swift nay pafs for probable beings; not fo much be:aure we know that a belief in 1 ignies was once current a the world (for the true ancient pigmy was at leaft hrice as tall as thofe whom Gulliver vifited), but be:aute we find that every citcumftance relaiing to them iccords with itielf, and with their iuppofed charaster. it is not the fize of the people ouly that is diminutive; heir country, feas, hhips, and tuwns, are all in exact roporti• $n$; their theological and political principles, heir paffions, manners, cultoms, and all the pats of heir conduct, betray a levity and ditteness perfectly iitable; and fo fimple is the whole narration, and apparently fo artlefs and fincere, that we thould not mas $h$ ronder if it had impofed (as we have bee told it has) pon fome perions of n ? contempticue underitandu'g. The fame degree of credit may perhaps for the fame reaens be due to his giants. But when he grounds his arrative upon a contradiction to nature: when he preents us with rational brutes, and irrational men; when te tells us of horfes building houfes fur habitation, milking cows for food, riding in carriages, and holding conertations on the laws and politics of Euroic, not ail is genius (and he there exerts it to the utmoth) is able - reconcile us to fo monitrous a fiction: we may finile It feme of his :abfurd exaggerations; we may be pleated with the energy of ftyle, and accuracy of defcription, a particular places; and a malevolent heart may trimph in the fatire; but we can never relith it as a fable, ecanfe it is at once unnatural and felf-contradictory. swift's judgment feems to have forfaken him on this ocafion: he wallows in naltinefs and brutality: and the ;eneral run of his fatire is downight defamation. Luian's True Hiflory is a heap of extravagancies put torether without order or unity, or any other apparent letign than to ridicule the language and manner of grave athors. His ravings, which have no better right to he name cf foblc, than a hill of rubbith las to that of valace, are deftitute of every colour of planfibility. Aninal trees, thips failing in the $\mathrm{fk} y$, armies of munftrous tings trave! ling between the fun and moon on a pavement of cobwebs, rival nations of men inhabuting woods ad mountains in a whale's belly, 一are liker the dreams o bedlamite than the inventions of a rational being.
If we were to profecute this fubjeat any farther, it vould be proper to remark, that in fome kind of pue.
tical invention a leriqer probability is required than in others:-that, for infance, Comedy, whether dramatic or narrative ( $B$ ), mult feldom deviate from the ordinary courle (f human affairs becaufe it enhil) ts the manners of real and even of familiar life:-that the tragic poet becaufe he imitates characters more exalted and gencrally refers to events little krown, or long dince pait, may be allowed a wider range; but muft never attenupt the marvellous fictions of an epic mufe, becaufe he addrefies his work, not only to the paffions and imariic:ation of mankind, butalio to their eyes and ears, which are not eatily impoled cn , and refule to be gratified wi h any reprefentation that does not come very near the truth :- that the epie poern may claim fill ampler privileges, becaufe its fictions are not fubjeot to the ferutiny of any outward fenfe, and becaute it convers information in regard both to the highef human characters, and the mut important and wonderfule events, an 1 alfo to the affairs of unfeen worlds and fuperior beings. Nor would it be improper to obferve, that the feveral fpecies of comic, of tragic, of epic compo:tion, are not confined to the fame degree of probability: for that farce may be allowed to be lefs probable than the regular comedy; the mafque than the regular tragedy: and the mixed epic, fuch as the Fairy Queen, and Orlando Furinfo, than the pure ep pee of Homer, Virgil, and Milton. But this part of the fubject feems not to require further illultration. Enough has been faid to lhow, that nothing unnatural can pleafe; and that therefore poetry, whote end is to pleafe, muft be accoriling to nature.
And if fo, it muft be either according to real nature, or according to nature fumewhat different from the reality.

## Sect. III. Of the Syfem of Nature caxibilied ly Poitry.

To exhibit real nature is the bufinefs of the hiftor: an ; who, if he were ftriatly to confine himfelf to his own iphere, would never record even the minnteat circum. ftance of any fpeech, event, or defcription, which was not warranted by fufficient authority. It has been the language of critics in every are, that the hiftorian ourlt miforans to relate nothing as true which is falfe or dubious, and their work: to conceal nothing material which he knows to be true. But it is to be doubted whether any writer of profanc hittory has ever been fo ferupulous. Thucydides himfelf, who began his hitory when that war began whic'/ he records, and who fet down every event foon after it happened, according to the mof authentic information, leems, however, to !ave indulged his fancy not a little in his harangues and deferiptions, particularly that of the pl.ggue of Athens: and the fame thing has been praftifed, with greater latitude, by Livy and Tactus, and more or lefts by all the beft hitarims both ancient and modern. Nor are they to be blamed for it. By thefe improved or invented fipeeches, and by the heightenings thus given to their deleriptions, the reork becomes more interetting, and more ufeful ; noboty is deceived,
(B) Fielding's Tom Gones, Anelik, and $\mathscr{F}$ feph Andreres, are examples of what may be called the $E_{l}$ :s or Nurcaive Comedy, or more properly perthaps the Conic Eporec.
ceived, and hinorical truth is not materially affected. A Nathre in medium is however, to be oberved in this, as in other
1 'octry.

## -

 things. When the hiforian lengthens a defeription into a detail of fatitious events, as Voltaire has done in his account of the battle of Fontenoy, he lofes his credit with us, by railung a fufpicion that he is more intent upon a pretty fory than upon the truth. And we are difguttad with his intincerity, when, in defiance even of verifinilitude, he puts long elabuate orations in the mouth of thefe, of whom wo know either from the circurafances that they could not, or from more authentic records that they did not, make any fuch orations; an Diceyfins of Halicarnafing has done in the cafe of Volumn'a haranguing her fon Coriolanus, and Flavius Jorephus in that of Judsh addrefling his brother as vicerny (if Egypt. From what thefe hittorians relate, one would conjestare that the Roman matron had ituaiblat A thens under fome long-winded rhetorician, and that the Jewilh patriatch mall have been one of the mof flowery orators of antiguity. but the fistitious part of hiftory, or of fory-tcling, oughe never to take up anuch room; and mult be highly blameable when it leads into any mifale cither of facts or of characters.Fow, why do hinnviaus take the libenty to embellifl the'r works in this manner? One reafon, no doubt is, thet they may difplay ther calents in oratory and narra-
14 tion : but the chicf reation, as himted already, is, to renIn fome de- der their compofition more agreeab'e. It would feem, grce poe- then, that fomething more pleafing than real nature or ucal.
leattic's Iffur, chap, ii,
fomething which that add to the plealing qualities of real wature, may be devifed by human fancy. And this may certainiy be done. And this it is the poet's bufinefs to do. And when this is in any degree done by the hiltorian, his narative becomes in that degree poetical.

The pofibility of thus improving upon nature muft be obvious to every one. When we look at a landfcape, we can fancy a thoufand additional embellifhments. Mountains loftier and more piqturelicue ; rivers more copious, more limpid, and more beautitully winding ; fmoother and wider lawns; valleys more richly diverlificd; caverns and rocks more gloomy and more flupendous; ruins more majeitic ; buildings more magnificent ; oceans more varied with inands, more fiplendud with fhipping, or more agitated by ftorm, than any we have ever fecn-it is eafy for human im gination to concoive. Many things in art and nature exceed expectation ; but nothing fenfiole tranfends or equils the calpacity of thought:-a ftriking evidance of the dignity of the human toul? The fineft woman in the world appears to every eyc fufceptible of improvement, except perhaps to that of her lover. No wonder, then, if in poetry events can be exhibited more compact, and of more pleafing vaniety, than thre: delineated by the hiftorian, and fenes of inanimate nature more dreadiul or: more lovely, and humin charadters more fublime and more exquifite, both in grod and cvil. Yet Atll let nature fupply the ground-work and materials, as well as the itandard, of poetical fiation. The molt expert printers ufe a layman, or other vifible figure, to direat their hand and regulate their fancy. Homer him'elf foun!'s his two poems on authentic tradition; and tragic as woll as epric poets bave followed the example. The writers of romance, too, are anbiti us to interweave true adventures with their fables; and when it can be conve-
niently done, to take the oullines of their plan from reall life. 'Thus the tale of Robinfon Crufoe is founded Watu on an incident that acqually befel one Alexander Scl. Pu:t lirk, a fea-faring man, who lived feveral years alone in the illand of Juan Fernandes: Smollet is thonghit to have given us feveral of his owis adventures in the hiftory of Roderic Random: and the chief characters in Tom Jones, Jofeph Andrews, and Pamela, are faid to have been copied from real originals. Dramatic comedy, indeed, is for the molt part purely theitious : for it it were to exhibit real cvents as well as prefent manners, it would become too perfonal to be endured by a well:-bred audience, and degenerate into downright abufe; which appears to have been the cale with the old comedy of the Greeks*. Dut in general, hints taken from real exittence will be found to give no hitte H grace and fability to fiation even in the mot fancitul pems. Thafe hints, however, may be inproved by the f . poet's imtgination, and fet off with every probable ver ormament that can be devifed, confiliently with the de-ass fign and genius of the work; or, in other words, with the fympathies that the poet means to awaken in the mind of his reader. For mere poctical ornament, when it fails to intereft the affections, is not only uielefs, hut improper ; all true poetry being addreffed to the heart, and intended to give pleafure by raifing or fouthing the pallions; -the only cffcetnal way of pleafing a rational and moral creature. And therefore we would take Horace's maxim to be univerfal in poetry: "Non fatis efl, pulchra effer, pocmata; dulcia fu to:" "It is not enough that poems be beautiful ; let them alfo be afiening: :' For that this is the meaning of the word dulcia in this place, is admitted by the beft interpreters, and is indeed evident from the context $\dagger$.

That the fentiments and feelings of percipient beings, wev when expreffed in poetry, fhould call forth our affec- $95-$ tions, is natural enough ; but can deferiptions of inanimate things alio be nade affecting ? certainly they can: Anfi and the more they aftect, the more they picafe us, and hhir the more poetical we allow them to be. Virgil's Geor- ani gic is a noble fpecimen (and indecd the nobleft in the ast world) of this fort of poetry. His admiration of ex. ternal nature gains upon a reader of tafte, till it rife to perfect enthufiaim. The folluwing ubfervations will perh.ips explain this matter.

Every thing in nature is complex in itfelf, and bears innumerable relations to other things; and may therefore be viewed in an endiefs varisiy of lights, and confequently defcribed in an endelds variety of ways. Some defcriptions are good, and others bad. An hiferical defcription, that enumerates all the qualities of any objea, is certainly guod, becanfe it is true; but may be as unaffeding as a logical definition. In poetry, no unaffecting delecription is good, however confornable to truth : for here we expet not a complete enumcration of qualities (the chief end of the art being to pleafe), but only fuch an enumeration as may give a lively and intcrefting ide:i. It is not memory, or the knowledge of ulues, that can qualify a poct for this fort of deficription; but a peculiar livelinefs of fancy and fembibiity of heart, the nature wheref $f$ we may explain by its effeds but we camnot lay down rules for the attainment of it .

When our mind is occupied by any emotion, we na. turally ufe words :and meditatc on things that are fuit-
able to it and tend to cncocrage it. If a man wore to ftyle, even though the perion to whom he wrote were not the object of bis anger. The fame thing holds truc of every other ftrong paffien or emotion :-while it predominates in the mind, it gives a peculiarity to our thoughts, as well as to our voicc, getture, and countenance : And hence we expect, that every perfonage introduced in peetry fhrould fee things through the medium of his ruliner paflion, and that his thonghis and r- language thould be tinctured accordingly. A melancholy nan walking in a grove, attends to thofe things that fuit and encourage his melancholy; the fighing of the wind in the trees, the murmuring of waters, the datkels and folitude of thates: A cheerfulman in the the fame place, finds many fubjects of cheerful meditaftion, in the finging of bids, the britk motions of the babbling ftream, and the livelinel's and variety of the verdure. Perfons of different characters, contemplating the fame thing, a Roman tiumph, for inftance, feel different emotions, and turn their view to different objects. One is filled with wonder att fuch a difplay of wealth and power ; another exults in the idea of conquelt, and pants for military renown; a third, ftumed with clamour, and haraffed with confufion, withes for filence, fecurity, and folitude ; one melts with pity to the vanquithed, and makes many a fad reflection upon the infignificance of a. , worldly grandeur, and the uncertainty of heman things; while the beffoon, and perhaps the philofopher, confiders the whole as a vain piece of pageantry, which by its folcmn procedure, and by the admiration of fo many people, is only rendered the more ridiculous :-and each of thete perfons would deferibe it in a way fuitable to his own feelings, and tending to raife the fame in others. We fee in Milton's Allegro and Penforofo, how a different calt of mind produces a variety in the mamer of conceiving and contemplating the fame rural feenery. In the former of thefe excellent poems, the author perfonates a checrful man, and takes notice of thole things in external nature that are fuitable to cheerful thoughts, and tend to encourage them : in the latter, every object defcribed is ferious and folemm, and produtive of calm reflection and tender mlancholy : and we fhould not be eafily perfuaded, that Milton wrote the firit under the influence of forrow, or the fecond under that of gladnefs. We often fee an authors's character in his works, and if every author were in earnett when he writes, we fhould oftencr fee it. Thomfon was a man of piety and benevolence, and a warm admirer of the beauties of nature ; and every defcription in his delightful poem on the feafons tends to raife the fame laudable affections in his reader. The parts of nature that attraft his notice are thofe which an impious or hard. harted man would neither attend to, nor be affected with, at leaft in the fame manner. In Swift we fee a turn of mind very different from that of the amiable Thomion; little relitl for the fublime or beautiful, and a perpetual fucceflion of violent emotions. All his pic-

Vox. XV.
tures of human life femn to morr, that deformity and meamefs were the favourite objects of his attontion, and that his fonl was a conftant prey to indignation (c), difgut, and other gloomy palfions, arifing from fuch a vier of things. And it is the tendency of almoft all his writings (though it was not always the anthor's de. fign), to communicate the fame paffions to his reader: infomuch that notwithotan diag his crudition and knowledge of the world, his abilities as a popular orator ar.d man of bufinefs, the energy of his flyle, the elegance of fome of his verfes, and his extraordinary talents in wit and humour, there is reafon to doubt, whether by fudying his worts any perfon was ever much improved in piety or benevolence.

18
And thus we fee, how the compofitions oit an inge- $1 t$ is thus nious author may operate upon the lieatt, whatever be that poetry the fubject. 'The affections that prevail in the author affects the himfelf, direet his attention to objetts congenial, and evart be its give a peculiar bias to his inventive powers, and a pe-fuhjes. culiar colour to his language. Hence his work as well as face, if nature is permitted to exert herfelf freely in it, will exhibit a picture of his mind, and awa'en cor refpondent fympathies in the reader. When thefe are favourable to virtue, which they always ought to be, the work'will have that fweet pathos to which Horace alludes in the paffige above mentioned; and which we fo bighly admire, and fo warmly approve, even in thofe parts of the Georgic that defribe inarimate nature.

Hurace's account of the matter in quetion differs not from what is here given. "It is not enough (fays he*) *Ar. Poet, that poems be beautiful; let them be affetting, and v.99-111, agitate the mind with whatever paffions the poet wifhes to impart. The humam countenance, as it fmiles on thofe who fmile, arcompanies alfo with fympathetic tears thofe who mourn. If you would have me weep, you muft firlt weep yourfelf; then, and not before, fhall I be tcuched with your misfortunes - For nature firt makes the emotions of our mind correfpond with our circumflances infufing real joy, forrow, or refentment, according to the occafion : and afterwards gives the true pathetic utterance to the voice and language." This doctrine, which concerns the orator and the player no lefs than the poet, is ftrictly philofophical, and equally applicable to dramatic, to deferiptive, and indeed to every fpecies of interefting poetry. The poet's fenfibility mult firt of all engage him warmly in his fubjert, and in every part of it; otherwife he will labour in vain to interelt the reader. If he would paint external nature, as Virgil and Thomfon have done, fo as to make her amiable to others, he mult firlt be enamoured of her himfelt; if he would have his heroes and heroines ipeak the language of love or forrow, devotion or conrage, ambition or anger, benavolence or pity, his heart mult be fuiceptible of thofe emotions, and in fome degree feel them, as long at leaft as he employs himfelf in framing words for them ; being affured, that

He beft fhall paint them who can feel them moft.

$$
\text { Popi's Eloifor, v. } 366 .
$$

Z
(c) For part cf this remark we have his own authority, often in his letters, and very explicitly in the Latin epitaih which he compofed for himfelf:-"ubi feva indignatio ulterius cor laccrare nequit." See his laft evill and tiglement

The'true poet, chercfore, mult not only ftudy nature, and how the teality of things, but muf alfo pollefs fancy to invent additional decorations; judgment, to direet him in the choice of fuch as accord with verifimilitude ; and feufibility, to enter with ardent emotions into crery part of his fubject, fo as to transfufe into every part of his work a pathos and energy fuflicient to raife correfponding emotions in the reade.
'The hiftorin and the poct (Fays Ariftotle *) differ in this, that the former exhibits things as they are, the latter as they might be:"-i.e. in that fate of perfection which is conflilent with probability, and in wheh, for the fake of our own gratification, we with to tind them. If the poet, after all the liberties he is allowed to t:the with the truth, can produce nothing more exquifite than is commonly to to be met with in hiltory, his reader will be difappointed and diffitisfied. Poetical reprefentations muft therefore be framed after a pattern of the ligheft probable perfection that the genius of the work will admit:-external nature mult in them be more picturefque than in reality; action more animated; fentiments more expreffive of the feelings and character, and more fuitable to the circumfances of the fpeaker; perfonages better accomplithed in thofe qualites that ruife admiration, pity, terror, and other ardent emotions; and events more compact, more clearly connected with caufes and confequences, and unfolded in an order more flatering to the fancy, and more interefting to the paffions. But where, it may be faid, is this pattern of perfection to be found? Not in real nature ; otherwife hifory, which delineates real nature, would alfo delineate this pattern of perfection. It is to be found only in the mind of the poet; and it is imafrimation, regulated by knowledge, that enables him to form it.

In the begianing of life, and while experience is confined to a fmali citcle, we admire every thing, and are pleafed with very moderate excellence. A peatant thinks the hall of his landlord the fineft apartment in the univerfe, liftens with rapture to the frolling ballad-finger, and wonders at the rude wooden cuts that adorn his ruder compofitions. A child looks upon his native village as a town; upon the brook that runs by as a river; and upon the meadows and hills in the neighbourhood as the moft fpacious and beautiful that can be. But when, after long abfence, he returns in his dealining years, to vifit, once before he die, the dear fpot that gave him birth, and thofe feenes whereof he remembers rather the oi iginal charms than the exaet propertions; how is he difappointed to find every thing fo debafed and fo diminithed: The hills feem to have funk into the ground, the brook to be dried up, and the village to be forraken of its people; the pirtih church, Itripped of all its fancied magnificence, is become low, gloomy, and narrow; and the fields are now only the miniature of what they were. Had he never left this fpot, his notions might have remained the fame as at tirt ; and had he travelled but a little way from it, they would not perhaps have received any material enlargement. It fecms then to be fiom cbfervation of many things o the fime or fimilar kinds, that we acquire the talent offorming ideas more perfect than the real objects thit he imnedintely around us: and thefe deas we may improve sradually more and more, according to the vivacity oi cur mind, and extent of our experience, till at
lat we come to raife them to a degree of perfection fuperior to any thing to be found in reallife. There can. not fure be any myftery in this doctrine; for we think and fpeak to the fime purpofe every day. Thus nothing is more common than to fay, that fuch an artift excels all we have ever known in his profeflim, and yet that we can till conceive a fuperior performance. A moralift, by bringing together into one vicw the feparate virtues of many perfons, is enabled to lay down a fyftem of duty more perfect than any he has ever feen excmplified in human conduct. Whatever be the cmo. tion the poet intends to raife in his reader, whether admiration or terror, joy or forrow; and whatever be the object he would exlibit, whether Venus or Tifiphone, Achills or Therfites, a palace or a pile ef ruins, a dance or a battle; he generally copies an idea of his own imagination: confidering each quality as it is found to exift in feveral individuals if a fpecies, and thence forming an aifemolage more or lefs perfect in its hind, according to the purpofe to which he means to apply it.

Hence it would appear, that the ideas of poctry are poetica rather general than fingular; rather collented from the concep examination of a pecies or clafs of things, than copied tions $n$ from an individual. And chis, according to Arittotle, is in fact the cafe, at leaft for the moft part; whence thit critic determines, that poetry is lomething more exquilite and more philofophical than hifory *. The hi- - l'oetil Itorian may defcribe Bucephalus, but the poet delineates a war-herie ; the former mult have feen the animal he fpeaks of, or received authentic information concern. ing it, if he mean to defcribe it hiftorically; for the latter, it is enough that he has feen feveral animals of that fort. The formor tells us, what Achilles actually did and faid; the latter, what fuch a fpecies of human character as that which bears the name of Achil. les would probably do or fay in certain given circumftances.

It is indecd true, that the poet may, and often does, copy after individual objects. Homer, no doubt, took his characters from the life; of at leatt, in forming them, was careful to follow tradition as far as the nature of his plan would allow. But he probably took the freedom to add or heighten iome qualities, and take away others; to make Achilles, for example, Itronger, perhaps, and more impetuous, and more eminent for filial affection, and Hector more patriotic and more amiable than he really was. If he ha: not done this, or fomething like it, his work would have been rather a hiftory than a poem; would have cahibited men and things as they were, and not as they might have been ; and Ackilles and Hicfor would have been the names of individual and real heroes; whereas, according to Ariforle, they are rather to be confiderest as two diftind modifications or fpecies of the heroic character. Shakefperre's account of the elifth of Dover comes fo near the truth, that we cannot doubt of its laving been written by one who had feen them: but he who takes it for an exact hitorical defeription, will be furprifed when he eomes to the place, and finds thofe clifs not half fo lofty as the poet had made him believe. An hiftorian would be to blame for fuch amplification ; becaufe, being to deferibe an individual precipice, he ought to tell us juft what it is; which if he did, the defcription would fuit that place, and perhaps no other
in the whole world. But the poet means oaly to give in an idea of what fuch a precipice may be; and therciore his defription may perhaps be cguntily applicable to many fuch chalky precipices on the feathore.

This method of copying after general ideas formed by the artill from obicrvation of many individuals, difinguifles the ltalime and all the fublime painters, frons the 1)utely and their imitators. Thefe give us bare nature, with the imperfections and pecularities of individual things or perfons; but thofe give nature impreved as tar as probability and the defign of the piece will admit. T'enicres and Hogarth draw faces, and figures, and drefies, from real life, and prefent manners; and therefore their pieces mut in fome degree lofe the effect, and beome aukwa:d, when the pretent fahtions become obfolete. - Raphacl and Reynolds take their medcls from gencral nature, avoiding, as far as pofible, (at leatit in all their gieat performances), thoic peculiarities that derive their beauty from more fallion; and therefore their works mult give pleafure, and appear elegant, as long as men arc capable of forming general idens, and of judging from them. The lat-mentioned incomparable artift is particularly obfervant of chldren, whofe looks and attitudes, being lefs under the controul of art and local manners, arc more characterifical of the fpecies than thofe of men and women. This field of obfervation has fupplied him with many fine figures, particularly that moft exquifite one of Comedy, ftruggling for and winning (for who could refilt her!) the aftections of Garrick:-a figure which could never have occurred to the imagination of a painter who had confined his views to grown perions looking and moving in all the formality of polite life; -a figure which in all ages and countries would be pronounced natural and engaging ;whereas thofe human forms that we fee every day bowing and courtefying, and ferutting, and turning out their toes fecundum artom, and dreffed in rufles, and wigs and flounces, and hoop-petticoats, and full-trimmed fuits, would appear elegant no further than the prefent farhions are propagated, and no longer than they remain unaltered.

There is, in the progrefs of human fociety, as well as of human life, a period to which it is of great importance for the higher order of pocts to attend, and from which they vill do well to take their characters, and manners, and the era of their events; namely, that wherein men are raifed above favage life, and confiderably improved by arts, government, and converfation ; but not advanced fo high in the alcent towards politenefs, as to have acquired a habit of difguifing their thoughts and paffions, and of reducing their behaviuur to the uniformity of the mode. Such was the period which Hom r had the good fortune (as a poer) to live in, and to celebrate. This is the period at which the manners of men are moft pifturelique, and their adventures mot romantic. This is the period when the appetites unperverted by luxury, the powers unenervated by effeminacy, and the houghts difengaged from artificial reftraint, will, in perions of fimilar difpofitions and circumitances, operate in nearly the fame way and when, confequently, the characters of particular men will approach to the nature of poetical or general idea, and, if well imitated, give pleafure to the whole, or at lealt to a great majority of mankind.

But a character tinctured "ith the fanhions of prdite ife ne roetical would not be fo gencrilly interefling. Like a human characters. figure adjutled by a modern dancing-matter, and daet: fed by a modern taior, it may have at good eficet in fatire, comedy, or farce: but if introluced into the higher peetry, it would be admired by thofe only who had leuned to a lmire nothing but prefent fathines, and by them no longer tha: the pretent fathions lafted; and to all the rett of the world would appear auk. ward, unaffecting, and pee haps ridiculons. Bat A. chilles and Sarpedon, Diomede and Hestor, Nefor and Ulyfles, as drawn by Homer, nuft in all ages, independently on falhiom, cormm the attention and admiration of mankind, fhel have the qualitics that are uaiverfally known to belong to human nature; whereas the modern finc gentlemin is difinguifhed by qualities that beleng only in a particular age fociety, and corncr of the woild. We fpeak not of moral or intelleciual virtues, which are objects of artmiration to every age; but of thofe outward accompl/hments, and that particular temperature of the pafions; which form the moft perceptible part of a human character.As, therefore, the politician, in difcufing the rights of mankind, mult often allude to an imaginary fate of nature ; fo the poet who intends to raife admiration, pity, terror, and other important cmotions, in the generality of mankind, efperially in thofe readers whofe minds are moft improved, mult take his pictures of life and manners, rather from the heroic period we now ipeak of, than from the ages of refincment; and muft therefore (to repeat the maxim of Arifotle) " exhibit things, not as they are, but as they might be."

## Sect. IV. Of Poetical Charafers.

Horace feems to think, that a competent know- Requfites ledge of moral philofophy will fit an author for affign- to the deliing the fuitable qualities, and duties to each poetical neation of perfonage: (Art. Poct. v. 309.-316.). The maxim phariacters may be true, as far as mere morality is the aim of the poet ; but cannot be underfood to refer to the delineation of poetical characters in general: for a thorough acquaintance with all the moral philofophy in the world would not have enabled Blackmore to paint fuch a perfonage as Homer's Achilles, Shakefpeare's Othello, or the Satan of Paradife Lof. To a competency of moral fcience, there muft be added an extentive knowledge. of mankind, a warm and elevated imagination, and the greateft fenifibility of heart, before a genius can be formed equal to fo difficult a tafk. Horace is indeed fo fenfible of the danger of introducing a new character in poetry, that he even dilcourages the attempt, and advifes the poet rather to take his perfons from the ancient authors, or from tradition : $1 b i d . v$. 119.-130.

To conceive the idea of a good man, and to invent and fupport a great poetical charater, are two very different things, however they may feem to hive bee:1 confounded by fome late critics. The firl is eafy to any perfon fufficiently inftructed in the duties of life: the laft is perhaps of all the efforts of human genius the nof dificult; fo very difficuit, that, though attempted by many, Homer, Shakefpeare, and Niltor, are alnoof the only authors who have fucceeded in it. But charaders of perfen virtue are not the moft pro-

## 180

P O E
or Boctical Characters

25
Which, though elcvated,
flauld par-
take of the frailisur fore wines for the vices of i'me principal perionages, the lind humanity; would not be either fo imterelting or to moral: the molt moving and moft cventful parts of the Emeid are thofe that defcribe the effedt of mulawful paffion:the moit infructive tragedy in the world, we mean Micheth, is founded in crimes of dreadful enormity: -and if Miiton had not taken into his plan the fall of our firft parents, as well as their ftate of imnocence, his divine poem mult have wanted much of its pathos, and could not have been (what it now is) fuch a treafurc of important knowledge, as no other uninfpired witer ever eomprehended in fo fmall a compafs.Virtue, like truth, is uniform and unchangeable. We may anticipate the part al good man will act in any given circumftances; and therefore the event that depends on fuch a man mult be lefs furprifing than thofe which proceed from palfion; the vicilfitudes whereof it is frequently impolible to forefec. From the violent temper of Achilles, in the Iliad, fpring many great incidents; which could not have taken place, if he had been calm and prudent like Ulyffus, or pious and patritotic like Eneas:-his rejection of Agamemnon's offers, in the ninth book, arifes from the violence of his refentment; his yielding to the requeft of Patroclus, in the 16 th, from the violence of his friendhip (if we may fo (peak) counteracting his refentment; and his yeftoring to Priam the dead body of Heftor, in the $24^{\text {th }}$, from the violenee of his affection to his own aged father, and his regard to the command of Jupiter, counteracting, in fome meafure, both his forrow for his friend, and his thirft for vengeancc.-Befides, exeept where there is fome degree of vice, it pains us too exquifitely to fee misfortune; and therefore poetry would ceafe to have a pleafurable influence over our tender paffions, if it were to exhibit virtuons characters only. And as in life, evil is neceffary to our moral probation, and the poflibility of crror to our intellectual improvement ; fo bad or mixed characters are uffeful in poetry, to give to the good fuch oppofition, as puts them upon 26 difplaying and exercifing their virtue.
Whild the All thofe perfonages, however, in whofe fortune perfonagcs the poet means that we fhould be interefted, muft have in whole fate the poet mean that we fhould be ioterefted ought to have good and great qualities. of necefficy be, infinitely inadequate, ever fatisfy the buman mind. Poetry, aecording to the belt critics, is an imiation of human action; and therefore poetical charagers, though clevated, hould fill partake of the paffions and frailties of humanity. If it were unt
per for poetry. It feems to he agrced, that the Deity floould not be introduced in the machinery of a poetic.ll fable. To afcribe to him words and actions of our own invention, feems very unbecoming; nor cim a poetical defription, that is known to be, and mult per direction to human fenfibility; and, without any perverfion of our faculties, or any confufion of right and wrong, to make the fame perfon the object of very different emotions, of pity and hatred, of admiration and horror. Who does not eftem and admire Macbeth for his courage and generolity? who does not pity him when befet with all the terrors of a pregnant imagination, fuperftitious temper, and awakened confience? who does not abhor him as a monfter of cruelty, treachery and ingratitude? His good quaiities, by drawing us near to him, make us, as it were, eye-wituefles of his crime, and give us a fellow-feeling of his remorfe; and therefore, his example cannot fail to have a powerful effect in cherifhing our love of virtue, and fortifying cur minds againft criminal im. prefficns: whereas, had he wanted thofe good qualities, we flould have kept aloof from his concerns, or viewed them with a fuperficial attention ; in which cafe his example would have had little more weight than that of the robber, of whom we know nothing, but that he was tried, condemned, and executed, Satan, in Paradife Lolt, is a character drawn and fupported with the moft confummate judgement. The old furies and demons, Hecate, Tifiphone, Alecto, Megara, are objects of unmixed and unmitigated abharrence; Tiisus, Enceladus, and their brethern, are remarkable for nothing but impiety, deformity, and valtnefs of fize; Pluto is, at belt an infipid perfonage; Mars, a hairbrained ruffian ; Taffo's infernal tyrant, an ugly and overgrown monfter: But in the Miltonic Satan, we are forced to admire the majelty of the ruined archangel, at the fame time that we deteft the uneonquerable depravity of the fiend. "But, of all poetieal cha- Deattic" racters, (fays the elegant critic from whom we are Efays. extracting), the Achilles of Homer (D) feems to me the moft exquifite of invention, and the moft highly finifhed. The utility of this character in a moral view is obvious; for it may be confidered as the fource of all the morality of the Iliad. Had not the generous and violent temper of Achilles determined him to patronife the augur Chalcas in defiance of Agamemnon, and afterwards, on being affronted by that vindictive commander, to abandon for a t me the common cuufe of Greece; - the fatal effects of diffenfion among contederates, and of capricous and tyrannical hehaviour in a fuvereign, would not have been the leading moral of

Homer's
(D) "I fay the Acbilies of How¢R. Latter authors have degraded the character of this hero, by fuppofing every part ot his body invulnerable except the heel. I know not how often I have heard this urged as one of Homer's abfurditics; and indeed the whole Iliad is one conimued abfurdity, on this fuppolition. But Homer all along makes his hero equally liable to wounds and death with other men. Nay, to prevent all miftakes in regard to this matter, (if thoie who cavil at the poct would but read his wr rk), he athua'ly wiunds him in the right arm by the lance of Afteropus, in the batte near the river Scamander." See Iilad, wxi. ver. $16 \pm .-163$.
ca! Homar's poetry ; ronr could Hedor, Sarpacion, Eneac, Ulsfes, and the nther amidble herncs, have been brought forward to fignaliee their virtues, and to recommend themfelves to the efteem and imitation of mankins.
"They who form their judgment of Achilles f:om the imperfed fketch given of him by Horace in the Art of Poetry, ( v . 121, 122.) ; and confider him only as a hateful compofition of anger, revenge, ficrecnefs, 'obftinacy, and pride, can never enter into the views of Homer, nor be fuitably affeted with his narration. All thefe vices are no doubt, in fome degree, combined in Achilles: but they ate tempered with qualities of a different fort, which renjer him a molt interelting character, and of courfe make the liiad a mot interciting foem. Every rcader abhors the faults of this hero: and yet, to an attentive reader of Homer, this l.ero mult be the object of effecm, admiration, and pity; for he las many good as well as bad affections, and is equally violent in all: Nor is be pofielled of a fingle vice or virtue, which the woaderful art of the poet has not made fublervient to the defign of the poem, and to the progrels and cataftrophe of the action; fo that the hicro of the Iliad, confidered as a poctical perfonage, is juft what he fhould be, neither greater nor lefs, neither worfe nor better.-He is everywhere diftinguifhed by an abhorrence of oppretion, by a liberal and elevated mind, by a paflion for gimry, and by a love of truth, freedom, and fincerity. He is for the moft part attentive to the duties of reli,yion ; and, except to thofe who have injured him. courteous and kind: he is affectionate to his tutor Phenix; and not only pities the misfortunes of his enemy Priam, but in the moft foothing manner adminilters to him the beft confolation that Homer's poor theolugy conld furnifh. Though no admirer of the caufe in which his evil dentiny compels him to engage, he is warmly attached to his native land; and, ardent as he is in vengeance, he is equally fo in love to his aged father Pe leus, and to his friend Patroclus. He is not luxurious like Paris, nor clownill like Ajax; his accomplifhments are princely, and his amuiements worthy of a hero. Add to this, as an apology for the vehemence of his anger, that the affront he had received was (according to the manners of that age) of the moft atrocious nature ; and not only unprovoked, but fuch as, on the part of Agamemnon, betrayed a brutal infenfibility to merit, as well as a proud, felfinh, ungratcful, and tyrannical difpofition. And though he is often inexcufably furious; yet it is but jultice to remark, that he was not naturally cruel ( E ) ; and that his wildeft outrages were fuch as in thofe rude times might be expected from a violent man of invincible firength and valour, when exafperated by injury, and frantic with forrow.-Our hero's claim to the admiration of mankind is indifputable. Every part of his charaiter is fublime and aftonilhing. In his perfon, be is the Atrongeft, the fiwifteft, the moft beautiful of men:--lhus laft circumftance, however, occurs not to his own obfervation, being too trivial to attract
the notice of fo great a mind. The Fates ind plu: it of foetical in his power, cither :o rcillm home befora the end of Charaftersthe war, on to remain at 'Troy:-if he chefe the former, he would eajoy trauquility and happincfs ia: h:s own country to a good old age; if the latter, lee muit perifh in the blocm of his youth:- his affeation to his father and native country, and his hatred to Agamemnon, Atrongly urged him to the firft ; but a defire to areage the death of his friend determines him to ace cept the latt, with all its confequences. This it once difplays the greatnefs of his fortitude, the warmth of his friendthip, and the vinlence of his fanguinary paffions: and it is this that fo wfen and fo powerfully recommends him to the pity, as well as admiration, of the attentive reader."

It is equally a proof of rich invention and exact of all Ho judgment in Homer, that he mixes fome good qualities in all his bad charaters, and fome degree of imperfection in almoft all his good ones.-Agamemnon, notwithfanding his pride, is an able general, and a valiant man, and highly efteemed as fuch by the greater part of the army.-Paris, though effeminate, and vain of his drefs and perfon, is, however, good-artured, patient of reproot, not deftitute of courage, and eminently fkilled in mufic and other fine arts.-Ajax is a huge giant; fearlefs rather from infenfibility to danger, and confidence in his mafiy arms, than from any nobler principle; boalful and rough ; regardlefs of the gods, though not downight impious: yet there is in his manner fomething of Beattie, franknefs and blunt fincerity, which entitle him to a at fupras, Chare in our efteem; and he is ever ready to aflif his countrymen, to whom he renders good fervice on many a peribus emergency. -The charater of Helen, in fpite of her faults, and of the many calamities whereof the is the guilty caufe, Hnmer has found means to recommend to our pity, and almoft to our love; and this he does, without feeking to extenuate the crinte of Paris, of which the mort refpectable perfonages in the poem are made to feak with becoming abhorrence. She is fo full of remorfe, fo ready on every occafion tn condemn her paft conduct, fo affectionate to her friends, fo willing to do juftice to every body's merit, and withal fo finely accomplifhed, that fhe estorts our admiration, as well as that of the Trojan femators.Menelaus, though fufficiently fenfible of the injury he had received, is yet a man of moderation, clemency, and good-nature, a valiant foldier, and a moft affectionate brother: but there is a dah of vanty in his compofition, and he entertains rather too high an opinion of his own abilites, yet never overlooks nor undervalues the merit of others.-Priam would claim unreferved elteem, as well as pity, if it were not for his inexculeable waknefs, in gratifying the humour, and by indulgence abetting the crimes, of the moft worthleis of all his children, to the utter ruin of his people, fanily, and kingdom. Madane Dacier fuppofes, that he had lift his authority, and was ofliged to fall in with the politics of the times: but of this there appears no evidence;
(E) Sec Iilad xxi. 100. and xxiv. 485.-673-. In the nirft of thefe paffages, Achiilcs himfelf declares, that before Patroclus was flain, he of ien fated the lives of his enemies, and took pleafure in doing it. It is Arange, as Dr Deattic obfervcs, that this fhould lee left out in Pope's Tranflation.
of Poetical evicience; on the contrary, he and his unworthy favouCharaders. rite Paris feem to have been the only perfons of dif. tinction in Troy who wele averfe to the reftoring of He len. Priam's fuible (if it can be called by fo foft a name), however faulty, is not uncommon, and has often produced calamity both in private and public life. The Scripture gives a memorable inftence in the hillory of the grod old Eli._-Sarpedon comes nearer a perfef character than any other of Homer's herocs; but the part he hats to act is thort. It is a chataker which one could hardly have expected in thofe rude times: a fovereign prince, who confiders himfelf as a magiltrate fet up by the poople for the public good, and therctore bound in honour and gratitude to be himfelf their example, and fudy to excel as much in virtue as in rank and authority. - Hecior is the farouritc of every reader, and with good reafon. To the truet valour he joins the mott gencrous patriotifn. He abominates the crime of Paris: but not being able to prevent the war, he thinks it his duty to defend his country, and his father and fovercign, to the lait. He too, as well as A. chilles, forefees his own death; which heightens our compafion, and raifes our idea of his magnanimity. In all the relations of private life, as a fon, a father, a hufband, a brother, be is amiable in the higheft degree; and he is dittinguifhed among all the herocs for tendernefs of affection, gentlanefs of manners, and a pious regrard to the duties of religion. One circumftance of his character, ftrungly exprelifive of a great and delicate mind, we learn from Helen's lamentation overhis dead body, that he was almoft the only perfon in Troy who had always treated her with kindaefs, and never uttered one reproachful word to give her pain, nor heard others reproach her withut blaming them forit. Some tendeacy to oftentation (which, however, may be pardonable in a commander in chief), and temporary fits of t midity, are the only blemifhes difcoverable in this hero; whofe portrait Homer appears to have drawn with an affectionate and peculiar attention.

By afcribing fo many amiable qualities to Hector and and fome others of the Trojans, the poet interclts us in the fate of that people, notwithfanding our being continually kept in mind that they are the injurious party. And by thus blending good and evil, virtue and trailty, in the compofition of his characters, he makes them the more conformable to the real appearances of human nature, and more ufeful as examp.es for our inprovement; and at the fame time without hurting verifimilitude, gives every necellary embellifhment to particular parts of his poem, and variety, coherence, and animation, to the whole fable. And it may alfo be oblerved, that though feveral of his characters are complex, not one of them is made up of incompatible parts : all are natural and probab!e, and fuch as we think we have met with, or might have met with in our intercourfe with mankind.

From the fime extenfive views of good and evil, in all their firns and combinations, Homer has been enabled to make each of his characters perfectly ditinet in itfelf, and different from all the relt ; infomuch, that before we come to the end of the Iliad, we are as well acquainted with his heroes, as with the faces and tempers of rur mof familiar friends. Vurgil, $b_{j}$ con ming limfelf to a few general ideas of fidelity and furtitude, has made his fubordinate heroes a very good fort of people;
but they are all the fame, and we have no clear know- of $P_{0}$ ledge of any one of them. Acathes is faithful, and chara Gyas is brave, and Cloanthus is brave; and this is all we can fay of the matter. We fee thefe heroes at a difance, and have fome notion of their thape and fize; but are not near enough to diftinguifh their features; and every face feems to cxhibit the fame faint and ambiguous appearance. Dut of Homer's heroes we know every particular that can be known. We eat, and drink, and talk, and figlat, with them: we fee them in action and out of it; in the field and in their tents and houfes: the very face of the country about 'l'roy we feem to bc as well acquainted with as if we had been there. Similar characters there are among thefe horoes, as there are fimilar faces in every fociety; but we never miftake one for another. Neftor and Ulyfies are both wife and both eloquent: but the widom of the former feems to be the effict of experience; that of the latter of genins: the eloquance of the one is fweet and copious, but not always to the purpofe, and apt to derrenerate into forytelling; that of the other is clofe, emphatical, and perfuafive, and accompanied with a peculiar modefty and fimplicity of manner. Honter's heroes are all valiant ; yct each difplays a modification of valuur peculiar to himfelf; one is valiant from principle, another from conItitution; one is ralh, ano:her cautious; one is impetuous and headfrong, anotherimpetuous, but tractable; one is cruel, another merciful ; one is infolent and ollentatious, another gentle and unalluming ; one is vain of his perfon another of his ftrength, and a third of his family. -It would be tedions to give a complete enumeration. Almoft every fpecies of the heroic character is to be found in Homer.

Of the agents in Paradife Loft, it has been obferved*, "Jo that " the weakeft are the higheft and nobleft of human beings, the original parents of mankind; with thofe actions the elements confented; on whofe rectitude or deviation of will depended the ftate of terreftrial nature, and the condition of all the future inhabitants of the globe. Of the other agents in the poem, the chief are fuch as it is irreverence to name on flight occafions: the seft are lower puwers;

## Of which the leaft could wield

 Thefe elements, and arm him with the force Of all the regions :Powers, which only the controul of Omnipotence reftrains from laying creation wafte, and filling the vaft expanfe of face with ruin and confufion. To difplay par the motives and actions of beings thus fuperior, fo far as Lof human reafon can examine, or human imagilation reprefent them, is the tafk which Milton mondertook and performed. The characters in the Paradie La it, which admit of examination, are thofe of angels and of men: of angels good and evil ; of man in his innocent and finful ftate.
"Among the angels, the virtue of Raphael is mild and Mil placid, of eafy condefcenfion, and free communication: fuce that of Michael is regal and lofty, attentive to the dig- his nity of his own nature. Abdiel and Gabriel appear oc- taki calionally, and act as every incident requires : the folitary fidelity of Abdiel is very amiably painted.
" Of the evil angels, the characters are more diverfified. To Satan fuch fentments are given as fuit the

I. The origin of nations, an J the beginnings of great events, are little known, and ichlomintereftiry; whence the firft part of every hillory, compared with the fequel, is rimewhat dry and tecious. But a poet muth, ceven in Kow a the beginning of his work, interell the readers, and raife toem high expedition; not by any affected pamp of lyle, beghe the far lefs by ample promifes or bold protellions; but by fetting immediately before them fome incident, Atriking enough to raife curiofity, in regard buth to its caufes and to its confequences. He muf therefore take up his fors; not at the begimning, but in the middle; or rather, to prevent the work from being too long, as near the end as poffible; and afterwaids take fome proper opportunity to inform us of the preceding events, in the way of narrative, or by converfation of the perfons introduced, or by thert and natural digrefions.

The attion of both the Mliad and Odygey begins about fix weeks before its conclution; although the principal events of the war of Troy are to be found in the former: and the adventures of a ten years voyage, followed by the fuppreflion of a dangerous domeltic enemy, in the latter. One of the firt things mentioned by Homer in the lliad, is a plague which Apollo in anger fent into the Grecian army commanded by Agamemnon and now encamped before Troy. Who this Agamemnon was, and who the Grecians were; fcr what reafon they had come hither; how long the fiege had lafted; what memorable actions had been already performed; and in what condition both parties now were:-all this, and much more, we foon learn from occational hints and converfations interfperfed through the poem.

In the /Eneid, which, though it comprehends the tranfactions of feven years, opens within a few months of the concluding event, we are firl prefented with a view of the Trojan fleet at fea, and no lefs a perfon than Juno interefting herfelf to raife a form for their defruction. This excites a curiofity to know fomething further : who thefe Trojans were, whence they had come, and whither they were bound; why they had left their own country, and what had befallen them funce they left it. On all thefe points, the poet, without quitting the track of his narrative, foon gives the fullefl information : the form rifes; the Trojans are driven to A/rica, and hofpitably received by the queen of the country; at whofe defire their commander relates his adventurcs.

The action of Paradife Lof conmences not many days before Adam and Eve are expelled from the garden of Eden, which is the concluding evert. This poem, as its plan is incomparably more fublime and mare important than that of either the Iliad or Eneid, opens with a far more interelting fcene: a multitude of angels and archangels fhut up in a region of torment and darknefs, and rolling on a lake of unquenchable fire. Who thefe angels are, and what brought them into this miferable condition, we naturally wifh to know; and the poet in due time informs us; partly from the converfa. tion of the fiends themfelves; and more particularly by the mouth of a happy fpirit, fent from heaven to caution the father and mother of mankind againt temptation, and confirm their gond refolutions by unfolding the dreadful effets of impiety and difobedience.

Theadvan-
dages of the
poetical ar-
raugention.

This poetical arrangement of events, fo different from the hiftorical, has uther advantages betides thofe arifing from brevity and compantnefs of detail: it is obvioufly more affecting to the fancy, and more alarming to the paffions; and, being more fuitable to the order and the manner in which the actions of other men ftrikes our fenfes is a more exact imitation of human atrairs. I hear a fudden noife in the ftreet, and ruu to fee what is the matter. An infurrection has happened, a great miltitude is brought tugether and fomething very important is geing forward. The fcene before me is the firf thing that engages my attention; and is i:a itfeif fo interelting, that for a moment or two I look at it in filence and wonder. By and by, when I get time for reflection, I begin to inquire into the caufe of all this tumult, ind what it is the people would be at ; and one who is better informed than I, explains the affair from the beginning; or perhaps I make this out for myfelf, from the words and actions of the perfons principally concerned. This is a fort of picture or poetical arrangement, both in epic and dramatic compofition; and this plan las been followed in narrative odes and ballads both ancient and modern. - The hiftorian purfues a different method. He begins perhaps with an account of the nunners of a certain age, and of the political conflitution of a certain country; then introduces a particular perfon, gives the ftory of his birth, conncetions, private character, purfuits, ditappointments, and of the events that promoted his views, and brought him acquainied with other turbulent firits like himfelf; and fo proceeds, unfolding, according to the order of time, the canfes, principles, and progrefs of the confpiracy, if that be the fubject which he undertakes to illuftrate. It cannot be denied, that this latter method is more favourable to calm information: but the former, compared witl it, will he found to have all the advantages already fpecified, and to be more effectually produstive of that mental pleafure which depends on the pallions
II. If a work liave no determinate end, it has no meaning ; and if it have many ends, it will diltract by its multiplicity. Unity of delign, therefore belongs in fome meafure to all compofitions, whether in verfe or profe. But to fome it is more effential than to others; and to none fo much as in the higher poetry. In certain kinds of hiftory, there is unity futticient if all the events recorded be referred to one pelfon; in others, if to one period of time, or to one people, or ever to the inhabitants of one and the fame planet. But it is not enongly that the fubject of a poetical fable be the expluits of one perfon; for thefe may be of various and even ef oppolite forts and tendencies, and take up longer time t'an the nature of poetry can admit:-far lefs can a regular poem comprehend the affiars of one period or of one people :-it mult be limited to one great adton or event, to the illuftation of which all the fubordirate events muft contribute; and thefe mult be fo commedted with cne anotler, as well as with the poct's general purpole, that one cannot be chancred, tranfoted, or taken away, withont affecting the confittence sind fability if the whole*. In itfelf an incident may be interelting, it charafer well drawn, a defeription beautiful; and yet, it it di figure the general plan, or if it obtruct or incumber the main action, infead of helping it forwadd, a coricet antil would conlider it but as a gaudy
fuperfluity or fplendid deformity; like a piece of farlet of cloth fowed upon a garment of a different colour $\dagger$. Not A that all the parts of the fible either are, or can be, tie equally effential. Many defcriptions and thoughts, of +H little confequence to the plan, may be admitted for the l'o fake of variety ; and the poet may, as well as the hifo- \& 6 rian and plilufopher, drop his fubject for a time, in order to take up an affecting or inftructive digreifion.
III. The doctrine of poetical digreflions and epi- Th fodes has been largely treated by the critics. We fhall pro here only remark, that, in eltinating their propriety, digg three things are to be attended to:-cheir connestion and with the fable or fubject ; their own peculiar excellence ; per and their fubierviency to the poet's detign.
(i.) Thofe digreflions that both arife from and ter- Th minate in the fubject, like the epifode of the angel Ra- ne phael in Paradife Loft, and the tranfition to the death of wit Cæfar and the civil wars in the firft book of the Georgic, the are the molt artful, and if fuitably executed claim the higheft praife :-thofe that arife from, but do not terminate in, the fubject, are perhaps fecond in the order of merit ; like the ftory of Dido in the Aneid, and the encomium on a country life in the fecond book of the Georgic:-thofe come next that terminate in, but do not rife from, the fable; of which there are feveral in the third book of the Aineid, and in the Odyffey:and thofe that neither terminate in the fable nor rife from it are the lealt antfu]; and if they be long, cannot efcape cenfure, unlefs their beauty be very great.

But (2.) we are willing to excufe a beautiful epifode Th at whatever expence to the fubject it may be introduced. pec They who can blame Virgil for obtruding upon them the cell charming tale of Orpheus and Euridice in the fourth ${ }^{\text {an }}$ Georgic, or: Milton for the apoftrople to light in the beginning of his third book, ought to forfeit all title to the perulal of good poetry; for of fuch divine Atrains one would rather be the author than of all the books of criticifm in the world. Yet ftill it is better that an epifode pollefs the beauty of comnection, together with its own intrinfic elegance, than this without the other.

Moreover, in judging of the propriety of epifodes The and other fimilar contrivances, it may be expedient to ferv attend (3.) to the defign of the poet, as diftinguifhed to et's from the fable or fubject of the poem. The great defign, for example, of Virgil, was to interelt his countrymen in a poem written with a view to reconcile thens to the perion and government of Auguftus. Whatever, therefore, in the poem tends to promote this defign, even though it thould in fome degree hurt the contexture of the fable, is really a proof of the poet's judgment; and may be not only allowed, but applauded.-The progrefs of the ation of the Ancid may feem to be too long obftrueted in one place by the itory of Dido, which, though it rifes from the preceding part of the poem, has no influence upon the iequel; and, in another, by the epifode of Cacus, which, without injury to the fable, might have been omitted altogrether. Yet thefe epifodes, interelting as they are to us and all mankind becaufe of the tranicendent merit of the poetry, muft have been ftill more interefting to the Romans becaufe of their connection with the Roman affurs; for the one accounts poctically for their wars with Carthage; and the other not mly explains fome of their religious ceremonies, but alfogives a molt charming rural picture of thofe hills and valleys in the neighbourhod of the Tiber on which,
cal in after times, theeir majctitic city was fated to fland.-e- And if we confider, that the defign of Homer's Iliad was not only to llow the fatal effeeas of diffenfion among confederates, but alfo to inmortalize his country, and celebrate the moft diftinguifhed families in it, we fhall be inclined to think more favourably than critics generally do of fome of his long fpecches and digrefions; which, though to us they may feem trivial, mult have been very interefting to his countrymen on account of the genealogies and private hiftury recorded in them.Shakefpeare's hiftorical plays, confidered as dramatic fables, and tried by the laws of tragedy and comedy, appear very rude compofitions; but if we attend to the poet's defign (as the elegant critic * has with equal truth and beauty explained it), we fhall be forced to admire his judgment in the general conduct of thofe pieces, as well as unequalled fuccefs in the execution of particular parts.

There is yet another point of view in which thefe digreflions may be confidered. If they tend to elucidate any important character, or to introduce any intetefting event not otherwife within the compafs of the poem, or to give an amiable difplay of any particular virtue, they may be entitled, not to our pardon only, but even to our admaration, however loofely they may hang upon the fable. All thefe three ends are effected by that molt beautiful epifode of Hector and Andromache in the fixth book of the Iliad; and the two laft, by the no lefs beautiful one of Euryalus and Nifus in the ninth of the Eneid.
IV. And now, from the pofition formerly eftablifhed, that the end of this divine art is to give pleafure, it has been endeavoured to prove, that, whether in difplaying the appearances of the material univerfe, or in imitating the workings of the human mind, and the varieties of buman character, or in arranging and combining into one whole the feveral incidents and parts whereof his fable conlifts, - the aim of the poet mult be to copy nature, not as it is, but in that flate of perfection in which, confiltently with the particular genius of the work, and the laws of verifimilitude, it may be fuppofed to be.

Such, in general, is the nature of that poetry which is intended to raife admiration, pity, and other ferious emotions. But in this art, as in all others, there are different degrees of excellence ; and we have hitherto directed our view chiefly to the higheft. All ferious poets are not equally folicitous to improve nature. Euripides is faid to have reprefented men as they were; Sophocles, more pnetically, as they fhould or might be $\dagger$. Theocritus in his Idyls, and Spencer in his Shepherd's Calendar, give us language and fentiments more nearly approaching thofe of the Rus verum ct barbarum $\ddagger$, than what we meet with in the Paftorals of Virgil and Pope. In the hiftorical drama, human characters and events mult be according to hiftorical truth, or at leaft not fo remote from it as to lead into any important mifapprehenfion of fart. And in the hiftorical epic poom, fuch as the Pharfalia of Lucan, and the Campaign of Addifon, the hiforical arrangement is preferred to the poetical, as being nearer the truth. Yet nature is a littlc be improved even in thefe poems. The perfons in Shakefpeare's hiftorical plays, and the herocs of the Pharfalia, et, talk in verfe, and fuitably to their characters, and with

Vol. XV.
$T R K$
a readinefs, beauty, and larmony of exprefion, not to of boctical be met with in real life, nor even in hiftory: f feeches Arrangeare invented, and, to heighten the defcription, circum- ment, \&c. ftances added, with great latitude: real events ate rendered more compact and more ftrictly deperdent upon one another ; and fictitious ones brought in, to elucidate human characters and diverfify the narration.

The more poetry improves nature, by copying after general ideas collected from extenfive obfervation, the more it partakes (according to Arifotle) of the nature of philofophy ; the greater Aretch of fancy and of cbfervation it requires in the antit, the better chance it has to be univerfally agreeable.
Yet poetry, when it falls thort of this perfection, when premay have great merit as an inftrument of both inftruc- try fallo tion and pleafure. To moft men, fimple unadorned fhart of nature is, at certain times, and in certain compofitions, this perfeimore agreeable than the moft elaborate improvements have grese of art; as a plain fhort period, without modulation, meritin gives a pleafing variety to a difcourfe. Many fuch other reportraits of fimple nature there are in the fubordinate frects. parts both of Homer's and of Virgil's poetry : and an excellent effert they have in giving probability to the fiction, as well as in gratifying the reader's fancy with images diftinct and lively, and eafily comprehended. The hiftorical plays of Shakefpeare raife not our pity and terror to fuch a height as Lear, Macbeth, or Othello; but they intereft and inftruct us greatly netwithftanding. The rudeft of the eclogues of Theocritus, or even of Spencer, have by fome authors been extolled above thofe of Virgil, becaufe more like real life. Nay, Corneille is known to have preferred the Pharfalia to the Æneid, perhaps from its being nearer the truth, or perhaps from the fublime fentiments of foical morality fo forcibly and fo offentatioufly difplayed in it.

Poets may refine upon nature too much as well as too little; for affectation and ruflicity are equally remote from true elegance. The Ayle and fentiments of comedy fhould no doubt be more correct and more peinted than thofe of the mof polite converfation: but to make every footman a wit, and every gentlemeri and lady an epigrammatif, as Congreve has done, is an excefive and faulty refinement. The proper medium has been hit by Menander and Terence, by Shakefpeare in his happier icenes, and by Garrick, Cumberland, and fome others of late renown. To defcribe the paffion of love with as little delicacy as fome men fpeak of it would be unpardonable; but to transform it into macre Platonic adoration is to run into another extreme, lefs criminal indeed, but too remote from univerfal truth to be univerfally interefting. To the former extreme Ovid inclines, and Petrarch and his imitators to the latter. Virgil has happils avoided beth : but Milton has painted this paffion as diftinct from all others, with fuch peculiar truth and beauty, that we cannot think Voltaire's encomiam too bigh, when he fays, that love in all other poetry feems a weaknefs, but in Paradife Loft a virtue. 'There are many good ftrokes of Nature in Ramfay's Gentle Shepherd ; but the author's paffion for the rus verum betrays him into fome indelicacies: a cenfure that falls with greater weight upon Theocritus, who is often abfolutely indecent. The Italian paftoral of Taffo and Guarini, and the French of Fontenelle, run into the oppofite extreme (though in fome parts beautifully fimple), and difplay a fyltem of rural manners fo quaint A a and
of Potiial and affected as to outrage all probability. In fine, admire; and thus, in the works of poets down through of toe though mediocrity of execution in poetry be allowed to deferve the doom pronounced upon it by Horace; yet it is true, notwithitanding, that in this art, as in many other good things, the point of excellence lies in a middle between two extremes; and has been reached by thofe only who fought to improve nature as far as the genius of their wolk would permit, keeping at an equal diftance from rufticity on the one hand, and affectod elegance ca the other.

## Sect. VI. Of Pootical Language.

12
Words in peretry io be chore: for theis fenfe and? for their found.

- lifiays, lart ii. chap. I,

44
inprused. ess far as m.s) be
crufinent wath probability, \&く。

Words in poctry are chofen, firlt, for their fenfe; and, fecondly, for their found. That the firdt of thefe grounds of choice is the more excellent nobody can deny. He who in literary matters prefers found to fenfe is a fool. Yet found is to be attended to even in profe, and in verfe denands particular attention. We fla all conficler poetical language, firt, as significant; and, fecondly, as susceftele of harmony.

## fir. Of Poctical Language confutiod as significint.

$I_{F}$, as it hats been endeavoured to prove, poetry be imitative of mature, poetical fictions of real events, poetical images of real appearances in the vifible creation, and poetical perfonages of real human characters; it would feem to follow, that the language of poctry mult be an imitation of the language of nature.

According to Dr Beattie*, that language is natural which is fuited to the fpeaker's condition, character, and circumftances. And as, for the moft part, the images and inntiments of ferious poetry are copied from the imazes and fentiments, not of real, but of improved, nature ; fo the language of ferious poetry muft (as hinted already) be a tran!eript, not of the real language of nature, which is often dillonant and rude, but of natural language improved as far as may be confifent with probability, and with the fuppofed character of the fpeaker. If this be not the cafe, it the l.nnguage of poetry be fuch noly as we hear in conver fation or read in hiftory, it will, inftead of delight, britg difippointment: hecaufe it will fall hort of what we expect from an art which is recommended rather by ita pleafurable qualities than by it intrinfic utility; and to which, in order to render it pleating, we grant ligher ptivileges than to any other lind of literary computition, or any other mose of human language.

The next inquiry mult therefore be, "What arc thofe improvements that peculianly belong to the language of poetry:" And thefe may be comprehended under two heads; foelical woords, and tropes and fyures.

## Art. I. Of Poetical Worrs.

Ore mode of improvement peculiar to poetieal diction refults from the ufe of thofe words and phrafes which, becoule they arciy occur in profe, and frequently in verfe, are by the grammarian and lexicographer termed poe:tal. In thefe fome languages abound more than others; but no language perhaps is altogether withont ther,, and perlaps no language can be fo in which any number of good poems have heen written: for poetry is tetter remembered than profe, efpecially by poetical authors, who will always be apt to imitate the phrafe. dogy of thote they lave been accuftomed to read and
fuccellive generations, certain phrafes may have been conveyed, whicl, though orig:nally perhaps in common ufe, are now confined to pnetical compofition. Profe writers are not fo apt to imitate one another, at leaft in words and phrafes, both becaufe they do not fo well remember one another's phrafology, and alfo becaufe their language is lefs artificinl, and mult not, if they would make it eafy and flowing (without which it cannot be elegant ), depart effentially frum the fyle of correst convertation. Poets, too, on account of the greater difficulty of their numbers, have, both in the choice and in the arrangement of words, a better claim to indul. gence, and ftand more in need of a difcretionary power.

The language of Homer differs materially from what was written and fpoken in Greece in the days of Socrates. It differs in the mode of infection, it differs in the fyntax, it differs even in the words: fo that one might read Homer with eafe who could not read Xenophon; or Xenophon, without being able to read Homer. Yet we cannot believe that Homer, or the firft Greek poet who wrote in his fyle, would make choice of a dialcet quite different from what was intelligible in his nwn time: for poets have in all ages written with a view to be read, and to be read with pleafure; which they could not be if their diction were hard to be underitood. It is more reafonable to fuppofe that the language of Homer is according to fome ancient dialect, which, though not perhaps in familiar ufe among the Greeks at the time he wrote, was however intelligible. From the Homeric to the Socratic age, a period had elarfed of no lefs than 400 years; during which the Atyle both of difcourfe and of writing muft have undergone great alterations. Yet the Iliad continued the ftandard of heroic pretry, and was confidered as the very perfection of poetical language; notwithftanding that fome words in it were become fo autiquated, or fo ambiguous, that Ariflote himfelf feems to hive been fomewhat doubtful in regard to their meaning*. And "Poe: if Chaucer's merit as a poet had been as great as Ho- cap! 2 me:'s, and the Englifh tongue under Edward III. as. perfect as the Greek was in the fecond century after the Trojan war, the Atyle of Chaucer would probably have been our model for poetical diction at this day; even as Petrarch, his cotemporary, is fill! imitated by the be? poets of Italy.

The rudenefs of the ftyle of Ennius has been imputed by the old critics to his hating copied ton clofely. the dialect of common life. But this appears to be a miltake. For if we compare the fragments of that author with the comedies of Plautus, who flourifhed in the fame age, and whofe language was certainly copied from that of common life, we thall be alruck with an air of antiquity in the former that is not in the lattcr. Ennius, no doubr, like mott other fublime pocts, affected fomerhing of the antique in his expreflion: and many of his words and phrafes, not adopted by any profe-writer now extant, are to be found in Lucrctius and Virgil, and were by them tranfmitted to fucceeding poets. Thefe form part of the Roman poetical diale ot ; which appears from the writings of Virgil, where we have it in perfection, to have been very copious. The fyle of this charming poet is indced fo different from profe, and is altogether fo peculiar, that it is per-profe. haps impoffible to analyfe it on the commen principles
sical of Latin grammar, And yet no author can be more perpicuous or more exprefive; notwithftanding the fre puency of Grecifm in his fyntax, and his love of old words, which he, in the judgment of Quintilian, knew better than any other man how to improve into decoration*.

The poetical dialect of modern Italy is fo different from the profaic, that perfons who can read the hiftorians, and even fpeak with tolerable fluency the language of that country, may yet find it difficult to conItrue a page of Petrarch or Taffo. Yet it is not probable, that Petrarch, whofe works are a flandard of the Italian poctical didion $\dagger$, made any material imnovations in his native tongue. It is rather probable that he wrote it ne:rrly as it was fpoken in his time, that is, in the ifth century; onitting only harif combinations, and taking that liberty which Homer probably, and Virgil certainly, tonk before him, of reviving fuch old, but not oblolete expreflions, as feemed peculiarly fignificant and melocious; and polifling his fyle to that degree of elegance which human fpeech, without becoming unnatural, may admit of, and which the genius of poetry, as an art lubfervient to pleafure, may be thought to require.

The French poetry in general is difinguifhed from profe rather by the rhyme and the mealiure, than by any oid or uncommon phrafeol gy. I'et the French, on certain fubjects, imitate the llyle of their old peets, of Marot in particular; and may therefore be faid to have ficmething of a poetical dialect, though far lefs extenfive than the Italian, or even than the Encl:ifh. And it nay be prefumed, that in future ages they will have more of this dialect than they bave at prefent. This may be inferred from the very uncommon merit of fome of their late poets, particularly Boileau and La Fontainc, who, in their refpective separtments, will continue to be imitated, when the prefent modes of French profe are greatly changed: an event that, for all the painstley take to preferve their language, muft inevitably happen, and whereof there are not wanting fome prefages alrea y.

The Englith poetical dialect is not characterifed by any peculiarities of inflection, nor by any great latitade in the ufe of foreign idioms. More copious it is, however, than one would at firt imagine; as may appear from the following fecimen and obfervations.
(r.) A few Greek and Latin idioms are common in Englith poetry, which are feldom or never to be met with in profe. Quenched of hope. Shakefpeare.Shorn of his beams. Milton.-Created thing nor valued he yor shun'd. Milton.--'Tis thus rue riot, rubile who sow it starve. Pope.-This day be bread and peacemy lot. Pope--Into what pit thou sie'st From what height fallen. Milton. He decirved the Mooker of mimkiud. what time his pride Had cast him out of beazen. Milton.Some of thefe, with others to be fiund in Milton, feem to have been adopted for the falic of brevity, which is the paetical tungue is indifpenfable. For the fame reafon, perhaps the articles $a$ and the are fometimes omitted by our poets, though lefs frequently in ferious than balefque comprition.-In Englith, the adjestive gelierally goes before the fubtantive, the nominative before the verb, and the ative verb befre (what we call) the accufative. Exceotions, however,
to this rule, are not uncommon even in profe. But Of Pnerical in poetry they are more frequent. Their bomely joys, and destiny obscure. Noow fudes the glimmerings landforfe on the fight: and all the cir a folemn fillnefs. bolis. In general, that verfification may be lefis difficult, and the cadence more uniformily pleafing; and fometimes, too, in order to give energy to expreffion, or vivacity to an image ;-the Einglith poet is permitted to take much greater liberties than the profe-writer, in arranging his words, and modulating lis lines. and periods. Examples may be feen in every page of Paradife Loft.
(2.) Some of our poetical words take an additional fyllable, that they may fuit the verfe the better; as, dijpart, difain, difport, afright, enchain, for fart, Atain, fport, fright, chain. Others feern to be nothing elfe than common words made floter, for the conrenience of the verfifier. Such are, cuuxiliar, fubluser, trump, vale, part, clinie, fubmi/s, frclic, plain, drear, drcad, belm, morn, mead, cve and cven, gan, illame and illumine, ope, boar, bide, fwags, fape; for auxiliary, fublunary. trumpst, valley, depart, climate, fubmilive, frolicfome, complain, dreary, dreadful, h:lmet, morning, meadow, evening, began or began to, illuminate, open, boary, abide, alluage, efcape.-Of lome of thefe the thort form is the more ancient. In Siotland, eqen, morn, bide, frwage, are ftill in vulgar ufe; but morn, except when contradifinguifhed to erch, is fynonymous, not with morning (as in the Englifh poetical dialest), but with norrow.-The Latin poets, in a way fomewhat fimilar, and perhaps for a fimilar reafon, fhortened fundamentum, tutamentunt, mumimentum, \&c. into fundamen, tutamen, munimen.
(3.) Of the following words, which are now almof peculide to poeiry, the greater part are ancient, and were once no doubt in common ule in England, as many of them fill are in Scotland. Afeld, amain, annoy (a noun), anon, aye (ever), bebjph, blitic, branid (fiword), britial, caro!, dame (lady), featly, foll (an adjective), goude, gore, lof (army), lumbkin, late (of late), lay (poem), l.a, glade, glean, burl, lore, meed, orifons, plod (to travel laborioully), ringlet, rue (it verb), ruth, rutblefs, fojourn (a noun), fmite, Spied (an ative verb), fave (except), firay (twig), fleed, firain (fong), frand, favain, thrall, thrill, trail (a verl), troll, zuail, welter, zuarble, zuayruard, zoo, the while (in the mean time), yon, of jori.
(t.) Thefe that follow are alfo poetical; but, fo far as appears, were never in common ule. Alppai, arrowy, attunc, latailous, breesy, car (chariat), clarien, cates, coirfer, darkling, ficker, flosueret, emilla $=e$, gairilh, circlet, impearl, nighbly, noifelefs, pinion (wing), finaisury, Aumberous, freany, troublous, swil!er (a ve:b), /J:ill (: verb), flook (thaken), madliny, viezulefs.-The following, too, derived from the Grees and Latin, feem peculiur to poetry. Clung, clangor, cboral, blarel, bareal, dire, crfauguined, are, iveful, have (to waht), nymph (lady, girl), orient, paropiy, phi:'on i, infuriute, josurd, radiant, rapt, radilent, refulgont, verdant, vernal, ziphyr, zone (girdle), fylean, fuffufe.
(5.) In mon languages, the rapidity of prorunci?. tion abbreviates fome of the commoneft words, or even joins two, or perhaps more, of them, into one; and Fr me of thofe abbreviated forms finds admifion into writing. The Englifh language was quite disigured by A a?
them

Of Pectical them in the end of the lat century; but Swift, by his Words. fatire and example, brought them into diffepute : and, though fome of them be retained in converfation, as don't, Buan't, can't, they are now avoided in folemn fiyle ; and by elegant writers in general, except where the colloquial dialect is imitated, as in comedy. ' $T$ is and 'twas, fince the time of Shaftefbury, feem to have been daily loling credit, at leaft in profe; but till have a place in poetry, perhaps becaufe they contribute to concienefs. 'Tzuas on a lofyy vafe's fide. Gray.-'Tis true, 'is certain, man, though dead, retains part of himfelf. Pupe. In verfe too, over may be thortened into ober, (which is the Scotch, and probably was the old Englifh, pronunciation): never into ne'er; and from the and to, when they go before a word beginning with a vowel, the final letter is fometimes cut off. O'er hills, o'er dales, o'er crags, o'er rocks they go. Pope.-Where'er Jue turns, the Graccs boinage pay. And all that beauty, all that wealth c'er gave. Rich with the fpoils of fime did ne'er unroll. Gray.-T' alarm th' eternal midnight of the grave.-Thefe abbreviations are now peculliar to the poetical tongue, but not neceffary to it. They fometimes promote brevity, and render verfification lefs dificult.
(6.) Thofe words which are commonly called compound epithets, as rofy-finger'd, rofy-lofom'd, many-twinkling, many-founding, moforgrowun, bright-ejed, fraw-buitt, Spirit-firring, incenfe breathing, beaven-taught, love-whbif. prering, hute-refornding, are alfo to be confidered as part of our poetical dialect. It is true, we have compounded adjectives in familiar ufe, as high-feufoned, svell-natured, ill-lred, and innumerable others. But we fpeak of th:ofe that are lefs common, that feldom occur except in poetry, and of which in profe the ufe would appear affected. And that they fometimes promote brevity and vivacity of expreflion, cannot be denied. But as they give, when too frequent, a fliff and finical air to a performance; as they are not always explicit in the fenfe, nor agreeable in the found; as they are apt to preduce a confufion, or too great a multiplicity, of mages; as they tend to disfigure the language, and furnith a pretext for endlefs innovation; they ought to be ufed fiparingly; and thofe only ufed which the practice of popular authors has rendered familiar to the ear, and which are in themfelves peculiarly emphatical and harmonious.
(7.) In the transformation of nouns into verbs and participles, our poetical dialeet admits of greater latitude than profe. Hymn, pillow, curtain, flory, pillar, picture, peal, furge, cavern, honey, career, cinccure, bofom, fphere, are common nouns; but to bymn, to pillow, curtained, pillared, piatured, pealing, furging, cavern'd, lonied, carcering, cindured, lofomed, Jphered, would appear affected in profe, and yet in verfe they are warranted by great authorities, though it mult be confefled that they are cenfured by an able critic *, who had fudied the Englifh language, both poetical and profaic, with wonderful diligence.

Sorme late poets, particularly the imitators of Spencer, have introduced a great variety of uncominon words,
as certes, efffoons, ne, whilom, tranfmew, moil, fone, of $P_{1}$ lofel, albe, hight, dight, pight, thews, couthful, affot, wo muchel, wend, arrear, \&c. Thefe were once poetical words, no doubt; but they are now obfolete, and to many readers unintelligible. No man of the prefent age, however converfant in this dialect, would naturally exprefs himfelt in it on any interefting emergence; or, fuppofing this natural to the antiquarian, it would never appear fo to the common hcarer or reader. A mixture of thefe words, therefore, nult ruin the pathos of modern language ; and as they are not familiar to our ear, and plainly appear to be fought after and affected, will generally give a ftiffnefs to modern verfification. Yet in fubjefts approaching to the ludicrous they may have a good effect; as in the Schoolmifrefs of Shenftone, Parnel's Fairy-tale, Thomfon's Cafle of Indolence, and Pope's lines in the Dunciad upon Wormius. But this effect will be moft pleafing to thofe who have leaft occafion to recur to the glofiary.

Indeed, it is not always eafy to fix the boundary between poetical and obfolete cxpreffions. To many readers, lore, meed, behef, blitbe, gaude, fpray, thrall, may already appear antiquated; and to fome the typle of Spencer, or even of Chancer, may be as intelligible as that of Dryden. This however we may venture to aflirm, that a word, which the majority of readers cannot underftand without a gloffary, may with reaf $n$ be confidered as obfolete; and ought not to be ufed in modern compofition, unlefs revived, and recommended to the public ear, by fome very eminent writer. There are but few words in Milton, as nathlefs, tine, frore, $b_{0} / \mathrm{ky}$, \&cc. ; there are but one or two in Dryden, as falfify ( F ) : and in Pope, there are none at all, which every reader of our poetry may not be fuppofed to underttand: whereas in Shakefpeare there are many, and in Spencer many more, for which one who knows Englifh very well may be obliged to confult the distionary. The practice of Milton, Dryden, or Pope, may therefore, in almoft all cafes, be admitted as good authority for the ufe of a poetical word. And in them, all the words above enumerated, as poetical, and in prefent ufe, may aftually be found. And of fuch poets as may choofe to obferve this rule, it will not be faid, either that they rejeft the judgment of Quintilian, who recommends the newelt of the old words, and the oldeft of the new, or that they are inattentive to Pope's precept;

Be not the firlt by whom the new are tried,
Nor yet the laft to lay the old afide.

$$
\text { Eff. on Crit. v. } 335
$$

We mult not fuppofe that thefe poetical words never occur at all except in poetry. Even from converfation they are not excluded: and the ancient critics allow, that they may be admitted into profe, where they occafionally confer dignity upon a fublime fubjects or heighten the ludicrous qualities of a mean one. But it is in poetry only where the frequent ufe of them does not favour of affectation.

Nor muft we fuppofe them effential to this art. Many
(F) Dryden in one place ( Ancid ix. verf. 1095:) ufes Falfified to denote Picrcel through and through. He acknowledges, that this ufe of the word is an innovation; and has nothing to plead for it but his own authority, and that Faffore in Italian fometimes means the fame thing.
tical Many paffages there are of exquifite poetry, wherein prove. In fan, the influence of thefe words in adorning English verfe is not very extenfive. Some influence however they have. They ferve to render the poetical ftyle, firf, more melodious; and, fecondly, more folemn.

Firf, They render the poetical style more melodious, and more deafly reducible into meafure. Words of unwieldy faze, or difficult pronunciation, are never ufed by correct poets, where they can be avoided: unlefs in their found they have fomething imitative of the fence. Homer's poetical inflections contribute wonderfully to the fweetnefs of his numbers : and if the reader is plcalfed to look back to the fpecimen above given of the Englifl poetical dialect, he will fund that the words are in general well-founding, and foch as may coalefce with other words, without producing liarfh combinations. Quintilian observes, that poets, for the fake of their verfe, are indulged in many liberties, not granted to the orator, of lengthening, fhortening, and dividing their words*:-and if the Greek and Roman poets claimed this indulgence from necellity, and obtanned it, the Englifl, thofe of them efpecially who write in rhyme, may claim it with better reafon; as the words of their language are leis mufical and far leis fuiceptible of variety in arrangement and fyntax.

Secondly, Such poetical words as are known to be ancient lave fomething venerable in their appearance, and impart a folemnity to all around them. This remark is from Quintilian; who adds, that they give to a compofition that catt and colour of antiquity which in painting is fo highly valued, but which art can never effectually imitate $\dagger$. Poetical words that are either not . ancient, or not known to be fuch, have, however, a pleafung effect from afiociation. We ate accultomed to meet with them in fublime and elegant writing; and hence they come to acquire fublimity and elegance : Even as the words we hear on familiar occasions come to te accounted familiar; and as thole that take their rife among pickpockets, gamblers, and gypfies, are thought too indelicate to be unfed by any perion of tate or good manners. When one hears the following lines, which abound in poetical words,

The breezy call of incenfe-breathing morn,
The fallow twittering from the Atraw-built fled,
The cock's frill clarion, or the echoing horn,
No more fall roufe them from their lowly bed :
-one is as fenfible of the dignity of the language, as one would be of the vilenefs or vulgarity of that man's fpeech, who fhould prove his acquaintance with Bride. well, by interlarding his difcourfe with fuch terms as milldoll, queer cull, or nubling cheat $\ddagger$; or who, in imitation of fops and gamblers, flould on the common occasions of life, talk of being beat bolozv, cr faring his diflance $\oint$. What gives dignity to perfons gives dignity to language. A man of this character is one who has borne important employments, been connected with honourable affociates, and never degraded himfelf by levity or immorality of conduct. Dignified phrafes are thofe which have been ufed to exprefs elevated fentiments, have always made their appearance in elegant compofition, and have never been profaned by giving permanency or utterance to the patrons of the vile, the giddy, or the worthless. And
as by an active old age, the dignity of foch men is con. firmed and heightened; fo the dignity of fuch words, if they be not fuffered to fall into difufe, feldom fails to improve by length of time.

## Art. II. Of Tropes and Figures.

Ir it appeartlat, by means of figures, language may Tropes and be made more plicfong and more natural than it would be figures newithout them; it will follow, that to poetic language, cestary to whole end is to pleafe by imitating nature, figures mut poetical be not only ornamental, but necetlary. It will here be proper, therefore, firs to point out the importance and utility of figurative language; fccondly, to flow, that figures are more necellity to poetry in general than to any other mode of writing.
i. As to the importance and utility of figurative expreffon, in making language more pleafing and more natural; it may be remarked,
(r.) That tropes and figures are often neceffary to fupply the unavoidable defects of language. When proper words are wanting, or not recollected, or when we do not choofe to be always repeating them, we mut have recourfe to tropes and figures. When philofophers began to explain the operations of the mind, they found that molt of the words in common ufe, being framed to that mot of the words in common ute, being framed to 52
answer the more obvious exigencies of life, were in their To fop proper fignification applicable to matter only and its the qualities qualities. What was to be done in this cafe? Would they think of making a new language to exprefs the qualities of mind? No: that would have been difficult or impracticable ; and granting it both practicable and eafy, they mut have forefeen, that nobody would read or lifter to what was thus fpoken or written in a new and confequently in an unknown tongue. They therefore took the language as they found it; and whereever they thought there was a fimilarity or analogy be. tween the qualities of the mind and the qualities of matter, fcrupled not to ufe the names of the material qualeties tropically, by applying them to the mental qualities. Hence came the phrafes folidity of judgment, warmth of imagination, enlargement of underfunding, and many others; which, though figurative, express the meaning jut as well as proper words would have done. In fact numerous as the words in every language are, they must always fall hort of the unbounded. variety of human thoughts and perceptions. Taftes and fuels are almost as numerous as the fpecies of bodies. Sounds admit of perceptible varieties that firpais all computation, and the feven primary colours may be diverfified without end. If each variety of external perception were to have a name, language would be infurmountably difficult ; nay, if men were to appropriate a clafs of names to each particular fenfe, they would multiply words exceedingly. without adding any thing to the clearness of speech. 'I'hole words, therefore, that in their proper fignification denote the objects of one fenfe, we often apply tropically to the objects of another, and fay, Sweet tate, fret fuel, fleet found; fharp point, harp tate, tharp found; harmony of founds, harmony of colours, harmony of parts; foft filk, foft colour, fofl found, for temper ; and fo in a thonfand instances: and yet thefe words, in their tropical fignification, are not lefs intelligible than in their proper one; for fharp taft and flare found, are as expreflive as harp fivord; and harmony of tomes is not better underfood by the mufician, than liar-

gures.
Savages, illiterate perfons, and children, have comparatively but few words in proportion to the things they may have occafion to fpeak of; and mult therefore recur to tropes and figures more frequettly than perfons of copions elocution. A feaman, or mechanic, even when he talks of that which does not belong to his art, borrows his language from that which does; and this makes his diction figurative to a degree that is fometimes entertaining enough. "Death (fays a feaman in one of Smollet's novels) has not yet boarded my comrade; but they have been yard-arm and yard-arm thefe timee glaflis. His furboard eye is open, but falt jammed in his head; and the hautyards of his under jaw have griven way." Thefe phrafes are exaggerated; but we allow them to be natural, becaufe we know that illiterate people are ayt to make ufe of tropes and figures taken from their own trade, even when they fpeak of things that are very remote and incongruous. In thofe poems, therefore, that imitate the converlation of illiterate perfons, as in comedy, farce, and paftoral, fuch figures judiciouly applied may render the imitation more plealing, becaufe more exact and natural.

Words that are untuneable and harfh, the poet is often obliged to avoid, when perhaps he has no other way to exprets their meaning than by tropes and figures; and fometimes the meafure of his verfe may oblige him to rejeek a proper word that is not harth, merely on account of its being too long, or too fhort, or in any other way unfuitable to the rhythm, or to the rhyme. And hence another ufe of figurative language, that it contributes to poetical larmony. Thus, to prefs the p'ain, is frequently ufed in fignify to be fain in battle; Lifuill plain is put for occan, blue firene for $\beta k y$, and Silvan rign for country life.
(2.) Tropes and figures are favourable to delicacy. When the proper name of a thing is in any refpeit unp'cafant, a well-chofen trope will convey the idea in fuch a way as to give no offence. This is agreeable, and even neceffary, in polite converfation, and cannot be difpenfed with in elegant writing of any kind. Many worls, from their being of em applied to vulgar nfe, acquire a meanefs that difqualifes them $\mathrm{f} r$ a place in ferious poctry; while perhaps, under the influence of a different fyllem of manners, the correfponding words in amother language may be elegant, or at leal not vulgar. When one reads Homer in the Greek, me takes no offence at his calling Eumeus by a name which, literally rendered, fignifiss fwime herd; firft, becaufe the Greek word is weil-founding in itfelf; fecond'y, hecaufe we have never heard it pronounced in ennverfation, nor confequently debafed by vulgar wic; and, thirdly, becaufe we know, that the office denoted by it was, in the age of Eumeus, both important and honourable. But Pope would have been blamed, if a a mo fo indelicate as fwincJerd laxd in his tranlation iseen applied to fo eminent a

- ody 1
b. 14.
v. 4 I . perfonage ; and therefore he judicianty makes ufe of the trope foncoloche; and calls him frovin "; a word Loth elergint and poetical, and not likely to lead the reader into any miftake about the Ferfon fpoken of, as his employment had been deferibed in a preceding palfage. The fame Eumous is faid, in the finple but melodious language of the nrigiral, to have been making his owa fhoes when Ulyffican!e to his door; a work

T K そ.
which in thofe days the greateft heroes would often find or neceflity. This, too, the tranlator foftens by a tropi- a cal expreffions:

Here fat Eumeus, and his carcs app ied,
To form trong bufins of well feafoned hide.
A hundred other examples might be quoted from this tranilation; but thefe will explain nur meaning.

There are other occations on which the delicacy of figurative language is fill more needful; as in Virgil's account of the effects of animal love, and of the plague among the beafts, in the third Georgic ; where Dryden's ftyle, by being lel's figurative than the original, is in one place cxceedingly fithy, and in another fhockingly obfcene.

Hobbes could confrue a Greek author ; but his fkill in words muft have been all derived from the distionary: for he feems not to have known that any one articulate found could be more agreeable, or any one phrafe more dignified, than another. In his liad and Odyfley, even when he hits the author's fenfe (which is not always the cale), he proves, by his choice of words, that of harmony, elegance, or energy of fyle, he had no manmer of conception. And herce that work, though called a Tranflation of Homer, does not even deferve the name of poent ; becaufe it is in every refpect unpleafing, being nothing more than a fistitious narrative delivered in a mean profe, with the additional meannefs of harfa rhyme and untuneable meafire.--Trapp underfood Virgil well enough as a grammarian, and had a tatte for his beauties: yet his tranflation bears no refemblance to Virgil ; which is owing to the fame caufe, an imprudent choice of words and fifures, and a total want of harmony.
The delicacy we here contend for, may indeed, both wh in converfation and in writing be carried too far. To hov call killing an innoocnt man in a duel an affair of honour, maa and $a$ violution of the rights of wedlock an affair of gal. rie lantry, is a proflitutio of figurative language. Nor is it any credit to us, that we are faid to have upw:ards of 40 figurative plrafes to denote exceflive drinking. Language of this fort generally implies, that the public ab. horrence of fuch ctimes is not fo flrong as it ought to be; and it is a quellion, whether even our morals might not be improved, if we were to call there and fuch like crimes by their proper names, murder, adultery, drunkennefs, gluttony ; names, that not only exprefs our meaning, but alfo betoken our dif.pprobation.-As to writing, it cannot be denied, that even Pope himfelf, in the excellent verfion juft now quoted, has fometimes, for the fake of his numbers, or for fear of giving offence by too clofe an inmitation of Homer's limplicity, employed tripes or figures too quaint or too folemn for the occafion. And the finical fyle is in part characterifed by the writer's diflike to literal expreflions, and affectedly fubftituting in their fead unnecefary tropes and figures. With thefe authors, a man's only child mult alway be his on'ly hape; a country maid becomes a rurai b:auty, or perhaps a mymsh of the groves; if flattery fing at all, it muit be a fiven fonis; the Thepherd's flute dwindles into an oatch recic, and his crook is evalted into a Jecp're; the filvor lulies rife from their golien leds, and languifa to the complainint gale. A young woman, though a good Chriftian, calinnt make hercelf agreable without facrificing to the Graces; nor
s hope to do any execution among the gerrile fackins, till a whole legion of Cirpids, armed with farmes :and darrs, and other weapons, begin to difcharge arom her cyes their formidable artillery. For the fakc of varicty, or ot the verfe, fome of theie figures may now and then find at place in a poems; but in profe, unlefs very faringly ufed, they favour of affectation.
(3.) Tiopes and ficures promote brevity; and brevity, ${ }^{1-}$ united with perfpicuity, is always agrecible. Ancxample or two will be given in the next paragraph. Scntiments thus delivered, and imagery thus painted, are rcadily apprehenced by the mind, make allrong innpreflion upon the fincy, and remain long in the nicmory ; whereas too many words, even when the meaning is good, nercr fail to bring difyuft and wearinefs. 'They argue a debility of mind which hinders the author from feeing his thoughts in one diftinet point of view; and they alfo encourage if fulpicion, that there is fomething faulty or dofective in the matter. In the poetic liyle, therefore, which is addreffed to the fancy and paffions, and intended to make a vivid, a pleafing, and a permanent impreflion, brevity, and confequently tropes ard figures are indifpe:fable. And a language will always be the better fuited to poetical puipofes, the more it admits of this brevity;-a character which is more conipicuous in the Greek and Latin than in any modern tongue, and nuch lefs in the French than in the Italian or Englif.
(4.) Tropes and figures'contribute to frength or energy of language, not only by their concienefs, but alfo is by conveying to the fiacy ideas that arc eafily comprehended, and make a flong impreffion. We are powerfully affected with what we fee, cr feel, or hear. When a fintiment comes enforced or illuftrated by figures taken from objecis of fight, or touch, or hearing, one thinks, as it were, that one fees, or feels, or hears, the thing fooken of; and thus, what in itfelf would perhaps be oblcure, or is merely inteliechual, may be made to icize our attention and intereft our paffions almoit as effictu,llly as if it were an object of cutward fenfe. When Virgil calls the Scip:os thunderbots of war, he very frongly cxpreffes in one word, and by one image, the rapidity of their vitories, the noife their atchievements madc in the world, and the ruin and confernation that attanded their irrcfiftible career.-When Homer calis Ajax the lulteurk of the Grecks, he paints with equal brevity his rat lize and ftrength, the diffen'ty of prevailing againt him, and the conidence wherewith his countrymen repofed on his valour. - When Sclomon fays of the Atrange woman, or harlet, that " her feet go "lown to dea:l," he lets us know, not only that lier path ends in defliruction, but alfo, that they who accompany her will find it eaty to go forwerds to 1 uin, and difficult to retams to their duty.-S:atar:'s enorm us. magnitude, and refulgent appearance, his perpendicular afcent tirough a region of darknefs, and the inconceiv. able rapidity of his motion, are all painted out to our fancy by Milton, in one very thort dimilitude,

$$
\begin{aligned}
& \text { Sprung upward, like-a pytamid of fire. } \\
& \text { Par. Lg } / \text { b. 4. v. } 1013 \text {. }
\end{aligned}
$$

To take in the full meaning of which figure, we mult imagine ourfelves in chaos, and a val fuminnus bedy riling upward, near the place where we are, fo fuiftly as to appear a continued track of light, and leffening
to the view according to the incrafe of dinance, till it of Tropes cond in a point, and then difupear; and all this mult be fuppotal to thil:e our cye in cane inflant.-- Equal to this in propricty, though not in magnaficence, is :lat allegory of Graj;

The paths of gloyy le.d lut to the grave:
Which prefents to the imagination a wide fiain, where feveral roads appear, crowded with glittering multitude,, and illuing from different quarters, but drawing nearer and neater as they advance, till they terminate in the dark and narrow houfe, where all their glories enter ia fucceflion, and difappear for ever.-When it is laid in Scripture, of a gond man who died, that he fell aflece, what a number of ideas nre at once conveyed to our imagination, by this beautiful and exprefive figire : As a labourer, at the clofe of day, gnes to fleep, witht the fatisfaction of having peiformed his work, and with the agrecable hope of awakening in the morning of a new day, refrefhed and cheerful; fo a good man, it the end of life, refigns himfelf calm and contented to the will of his Makcr, with the fweet reflection of having endeavoured to do his duty, and with the tranfporting hore of foon awaking in the regions of light, to life and happinefs eternal. The figure alfu fugzefts, that to a good man the tranfition from life to death is, even in the fenfa* tion no more painful, than when our faculties melt away into the pleafing infenfibility of fleep.-Satan, flying among the fars, is faid by Milton to "fail between worts and worlds; which has an clegance and force far fuperior to the proper word $f y$. For by this allufion to a fhip, we are made to form a lively idea of his gुreat fize, and to conceive of his motion, that it was equable and majeftic.- Virgil ufes a happy figure to exprefs the fize of the great wooden horfe, by means of which the Greeks were conveyed into Troy: "Equum divin:a Palladis arte adificant."-Milton is fill bolder when. he fays,

## Who would not fing for Licidas? he knew <br> Himfelf to fing, and build the lofiy rbyme.

The phrafe, however, though bold, is emphatical; and gives a noble idea of the durability of poetry, as well as of the art and attention requifite to form a good poem. - There are hundreds of tropical expreffions in common ure, imcomparably more energetic than any proper words of equal brevity that could be pat in their place. A cheek burning with blufhes, is a trope which at once defcribes the colour as it appears to the beholder, and the glowing heat as it is felt by the perfon blufhing. Cbilled with defpondence, petrified with aftonifhment, thunderftruck with difdgrecable and unexpected intelligence, melted wi.h love or pity, difolved in luxury, bardencd in wickednefs, fofiening into ren:orfe, infanzed with defire, tofed with uncertainty \&c.- every one is ferifiole of the force of thefe and the like phr:fes, and that they mult contribute to the energy of compofition.
(5.) Tropes.and figures promote ftre. gth of expref- They are fion; ardare in peetry peculianly reçuifite, becaufe they likewife are often more natural, and more imitative, than proper the lanwords. In fact, th:s is fo much the cafe, that it would fuage of be imponible to imitate the language of paffion without fiong pass them. It is true, that when the mind is agritated, onc does not run ont into allegorics, or long-winded fimilitudes, or any of the figures that require much attention

Or Tropes and $1 \mathrm{i}-$ gures.
from the object of the paffion. Yet the language of many pallions muft be figurative notwithllanding; becaule they roufe the fancy, and direct it to objects congenial to their own nature, which diverfify the lansuage of the fpeaker with a muititude of allufions. The fancy of a very angry man, for example, prefents to his view a train of difagreeable ideas connected with the paftion of anger, and tending to encourage it; and if he fpeak withnut refraint during the paroxyfm of his rage, thofe ideas will force themfelves upon him, and compel him to give them utterance. "Inferval monfer! (he will fay),-my blood boils at him; he has ufed me like a dog; never was man fo injured as I have been by this barbarian. He has no morefenfe of propriety than a ftone. His countenance is diabolical, and his foul as ugly as his countenance. His heart is cold and hard, and his refolutions dark and bloody," \&c. This fpeech is wholly figurative. It is made up of metaphors and byperboles, which, with the profopopeia and apolirophe, are the moft paffionate of all the figures. Lear, driven out of doors by his unnatural daughters, in the midit of darknefs, thunder, and tempeft, naturally breaks forth (for lis indignation is juft now raifed to the very higheft pitch) into the following violent exclamation againft the crimes of mankind, in which almott every word is figurative.

Tremble, thou wretch,
That haft within thee undivulged crimes Unwhipt of juftice. Fide thee, thou bloody hand, Thou perjur'd, and thou fimular of virtue, That art inceftuous. Caitiff, to pieces fhake, That under covert, and convenient feeming, Haft practis'd on man's life. Clofe pent-up guilts, Rive your concealing continents, and cry
Thefe dreadful fummoners grace.
King Lear.
-The vehemence of maternal love, and forrow from the apprelienfion of lofing her child, make the Lady Confance utter a language that is Itrongly figurative, though quite fuitable to the condition and character of the fipeaker. The paffage is too long for a quotation, but concludes thus:
O Lord! my hoy, my Arthur, my fair fon, My life, my joy, my food, my all the world, My widow-comfort, and my forrow's cure. King Yohn.
-Similar to this, and equally expreffive of conjugal love, is that beantiful hyperbole in Homer; where Andromache, to difluade her hufband from going out to the battle, tells him that fhe had now no mother, father, or brethren, all her kindred being dead, and her native country defolate; and then tenderly adds,
But while my Hector yet furvives, I fee
My father, mother, brethren, all in thee.
Miad, b. 6.
As the pafions that agitate the foul, and roufe the fancy, are aft to vent themfelves in tropes and figures, fo thofe that deprefs the mind adopt for the molt part a plain diclion without any ornament : fir to a dejected mind, wherein the imagination is generally inactive, it is not probable that any great variety ot ideas will prefent themfelves; and when thefe are few and familiar, the words that exprefs them muf he fimple. As no atthor equals Shakefpeare in boldnefs or varicty of
figures when he copies the fyle of thofe violent paffions of that Amulate the fancy; fo, when he would exhibit the human mind in a dejected flate, no uninfpired writer excels him in fimplicity. The fame Lear whofe refentment had impaired his underfanding, while it broke out in the mof boiterous language, when, after fome medical applications, he recovers his reafon, his rage being now exhauRed, his pride humbled, and his firits totally depreffed, fpeaks in a fyle than which nothing can be imagined more fimple or more affecting.

> Pray, do not mock me:

I am a very foolifh, lond old man,
Fourfcore and upward; and, to deal plainly with you, I fear I am not in my pertect mind.
Methinks I fhould know yon, and know this man ;
Yet I am doubtful : for I amm mainly ignorant What place thisis; and all the fkill I have
Remembers not thefegarments: nor I know not
Where I did lodge latt night.——Lear, act 4. fc. 7.
-Defdemona, ever gentle, artlefs, and fincere, fhocked at the unkindnefs of her hufband, and overcome with melancholy, ipeaks in a fyle fo beautifully fimple, and fo perfectly natural, that one knows not what to fay in commendation of it :
My mother had a maid call'd Barbara;
She was in love, and he he lov'd prov'd mad,
And did forfake her. She had a fong of willow;
An old thing it was, but it exprefs'd her fortune, And the died finging it. That fong to night
Will not go from my mind: I have much to do, But to go hang my head all at one fide, And fing it like poor Baibara. Othello, act 4. fc. 3 .

Sometimes the imagination, even when exerted to the utmoft, takes in but few ideas. This happens when the attention is totally engroffed by fome very great object; admiration being one of thofe emotions that rather furpend the exercife of the faculties than pufh them into action. And here, too, the fimplent language is And the moft natural; as when Milton fays of the Deity, fent that he fits " ligh-throned above all height." And as of a this fimplicity is more fuitable to that one great exertion tion which occupies the feeaker's mind than a more elaborate imagery or language would have been, fo has it alfo a more powerful effect in fixing and elevating the imagination of the hearer; for to introduce other thoughts for the fake of illuftrating what cannot be illufrated, could anfiver no other purpofe than to draw off the attention from the principal idea. In thefe and the like cafes, the fancy left to itfelf will have more fatisfaction in purfuing at leifure its own fpeculations than in attending to thofe of others; as they who fee firs the firit time fome adnurable object would choofe rather to feaft upon it in filence, than to have their thoughts interrupted by a long defeription from another perfon, informing them of nothing but what they fee before them, are already acquainted with, or may eafily conceive.
It was remarked above, that the byperbole, profopopeia, and apofrophe, are among the moft pafionate figures. This defervesilluftration.
$1 / f$, A very angry man is apt to think the injury he Hyt has juft received greater than it really is; and if he proceed immediately to retaliate by word or deed, feldom fails to exceed the duc bounds, and to becomc isjurious
es in his turn. The fond parent looks upon his child as a prodigy of genius and beanty; and the romantic lover will not be prifuadel that his miftrefs has nothing fupernatural either in her mind or perfon. Leas, in iike manner, not only maguifies its cbjest whecn real, but evenf fornts an oljcet out of nothing and milakes the fictions of fancy ior the imitations of ferfe.-No wonder, then, that they who (peak according to the impulfe of parfion fhouid fpeak byperbolicaliy; that the angry man thould exaggerate the injury he has received, and the vengcance he is going to inflict; that the forrowful flould nargnify what they have loft, and the jogful what they have obtained; that the bover fhould ipcak extravalgantly of the beauty of his miltrefs, the coward of the dangers he has encourtered, and the credulous clown of the niracles performed by the juggler. In fact, there penple would not do jufice to what they feel ii they did not fay more than the truth. The valiant man, ont the other hand, as naturally adopis the diminifhing hyperbole when he fi, eaks of tlanger; and the man of fenie, when he is obliged to mention his own virtue or ability; becaufe it appears to him, or he is willing to coufluder it, as lefs than the truth, or at beft as iaconfiderable. Contempt uies the fame figure; and therefoie Petruchio, affecting that paffion, affects alfo the language of it.

Thou lieft, thou thread, thou thimble, Thou yard, three-quarters, half-yard, quarter, nail, Thou flea, thou nit, thou winter-cricket, thou! Brav'd in mine own houfe with a fleein of thread! Away, thou rag, thou quantity, thou remnant!

Taming of the Sbrews, adt 4.f. 1.
For fome paflions confider their objects as important, and others as unimportant. Of the former fort are anger, love, fear, admiration, joy, furrow,pride ; of the latter are contempt and courage. Thefe may be faid to fubdue the mind to the object, and there to dubdue the objeft to the mind. And the former, when viclent, always magnify their objects; whence the hyperbole called amplification, or auxefis : and the latter as conftantly diminith theirs; and give rife to the hyperbole c:llled meiofis, or diminution.- Even when the mind cannot be faid to be under the influence of any violent paf. fion, we naturally employ the fume figure when we would imprefs another very frongly with any idea. "He is a walking fhadow; he is worn to fkin and bone; he has one foot in the grave and the other following :" thefe, and the like phrafes, are proved to be natural by their frequency. By introducing great idens, the hyperbole is further ufeful in poctry as a fource of the iubline; but when employed injudiciouly is very apt to become ridiculous. Cowley makes Goliah as big as the hill down which he was marching + ; and tells cis, that when he came into the valley le feemed to fill $i$, and to overtop the neighbouring mountains (which, by the by, feems rather to leffen the mountains and valley's than to magnify the giant); nay, he adds that the fun flarted back when he faw the fplendour of his arms. This poet feems to have thought that the figure in queftion cululd never be fufficier, ely enormous: but Quintilian would have taught him, "Quamvis omnis hyperbole ultra fidem, non tamen effe debet ultra modum." The reafon is, that this figure, when excelive, betokens rather abiolute infatuation than intenfe emotion; and Vos. XV.

26
afinity
of Tropes afinity to action, and affects our imagination nearly in
and Figures. the fame manner; ind we fee a great part of nature in mution, and by its fenfible effects ate led to contemplate energies innumerable. Theie condut the rational mind to the Great Firft Caufe ; and theie, in times of imnorance, difpofed the vulgar to believe in a variety of fubordinate agents employed in producing thofe appearances that couid not otherwife be accourted for. Hence an endlets train of fabulous deisics, and of witches, demons, fanies, genii ; which, if they prove our reafon weak and our fancy frong, prove allo that perfonification is natural to the human mind; and that a right ure of this figure may have a powerful effect, in fabulous writing efpecially, to engage our fympathy in behalf of things as well as perfons: for nothing can give lafting delight to a moral being, but that whinh awakens fympathy, and touches the heart; and though it be irue that we fympathiie in fome degree even with inanimate things, yet what has, or is fufpofed to have, life, calls forth a more fincere and more permanent fellow-feeling. -Let it be obferved further, that to awaken our fympathetic feelings, a lively conception of their object is receflary. This indeed is true of almon all our emotions; their keennefs is in proportion to the vivacity of the perceptions that excite them. Diftrefs that we fee - Hor. As, is more affeding than what we only hear of * a perloct.v sio ulal of the gayelt feenes in a comedy does not roufe the mind fo effectually as the $p$ eience of a cheerful companion; and the death of a friend is of greater energy in preducing ferioufnefs, and the confideration of om latter end, than all the pathos of Young. Of deferiptions addreffed to the fancy, thofe that are moft vivid and picturefque will gencrally be found to have the mof powerful influence over our affestions; and thefe that cxhibit perfons engaged in action, and adorned with vilible infignia, give a brifker impulfe to the faculties thim fuch as conver intellectual iders only, or images taken from aill life. No abetract notion of time or of love can be fo Itiking to the fancy as the image of an old man accoutred with a fcythe, or of a beantiful boy witi wings and a bow and arrows: and no phyfological account of frenzy could fuggeft fo vivid an idea as the poet has given us in that exquifite portrait,

And moody madnefs laughing wild amid feverelt wo. And for this reafon partly it is that the epic poet, in order to work the more effecually upon our paflions and imagination, refers the fecret fprings of luman conduct, and the viciffudes of hmman affairs, to the agency of perfonifed calues; that is, to the machinery of gods and goddeffes, angels, demons, magicians, and nther powertul beings. And hence, in all fublime poetry life and motion, with their feveral modes and attributes, are liberally bellowed on thofe objects wherewith the auther in:ends that we fould be frongly imprelfed foenes perfectly inanimate and fill, tending ather to diffure a languor over the mind than to commomicate to our internal powers thofe lively energies wishout which a being eftentially adive can never re. ceive complete gratification.-Latly, f me violent paflions are pecalinly inclined to change thang; into perfons. The horrurs of his mind haunted Orelles in the thape of turies. Confcience, in the form of the murdered pelfom, fares the murderer in the face, and often fertifies him to diftraction. 'The fuperfitious man,
travelling alone in the dark, miftakes a white fone for a of $\mathrm{T}_{\mathrm{r}}$ gholt, a bufl for a demon, a tree waving with the wind and $F$ for an enormous giant brandifhing a hundred arms. The lunatic and enthufuit converfe with perfons who exift only in their own diltempered fancy; and the glutton and the miler, if they were to give utterance to all their thoughts, would often, it is prefumable, fpeak, the one of his gold, the other of his belly, not only as a perfon, but as a ged,-the object of his warment love and moft devout regard.- More need not be faid to prove that perfonification is natural, and may frequently contribute to the pathos, energy, and beauty of poetic language.

3dly, Apgitophe, or a fudden diverfion of fpeech from Apolir one perfon to another perfun or thing, is a figure how to neatly related to the former. Poets fometimes make ufed: ufe of it, in order to help out their verfe, or merely to give variety to their fyle: but on thefe occafions it is to be confidered as rather a trick of art, than an effort of nature. It is molt natural, and mof pathetic, when the perfon or thing to whom the apoftrophe is made, and for whofe fake we give a new direction to our fpeech, is in our eyes eminently diftinguifhed for good or evil, or raifes within us fome fudden and powerful emotion, fuch as the hearer would acquiefce in, or at leaft acknowledge to be reafonable. But this, like the other pathetic figures, muft be ufedwith great prudence. For if, inttead of calling forth the hearer's fympathy, it fhould cnly betray the levity of the fpeaker, or fuch wanderings of his mind as neither the fubject nor the occafion would lead one to expect, it will then create difguft inftead of approbation. The orator, therefore, muft not attempt the paffionate apoftrophe, till the minds of the hearers be prepared to join in it. And every audience is not equally obfequious in this refpect. In the formm of ancient Rome that would have paffed for fublime and pathetic, which to the mott refpectable of our andiences would appear ridiculous. For onr tyle of public fpeaking is cool and argumentative; and partakes lefs of enthufiafm than the Roman did, and much lels than the modern French or Italian. Of Britifh eloquence, particularly that if the pulpit, the chief recommendations are gravity and fimplicity. And it is vain to fay, that our oratury ougbt to be morc vehement: for that matter depends on caules, which it is not only inexpedient, but impofible to alter; namely, on the character and fpirit of the people, and their mationall notions in regard to religion, policy, and literature. The ex. clamations of Cicero would weigh but little in our Congrefs ; and many of thore which we meet with in French fermons wonld not be more effectual if attempted in our pulpit. 'To fee one of our preachers, who the moment before was a cool reafoner, a temperate fpeaker, an humble Chriltian, and an orthodox divine, break out into a fudden apollrophe to the immortal powers, or to the walls of the church, tends to force a fmile, rather than a tear, from thofe among us who refect, that there is nothing in the fubject, and fhould be nothing in the orator, to warrant fuch wanderings of fancy or vehemence of cmotion. If he be careful to cuitivate a pure Ayle, and a grave and graceful utterance, a clersyman, who fpeaks from conviction the plain unaffested words of truth and fobernefs, of benevolence and piety, will, it is believed, convey more pathetic, as well as more permanent, impreffions to the heart,
heart, and be more ufeful as a Chriftian teacher, than if he were to put in pratice all the attitudes of Rofcius, and all :he tropes and figures of Cicero.

But where the language of pafion and enthufiafm is permitted to difplay itfclf, whatcuer raifes any ftoong cmotion, whether it be animated or inanimate, abfent or prefent, fentible or intellectual, may give rife to the apoftrophe. A man in a diftant country, fpeaking of the phace of his birth, might haturaliy exclaim, "O my de..r $1 . a t$ ve hind, ihall I never fee thee more!" Or, when fome "reat misfortune befalls him, "Happy are ye, O my pie ents, that ye are not alive to tee this." We lave a beantiful ap f:ophe in the third book of the E-eid, where Neat, who is telling his !lor: to Dido, happening to mention the death of his father, makes a sucu-n addrefs to him as lollows:
_-_hic pelagi tot tempeftatibus açus,
Hion, geni orem, omnis cura cafurcue levamen, Amito Anchilen :- hic me, pater optime, felfum Deferis, heu, tantis, nequicquam erepte periclis!
This apotror he has a pleafing effec. It feems tu intimate, that the love which the hero bore his father was fo yreat, that when lie menticned him he forgot every thing elfe; and, without minding Li, company, one of whem was a quien, iuduen'y addrelfed himfelf to that
 object of his affecti n. An emotion fo warm and fo reaf nable cannot iaiii to command the fympathy of the reader- - Whien Mich..el, in the eleventh book of Paradife Ln $\Omega$, announces to Adam and Eve the neceffity of their immediate departure from the garden of Eden, the poet's art in preferving the decoruni of the two characters is very remarkable. Pierced to the heart at the thought of leaving that happy place, Eve, in all the violence of ungovernable forrow, breaks fordh into a pathetic apoffrophe to Paradife, to the flowers fle had reared, and to the nuptial bower fhe had adorned. A. dam makes no addrei's to the walks, the trees, or the flowers of the garden, the lofs whercof did not fo much afflia lim; but, in his reply to the archangel, expreffes, without a figure, his regret for being banithed from a place where he had been io oft honoured with a fenfible manifeflation of the divine prefence. The ufe of the apoftrophe in the one cale, and the om:fiion of it in the other, not only gives a beautiful variety to the Ayle, but aifo marks that fuperior elevation and compoffure of mind, by which the poet had all :al $n$ ng diftinguifhed the clazater of Adam. - One of the finelt applications of this figure that is anywhere to be feen, is in the fourth book of the fame poem ; where the author, caiclining by lympathy the devotion of our firt parents, furdennly drop. his narrative, and joins his voice to theirs ia adoring the Father of the univerfe.
Thus at their fhady lodge artiv'd, both flood, Both turn'd, and under open fky ador'd
The God that made both $k \mathrm{ky}$, air, earth, and heav'n, Which they beheld, the muon's refplendent globe, And farry pole :-Thou alfo mad'ti the night,
Malker ommipotent! and thou the day,
Which we in our appointed work employ'd
Have finith'd.
Milton took the lint of this fine contrivance from a well-known paflage of Virgil:

H:c juvenum cl:nrus, ille fenum ; qui carminec laukes Hercule.ts et fasta ferant;
-ut duros mille labores

Rege fub) Eurvilieo, tatis Junonis iniqux, Periulerit: - Tu nubig nas, inviage, bimembres,
 1rodigit.
The beally arifing from diverffied componition is the fane in brih, and very great in each. Lintevery rcader muit feel, that the figure is inermparably more atilesting to the mind in the initution tha: in the original. So taue it i , that the ro of sational emotions raife tl: moft intenfe fellow-fee.ing; and that the apoltiophe is then the molt enphatical, when it difpl iss thote work: ings of humen affection which are at once ardent and well-founded.

To condude this head: Trnpes and figures, parti- Tropesani cularly the mataphor, fimilitidi, and alleg ry, are further figures are ufeful, in beautifing languaige, by fugcefing, together wfeul as. with the thoughts ellential to the fuhtict, an enders variety of agreable images, fur which there wonld be no endatef plaze, if writers were always to confue themflves t., the riery or aproter names of things. And this beauty and variety, rreable judicioully applied, is fo far from ciflracting, that it inages. tends rather to fix, the attention, and captivate the heart of the readers, by giviny light, and life, and pathos, to the whole compolition.
11. That tropes and figures are more neceffary to posury, than to any other mode of writing, was the fecond point propofed to be illuftrated in this fection.

Language, as already obferved, is then natural, when Tropes and it is fuitable to the fuppored condition of the fpeater. figures Figurative language is peculiarly fuitable to the fuppof more need condition of the poet; becaufe figures are fuggetted $\begin{gathered}\text { ceffary to } \\ \text { poetry }\end{gathered}$ by the fancy; and the fancy of him who compoies to any poztry is more employed than that of any other au hor. other mode Of all hiftorical, philofophical, and theological refearch. of writina, es, the object is real truth, which is fixed and permanent. The aim of rhetorical declamation (according to Cicero) is apparent truth, which, being lefs determinate, leaves the fancy of the fpaker more frec, gives greater fcope to the inventive powers, and fupplies the materials of a more figurative phrafeology. But the pnet is lubjeat to no reftraints, but thofe of verilinilitude; which is fill lefs determinate than rhetorical truth. He feeks not to convince the jadyment of his reader by arguments of either real or apparent cogeney ; be mean only to pleafe and intereft him, by an appeal to his fenfibility and imagination. His own tiaramation is therefore continually at work, ranging through the whole of seal and probable exitence, "glancing from heaven to earth, from earth to heaven," in quelt of images and ideas fuited to the emotions he himfelf feels, and to the fympathies he would communicate to others. And, confequently, figures of fpeech, the offispring of excurfive fincy, muft, (if he fpeak accordiag to what he is fuppofed to think and feel, that is, according to his fuppofed condition) tineture the hanguage of the poet more than that of any other eompofer. So that, ii figurative distion be umatural in gcometry, becaufe all wanderings of fancy are uniuitable, and even imponible, to the geometrician, while intent upon his argument; it is, upon the fame principle, per-

Of Tropes and Fi. gures.
fectly naturnl, and cren unavoidabie, in poetry; becaufe the more a poet attends to his fubject, and the better qualified he is to do it juttice, the more active will his inagination be, and the more diverfified the ideas that prefent themfelves to his mind. - Befides, the true poet addreffes himfelf to the paffions and fympathies of mankind; which, till his own be raifed, he camnot hope to do with fuccefs. And it is the nature of many paffions, though not of all, to increafe the activity of imagination : and an affive imagination naturally vents itfelf in figurative language ; nay, unlefs reftrained by a correct tafte, has a tendency to exceed in it; of which Bifhop Taylor and Lord Verulam, two genuifes different in kind, but of the highef order, are menorable cxamples.

We faid, that "the poet feeks not to convince the judgment of his reader by arguments of ei.her real or apparent cogency." We do not mean, that in poetry argument has no place. The molt legitimate reafoning the foundeit plilofophy, and narratives purely hiftorical may arpear in a poem, and contribute greatly to the honour of the author, and to the importance of his work. All this we have in Paradife Lolt.-We mean, that what diftinguifhes pure poetry from other writing, is its aptitude, not to fway the judgment by reafoning, but to pleafe the fancy, and move the palfions, by a lively imitation of nature. Nor would we exclude poetical embcllifhment from hitory, or even from philofophy. Plato's Dialogues and the Moral Effays of Addifon and Johnfon abound in poetic imagery ; and Livy and Tracitus often amufe their readers with poetical defcription. In like manner, thouch geometry and phyfics be different fciences; though abttract ideas be the fubj. ct, and pure demonfration or intuition the evidence, of the former; and though the material univerfs, and the informations of fenfe, be the fubject and the evidence of the latter; yet have thefe fciences been united by the beft philofophers, and very happy effects refilted from the union.-In one and the fame work, poetry, hitory, philofophy, and oratory, may donbtlefs be blended; nay, thefe arts have all been actually blended in one and the fame work, not by Milton only, but alfo by Homer, Virgil, Lucan, and Shakefpeare. Yet fill thefe arts are different ; different in their ends and principles, and in the faculties of the mind to which they are refpectively addreffed : and it is eafy to perceive when a witer employs one and when another.

## §2. Of the Sound of Poetical Language.

As the ear, like every other perceptive faculty, is capable of gratification, regard is to be had to the found of words, even in profe. But to the harmony of language, it behoves the poet, more than any other writer, 10 atiend; as it is more efpecially his concern to render his work pleafurable. In fact, we find, that no peet was cyer popular who did not pollefs the art of harmoninus compotition.

What belongs to the fubject of Poctical Harmony
may be referred to one or other of thefc heads, Suceetnefs, Dleafure, and Imitation.
I. In order to give freetnefs to language, either in verfe or profe, all words of harfh found, difficult pro 56 harm found, difficult pro- Swectecte nunciation, or unwieldy magnitude, are to be avoided as and much as polfible, unlefs when they have in the found fomething peculiarly emphatical; and words are to be fo placed in refpect of one another, as that difcordant combinatic ns may not refult from their union. But in poctry this is more neceflary than in profe; pcetical linguage being underfood to be an imitation of natural language improved to that perfection which is confiftent with probablity. To pnetry, therefore, a greater latitude mult be allowed than to profe, in exprefling, by tropes and figures of pleafing found, thofe ideas whereof the proper names are in any refpect cffenfive, eirher to the ear or to the fancy.
II. How far verfifiation or regular meafure may be effential to this art, has been difputed by critical writers; fome holding it to be indifpenfably neceffary, and fome not neceffary at all.

The fact feems to be as already hinted, that to poetry verfe is not effential. In a profe work, we may have the fable, the arrangement, and a great deal of the pathos and language, of poetry; and fuch a work is certainly a pnem, shough perhaps not a perfect one. For how abfurd would it be to lay, that by changing the pofition only of a word or two in each line, one might diveft Homer's lliad of the poetical character! At this rate, the arts of poetry and verfification would be the fame ; and the rules in Defpauter's Grammer, and the moral diftichs afcribed to Cato, would be as real poetry as any part of Virgil. In fact, fome very ancient poems, when tranflated into a modern tongue, are far lefs poetical in verfe than in profe; the alterations neceffary to adapt them to our numbers being detrimental to their fublime fimplicity; of which any perfon of tafte will be fenfible, who compares our commen profe-verfion of Job, the Pfalms, and the Song of Solomon, with the belt metrical pasaphrafe of thoie books that has yet appeared. Nay, in many cafes, Comedy will be more poetical, becaule more pleafing and natural, in profe than in verfe. By verffying Tom Jones, and The Merry Wives of Windfur, we fhould fpoil the two finett conic poems, the one epic, the other dramatical, now in the world.

But, fecondly, though verfe be not effential to poetry it is neceifary to the perfection of all poetry that admits of it. Verfe is to poctry, what colours are to painting (c). A painter might difplay great genius, and draw mafterly figures with chalk or ink; but if he interd a perfect picture, he mult employ in his work as many colours as are focn in the objeet he imitates. Or, to adopt a beautiful comparifon of Demonhenes, quoted by Aritutle *, "Verfilication is to poetry what bloom "Rhetor is to the human countenance." A grod facc is agree. Hib. 3. able whon the blonm is gone, and good poeiry may cup. 4 . pleafe without verfification; harmonious numbers m.ly
(c) Inrace feems to hint at the fame comparifon, when, after fpecifying the feveral forts of verfe fuit. ble toEpic, Elegiac, Lyric, and Dramatic Poetry, he adds,

## llllll

I fet off an indifferent foem, and a fine bloom indifferent features: but, without verfe, poetry is incomplete; and beauty is not perfect, unlefs to fweetncfs and regularity of feature there be fuperadded,
The bloom of joung defirc, and purple light of love. If numbers are neceffary to the perfection of the higher poetry, they are no lefs to to that of the lower kinds, to Paltoral, Song, and Satire, which have litie befides the language and verfification to diffinguifh them from profe; and which fome ancient authors are unwilling to admit to the rank of poems: though it teems too nice a fcruple, both becaufe fuch writings are commonly termed poetical; and alfo becaufe there is, even in them, fome lang that may not improperly be confidered as an imitation of nathe.

That the rhythin and meafures of verfe are naturally agreeable, and therefore that by thefe poetry may be made more plealing than it would be without them, is evident from this, that ehildren and illiterate people, whofe admiration we cannot fuppofe to be the effect of habit or prejudice, are exceedingly delighted with them. In many proverbial hayings, where there is neither rhime nor alliteration, rhythm is obvioully fudied. Nay, the ufe of rhythm in poetry is univerfal ; whereas alliteration and shime, though relithed by fome nations, are not much fought after by others. And we need not be at a lofs to account fur the agreeablenefs of proportion and order, if we reflect, that they fuggeft the agreeable ideas of contrivance and 1 kill , at the fame time that they render the connection of things obvious to the underitanding, and imprirt it deeply on the memory. Verfe by promoting diftinct and eafy remembrance, conveys ideas to the mind with energy, and enlivens every emotion the poet intends to raife in the reader or beater. Befides, when we attend to verfes, after hearing one or two, we become acquainted with the meafure, which therefore we always look for in the fequel. This perpetual interchange of hope and gratification is a fource of delight; and to this in part is owing the pleafure we take in the rhimes of modern poetry. And herce we fee, that though an in:correat rhime or untuneable yerfe be in itfelf, ard compared with an important fentiment, a very trifing matter; yet $j_{i}$ is no trifie in regard to its effects on the heaser; becaule it brings diflappointment, and fo gives a ten:porary flock to the mind, and interrupts the current of the affections; and becanic it fingeelis the difagreeable ideas of necligence or want of frill on the part of the author. And therefore, as the public ear becomes more delicate, the negligerce will be more giaring, and the difappointmenc m re re intenfly felt; and correctneis of rhime and of maafure will of cuurfe be the morc indifpenfable. In our tenguc, rhime is more necellary to Lyric than to Heroic pioetry. The reafon feems to be, that in the latter the ear can of ifféf pereceive the bounday of the meatise, becaufe the lines anc - ail of equal length nearly, and every good reader makics a thort paufe at the end of ench, wherean, in the former, the lines valy in length: asd theretore the rhime is requifite to make the neafure and rhytimm fufficienly Ferceptible. Cuitom too may have fome i if fluence. Englifh Odes without thime are uncemmon; alid therefore have fomeching awsward about them, or fomeihing at leaft to which the public ear is not yet horoughly re. conciled. Indeed, when the drama is eacepted, we do
not think that rhime can be fafely fared from Conglifh peetry of any kind, but when the fubject is able to fupport itfeif. "He that thinks limfelf capable of aftonithing (fays Johafon) may write blank verie; but thofe that hope only to plafe, muft condefeend to shime."

Rame, however, is of le?s importance by far than rhythm, which in poctry as well as in munc is the fource of much pleafing variety ; of variety tempered with uniformity, and regulated by art; infomuch that, notwithltanding the hikenets of one hexameter verfe to anather, it is not common, even in Viigil or in Homer, to meet with two contignous hexameters whofe thythm is exactly the fame. And though all Engl:th hercic verles confilt of five feet, among which the ian bic predominates; yet this meafure, in refpect of ryihm alone, is fufceptible of more than 30 varieties. And let it te remarked further, that different kinds of verfe, by being adapted to different fubjests and modes of wri.ing, give varicty to the poctic language, and multiply the charms of this pleafing art.

What has formerly been fhown to be true in regard to ftyle, will allo in many cafes hold true of verfification, "that it is then natural, when it is adapted to The lan the fufpofed condition of the feaker."- In the epopee, guage of the poet affumes the character of calm infpiration; and therefore his language mult be elevated, and his numbers majeftic and uniform. A peafant fpeaking in he. roic or hexameter verfe is no improbability here; be caufe his words are fuppofech to be tranfmitted by one uniformly who will of his own accord give them every ornament majeftic. neceffary to reduce them into dignified meafure; as an eloquent man, in a folemn afiembiy, recapitulating the fpeech of a coown, would naturally exprefs it in pure and perfpicuous language. The uniform heroic meafure will fuit any fubject of dignity, whether rarrative or didactic, that admits or requires uniformity of flyle. In tragedy, where the imitation of real life is more perfeet than in epic poetry, the uniform magnificence of epic numbers might be improper; becaule the herocs and heroines are fuppoled to fpeak in their own perfons, and according to the immediate impulfe of parfion and rentiment. Yet, cren in iragedy, the verfitica. In is $i^{2}$ tion may be both harmonious and dignified; becaufe the the fame characters are taken chichy from high lite, and the evenis from a remote period; and becaufe the higher pertry is permitted to imitate nature, not as it is, but in that flate of perfection in which it might be. The Greeks and Romans confidered their hexameter as too artilicial for damatic poetry; and therefore in tragedy, and tven in comedy, mide ufe of the i.mbic, and fome other meafures that came rear the cadence of converfation: we ufe the iambic both in the epic and dramatic poem; but for the moft part it is, or ought to be, much more eliborate in the former than in the latter. In dramatic come.ly, where the manners and concerns of fimiliar life are exhibied, verfe wonld fecm to be unn:tural, except it be fo like the lound of common difcourfe as to be hardly diftinguifhable from it. Cultem, however, naly in fome cruntries dutermine ohlerwile; and againtt cuftem, in thefe mat:ers, it is in vais to argue. 'i ne protelfed euthutiafm of the dithyramic poet renders wildnefs, variety, ard a fonorous ha:mony of numbers, peculiarly fuitable to his odes. The leve-fe nmel and Anacreontic fong, will be lefs vaiou, more regu-

Of boctical har, and of a fofter harmony; becanie the ftate of mind Harmony. -exprefled in it has more compolure. Phil fophy can feare go further in this invelligation, without deviating into whim and hypothefis. The particular forts of verfe to be adopted in the lower feccics of poetry, are determined by fathion chiefly, and the practice of appro. ved authore.
III. The crigin and principles of imitative barmony, or of that artifice by which the found is made, as Pope fiys, "an echo to the fenfe," may be explained in the fullowing manner.

It is pleafing to obferve the uniformity of nature in all her rperations. Between moral and material beauty and harson:v, between moral and material deformity and diffonance, there obain; a very friking analogy. The vifible and audible exprefions of almoll every virtuous emotion are agreeable to the eye and the ear, and thofe of almoft every criminal pulfion difagreeable. The looks, the attitudes, and the vocal founds, natural to benevolence, to gratitude, t" compafion, to prey, ate in themfelves gracetill and plealing; while anger, dif. content, defpdir, and crucley, bring difcord to the voice, deformity to the features and ditortion to the limbs. That fowing curve, which painters know to be effential to the beauty of animal fhape, gives place to a mul. tiplicity of right lines and fharp angles in the countenance and gefture of him who knits his brows, ftretches his noftrils, grinds his teeth, and clenches his filt; whereas, devotion magnanimity, benevolence, contentment, and gond.humour, foften the attitude, and give a more graceful fwell to the outline of every feature. Certain vocal tones accompany certain mental emotions. The voice of forrow is feeble and broken, that of de. fpair boifterous and incoherent; joy affumes a fweet and fprightly note, lear a weak and tremulous cadence; the tones of love and benevolence are mufical and uniform, thofe of rage loud and diffonant; the voice of the fedate reafoner is equable and grave, but not unpleafant; and he who declaims with energy, employs many varieties of modulation fuited to the various emotions that predominate in his difcourfe.

But it is net in the language of paftion only that the human voice varies its tone, or the human face its features. Every friking fentiment, and every interefting idea, has an effest upon it. One would efteem that perfon no adept in narrative eloquence, who fhould defcribe, with the very fame accent, fivift and flow motion, extreme labour and eafy performance, agreeable fenfation and excruciating pain; who thould talk of the tumult of a tempeltuous ocean, the roar of thunder, the devaftations of an earthquake, or an Egyptian pyramid tumbling into ruins, in the fame tone of voice wherewith he defcribes the murmur of a rill, the warbling of

## T R Y.

the harp of Rolus, the fwinging of a cradle, or the de- 0 fcent of an angel. Elevation of mind gives dignity to the voice. From Achilles, Sarpedon, and Othello, we fhculd as naturally expect a manly and fonorous accent, as a nervous fiyle and majeftic attitude. Coxcombs and bullies, while they afume airs of importance and valour, affect alio a dignified articulation.

Since the tones of natural language are fo various, poetry, which imitates the language of nature, muft al. fo vary its tones; and, in r.fecet of found as well as of meaning, be framed after the modcl if ideal perfection, whith the variety and energy of the human articulate voice render irrbablc. This is the more eafly accomplithed, bectufe in every language there is between the foutd and fenfe of certain words a perceptible analogy; which, though not fo accurate as to lead a foreigner from the fourd to the figr,ification, is yet accurate cnough to fhow, thet, in forming fuch words, regard has been had to the imta-ive qua ities of vocal found. Such, in Englifh, are the words ycil, cra/h, couck, liffs, roar, murnur, and many others.

All the particulur laws that regulate this fort of imitation, as far as they are founded in natur, and iable tu the cognizance of philofophy, depend on the gene:al law of fyle above mentioned. Together with the other circumfances of the firppifed fyeaker, the poet takes into confideration the to:? of voice fuitable to the ideas that occupy his mind, and thereto adapts the found of his language, if it can be done confiltently witl eale and elegance of exprefficn. But when this imitative harmony is too much furhtafter, or words appear to be chofen for found rather than fenfe, the verie becomes finical and ridiculous. Such is Ronfard's affected imitation of the fong of the k y -lark:

> Elle quindće du zephire
> Sublime en l'air vire et revire,
> Et y declique un joli cris,
> Qui rit, gućrit, et tire l'ire
> Des efprit mieux que je n'écris.

This is as ridiculous as that line of Ennius,
Tum tuba terribili fonitu taratantara dixit :

## Or as the following verfes of Swift:

The man with the kettle-drum enters the gate,
Dub dub a dub dub: the trumpeters follow,
Tantara tantara; while all the boys hollow.
Wrords by their found may imitate found; and quick $w$ or flow articulation may imitate quich or flow mution. mu Hence, by a proper choice and arrangement of words, nu the poet may imitate Sounds thatt are fweet with dig- ral nity $(H)$,-fweet and tender ( 1 ), -loud ( $K$ ), -and harth
(H) No fooner had th' Almighty ceas'd than all The multitude of angels, with :t fhout Loud as from numbers without number, fweet As from bleft voices uttering joy; heav'n rung With jubilee, and loud hofannas fill'd 'ilh' eternal regions. $\quad$ Pur. Loft, b. 3 .

alwass to predominate. And we find in fact, that good poet; can occalionally ceprels themfelves fomewhat harfly, when the fu!ject requires it, and yet preferve the fweetnels and majelty of poetical diction. Further, the voice of complaint, pity. love, and all the gentler affec. tions, is mild and mulical, and fhould therefore be imitated in mufica! numbers; while defoair, defiance, revenge, and turbulent emotions in general, afume an abrupt and forormus cadence. Dignity of defcription (A), folemn vows (B), and all fentiments that proceed irnm a mind elevated with great ideas $(c)$, require a correfondent pomp of language and verfification. Lafty, an irregular or uncamon movement in the verfe may fumetimes be of ufe, to make the reader conceive an imase in a particular manner. Vireil, deferibing horfes running over rocky lieights at full fpeed,
begins the lire with two dactyls, to imitate rapidity, and concludes it with eight long fyllables:

Saxa per, et fcopulos, et cepreflas crnvalles.
Gcor. III. 276.
which is a very unufual meafure, but feems well adapted to the thing expreffed, namely, to the defcent of the animal from the hills to the low ground. At any rate, this extraordinary change of the rhythm may be allow. ed to bear fome reemblance to the animal's change of motion, as it would be felt by a rider, and as we may fuprofe it is felt by the animal itfelf.

Other forms of imitative harmony, and many other examples, befides thofe referred to in the margin, will readily occur to all who ate converfaut in the writings of the beft verfifiers, particularly Homer, Virgil, Milton, Lucretius, Spenfer, Dryden, Shakefrare, Pope and Cray.

## SEct. 1. Of Esic and Dramatic Comprfitions. <br> § 1. The Epopee and Drama compared.

Elem.of Criticifm. $7^{6}$ In what t.agic and epic poctry agree, and in what they differ.

TRagedy and the epic differ not in fibbtantials : in both the fame ends are propofed, viz. inftruction and amufement; and in both the fame mean is employed, viz. imitation of human actions. They differ only in the manner of imitating: epic poetry employs narration ; tragedy reprefents its facts as palling in our fight: in the former, the poet introduces himfelf as an hiltorian: in the latter, he prefents his actors, and never himfelf.
This difference, regarding form only, may be thought flight : but the effects it occalions are by no means to ; for what we fee makes a decper impreflion than what we learn from others. A narrative poem is a fory told by another: fafts and incidents paffing upon the ftage, come under our own oblervation; and are befide much enlivened by action and getture, exprefive of many fentiments beyond the reach of language.

A dramatic compofition has another property, independent altogether of action; which is, that it makes a deeper impreflion than narration: in the former, perfons exprefs their awn fentiments; in the latter, fentiments are related at fecond-hand. For that reafon, Ari-
flosle, the father of critics, lays it down as a rule*, That in an epic poem the author ought to take every opportunity of introducing his actors, and of confining the narrative part within the narroweft bounds. Homer underitood perfectly the advantage of this method; and his poems are both of them in a great meafure dramatic. Lucan runs to the oppofite extreme: and is guilty of a till greater fault in ftuffing his Pharfa-
lia with cold and languid rcflections, the merit of which he alfumes to himfelf, and deigns not to fhare with his afters. Nothng can be more injudicioufly timed, than a chain of fuch reflections, which futpend the battle of Pharfalia after the leaders had made their fjeceches, and the two armies are ready to engage $\dagger$.

Ariftotle, from the nature of the lable, divides tragedy into fimple and complex : but it is of greater moment, with refpect to dramatic as well as epic poetry, to found a diftinction upon the different endsattained by fuch compofitions. A poen, whether dramatic or epic, that has nothing in riew but to move the paffions and to exhibit pictures of virtue and vice, may be diflinguilhed by the name of pathetic: but where a tory is purpofely contrived to illuftrate fome moral truth, by fhowing that diforderly paffions naturally lead to external misfortunes, fuch compofition may be denominated moral. Beffde making a deeper impreflion than can be done by cool reafoning, a moral foem does not fall fhort of reafoning in affording conviction: the natural connection of vice with mifery, and of virtue with happinefs may be illuftrated by ftating a fact as well as by urging an argument. Let us affume, for example, the following moral truths: That difcord among the chiefs renders ineffectual all common meafures; and that the confequences of a llightly-founded quarrel, foftered by pride and arrogance, are not lefs fatal than thofe of the grofleft injury; thefe truths may be inculcated by the quarrel between A gamemnon and Achilles at the fiege of Troy. If facts or circumitances be wanting, fuch as tend to roufe the turbulcut parfions, they muft be invented; but no accidental nor unaccountable event ought to be admitted; for the necelliry or probable connection between vice and mifery

is is not learned from any cicnts but what are naturally and occafioned by the characters and paflions of the perfons - reprefented, acting in fuch circumftances. A real event, of which we fee not the coufe, may afford it lefon, upon the prefumption that what hath happened may again happen: but this cannot be inferred from it flory that is homen to he a fiction.

Many ate the grodeffels of fuch compofitions. $A$ pathetic compofition, whether epic or dramatic, tends to a habit of virtue, by cxcieing us to do what is right, and reftraining us from what is wrong; Its frequent pietures of homan wnes rroduce, befide, two cfleets, extremely falutary: they improve our fympathy, ind fortify us to bear down nur misfortunes. A moral compoftion mult obvioully produce the fime good cffects, hecanfe by being noral it ceafeth not to be pathetic: i: enjoys befides an excellence peculiar to ittelf; for it ne: only improves the heart as abovementioned, but inftucts the head by the moral it contains. It feems impofible to imagine any entcrininnent more fuited in a rational being, than a worl thus happily illuttrating fome moral truth; where a number of perfons of differcni characters are engaged in an important action, frme retarding, others promoting, the great catafroulc ; and where there is dignity of ftyle as well is of matter. A work of this kind has our fympathy at command, and can put in motion the shole train of the focial affections: our curiofity in fome fcenes is excited, in others gratified; and our delight is confummated a: the cloie, ufon finding, from the characters and fitmations exhibited at the commoncement, that cvery incident down to the finsl cataltrophe is natural, and that the whole in conjunetion make ar regaiar chain of calles and efiects.

Confidering that an epic and a dramatic poem are the fame in fubftace, and have the fame aim or end, cne will readily imagine, that fubjects proper for the one mult be equally proper for the other. But confidering hacir difference as to form, there will be found reafon to correct that conjecture, at leatt in fonme degree. Minny fubjects may indeed be treated with cqual advantage in either form: but the fubjects are fill more rumerous for which they are not equally qualified: and there are fubjects froper for the ene and not at all for the other. To give fome flight notion of the difference, as there is no room here for enlarging upon every article, we obferve, that dialogue is better qualified for exprefling fentiments, and narrative for diiplaying fafts. Heroifm, magnanimity, undaunted courage, and other elevated virtues, figure beft in action: tender paffinns, and the whole tribe of fympathetic affections, figure beft in fentiment. It clearly follows, that tender patrions are more peculiarly the province of iraredy, grand and heroic actions of epic poetry.
"The epic poem is univerfally allowed to be *, of ail poetical works, the moft digrified, and, at the fame time, the mont difficult in execution. To contrive a ftory which thall pleafe and intereft all readers, by bein:o it once entertaining, important and inftructive; wh fill it with fuitable incidents: to enliven it with a vamety of characters and of defcriptiens : and, throughout a inag work, to maintain that propriety of fentinent, and that elevation of fole, which the epic cha1acter requires, is unquefionably the higheft effort of nectical genine.

Voi. XV.
"The adion or fubjes of the efic focm mut be great and interelting. Withoui greatnets it would not have fufficient inpurtance cither to lix our attention or
to jutity the magnificent apparatus which the poct beto jutity the magnificent apparatus which the poet beRouss on it. This is fo evidently requifite as noter require illuftration ; and, indeed, hadly any whon have falfotet :itienapted epic poctry have fatloch in clionfing fome fubject fufficiontly importanc, cither by the nature of the adien or by the fanc of the perforeces concenned in $i$. The famc of Llomer's heroes, and the comequences or difenfion bet-ren the greatef of them, is a fubject impo:tan: in itfelf, and inult have appeared partictilarly fo to his countrymen, who boafted their defcent from thofe herocs. 'The fubject of the Aineid is fill greater than that of the Iliad, as it is the foundation of tha mof powerfill cmpire that ever was eflablifhed tupon this riobe; :un event of much greater impertance than the deltruftion of a cits, or the anger of a femibarba. rous warrio:. But the poems of Homer and Virgil fall in this refpeen infinitely fhort of that of Milton. " B :fore the greatuefs difplayed in Paradife Loft, it has beca well obferved s that all other greatnefs thrinks away. The fubject of the Englifh poct is not the dettruction of a city, the conduet of a colony, or the foundation of Mile of an empire : it is the fate of worlds, the revolutions of heaven and carth; rebellion againf the Supreme King, raifed by the highet order of crented beings; the overthrow of their hof, and the puniffment of their crime ; the creation of a new racc of reafonable crazures; their original happinefs and innocence, their forfeiture of immortality, and their reforation to bope and peace."

An epic poem, horecrer, is defectire if its asion be not interelting as well as great: for a narratire of mere valour may be fo contructed as to prove cold and tirefomc. "Much * will depend on the liappy choice of biair n" fome fubject, which flall by its nature interef the pub- fups. lic; as when the poet feleets for his hero one who is the founder, or the deliverer, or the favourite of his nation; or when he writes atchevenzents that have been highly celebrated, or have been connected wit! important confequences to any public caufe. Ioft of the great epic poems are abundantly fortunatic in this refpect, and mut have been very interefting to thofe ages in which they were compofed." The fubjcen of the Paradife Lof, as it is infinitely greater, mult likewife be confidered as more iniverfally interefting than that of any other poem. "Wre all feel the etfeets of Adam's tranigrefion; we all fin like him, anc? like him mult all bewail oint offences. TVe have reftlefs and infidious eacmies in the failen angeis, and in the bleffed fpirits we have guardians and friends; in the redemption of mankind we hope to be ircluded; in the defcription of heaven and leell we are furcly interefted, as we are all to refide hereafter either in the regions of hor:or or blifs."
"The chief circum?ance which renders an epic poem Circurn. intercfingt, and which tends to intereft not one age ftances or country alonc, but all readers, is the tkifful conduct chiefly inof the author in the management of his fubject. His terefing in plan mutt comprehend many aftecting incidents. He + Pbicpoctry. may fometimes be awful and augult: he mult eften johnfors. he tender and pathatic; he muit give us gentie and pleafing fenes of love, friendihip, and afestion. The more that an epic poem abounds with fituations which Cc
awaken
of the awaken the feelings of humanity, it is the more inseEppeceand refling. In this refpect ferhaps no epic poets have Drama. Par hif ppy as Virgil and lallo. The plan of the Paradife layfl comprites neither human attions nor human manners. The man and woman who aet and fuff-r, are in a fate which no other man or wom in can ever know. The reader finds no tranfaction in which he can be engaged; beholds no condition in which he can by any effort of imagination place himfelf; he has therefore little natural curiofity or fympathy."
82
Whether the hero sumat necef-
 drily be that "there is no reafon why the hero thould not be fuccefofut. unfortunate, except eftablifhed practice, lince fuccefis and virtue do not necelfarily go together." Mofl critics, however, are of a different opinion, and hold fuccefs to be, if not the neceflary, at leaft the molt proper iffire of an epic poem. An unhappy conclufion depreffes the mind, and is oppofite to the elevating motions which belong to this fpecies of poetry. Terror and compaflion are the proper fubjects of tragedy ; but as the epic is of larger extent, it were too much, if, after the difficulties and troubles which commonly abound in the progrefs of the poem, the author thould bsing them all at laft to an unfortunate conclufion. We know not that any author of name has held this courfe except Lucan; for in the Paradife Lof, as Adam's deceiver is at lalt crufhed, and he himelf reflored to the fivour of his maker, Milton's hero mult be confidered as finally fuccer ful.

We have no occafion to fay more of the epic, conficered as peculiarly adapted to certain finbjecis, and to be condusted according to a certain plan. But as dramatic fubjests are more complex, it is necelfary to take a narrower view of them. They are either the light and the gay, or the grave and affecting, incidenis of human life. The former conllitute the fubject of comedy, and the latter of tragedy.
As great and ferious objects command more attention than little and ludicrous ones; as the fall of a hero interefts the public more than the marriage of a private perfon; tragedy has been always held a more dig. nified entertainment than comedy. The firlt thing required of the tragic poet is, that he pitch upon lome moving and interefting flory, and that he conduet it in a natural aud probable manner. For we mult ubferve, that the natural and piobable are more eilential to tragic than even to epic poetry. Admiration is excited by the wonderful; but paffion can be raifed only by the impre月ions of nature and truth upon the mind.

The fubject beit fitted for tragedy is where a man has himfelf been tha caufe of his misfortune; not io as to be deeply guilty, nor alcogether innocent: the misfortune nutat be occationed by it fault incident to humani nature, and thicref, re in fome icgree venial. Such misfortunes call firth the focial affelions, and warm'y intereft the fpertion. An alecidental misfortune, if not extremely firguiar, doth not greatly move our pity: the perfon who fuffers, being innocent, is freed from the greatelt of all torments, that anguith of mind which is occafionet by remorfe. An atrocious criminal, on the other hand, who bings misfurtunes upon himflf, creites little pity, for : different reafon:
his remorfe, it is true, aggravates his diftrefs, and fwells the firit cmotions of pity; but then our hatred of him as a criminal blending with pity, blunts its edge confiderably. Misfortunes that are not innocer.t, nor highly criminal, partake the advantages of each extreme: they are attended with remorie to embitter the diftrefs, which raifes onr pity to a great height; and the flight indignation we have at a venial fault detra@s not fenfibly from our pity. The happielt of all fubjects accordingly for raifing pity, is where a man of integrity falls ino a great misfortune by doing an action that is innocent, but which, by fome fin. gular means, is conceived by him to be criminal: his remorfe aggravates his diftrefs; and our compaffion, unreftrained by indignation, knows no bounds. Pity comes thus to be the ruling paftion of a pathetic tragedy; and, by proper reprefentation, may be raifed to a height farce exceeded by any thing feit in real life. A mor:al tragedy takes in a larger field; as it not only exerciies our pity, but raifes another paffion, which, though felfifh, deferves to be cherifhed equally with the focial affection. The paffion we have in view is fear or terror; for when a misfortune is the natural confequence of fome wrong bias in the temper, every fpectator who is confcious of fuch a hias in himfelf takes the alarm, and dreads his falling into the fame misfortune : and by the emotion of fear or terror, frequently reiterated in a variety of moral tragedies, the fpectators are put upon thcir guard againft the diforders of pafion.

The commentators upon Ariftotle, and other critics, have been much gravelled about the account given of tragedy by that author: " l'hat by means of pity and terror, it refines or purfics in us :all forts of pallion." But no one wh:, his a clear conception of the end and effeets of a gond tragedy, can have any difficulty about Ariftotle's meaning: Uur pity is engaged for the perfons repreferted; and our terror is upon our own account. Pity indeed is here made to ftand for all the fym. pathe:ic emotions, becaufe of thefe it is the capital. There can be no doubr, that our fympathetic emotions are refined nr improved by daily exercil:; and in what manner our other paffiens are icined by terror, has been julf now faid. One thing is certain, that no other meaning can juttly be given to the foregreing doatrine than that now mentioned ; and that it was re.lly Ariftotle's meaning, appears from his 13 th chapter, where he dilivers fevcral propofitions confurm ble to the doctrine as here explained. Theic, at the fume time, we take liberty to mention; becaufe, fo far as authority can go, they contirm the foregoing reafoning about fuljocts proper fer tragcdy. The firft propotition is, That it being the province of tragedy to excite pity and terror, an insocent perion falling into adverlity ought never to be the fubject. This propofition is a necelifary confcquence of his doctrine as explained: a fubject of that nature may indeed excite pity and terror ; but the former in an inferior degree, and the latter in no degree for meral intruction. The fecond prepofition is, That the hiffory of a wicked perfon in a change from mifery to happinefs ought not to be reprefented; which excites neither terror nor compalfion, nor is agrecable in any refpect. The third is, That the misfortuncs of a wicked perion ought not to be reprelented: fuch reprefentation may be agreeable in fome
meafure
meafure upon a prinicple of juftice; but it will not move our pity; nor any degree of terror, except in thofe of the fime vicious difpolition with the ferfon reprefented. Thise lat propoftion is, That the only chardeer fit for reprefentation lies in the middle, neither eminently good nor eminently bad; where the misfortune is not the effect of deliberate vice, but of fome involuntary fault, as our author exprefles it. The only objection we find to Arifotle's account of tragedy, is, that he confines it within too narrow bounds, by refuling admittance to the pathetic kind: for if terror be eflential to tragedy, no reprefentation deferves that name but the moral kind, where the misfortunes cx hibited are caufed by a wrong balance of mind, or fome diforder in the internal conftitution: fuch mistortunes always fuggeft moral inflruction; and by fuch misfortunes only can terror be excited for our improvement.

Thus Arifotle's four propofitions abovementioned rclate folely to tragredies of the moral kind. Thofe of the pathetic kind are not confined within fo narrow limits: fubjects fitted for the theatre are not in fuch plenty as to make us reject innocent misfortunes whicl roule our fympathy, though they inculcate no moral. With refpes indeed to the fubjects of that kind, it may be doubted, whether the conclufion ought not always to be fortunate. Where a perfon of integrity is reprefented as fuffering to the end under misfortunes purely accidental, we clepart difcontented, and with fome obfcure fenfe of injuftice : for feldom is man fo fubmilive to Providence, as not to revolt againt the tyranny and vexations of blind chance; he will be tempted to fay, this ought not to be. We give for an example the Ronseo and Fuliet of Shakefpeare, where the fatal catatrophe is occafioned by Friar Laurence's coming to the monument a minute too late; we are vexed at the unlucky chance, and go away diffatisfied. Such impreflions, which ought not to be cherithed, are a fufficient reafon for excluding fories of this kind from the theatre.

The misfortunes of a virtuous perfon, arifing from neceffary caufes,or a chain of unavoidable circumptances, as they excite a notion of dettiny, are equally unfatisfactory to the human mind. A metaphyfician in his clofet may reafon himfelf into the belief of fate, or what in modern language is called philofophical ncec $/ \sqrt{1} y$; but the feelings of the heart revolt againft that doctrine; and we have the confeffion of the two ablett philofophers by whom it was cver maintained, that men conduct themfelves through life as if their will were abfolutely free, and their actions no part of a chain of neceffary caufes and effects. As no man goes to the theatre to ftudy metaphyfics, or to divelt himfelf of the common feelings of humanity, it is impolible, whatever be his philotophical creed, that he fhould contemplate without horror and difguft an innocent perfon fuffering by mere deftiny. A tragedy of uncommon merit in every other refpect may indeed be en.lured, nay perhaps admired, though liuch be its cataftrophe; becaufe no work of man was ever perfect ; and becaufe, where imperfections are unavoidable, a multitude of excellencies may be allowed to cover one fault: but we believe the mifery of an innocent perfon refulting from a chain of unavoidable circumfances has never been confidered as a beauty by minds unperverted by a falfe philofophy. "It muf be acknowledged * that the fubjens of the ancient Greek
tragedies were frequently founded on mere deftiny and inevitible misfortunes. In the courfe of the drama ma.
 which the fable conveyed was, th:t reverence was due to the gods, and fubmiffion to the decrees of faic. I.fo. dem tragedy bas aimet at a higher nbjed, by beeoning more the theatre of palion; pointing out to mon the confequences of their own mifconduct, howing the dircful effens which ambition, jealnuly, love, refenment, and other fuch fronge emotions, when mifguided or lef: unrefrained, produce upon human life. An O.heils, hurried by jealoufy to murder his innocent wife; a Ialfier enfnared by refentment and want to engage in it confipracy, and then Aung with remorfe and involved in ruin; a Sifferedi, through the deceit which he cmploys for pablic-fpirited ends, bringing ceftruction on all whom he loved: thefe, and fuch as thefe, are the exam. ples which Tragedy now difplays to public view; and by means of which it inculcates on men the proper govenment of their palions."

There is indeed one fingular drama, in which deftiny is employed in a manner very difierent from that in whicl it was ufed by the poets of Greece and Rome. It is Schiller's Tragedy of the Robbers, of which "the hero, endowed by mature (as the tranllator of the piece obferves) with the moft gencrous feelings, animated by the highelf fenfe of honour, and fufceptible of the warm:eft affections of the heart, is driven by the perfidy of a brother, and the fuppofed inlumanity of his father, into a fate of confirmed mifanthropy and defpair:" He will:es that he "could blow the trumpet of rebellion through all nature; that he could extinguifh with one mortal blow the viperous race of men; and that he conld fo Atrike as to deftroy the germ of exiftence." In this fituation he is hurried on to the perpetration of a feries of crimes, which find from their very magnitude and atrocity a recommendation to his diftempered mind. Senfible all the while of his own guilt, and faffering for that guilt the fevereft pangs of remorfe, he yct believes himfelf an inftrument of vengeance it the hand of the . 11 mighty for the punifhment of the crimes of others. In thus accomplifhing the dreadful deftiny which is preferibed for him, he feels a fpecies of gloomy fatisfaction, at the fame time that he confiders himfelf as doomed to the performance of that part in life which is to confign his memory to infamy and his fnul to perdition. After burning a town, he exclaims, "O God of veng eance! am I to blame for this? Art thou to blame, $O$ Father of Heaven! when the influments of hy wrath, the pef. tilence, flood, and famine overwhelm at once the rigiteous and the guilty? Who can command the flames to Atay their courfe, to deftroy only the noxious vermin, and fpare the fertile field ?" yet with the fame breath, he ac. cufes himfelf of extreme criminality for "prefumptuonfly wielding the fword of the Mnlt High!" Ile frequently laments in the moft aficcing mamer the lofs of his innocence, wifhes that " he could return into the womb that bate him, that he hung an infant at the breaft, that he were born a bergar, the meaneft hind, a peafint of the field." He confiders himfelt as the outealt of Heaven, and finally rejected by the Father of merey; yet he tell's the band of robbers whom he commanded, that the st Almighty bonoured them as agents in his hands to execute his wonderons purpofes; enployed them as his angels to executc his lern decrecs, and pour the vi-
of the of his wrath :" and in a very fulemn prayer, he fuppofes Epopee and that "the God who ruleth over ail had dicreed that he Irama. thould become the chief of theie fuel murderers."
"It will be allowed, fuys the tranthator, that the imanation could not have conceived a peatacle more deeply interelting, more powerfilly affecting to the mind of man, than that of a human being thus ch.araterifed and aeting under fuch impreftions. The compafionate ntereft which the mind feels in the emotions or lufferings iof the guilty perfon, is not diminithed by the obfervation, that he atts under an imprellion of inevitable deftiny; on the contrary, there is fomething in our nature which leads us the more to compafionate the intrument of thofe crimes, that we fee him confider himfelf as bound to guilt by fetters, which lie has the conftant wilh, but not the flrength, to break."

This is indeed true: we fympathife with the hero of the Robbers, ant only on account of his exalted fentiments and his inflexible regard to the abfract principles of honour and jullice, but much more for that dif urder of intellect which makes him fuppofe" his dettiny fixed and unalterable," at the very time that he is torn with remorfe for the perpetration of thofe crimes by which he believed it to be fulfilling. Delliny, hewever, is not in this tragedy exhibited ạs real, but merely as the phantom of a dillempered though noble riind. Had the poet reprefented his hero as in fald decrecd by God or lound by fite, to head a band of foul murderers, and t.) commit a leries of the mont atrocious crimes; though sur pity for him might not have been leflened, the innfreflions of the whole piece on the mind could have been only thofe horror and difgut at what would ality of the whole. The Doator confiders this as a mater of no great confequence; for "it is proved by experience, that a fictitious t:le, if properly conducted, will melt the heart as much as any real hiftory;" this ebfervation is rerified in the Robbers. It is indeed a very irreguiar drama, and pcriaps could not be acted on a Buitifh theatre. But although the whole is known to be a fiction, we believe there are few effufions of human genius which more powerfully excite the emotions of terror and pity. Truth is indeed congenial to the mind; 2:nd when a fubjest proper for tragedy occurs in hiftory or tradition, it is periaps better to adopt it than to invent one which has no fich foundation. But in choofing a fubject which makes a figure in hiltory, greater precaution is necellary than where the whole is a fiction. Ii the latter cafe, the author is under no refleaint other thin that the charafers and incidents be jult copies of nuture. But where the fory is founded on truth, no sircumfances mof be added, but fuch as connect natu-
rally with what are known to be true; hifory may be fupplied but mult not be contradicted. Further, the Lepopet fubjer chofen mult be diltant in time, or at leat in place; for the familiarity of recent perfons and events ought to be avoided. Fumiliarity ought more cipecially to be avoided in an epic poem, the peculiar character of which is dignity and elevation: modern manners make but a poor figure in fuch a poem. Their familiarity unqualifies then for a lofey fubject. The dignity of them will be better underfood in future ages, when they are no longer familiar.

After Voltuire, no writer, it is probable, will think, of rearing an epic poem upon a recent event in the hifory of his nwn country. But an event of that kind is perhaps not altogether unqualified for tragedy: it was admitted in Greece ; and Skakefpeare has employed i: fuccerffully in feveral of his pieces. One advantage it poffilles above fiction, that of more readily engaging our belief, which tends above any other particular to raife our lympathy. The fcene of comedy is generally laid at home : familiarity is no objection; and we are peculiarly lenlible of the ridicule of our own manners.

After a proper fubject is chofen, the dividing it into parts requites lome art. The conclufion of a book in an cpic poem, or of an art in a play, cannot be altogether arbitray ; nor be intended for fo llight a purpofe as to muke the parts of equal length. The fuppofed pate at the end of every book, and the real paufe at the end of every act, ought al ways to coincide with fome pacie in the action. In this refpect, a dramatic or cpic poem ought to refemble a fenterse or period in language, disided into members that are diftinguilhed from each other by proper paures; or it ought to refemble a piece of mulic, having a full clofe at the cnd, preceded by imperfect clules that contribute to the melody. The divifion of every play into five acts has no other founda. tion than common practice, and the authority of Horace ( D ). It is a divifion purely arbitrary ; there is nothing in the nature of the compofition which fixes this number rather than any other; and it had been much better if no fuch number had been afeertained. But, fince it is afcertained, every act in a damatic poen ought to clofe with fome incident that makes a pauie in the ation; for otherwife there can be no pretext for interrupting the reprefentation. It would be abfurd to break off in the very heat of action; againft which every one would exclaim : the abfurdity fill remains where the astion relents, if it be not a ctually fulpended for fome time. This rule is alfo applicable to an epic poem : though in it a deviation from the rule is lefs remarkable; becaure it is in the reader's power to hide the abfiurdity, by proceeding inftantly to another book. The firt book of Paradife Loft ends without any clofe, perfect orim. perfeqt : it breaks off abruptly, where Satau, feated on his throne, is prepared to harangue the convocated hoft of the fallen angels; and the fecond book begins with the fpeech. Milton feems to have copied the Reneid, of which the two firlt books are divided much in the
fime

Ve Arte Poerica.
If youl would have your play deferve fuycefs, Give it five afts complete, nor more nơr lefs.
fime manner. Neither is there any ponper paufe at the end of the feventh b ok of Paradife Looth, hor at the end of the cleventh. In the Lliad little antumion is give: to tlis rule.

13:Cides tragedy, damatic poetry comprehends co-- medy and tarce. 'Thefe are fiuficiently dillinguith ed from tragedy by their general fipitatad train. "While lity :and terror, and the other firong paffions, form the province of the tras sic mule, the chicf or rather fole inftrument of cemedy and farce is ridicule." Thefe two ipecics of compolition are fo perpetually running into bach other, that we thatl not treat of them ieparately ; fince what is now known by the name of farce differs in nothing effential from what was called the old connedy among the Greeks. "Coinedy propofes for its object $\ddagger$ neither the great fufferings nor the great crimes of men: but their follies and llighter vices, thofe parts of their charatter which raitc in beholders a ferfe of impropriety, which expofe them to be cenfured and laughed at by o:lers, or which render them troublefome in civil fociety.
". The fubjects of tragedy are not limited to any age or country; but the fene and fuljeet of comedy fhould always be laid in our own country, and in our own times. The reaton is obvious: thofe decorums of behaviour, thefe lefler diferiminations of character, which afford fubject for comedy, change with the differences of countries and times; and can ncver be fo well undertood by foreighers as by natives. The comic poet, who aims at coireaing improprieties and follies of behaviour, thould 'catch the mamners living as they rife.' It is not his bulinefs to amufe us with a tale of vther times; but to give us piaures taken from among ourfelves; to fatirize reigning and prefent vices; to exhibit to the age a faithful copy of ittelf, with its humours, its follies, and its extravagancies.
"Coinedy may be divided into two kinds: comedy of charatier, and comedy of intrigize. The former is the. more valuable fpecies; becaufe it is the bufinefs of comecty to exhibit the previiling manners which mark the charater of the age in which the feene is laid: yet there fhould be always as much intuigue as to give us fomething to wifh and fomething to fear. The iscidents flould fo fucceed one another, as to produce ftriking fituations, and to fix our attention; while they afford at the fame time a pruper field for the exhibition of character. The action in comedy, though it demands the poct's care in order to render it animated and natural, is a lefs fignificant and important part of the performance than the action in tragedy: as in comedy it is what men fay, and how they behave, that draws our attention, rather th:m what they perform or what they fuffer.
"In the management of characters, one of the mont comnion fanlts of comic writers is the carrying of them too far beyond life. Wherever ridicule is concerned, it is inderd catremely difficult to hit the precife point where true wit ends and buffoonery begins. When the mifer in Plautus, fearching the perfon whom he fulpects of having Atwen his cafket, after examining firlt his right hand and then his left, cries out, ofende ctianh tertian:-- fhow me your third hand,' there is no onc but mult be fentible of the extravigance. Certain degrees of exag. geration are allowed to the comedian, but there are fi mits fet to it by nature and good tafte; and fuppofing the mifer to be evcr fo much engrofed by his jealoufy
and his fufpicions, it is impofithe to cenceive any man in his wis fulpesting wother of havirg more than two hands."

It appears from the phays of irifophanes which renair, that the chamate in the nid condedy of A thens were alravit alweys overchapged. They vere likewife
 were brought urion the fage by name. "The ridicul: employed ia them is extravibant, the wit for the mofe part bufionith and farcical, the raiilcoy biting and cruei, and the obreenity that reigns in then is grols and intolerable. They feen to lave been compofed merely for the mob." Yet of thefe atominable dramas, an cxcellent critic in hatsarmed, with too much tuth, that what is P Hurhi now called farce is nothing more then the fladow. The characters in genuine comedy are not thofe of paticular and known perfons, but the general characters of the age and nation ; which it requircs no fmall 12:11 to ditinguilh clc.rfly and maturally fom each other. In atterifting this, poets are too apt to enntratt chameters and introduce them alyays in pairs; which gives an affeded air to the whole piece. The perfection of art is to conceal art. "A mafterly writer will gire nis his characters diftinguihed rather by fuch thades of diverfity as are commonly found in fociety, than marked with fiach ftrong oppofitions as are rarely brought into actual contraft in any of the circumintancss of real lite."

The fyle of comedy ought to be pure, clegant, The fyle and lively, very feldom rifing higher than the ordinary of conted: tone of polite converfation; and upon no occafion defcending into vulgar, mean, and grofs expretions; and in one word, astion and charater being the fundamental parts of every epic and dramatic compofition, the fentiments and tone of language ought to be fubfervient to thefe fo as to appear natural and proper for the occalion.

## (5 2. Refperive peculiarities of the Elpopes and Drama.

In a theatrical entertainment, which employs both Machinery the eye and the car, it would bc a grofs abfurdity to can have. introduce upon the fage fuperior beings in a vifible noplaccia, thape. There is no place for fuch objection in an op:c a drama, porms; and Boileau, with many other critics, declares ${ }^{n o r}$ itrongly for that fort of machinery in an epic poen. But waving authority, which is apt to impofe upon the judgement, let us draw what light we can from reafon. We may in the firft place obferve, that this matter is but indiftinatly handled by critics: the poetical privilege of animating infenfible objects for cnlivening a defcription, is very diferent from what is termed mashinery, where deities, angels, devils, or other fupernatural powers, are introduced as real perfonages, mixing in the ataion, and. contributing to the cataltrophe; and yet thefe two things are conftantiy jumbled together in reatoning. The former is foonded on a natural priaciple: but nothing is more unatural than the later. Its effects, at the fame tine, are deplorable. Firft, it gives an air of fiation to the whole; and provents that imprefion of reality which is requifite to intereft our affections, and to move our paffions": which of itfelf is fufficient to explode machinery, whatever entertainment it may afford to readers of a fantaftic tafte or irregularimagimation. And, next, were it Has it a ase it pofitule, by cifruining the fiftion, to dclude good effes us into a notion of reality, an infuperable objedion in the would fill remain, which is, that the am or cod of hghorersisa
an epic poem can never be attained in any perfection where machinery is introduced; for an evident reafon, that virtuous emotions cannot be raifed fuccefffully but by the adions of thofe who are endued with paflions and affections like our own, that is, by human astions; and as for moral inftruction, it is clear, that none can be drawn from beings who act not upon the fame principles with us. A fable in Æffop's manner is no objection to this reafoning: lis lions, bulls, and goats, are truly men under difguife ; they act and feel in every refpeet as human beings; and the monal we draw is founded on that fuppofition. Homer, it is true, introduces the gods into his fable: but the religion of his country authorifed that liberty; it being an article in the Grecian creed, that the gods often interpofe vifibly and bodily in human affairs. It mult however be ob. ferved, that Homer's deities do no honour to his poems; fictions that tranfgrefs the bounds of rature, feldom have a good effect ; they may inflame the imagination for a moment, but will not be relithed by any perfon of a correct tafte. They may be of fome ufe to the lower rank of writers ; but an author of genius has much finer materials, of Nature's production, for elevating his fubject, and making it interefting.

One would be apt to think, that Boileau, declaring for the Heathen deities, intended them only for embellifhing the dietion: but unluckily he banithes angels and devils, who undoubtedly make a figure in poetic langruage, cqual to the Heathen deities. Boileau, therefore, by pleading for the latter in oppefition to the former, certainly meant, if he had any dittinet mcaning, that the Heathen deities may be introduced as actors. And, in frat, he himfelf is guilcy of that glaring abrurdity, where it is not fo pardonable 23 in an epic poem: In his ode upon the taking of Namur, he demands with a molt ferious countenance, whether the walls were built by Apollo or Neptune : and in relating the paffage of the Rhine, anno 1672 , he defrribes the god of that river as fighting with all his might to oppofe the French monarch; which is confounding fiction with seality at a ftrange rate. The French writers in general run into this error: wonderful the effect of cuf. tom, entirely to hide from them how ridiculous fuch fictions are.
That this is a capital error in Gicrufalemme Liberata, Taffo's greatent admirers mult acknowledge : a fituation can never be intricate, nor the reader ever in pain about the cataftrophe, fo long as there is an angel, devil, or magricimn, to lend a helping hand. Voltaire, in his effay upon epic poetry, talking of the Pbarfalia, obferves judicioufly, "That the proximity of time, the notoriety of event:, the character of the age, enlightened and political, joined with the folidity of Lucin's fubject, deprived him of poetical fiction." Is it not amazing, What a critic who reafons fo jufly with refpect to others, can be fo blind with refpect to himifelf? Voltaire, not fatisfied to enrich his language with infages drawn from invifible and fuperior beings, introduces them into the action: in the fisth canto of the Heariacte, St Louis appears in perfon, and terrifies the foldiers; in the feventh canto, St Louis fends the god of Sleep to Henry ; and, in the tenth, the demons of Difcord, Fanaticifm, War, \&ec, afift Aumale in a fingle combat with Turenne, and are driven away by a good angel brandithing the fivord of Cool I's blend fuch fictitious parfonages
in the fame action with mortals, makes a bad figure of at any rate; and is intolerable in a hifory fo recent $\mathrm{l}_{\mathrm{pc}}$ as that of Henry IV. But perfection is not the lot of man.

But perhaps the molt fuccefsful weapon that can be employed upon this fubject is ridicule. Addifon has applied this in an elegant manner: "Whereas the time of a general peace is, in all appearance, drawing near ; being informed that there are feveral ingenious perions who intend to flow their talents on fo happy an occafion, and being willing, as much as in me lies, to prevent that effution of nonlenfe which we have good caufe to apprehend; I do hereby frictiy require every perion who thall write on this fubject, to remember that he is a Chrifian, and not to facrifice his catechim to his poetry. In order to it, I do expect of him, in the firlt place, to make his own poem, without dependins upon Phoebus for any part of it, or calling out for aid upon any of the Mufes by name. I do likewife pofitively forbid the fending of Mercury with any particular meflage or difpatch relating to the peace; and thall by no means fuffer Minerva to take upon her the fhape of any plenipotentiary concerned in this.great work. I do further declare, that I thall not allow the Deftinies to have had a hand in the deaths of the feveral thoufinds who have been flain in the late war; being of opinion that all fuch deaths may be well accounted for by the Chriftian fyftem of powder and ball. I do therefore fricily forbid the Fates to cut the thread of man's life upon any pretence whatfoever, unlel's it be for the fake of rhyme. And whereas I have good reafun to fcar, that Neptune will have a great deal of bufinefs on his hands in feveral poems which we may now fuppofe are upon the anvil, I do alfo prohibit his appearance, unlefs it be done in metaphor, fimile, or any very fhort allufion; and that even here he may not be permitted to enter, but with great caution and circumfpection. I defire that the fame rule may be extended to his whole fraternity of Heathen gods; it being my defign to condemn every poem to the flames in which Jupiter thunders, or exercifes any other act of authority which does not belong to him. In fhort, I expect that no Pagan agent fhall be introduced, or any fact related which a man cannot give credit to with a good confcience. Provided always, that nothing herein contained fhall extend, or be conftrued to extend, to feveral of the female poets in this nation, who fhall Atill be left in full poifeflion of their gods and goddeffes, in the fame manner as if this paper had never been written." Spet. ${ }^{\circ} 523$.
The marvellous is indeed fo much promoted by machinery, that it is not wonderful to find it embraced by the bulk of writers, and pelhaps of readers. If itsdulged at all, it is generally indulged to cxcefs. Homer introduceth his deities with no greater ceremony thim his mortals; and Virgil has ftill lefs moderation: a pilot fipent with watching cannot fall affeep and drop into the fea by natural means one bod cannot receive the two lovers Eneas and Dido, without the immediate interpofition of fuperior powers. The ridiculons in fuch fictions mult appear even through the thickell veil of gravity and folemnity.

Angels and devils icrve equally with Healhen deitics as mateials for figurative language; ferhaps better among Chriftians, becaufe we believe in then, and nct
in Heathen deities. Lut every one is fenfible, as well as Hoilcau, that the invilible powers in our creed make a much worfe figure as adtors in a modern poem than the. invifible powers in the heathen creed did in ancient poems; the caufe of which is not far to feck. The Heathen deities, in the opinion of their votaries, were heings elevated one flep only above mankind, fubject to the fame palions, and directed by the fame motives; therctore not altogether improper to mix with men in an important action. In our creed, fuperior beings are placed at fuch a nighty diftance from us and are of a uature fo different, that with no propriety can we appear with them upon the fame thage: man, a creature much inferior, 1 fes all dignity in the comparifon.

There can be no doubt that an hiltorical poem admits the embelifihment of allesory as well as of metaphor, fimile, or other figure. Mural truth, in particular, is findy illultrated in the allegorical manner : it anufes the fancy to find abitract terms, by a fort of magic, metamorphofed into artive beings; and it is delightful to trace a general propofition in a pictured event. But allegorical bengs thould be confined within their own frere, and never be admitted to mix in the pincepal adtion, nor to comperate in retarding or advancing the cataftrophe; which would have a fill worfe effect than invilible powers: for the impreffion of real exiftence, effential to an epic poem, is inconfitent with that figurative exiftence which is eflential to an allegory; ind therefure 110 method can more effectualiy prevent the impreffon of reality than the intruduct on of allegorical beings co eperating with thufe whom we con eive to be re.lly exilting. 'Ihe love-epifode in the Henriade (canto 9 .), infufferable by the dife rdant mixture of allegry with ical life, is copied from that of Rinaldo and A rmida in the Gierufal.mme Lib, rala, which hath no merit to intitle it to be copied. An allergorical object, fuch as Fame in the Eneid, and the lenple of Love in the Henriade, may fit d place in a defcription: but to introduce Ditcord as a real perfinage, imploring the affiftance of Love as anotler real perfonage tor ehervate the cuurage ol the l.ero, is making thefe figurative beings act beyond their fphere, and creating a itrange jumble of truth and fistion. The allegory of $\operatorname{Sin}$ and Death in the Paradie Lolt is pulibly not generally rel thet, thongh it is not entirely of the f.me nature with what we have been condemning; in a work comprelending the atchieven:ents of fuperior beir.gs there is more room for fancy than where it is confined to human actions.

What is the true notion of an epifude? or how is it to be dittingu thed from the principal attion? Every incident that promotes or retards the cataltrophe mult be part of the principal action. This clears the nature of an epirode; which may be defued, "An incident connected with the principal action, but contributing. neither to advance nor retard it." The defeet of . Aaeas into hell does not advance nor retard the cataflrophe, and the efore is an epifode. The fory of Nitus and Euryalus, producing an alteration in the affairs of the contending parties, is a part of the principal action.

The family.fecne in the fixtl book of the lliad is of the fame nature ; for by Hector's retining from the ficld of battle to vifit his wite, the Grecians had opporiunity to breathe, and even to turn upon the 'l'rojans. 'The unavoid.able effect of an ep:fode according to this definition mult be, to break the unity of adion; and herefore it ought never to be indulged unlefs to unbend the mind after the fatigue of a long narration. An cpifinde when fuch is its purpofe, requires the following con. What ditions: it ought to be wll conne of with the principal eonfirute aft. it ought to be well connered withe priprl a gno.d action; it ought to be lively anc intercfing; it ought enifude. to be fhort; and a time ought to be chofen when the principal ation relents ( $E$ ).

In the following betutiful epifode, which clofes the fecond book of Fingal, all thefe conditions are united.
"Comal was a fon of Albion; the chief of an hundred hills. His deer drunk of a thoufend ftreams; and a thoutand rochs replie? to the reice of his dogs. His face was the mildnefs of youth; but his hand the death of heroes. One was his love, and fair was the! the daughter of mighty Conloch, She appeared like a funbeam anong women, and leer hair was like the wing of the raven. Her foul was fixed on Crmal, and fhe was his companion in the chace. Otten met their eyes of love, and happy were their words in fecrit. But Gormal loved the maid, the chief of gloomy Ardven. He watched her lune lleps on the heath, the foe of unhappy Comal.
"One day, tired of the clace, when the mift had concealed their friends, Comal and the danghter of Conloch met in the cave of Ronan. It was the wonted haunt of Comal. Its lides were hung with his arms ; a hundred thields of thones were there, a hundred helmets of lounding fteel. Reft here, faid he, my love Galvin:a, thou light of the cave of Rnnan: a deer appears on Mora's brow ; I go, but foon will return. I fear, faid the, daık Gurmal my fue: I will reft here; but foon return, my love.
"He went to the deer of Mora. The daughter of Co:loch, t. try his luve, clothed her white fide with his armour, and ftrode from the cave of Ronan. Thinking her his foe, his heart beat high, and his colour changed. He drew the bow : the arrow flew : Galvina fell in blood. He ran to the cave with hafty fteps, and called the daughter of Conloch. Where art thou, my love? but no anlwer. He marked, at length, her heaving heart teating againt the mortal arrow. O C loch's daughter, is it thou! -he funk upon her brealt.
" The hunters found the haplefs pair. Many and filent were his feps rourd the dark dwellings of his love. The fleet of the ocean came: he fought, and the ftrangers fell: he fearched for deati over the field ; but who conld kilt the nit hty Comal? Throwing away his thield an arrow found his manly breall. He fleeps with his Gralvina : their green tombs are feen by the matiner when he bounds on the waves of the nostl."

Next, upon the peculiarities of a dramatic poem. And
(E) Horrer's defcription of the fhield of Achilles is properly introduced at a time when the attion relents, and the reader can bear an interruption. But th: cutbor of Telemachus defcribes the fhield of that joung heroin the hest of battle; a very improper time for an interruption.
ortive !1:1m.. 93 Doulil plot

## in a deama

 fsidum fic:ef:fu!.the firt we fhall memion is a double plot : one of which mull reiemble an epifode in an epic poem; for it would diftat the Epectator, inftead of chtertaining hint, if he were forced io attend at the fame time to two capital plots equally interefing. And even fuppofing it an monder-plot like an epifocle, it feldom hath :? good effect in tragedy, of which fimplicity is a chief property; for an inerelling fubject that cigages our affections, occupies our whole attention, and leaves no room for any feparate concern. Varicty is more tolerable in comedy ; Which pretends only to amufe, withont totally oscupying the mind. But even there, to make a dnuble plot agreeable, is no fight efort of art: the under plot ought uot to vary greatiy in its tone from the principal; for difoordant emotions are unpleafant when jumbled together; which, by the way, is an infuperable objection to tragi-comedy. Upon that account the Provok'l Hufand deferves cenfure; all the fcenes that bring the family of the Wrongheads into ation, being ludicrous and farcical, are in a very different tonc frons the principal fecnes, difplaying fevere and bitter expoftulations between Lord Townley and his lady. The fame objestion touches not the double plot of the Carelefs Huiband ; the diffcrent fubjects being fweetly connected, and having only fo much variety as to retemble thades of colours harmonioufly mixed. But this is not all. T'he under-plot ought to be conrected with that which is principal, fo much at leaft as to employ the fame perfons: the under-plot ought to necupy the intervals or paufes of the principal action ; and both ought to be concluded together. This is the cafe of the Mcrry Wives of Windfor.

Violent action ought never to be reprefented on the nage. While the dialogue goes on, a thoufand particulurs coneur to clelude usinto an imprefion of reality; genuine fentiments, pafionate language, and perfuafive gefture: the fpedator, once engaged, is willing to be deceived, lofes light of himfilf, and without fermple .enjoss the fipestacle as a reality. From this abficit ftite he is roufed by violent ation; he wakes as from a plealing dream; and, cathering his fenfes about him, finds all to be a liction. Hoace delivers the fame rule; and founds it upon the fame reaton:

Ne peurns coram populo Medea trucidet;
Aut humana palam coquat exta nefarius Atreus ;
Aut in avem Progne vertatur, Cadmus in anguem:
Quslcumque oflendis milhi fic, incredulus odi.
The French critics jein with Horace in excluding blood from the fage; but overlooking the mofl fubtantial whection, they urge only that it is barbarons and thocking to a polite audience. I'he Greeks had no notion of fich delicacy or rather cffeminacy; witnefs the murder of Clytemneftra by her fon Orelles, palfing behind the fene, as reprefented by Sophocles: her voice is heard calling out for mercy, bitter expoltulations on his part, loud lhriels upou her being fabled, and then a deep filence. An appeal may bé made to every perfon offeeling, whether this fcene be not more horrible than if the deed had been committed in fiyht of the fpeciators uron a fudden gutt of pafinn. if Corneilte, in refrefenting the affair betwen Horatius and his fifter, upon which the murder enfues behind the feene, had no other view hat to remove from the fectators a fhocking action, he was guilty of a capital mift ike: for murder
in cold hood, which in fome meanure was the eafe as reprefented, is more fhocking to a polite audience, even where the concluive Itab is not feen, than the fame act performed in their prefence loy violent and unpremeditated paffion, as fuddenly repented of as committenl. Addifon's obiervation is jult $t$, Thit no part of this incident ought to hatve been reprefented but rcferved for a narrative, with every alleviating circunftance in favour of the hero.

A few words upon the dialoguc, which ought to be Th fo condusted as to be a true reprefentation of nature. con We talk not here of the fentiments nor of the lawguage the (which are treated eifewhere) : but of what properly $\log$ belongs to dialogue-writing; where evcry fingle fpeech, fhort or long, ought to arife from what is faid by the former fpeaker, and furnifh matter for what comes after till the end of the feene. In this view all the fpeeches from firft to laft reprefent fo many links of one regular chain. No author, ancient or modern, poffeffes the art of dialnguc equal to Shakefpeare. Dryden, in that particular, may jufly be placed as his oppofite. He frequently introduces three or four perfous fpeaking upon the fame fubject, each throwing out his own notions feparately, without regarding what is faid by the reft: take for an example the firft fene of Aurenzebe. Sometimes he makes a number club in relating an event, not to a thanger, fufpred ignorant of it, but to one another, for the fake merely of feaking: of which notable fort of dialogue we have a fpecimen in the firf feene of the firft part of the Conqueft of Granada. In the fecend part of the fame tragedy, feene fecond, the Kins, Abcnamar, and Zulema, make their feparate obicrvations. like fo many folilnquics, upon the fuctuating temper of the mob: a dialogue fo uncouth puts one in mind of two Thepherds in a pattoral excited by a prize to pronounce verfes alternately, each in praife of his own millrefs.

This manmer of dialogue-writing, befide an unatural air, has another bad effect : it fay's the comfe of the adtion, becaufe it is not productive of any confequence. In Congreve's comedies, the ation is often fufpended to make way for a play of wit.

No fault is more conimon among writers than to prolong a fipeech after the impatience of the perfon to whom it is addreffed ought to prompt him or her to break in. Confider only how the impatient actor is to behave in the mean time. To exprefs his impatience in violent action without interrupting would be unnatural; and yet to diffemble his impatience, by appearing conl where he ought to be highly inflamed, would be no lefs fo.

Rhyme being unnatural and difgufful in dialogue, is happily bamifhed from our theatre : the only wonder is that it ever found admittance, efjecially among a poople accuftomed to the more manly freedom of Shakefyeare's dialogruc. By banifhing rhyme, we have gained fo much as nevcr once to dream that there can be any further improvement. And yet, however fuitable blank verfe may be to elevated characters and warm paffions, it mult appear improper and affected in the mouths of the lower fort. Why then fhould it be a rule, That every feene in tragedy mult be in blank verfe? Shakefpeare, with great judgment, has followed a different rule ; which is, to internix profe with verfe, and only to employ the latter where it is required liy the importance or dignity of the fuljest. Familiar thoughts and ordinary facts nught 10 be exprefied in plain language ; to hear, for example
ree a fooiman deliver a fimpie meflige in blank verfe muft appear ridiculous to every one who is not biaffed by cufton. In thort that varicty of charasters and of fituations, which is the life of a piay, requires not anly a fuitable varicty in the fentiments, but alfo in the diftion.

## § 3. Tle Thre Unities.

When we confoler the chain of caufes and effeets in the material world, independent of purpore, defign, or thonglit, we find a number of incidents in fuccellion, without beginning, middle, or end : every thing that happons, is both a caule and an effect ; being the effect of what goes before, and the cande of what follows: one incident iniry affeet us more, another lefs; but all of them are laks in the noiverfal el ain: the mind, in viewing ther incidents, cannot reft or fettle ultimately upon iny one ; but is carried along in the train without any c!ofe.

But when the intellectual vorld is taken under view, in conjunction with the material, the fcene is varicd. Man aEts with deliberation, will, and choice: he aims at fome end; glory, for example, or riches, or conquelt, tie procuring hanpinefs to individuals, or to his country ia general: he propofes means, and lays plans to attain the end prop fed. Here are a number of facts or incidents leading to the end in view, the whole compofing one chain by the relation of caufe and effect. In running over a feries of fuch facts or incidents, we eannot relt upen any one; becaufe they are prefented to us as means only, leading to fome end : but we reft with fatifitation upon the end or ultimate event ; becaufe there the purpofe or aim of the chief perfon or perfons is accomplifhed. This indicates the beginning, the middle, c. 6. and the end, of what Ariftotle calls an entire aftion *. The fory raturally begins with defcribing thofe circumAances which move the perfon who acts the principal part to form a plan, in order to compafs fome defired cvent; the profecution of that plan, and the obftruc. tions, carry the reader into the heat of action; the mid. dle is properly where the action is the moft involved; and the end is where the event is brought about, and the plan accomplifhed.

We have given the foregoing example of a plan crowned with fuccefs, becaufe it affords the cleareft conception of a begimning, a middle, and an end, in which confifts unity of action; and indeed fricter unity cannot be imagined than in that cafe. But an action may have unity, or a beginning, middle, and end, without fo intimate a relation of parts; as where the cataftrople is different from what is intended or defired, which frequentiy happens in our beft tragedies. In the Fineid, the hero, after many obftructions makes his plan effectual. The Iliad is formed upon a different model: it begins with the quarrel between Achilles and Agamemnon ; goes on to defcribe the feveral effects produced by that caufe; and ends in a reconciliation. Here is unity of ation, no doubt, a beginning, a middle, and an end; but inferior to that of the Eneid, which will thus appear. The mind hath a propenfity to go forward in the clain of hifory; it keeps always in view the expected event; and wien the incidents or underparts are connected by their relation to the event, the mind runs fweetly and eafily alone them. 'flas pleafite we have in the Ensid. It is not altogether fo Vor. XV.
pleafent to conneet, as in the Ilisi, cfists by thor The the e common caut ; for fach connedion forces th • wind to Unatic. a continual retrofpect looking batwwatd is hto waiking brickward.
It unity of action be a capitaibeauty in fatle imita- Unty of tive of human affars, a plaralty of unconvected ibbles actine a muf be a capital deformity. Fine the fike of varicts, cipisa! we indulge an underplot that is conactad with the bedery. principal: but two unc masted cvents ase extremely
 both. Ariofo is quite licentious in that farticular: he carries on at the fame time a plamality of unconaneted forics. Ins only excufe is, that lis plan is pereally well adjutled to his fubject; for every thing in thi* Orlan $/ 0$ Furiofo is widd and extmyagant.

Though to tate facts in the order of time is rotural. yet that order may be varied for the fike of ennepicunus beauties. If, for exampie, a nored farry, coll' asi. fimple in its firft movements, be made the lubjeat of : cpic poem, the rea fer may be hurried into the heat cit action; referving the preliminarics for a converfation. piece, if thought neceflary: and that method, it the fame time, hath a peculiar beauty from being dramatic. But a privilege tiate devates from nature ought to lie fparingly indulged ; and yet romance-writers make no difficulty of prefenting to the reader, without the lealt preparation, unknown perfons engaged in foms arduous adventure equally unknown. In Caffandra, two perfonages, who afterwards are difcovered to be the heross of the fable, Atart up completely armed upon the banks of the Euphrates, and engage in a fingle combat.

A play analyfed is a chain of connected fatts, of which each fcene makes a link. Each feene, accord. ingly, ought to procuce fome incident relative to the catatrophe or ultimate event, by advancing or retarding it. A fcene that produceth no incident, and for that reafon may be termed barren, ought not to be indulged, becaufe it breaks the unity of action : a barren fcene can never be intitled to a place, becaufe the chain is complete without it. In the Old Bachelor, the 3 d feene of act 2. and all that follow to the end of that aft, are mere converfation-pieces, productive of no confequence. The Ioth and 1ith fcenes, a\& 3. Double Dealer, and the 10 th, 11 th, 12 th, 13 th, and 14 th feeres, aft i. Love for Love, are of the fame kind. Neither is The Wray of the World entircly guilele's of fuch feenes. It will be no jultification that they help to diplay characters: it were better, like Dryden in his dranatis perfone, to defcribe characers beforehand, which would not break the chain of action. But a writer of genius has no occafion for fuch artifice: he can difplay the characters of his perfonages much more to the life in fentiment and action. How fuccefsfully is this done by Shakefpeare! in whole works chere is not to be found it fingle barren fcene.

Upon the whole it appears, that all the facts in an hiforical fable ouglat to have a mutual connection, by their common relation to the grand event or cataltroph:. And this relation, in which the unity of adtion confits, is equally effential to epic and dramaric compofitions.

How far the unities of time and of place are effential, is a queftion of greater intricacy. Thefe unities were frietly obferved in the Greek and Roman theatres; and ther are inculcated by the French and Englith critics as effentidel to crary dramatic compofition. In theory
thef:

210
The three Unities.
theic unitie; are nifo acknowledged by our beft poets, though their pr:tctice feldom correfponds: they are often forced to take liberties, which they pretend not to julti$f_{y}$, againtt the practice of the Greeks and Romans, and againt the folemn decilion of their own countrymen. But in the courle of this inquiry it will be made evident, that in this article we are under no neceflity to copy the ancients; and that our critics are guilty of a miftake, in admitting no greater latitude of place and time than was admitted in Gresce and Rome.

Indeed the unities of place and time are not, by the moft rigid critics, required in a narrative poem. In fuch compofition, if it pretend to copy nature, thefe unities would b: abiurd ; becaufe real events are feldom confined wihin narrow limits either of place or of time: and yet we cair follow hiltory, or an hiftorical fable, through all its changes, with the greatelt facility : we never once think of mealuring the real time by what is taken in reading; nor of forming any connection between the place of action and that which we occupy.

We are aware, that the drama differs fo far from the epic as to admit different rules. It will be obferved, " That an hiforical fable, intended for reading folely, is under no limitation of time or of place more than a genuine hiftory ; but that a dramatic compofition cannot be accurately reprelented unlels it be limited, as its reprefentation is, to one place and to a few hours; and therefore that no fable can be admitted but what has thefe properties, becaule it would be ablurd to compofe a piece for reprefentation that cannot be juftly reprefented." This argument has at lealt a plautible appearance; and yet one is apt to fuipect fome fallacy, confidering that no critic, however itrict, has ventured to confine the unities of place and of time within fo narrow bounds.

A view of the Grecian drama, compared with our own, may perhaps relieve us from this dilemma: if they be differently coultructed, as thall be made evident, it is poffible that the foregoing reafoning may not be equally applicable to both.

104
They were eff. ntial to the fireek díaна, bct

All authors agree, that tragedy in Greece was derived from the lymms in praife of Bacchus, which were fung in parts by a chorus. Thefpis, to relieve the fingers, and for the face of variety, introduced one actor, uhofe province it was to explain hitorically the fubject of the fong, and who eccation.lly reprefented one or other per onage. Efchylus, introducing a fecond actor, formed the dialngue; by which the periormane became dramatic; and the actors were multiplied when the fubj :t reprefenied made it necelfary. But litl the choru-, which gave a beginning to tragedy, was confidered as an ellential purt. The firl feene, generally, unfolds the preliminary circumftances that lead to the grond event; and this fene, is by Atitotle termed the prolonuc. In the fecond feene, where the adtion properly bogins, the chorus is introduced, which, as crigiually. continues upon the flage during the whole perf. man:e : the chorus trequently makes one in the dialoy ue: and when the dinlngue happens to be fufpended, the chorus, dming the interval, is employed in finging. Sophec'cs athers to this plan religiouty. Euipides is mut altogether fo correa. In fome of his pieces it becomes necellity to remove the chores for a little time: but when that unolual nep is riked, matters are in orderel as not to interrupt the reprefentation: the chorns berce leave the flage of their own accord, but at the

TK K .
command of fome principal perfonare, who confantly The waits their return.

Thus the Grecian drama is a continued reprefentation without any interruption; a circumfance that merits attention. A continued reprefentation without a paufe affords not opportunity to vary the place of action, nor to prolong the time of the attion beyond that of the re. prefentation. To a reprefentation to confined in place and time, the foregoing reatoming is frictly applicable : a real or feigned action, that is brought to a conclution after conliderable intervals of time and frequent changes of place, cannot accurately be copied in a reprefentation that admits no latitude in either. Hence it is, that the unities of place and of time, were, or ought to have been ftictly obferved in the Greek tragedies; which is made necelfiry by the very conltitution of their drama, for it is abfurd to compofe a tragedy that cannot be jufly reprefented.

Modern critics, who for our drama pretend to efta. Not to blifh rules founded on the practice of the Greeks, are French guilty of an egregious blunder. The unities of place lingho and of time were in Greece, as we fee, a matter of neceflity, not of choice ; and it is eafy to fhow, that if we fubmit to fuch fetters, it muft be from choice, not necedity. This will be evident upon tahing a view of the conititution of cur drama which differs widely from that of Greece ; whether more or lets perfect, is a different point, to be handled afterward. By dropping the chorus, opportunity is afforded to divide the reprefentation by intervals of time, during which the ftage is evacuated and the fpectucle fufpended. This qualifies our dramil för fubjects fpread through a wide fpace both of time and of place : the time fuppuled to p.uls during the furpenfion of the reprefentation is not meafured by the time of the fufpention; and any place may be fuppofed, as it is not in fight: by which means nany iubjects can jully be repretented in our theatres, that were excluded irnm thofe of ancient Greece. 'This dotrine may be illultated, by comparing a modern play to a det of hift sical pictures; let us luppofe them five in number, and the refemblance will be complete: each of the pîीures tefembles atiact in one of our plays: there muft necellanily be the fliftelt unity of place and of time in each pisture; and the fame neceffity requires thefe two unities during each att of a play, becalufe during an act there is no interruption in the fpectacle. Now, when we view in fucceffion a number of fuch hiltorical pictures, let it be, for example, the hiftory of Alezander by Le Brun, we have no dificulty to conceive, that montlis or years have paffed between the events exhibited in two different pictures, though the interruption is imperceptible in palling our eye from the one to the other; and we have as hittle dificulty to conceive a change of place, however great : in which view, thete is truly no diffe. rence between five acts of a modern play and five fuch, pictures. Where the reprefentation is fufpended we can with the greaten licility fuppofe any length of time or any change of place: the ffeetatu $r$, it is true, may be confouns, that the real time and place are not the fame with what are employed in the repuefentation; but this is a work of reflection; and by the fame reflection he may alfo be confoious, that Garsich is not King Lear, that the playhoufe is not Dover cliffs, nor the noife he hears thunder and lightning. In a word, after an interryjtion of the reprefentation, it is not
:tee more difficult fur a fpector to inareine a new place, - or a different time, than, at the commencensent of the play, to imagine himfelf at Rome, or in a period of time two thoufand yeurs back. And indeed it is abundaratly ridiculcus, that a critic, who is wi.ling to bold candle-light for funflime, and fome puinted canvalies for a palace or a prifon, flould aflect fis much difficuliy in imagining a lititude of place or of time in the foule, beyond what is necefing in the reprefentation.

There are, it munt be acknowledged, fome effests of great latitude in time that ought never to be indu'ged in a compofition for the theatre: netling can be nore abfurd, than at the clofe to exhibit a full-grown perfon who appears a child at the beginning: the mind rejects, as conerary to all probability, fuch latitude of time as is repuilite for a change fo remarkable. The greateft change from place to place hath not altogether the fame bad effest: in the bulk of human affurs place is not material; and the mind, when occupied with an interelting event, is little regardful ot minute circumfances: thefe may be varied at will, becaafe they fearce make any impreflin.

At the fame time, it is not here mant to jultify liherty wilhoui any referve. An unbounded licence with relation to place and time, is faulty, for a reafon that feems to have been overlooked, which is, that it feldom fails to break the u ity of attion; in the ordinary courfe of human affairs, fingle events, fuch as are fit to be reprefented on the Itase, are confined to a narrow fpot, and generally employ no gieat extent of time: we accordingly feldom find ftrict unity of action in a dramatic compolition, where any remarkable latitude is inclulged in thefe particulars. It may even be admitted, that a compofition which employs but one place, and requires not a greater length of time than is neceffary for the reprefentation, is fo much the more perfect; becaufe the confining an event within fo narrow bounds, contributes to the unity of action, and allo prevents that labour, hovever flight, which the mind mult undergo in imagining frequent changes of place, and many intervals of tinse. But fill we muf infilt, that fuch Jimitation of place and time as was neceffary in the Grecian drama, is no rule to us; and therefore, that though fuch limitation adds one beauty more to the compolition, it is nt belt but a refinement, which may juftly give place to a thonfand beauties more fubfantial. And we may add, that it is extremely dificult, if not impraclicable, to contract within the Grecian limits any fable fo fruitful of incidents in number and variety as to give full fcope to the fluctuation of paffion.

It may now appear, that critics who put the unities of place and of time upon the fame footing with the unity of axtion, making them all equally effential, have not attended to the nature and conititution of the modern drama. If they admit an interrupted reprefentation, witle which no vriter finds fault, it is abfurd to reject its greatelt advantage, that of reprelenting many intercfing fubjests excluded from the Grecian ftage. If there needs mult be a reformation, why not reftore the ancient chorus and the ancient continuity of action? "here is cortainly no medium ; for to admit an interruption without relaxing from the ftrich unities of place ind of time, is in effeet to load us with all the inconveniences of the ancient drama, and at the fame time to with-hold front us its advantares.

And therefore the only proper cucifinn is, Fillether Tie there our nodel be or be not aldeal iny noucract? This in. Vusics deed m.y fairl! beealledi.s queftion ; :nd in oldel tua $1: 8$ comparative tual fome particalas mult be prenriced. vorathere
 imagimation to lhe fienc of aft un, lonwever dhatit it $b=$ lie 1 raforin time or in phace; becante we know lhat the prads is a alde force
 are engared: it is the perfection of repreentulign to hide itfelf, to impole on the focenaler, and to pindace in him an inpreflion of reality, as if le were flechator of a real event; but any interruption annikiat.s that innfreflion, by roufing lim out of his waking drenm, and unhappily reforing him to his fenfes. So difficult it is to fupport the imprefion of seality, that much flinhter incernupti ns than the interwal between two ads are fu:ficient to diflolve the charm: in the $5^{\text {th }}$ at of the ATourning E'ride, the three firt fcenes are in a rocm of late, the fourth in a prifon; and the change is operated by fhifting the feene, which is done in a tice: but however qu ck the trinfition may be, it is imprafiisable to impofe upon the fpectators lo as to make them con. ceive that they are actually carried from the palace to the prifon; they immediately reflet, that the palace and prifon are imaginary, and that the whole is a fistion.

From thefe premifes one will naturally be led, at firt view, to pronounce the frequent interruptions in the modern drama to be an imperfection. It will occur, "That every interruption mult have the effect to bunifa the dream of reality, and with it to banifh our concern, which cannot fubfift while we are confciuus that all is a fiction; and therefore, that in the modern drama, fuf. ficient time is not afforded for fluctuation and fwelling of paffion, lite what is afforded in that of Greece, where there is no interruption." This reafoning, it mult be owned, has a fpecious appearance: but we mult not become faint-hearted apon the firft repulfe; let us sally our troops for a fecoud engagement.

On the Greek ftage, whatever may have becn the cafe on the Roman, the reprefentation was never interrupted, and the divilion by a.fs was totally unknown. The woid af never once occurs in Arifotle's Poetice, ia which he defines exactly every part of the dama, and divides it into the beginning, the middle, and the end. Atcertain intervals indeed the actors retired; but the Atage was not then left empty, nor the curtain let fall; for the chorus continued and fong. Neither do thefe fongs of the chorus divide the Greek tragedies into five portions, fimilar to our afts; though fome of the con:mentators have endeavoured to force them into this office. But it is plain, that the intervals at which the chorus fung are extremely unequal and irregular, fuited to the occafion and the fubject ; and would divide the play fometimes into three, fornetimes into feven or eight acts.

As practice has now eftablinhed a different plan on the modern ftage, has divided every play into five akt, and made a total paufe in the reprefentation at the end of each act, the queftion to confidered is, Whether the plan of the ancient or of the modern drama is beft qualified for making a deep impreflion on the nind ! That the preference is cue to the plan of the modern drama, will be evident from the following confiderations. If it be indeed true, as the advocates for the three unities allege, that the audience is deluded into the belief Ddz

The thrie Unitics．
of the reality of a well－ated tragedy，it is certain that this delurion cannot be longy fupported；for when the fpirit；are exhauted by clofe atention，a：d by the agi－ tation of pafion，an uneafinefs enfues，which never fails to banith the waking dream．Now fuppoling the time that a man can enploy with trvict attention without wandering to he no greater than is requilite for a fingle at（a fuppofition that cannot be fur from trubh），it follows，that a continued reprefentation of lorger en－ durance than an ast，imfead of giving foope to fluclua－ tion and fwelling of paffion，would overlatain the at－ tention，and produce a total abfence of mind．In this relpect，the four paufes have a fine effeet ：for by af－ fording to the audience a feafonable refpite when the imprefion of reality is gone，and while nothing matcrial is in agitation，they relieve the mind from its fatigue； and conequently prevent a wandering of thought at the very time pofibly of the moft interefting fecnes．

In one article，findeed，the Grecian model has greatly the advantage ；its chorus，during an interval，not only preferves alive the impreflions made upon the audience， but allo prepares their hearts finely for new impreflions． In our theatres，on the contrary the audience，at the end of every act，being left to trifle time away，lofe every warm impreflion；and they begin the next att cool ard unconcerned，as at the commencement of the reprefentation．This is a grofs malady in our theatrical reprefentations；but a malady that luckily is not incu－ rable：to revive the Grecina chorus，would be to revive the Grecian thavery of place and time；but we can fi－ gure a detached choruscoinciding with a paufe in the reprefentation，as the ancient chorus did with a paufe
ro9
in im－ provement wis the mo－ dera dra－ ma fug－ sefled． i． icm ．of rititifm． ch．${ }^{2} 3$ ． in the principal action．What objection，for example， can there lie againft mufic between the ats，vocal and inltrumental，adapted to the fubjest？Such detached cho－ ras，without puting us under any limitation of time or place，would recruit the fpirits，and would preferve，en－ tire the tone，if not the tide，of paffion：the mufic，af－ teranaf，fhould commence in the tone of the prece－ ding pafion，and be gradtally varied till it accord with the tone of the paflion that is to fucceed in the next act．The mufic and the reprefentation would both of them be gainers by their comjunctim；which will thens appear．Mufic that accords with the prefent torie of mind，is，on that account，doubly agreeable；and ac－ cordingly，theugh mufic lingly hath not power to maic a panion，it tends greatly to fupport a paffion already raifed．Farther，mufic propares us for the palficn that follows．Dy making cheertul，tender，melancholy，or animated impreflien；as the fuhject requires．Take for an example the firlt feene of the ITourning BTHk，where foit mufic，in a melanchnly ferair，prepares us for Al－ metia＇s deep dill ret＇s．In this manner，mulic and repre－ fentation fupport each other delightully ；the impreflion made upon the andience by the ：eprefertation，is a Fine praparation for the mulic that fucceeds；and the impreflion made by the mufic，is a fine preparation for the sepecentation that fuecteds．It appears evident， that by fome futh contivance，the modern drama may be improved，fo as to enjoy the advantage of the a？－ sient chorus without its flavifin limitation of place and sinc．Lut to retuan to the comparifon between the an－ cient and the modenn drama．

The numberiefs improprieties forced upon the Greek Sramatic poets by the confitution of their drama，may
be fufficient，one fhould think，to rnake us prefer the The th modern drama，even atftrating from the improvement Uuiu propofed．To prepare the reader for this article，it muit be premifed，that as in the ancient drama the place of adtion never varies，a place neceflarily mut be chofen to which every perfon may have accefs without any im－ probability．This confines the icene to fome open place， generally the court or area before a palace ；which ex－ clades from the Grecian theatre traufastions within doors，though thefe commonly are the moft important． Such cruel reftaint is of it．elf fufticiet to cramp the molt pregnant invention；and accordingly the Greek writers，in order to preferve unity of place，are reduced to woful improprietics．In the Hippolytus of Euripides （att 1．fc．6．），Phedra，ditreffed in miad and body，is carried without any pretext from her palace to the place of action；is there laid upon a couch，unable to fupport herfelf upon her limbs；and made to utter ma－ ny things improper to be heard by a number of women who form the chorus：and what is itill more improper， her female attendant ufes the ftrongeft intreaties to make her reveal the fecret canfe of anguilh；which at laft Phedra，contrary to decency and probability，is frevailed upon to do in prefence of that very chorus （act 2．fc．2．）Alceftes，in Euripides，at the peint of death，is brought from the palace to the place of action， groaning and lamenting her untimely fate（act 2．fe．1．） In the Trachinits of Sophocles（act．2．），a feeret is imparced to Dejanira，the wife of Hercules，in piefence of the chorus．In the tragedy of Iphigenia，the meflen－ ger employed to inform Clytemneftra that lphigenia was facr ficed，fleps fhortat the place of action，and with a loud voice calls the queen from her palace to hear the news．Again，in the If hagenia in Tauris（act 4．），the neceffary pretence of the chorus forces Euripides into a grofs ab urdit $p$ ，whoch is to torm a fecret in then hear－ ing；and，to diguife the ablurdity，much comt is paid to the chorus，rot ote woman but a mumber，to engage them to fucrecy．In the Fletea of Euripides，that prin． cefo makes no dificulcy，in prefence of the chorus，to plot the death of her hulband，of his miftrefs，and（f her father the king of Corinth，all by poifon：it was ne－ ceffary $t$ bing Medea up n the flage；and there is but one place of action，which is abways nocupied by the chorl：s．This fene clofes the fecond at ；and ia the end of the thind，fhe fraikly malies the chorus her e mfidents in plotting the marder of her own chit－ dren．Terence，by identity of place，is often forced to make a converfation within docis be heard on the ope：a flecet：the cries of a woman in labour are there heard diffinaly．

The Greek poosts are not lefs hampered by unity of Incouv time than by that of place．In the Hippolytus of Eus niences ripides，that prince is banifled at the elid of the fth the phat ：a ；and in the firtt fccne of the following act，a rieff of thent d fenger relates to Thefeus the whole paticulars of the death of lippolytus by the feamonicr：that remark－ able cvent muft have occupied many hours ；and yet in the xeprefentation it is confened to the time empinyed by the chorns tipon the fong at the end of the the act． The inconfiltency is ftill greater in the Iphigenin in Tau－ ris（ad 5 ．fc． 4 ．）：the fory could mot exhault half an hour ；and yet the incident fuppofid to luve happened during that time could not maturally have been tranfacted in lefs than half a diry：

Tbe

The Gicck artits arc forced, not lefs fiequently, to tranfgrefs another rule, derived alio from a contmued reprefentation. The rale is, that as a vacuity, howercr momentary, interrupts the reprefentation, it is neceffiry that the place of action be confantly oscupied. Sophocles, with regard to that rule as well as to others, is generally correft : but Euripides camot bear fuch icitraint; he often cracuates the liage and leaves it empty for others. Iphigenia in Tauris, after prenouncing as foliloquy in the firlt fcene, leaves the place of acion, and is fucceeded by Oreltes and Pylades: they, after lome converfation, walk off; and Iphigenia re-enters, accompanied with the chorus. In the Alceftcs, which is of the fame tuthor, the place of ation is void at the end of the third act. It is true, that to cover the irregularity, and to preferve the reprefentation in motion, Euripides is carcful to fill the ftage wihout lof of time: but this Aill is an interruption, and a lisk of the chain broken : for during the change of the actors, were mult be a fpace of time, during which the fage is recupied by ncither fet. It makes indeed a more remarkable interruption, to change the place of action as well as the actors; but that was not practicabie upon the Grecian Itage.

It is hard to fay upon what model Terence has formed his plays. Having no chorus, there is a paufe in the reprefentation at the end of every act : but advantage is not taken of the ceffation, even to vary the place of action; for the Rreet is always chofen, where every thing paffing may be feen by every perfon; and by that choice, the molt fprightly and interefting parts of the aution, which commonly pafs within docrs, ate exeluded; witnefs the lalt act of the Eunuch. He hath fubmitted to the like flavery with refpeat to time. In a word, a play with a regular chorus, is not more eonfined ial piace and time than his plays are. Thus a zeslous fectary follows implicitly ancient forms and ecremonies, without once confidering whether their introductive caure be tiill fabfiting. Plautus, of a bolder genius than Terence, makes gord ufe of the liberty affirded by an inerrupted repretentation: lie vari s the place of action upon all occations, wien the variation funts his purpofe.

The intelligent render will by this time underfand, that we piead for no change of place in our plays but after an interal, nor for any latutude in point of time but what fa!ls in with an interval. The uaities of place and time onght to be Atrially obferved during each act; for during the repretentation there is no esportunity for the fmalle!t deviation from either. Hence it is an effential requifte, that during an act the Rage lie alvays occupiel; for even a momentary vacuity makes an interval or intermption. Another rule is no lefs effential: it would be a grofs breach of the unity of action to exhibit upon the fage two feparate actions at the fame time; and thercfore, to preferve that unity, it is neceffary that each perfonage introduced dwing an act be linked to thooe in poftellion of the hage, fo as to join all in one action. Thefe things follow from the very conception of an ant, whiclı admits not the flighteft inierruption : the moment the reprefentation is intermitted, there is an end of that att; and we have ro other notion of a new act, but where, after a paufe or intersal, the reprefentation is again put in moticu. Frencla writers,
gencrally fpeahing, are correâ in th:s pallucular. The Einglith, cat the contrary, are fo irrerular as fcarce to deferve a criticifm : actors not only fucced cach other in the fame place willut connectica, but, what is fill lefs excuftble, they frenuently fucceed each other in different phaces. This clange of phace in the fame act cught neror to be indiuiged; for, tefode breaking the wnity of the at, it has a difagrecable effer: after an interval, the imagimation adapts itfelf to any place that is noceflary, as readily as at the comrencement of the play: but during the rcprefentation we rejer change of place. From the foregoing cenfure mult be excepted the Mourning Er: ${ }^{\prime}$, of Congreve, where regularity concurs with the beauty of fentiment and of language, to make it one of the mot complete pieces England has to boalt of. It is to be acknowledged, however, that in point of regularity this elegani ferformance is not altegethor uncisceptionable. In the four firt aits, the unities of place and time are ftiotly offerved: but in the laft act, there is a capital error with refpect to unity of place; for in the three firf fcenes of that aft, the place of action is a room of fate, which is changed to a prifon in the fourth feene: the chain alfo of the aftors is broken; as the perfons introduced in the prifon are different from thofe who made their appearance in the room of fate. This remarkable intermption of the reprefentation makes in effect two acts infiead of ore: and therefore, if it be a rule that a play ought not to confit of more ats than five, this performance is fo far defective in point ef regularity. It may be added, that, even admitting fix acts, the irregulatity would not be altogether remored, without a longer paufe in the reprefentation than is allowed in the acting; for more than a momentary interruption is requifite for enabling the imagination readily to fall in with a new place, er with a wida fpace of time. In The Way of the Werd, of the fame author, unity of place is preferved cirring every att, and a fritat unity of time during the whole piay than is necuffary.

An opera is a drama reprefented by muitic. This The opera entertainment was invented az Venice. An exlibio a dranaretinn of this fort requires a moft brilliant magnificence, pefented and an expence truly rogal The dram:t muft neceffarily be compored in verfe; for as operas a:e fung
and accompanied with fymphonies, they munt be in farily be compofed in verfe; for as operas a:e funf
and accompanied with fymphonies, they munt be in verfe to be properly applicable to mufic. To render this entertainment ftill more brilliant it is ormamentad
with dances and ballettes, with fuperb decoration,s, this entertainment ftill more brilliant it is ornamented
with dances and ballettes, with fuperb decoration,s, and furprifing rnachinery. The dreffes of the ators, of thofe who affilt in the chorus, and of the dancers,
being ail in the moif folended and clecrant taite, contri. of thofe who affilt in the chorus, and of the dancers,
being ail in the moif fplended and clegant taite, contri. bute $t$, render the exlithition highity fumptuous. Dut notwithfanding this union of atss and plenfires at
an immenfe expenfe, and notwithltanding a monf daznotwithfanding this andon of ats and pleafures at
an immenfe expenfe, and nowithlanding a moft dazzling pageantry, an opera appears, in the eyes of many pzople of taft, but as a magnificent aburdity,
feeing that nature is never there from the beginaing to many people of taft, but as a magniticent aburdity;
feeing that nature is never there from che beginaing to? the end. It is not our bufinefs here, hawever, to detormine between the difierent taRes of inankind.

The method of expreflis: our thoughts by finging and mufic is fo little natural, and has fomething in it fo forced and affected, that it is nct cafy to conceive ,

how it could come into the minds of men of genius to reprefent any human adion, and, what is more, a fericus of tragic acticn, any therwife than by fpeeclı. We have, it is true, nperas in Englifh by Addifon, sce. ia Italian by Metafatio, in French by M. Ounault. Fontenelle, $\varepsilon c$. the fubjects of which are fo giave and irigic, that one might call them mufical traredies, and re.i dofs d"eurocs in their kind. But though we are highly fatisfied and greatly affefed on readng them, and are moch pleated with feeirg them reprefented, yet the fpetator is, perhap:, more charmed with the magnificence of the fight and the beaucy of the mudi:, than moved vith the action and the tragical part of the performance. We are not, however, of that order of cri ics who frive to prove, that mankind att varorg in finding fleature in an object with which they ate yeally fleafed; who blame a lover for thinking his nifitets charming, when her features are by no

Bielfictd’s
Flent of
Erudition. rules of logic t : the works of genius: we make thefe oblervations merely in order to examine if it be not polfible to angment the pleafures of a polite people, by making the opcra fomething more natural, more probable, and more confonant to reafon.

We think, therefore, that the poet fhould never, or at leaft very rarely, choofe a fulbjeer from hiftory, but from fable or mythulogy, or from the regions of enchantment. Every rational mind is conftantly inocked to hear a mutilated hero trill out, from the flender pipe of a chailinch, To arms! To arms! and in the fame tone animate his foldiers, ard lead them to the affault; or larangue an alfembly of grave fenator;, and fometimes a whole body of people. Nothing can be more burlefque than fuch exhibitions; and a man mult be pofieffed of a very uncommon fenfibility to be affected by theni. But as we know not what was the language of the gods, and their manner of exprefling thenfelves, we are at liberty in that cafe to form what illufions we pleafe, and to fuppofe that they fung to diftinguith themfelves from mortals. Befides, all the magic of decoritions and machinery become natural, and even necellary, in thefe kinds of fubje?ts; and therefore readily afford opportunity for all the pomp of theie performances. The choruc, the dances, the ballettes, the fymphonies and dreffes, may likewife be all made to correfpond with fuch fubjects : nothing is here affected, abfurd, or unnatural. Whoever is poffeffed of genius, and is well acquainted with mytho$\log y$, will there find an inexhauftible fource of fubjects highly diverfified, and quite proper for the drama of an opera.

We thall not fpeak here of that fint of mulic which appears to us the molt proper for fuch a drama, and of the feveral alterations ot which we think it fufceptible, in order to make it more complete, and to adapt it to a more pathetic, more noble, and more natural expreffion, as well in the recitatives as in the airs and chorus. (See Music). We have only here to confider the bufinefs of the poet. He thould never lofe fight of nature, even in the midt of the greaten fiction. A

115 And hould reprefent i: B , harac cers as confitcot. god, a deni-god, a renowned hero, fuch for example fury, \&c. fhould conftantly be reprefented according to the chardeters we give them, and never be made to talk the langu.nge of a fop or a pelite maitreffe. The
verîion that lafts full four hours, and fometimes longer.

They have indeed endeavoured to obviate this incon. venience by dividing an oper. into three, and even into five atts; but experience proves, that this divifion, though judicions, is fill not fufticient to relicve the wearied attention.

## Secr. II. Of Iyric Pcetry-

The ode is very ancient, and was probably the firft fpecies of poerry. It had its fource, we may fuppole, from the heart, and was employed to exprefs, with becoming fervour and dignity, the grateful fenfe man entertained of the bleffings which daily flowed from God the fountain of all goodnets: hence their harvelt hymns, and other devotional compolitions of that kind.
But in procefs of time it was employed, not or,ly to praife the Almighty for bounties received, but to lolicit his aid in time of trouble; as is plain from the odes written by king David and others, and collected by the Jewih Sanhedrim into the book of Palms, to be fung at their fafts, feltivals, and on other folemn occafions. Nor was this prafice confined to the Ifraelites only: other nations had their fungs of praile and peti.ions of this fort, which they preferred to their deities in time of public profpcrity and public dillrels, as well as to thofe herves who dillinguifhed themfelves in arms. Even the American Indians, whofe notions of religion are extremely confined, have their war-fongs, which they fing to this day.

It is reafonable to fuppofe that the awful purpofe to which the ode was applied, gave rife among the ancients to the cuifom of invoking the mules; and that the poets, in order to raife their fentiments and language, fo as to be acceptable to their deites, thought it expedient to folicit: medwine afifiance. Hence poets are faid to have been mfinired, and henee an unbounded liberty has been given to the ode; ft the lyric poet, fired, as it were, with his fubj-at, and borne away on the wings of grat:tude, dildains grammatical niceties and common modes of ipeech, and ofien foars above rule, though not above reafon. This freedom, however, confint, chielly in fudden tranfitions, beld digreffions, and lufty excurfions. For the ancient poete, and even Pindar, the mont daring and lnfty of them all, has ia his fub imelt flights, and amidft all his rapture, preferred harmony, and ofen uniformity in his verfification: but fo great is the variety of his meafures that the traces of famenefs are in a manner loft ; and this is one of the excellencies for which that poet is admired, and which, though feemingly devoid of art, requises to much that he has feldom been imitated with fuccefs.

The ancients in their odes indulged fuch a liberty of fincy, that fonec of their bett poeis rot only make bold excurfions and digrefione, but, having in their flights flarted fome new and noble tlisught, they frequently purine it, and never more retum to their fubjen. But this loofe kind of ode, which feems to reject all method, and in which the poet, having juft touched upon his fuljent, immediately diverts to another, we fhould think blameable, were it lawfal to call in queftion the authority of thofe great men who were our preceptors in this.
art. We may venture to afirm, howerer, that thefe of Lyric compolitions ftand in no degree of comparifon with Poerry. other odes of theirs; in which, after wandering from the fubject in purfuit of new ideas arifing from icme of its adjuncts, and ranging wantonly, as it wee, through a variety of matter, the poet is from fome other circumftance led naturally to his fubject again; and, like a bee, having collected the eflence of many different flowers, returns home, and unites them all in one uniform pleafing fweet.
The ade among the ancients fignified no more than a fing: but with the moderns, the ode and the fong are The 119 confidered as different compofitions; the ode being ulu- jeess of the ally mployed in grave and lofiy fubjeats, and feldom ode. fung but on folemn occafions.

The fubjets moft proper for the ode and fong, Horace has pointed out in a few elegant lines.

Godz, heroes, conquerors, olympic crown :Love's pleafing cares, and the free joys of wine, Are proper fubjects for the lyric fong.
To which we may add, that happinefs, the pleafures of a rural life, and luch parts of morality as afford leffons for the promotion of our felicity, and reflections on the conduct of life, are equally fuitable to the ode. This both Pindar and Horace were fo fenfible of that many of their odes are feafoned with thefe moral fentences and refections.

## But who can number ev'ry fandy grain <br> Wafh'd by Sicilio's hoarfe-refounding main? <br> Or who caa Theron's gen'rous works exprefs, <br> And tell how many hearts his bounteous virtues blefs? <br> Ode to Theron.

And in another Olympic ode, inferibed by the fame poet to Diagoras of Rhodes (and in fuch efteem, that it was depolited in the temple of Minerva, written in letters of gold), Pindar, after exalting them to the Rkies, concludes with this leffon in life:
Yet as the gales of fortune various blow,
To-day tempeituous, and to-morrow fair,
Due bounds, ye Rhodians, let your tranfports know;
Perlaps to morrow comes a form of eare.
Wrglis Pindar.
The man refolv'd and feady to his trun,
Infexible to ill, and obitinately jnit,
May the rude rabble's infolence defpie,
Their fenfelefs clamours and tumultuous cries ;
The tyrant's fiercenefs he beguiles,
And the flern brow and the harih voice defies,
And with fuperior greatnefs fmiles.
Not the rough whirlwind, that deforms
Adria's black gulph, and vexes it with forms,
The ftubborn virtue of his foul can move;
Nor the red arm of angry Jore,
That flings the thunder from the iky,
And gives it rage to roar, and Atrength to Hy.
Should the whole frame of nature reund him break, In ruin and confufion hurl'd,
He unconcern'd woill hear the mishity crack,
And ftard fecure anidft a falling world.
Horscez
M. Defpreaur: has given us a very beautiful and juft defeription of the ode in thefe lines.

L'Ode avec plus d'éclat, \& non moins d'énergie Elevant jutqu'au ciel fon vol ambitieux, Entretient dams vers eummerce avec les Dicux. Aux Aulctes dans Pife elle ouvre la barsiere, Chante un vainqueur poudreus au bout de la carriere; Mene Achille fanglant au bords du Simois
Ou fait fuchirl'Eicaut fous le joug de Louis.
Thatut crmme the abeille ardentc à fon ouvrage
Elle s'en va de fleurs dèponiller le rivage:
Elle peint les feftins, les danfes \& les ris,
Vante un baifer cueilli fur les levres d'Iris,
Qui mollement réfife \& par un úoux caprice Quelquafois le relu'e, afin qu'on le raville.
Son ftyle impetucux fon ent marche au hafard. Chez clle un baau defordic eft un effet de l'art, Loin ces rincurs craintifs, dont l'efprit phlegmatique Gande dans fes fireurs un ordre didactique: Qui chantant d'un heros les progrès ćlatans, Maigres hiforiens, fuivrunt l'ordre des temps.
A pollon de fon leu leur fut toujours avare, \&c.
The lofty ode demands the frongeft fice, For there the mufe all Phabus mutt infpire : Mounting to heav'n in her ambitious fight, Amongt: the gods and heroes takes delight; Of Pifi's wreitlers tells the finewy force; And fings the dufty conqueror's glorious courfe ;
'To Simois' banks now fierce Aciailles fends,
Dencath the Gallic yoke now Eicaut bends:
Sometimes the Hies, like an indull ricus bee, And robs the flow'rs by nature's chemitry; Defcribes the fteepherds' dances, featts, and blifs, And boatts from Phillis to furprife a kifs, When gently fhe refilts with feign'd remorfe, That what the grants may feem to be by force. Her generous fyyle will olt at random ftart, And by a brave diforder fhow her art ; Unlike thofe fearful poets whofe cold rhyme In all their raptures keeps exaktelt time, Who fing the illultrious hero's mighty praife, Dry journalifts, by terms of weeks and days; To thefe, Apollo, thrifty of his fire,
Denies a place in the Pierian choir, Sc.

## Sonmes.

The variety of fubjects, which are allowed the ljric poet, makes it neceffary to conlider this lpecies of poctry under the following heads, viz. the fublime ode, the leffer ode and the fong. We fhall begin with the lowen, and procced to that which is more eminent.
120
The fong.
I. Songs are little poetical compofitions, ufually fet to a ture, and frequently fung in company by way of en- tertainment and diverfion. Of thefe we have in our language a great number; but, confulering that number, not many whith are excellent; for, as the Duke of Buckingham obferves,

Though nothing feems more eafy, yet no part Of poetry requires a nicer art.
The fong admits of almoft any fubject; but the greatef part of them tum either upon love, contentment, or the pleafures of a comniry life, and drinting. Be the fubject, however, what i: will, the verfes thould be eaff,

natural, and flowiñ, end cortain a certain harmony, | Of |
| :--- | :--- |
| P |
| 10 c | fo that poetry and mulic mary be agreeably united. In poo theef compolitions, as in all others, obfene and profane expreffion flould be carefully avoided, and indeed every thing that tends to take off that refpect which is due to religion and virtue, and to encourage vice and immoritlity. As the bet longs in our language are already in every hand, it would feem fuperfluous to infert examples. For fun ther precepts, however, as well as felect eximples, in this tpecies of compolition, we may refer the reader to the elegant Efay on Song Writing, by Mr Aikin.

II. The leffer ode. The dittinguithing character of The d this is fweetnefs; and as the plealure we receive from guiki this fort of poem arifes principally from its foothing and charas aflecting the pafions, great regard fhould be paid to the tefler language as well as to the thoughts and numbers.
> 'Th' expreflion thould be ealy, fancy high;
> Yet that not feeni to creep, nor this to Hly :
> iNo words tranfpos'd, but in fuch order all,
> As, though hard wrought, mas feem by chance to fall.
> D. Bucking bozm's Efay.

The fyle, indeed, fhould becafy : but it may bealfo florid and figurative. It folicits delicacy, but difalains affectation. The thoughts fhould be natural, chatte, and elegant; and the numbers various, fmooth, and harmonions. A few examples will fulficiontly explain what we mean.

Longinus has preferved a fragment of Sappho, an ancient Greek poetefs, which is in great reputation amongt the critics, and has been fo happily tranflated by Mr Philips as to give the Englifs reader a jut idea of the fpirit, eite, and elegance of that admired author ; and thow how exactly the copied nature. To enter into the heauties of this ode, we mult fuppofe a lover fitting by his miftrefs, and thus expreffing lis paffion :

> Bleft as th' immortal gods is he, The youth who fondly fits by thee, And fees and hears thee all the while Softly fpeak, and fweetly fmile,
> 'Twas this deprived my foul of reft, And rais'd fuch tumults in my brealt; For while I gaz'd, in tranfport toft, My breath was gon', my voice was lof. My bofom glow'd, the fubtile name Ran quick through all my vital frame : O'er my dim cyes a darknefs hung; My ears with hollow murmurs rung. In dewy damps my limbs were chill'd; My blood with gentle horrors thrill'd; My feeble pulfe forgot to play; I fainted, funk, and dy'd away.

After this inftance of the Sapphic ode, it may" not be improper to fpeak of that furt of ode, which is called Anacreontic; being written in the manner and talte of Anacreon, a Greek poet, famous for the delicacy of his wit, and the cxquifie, yet eafy and natural, turn of lis poefy. We have feveral of his odes Atil extant, and many modern ones in imitation of him, which are moftly compufed in verfes of feven fyllables, or three feet and a half.

We thall give the young fudent one or two examples. The of his manner from Mr Fawkes's eacellent tranthation. crenn

The nole.

The following ode on the power of $z^{\text {old }}$, which had been often attempted but with little fuccefs, this gentecl man has tranflated very happily.

Love's a pain that works our wo;
Not to love is painful ton: But, alas! the greatef pain Waits the love that mects diflain.

What avails ingenuous worth, Sprichtly wit, or noble birh ? All thefe virtues ufelefs prove; Gold alone engages love.

May he be completely curft. Who the flecping mifchief firt Wal'd to life, and, vile before, Stamp'd with worth the fordid ore. Gold creates in brethren ftrife; Gold deftroys the parent's life; Gold produces civil jars, Murders, maffacres, and wars ; But the worft effect of gald, Love, alas! is bought and fold.
His ode on the vanity of riches is of a piece with the above, and conveys a good leffon to thofe who are over anxious for wealch.

If the treafur'd gold could give
Man a longer term to live, I'demploy my utmoft care Still to keep, and fill to fpare; Ard ' when death approach'd, would haf, 'Take thy fee and walk away.'

But fince riches cannot fave Mortals from the gloomy grave, Why fhould I mylelf deceive, Vainly figh and vainly grieve? Death will furely be my lot, Whether I am rich or not.

Give me freely while I live Generous wines, in plenty give Sonthing joys my life to cheer, Beauty kind, and friends fincere; Happy ! could I ever find Friends fincere, and beauty kind.

But two of the mof admired, and perhaps the moft imitated, of Anacreon's odes, are that of Mars wounded by one of the darts of Love, and Cupid ftung by a Bee; both which are wrought up with fancy and delicacy, and are iranflated with elegance and fpirit.Take that of Cupid, fung by a bee.

Once as Cupid, tir'd with play,
On a bed of rofes lay,
A rude bee, that flept unfeen,
The fweet brea:hing buds between,
Stung his finger, cruel chance!
With its little pointed lance.
Straight he fills the air with cries
Weeps, and fobs, and runs, and flies;
'Till the god to Venus came,
Lovely, laughter-loving dame;
Then he thus began to plain;
"Oh! undoac-I Ide with pain-
" Dear mamma, a ferpent fmall,
" Which a bee the ploughmen call. Vol. XV.

T R Y.
" Imp'd with wings, and arm'd with dart,
Of dytic
". Oh!-has Itung me to the heart."
loctry. Venus thas repls'd, and fmil'd;

- Dry thefe tears for flome ! my child;
- If a lee can wound fo deep,
- Canfing Cupid thas to weep,
- Think, O thi.k! what crucl pains
" HIcthat's fung by thec futains.'
Among the molt fuccefsful of this poet's Englifl Imitations imitators mary be reckoned Dr Johnfon and Mr lri. of Anaor. The following ode on Evening by the formerenf creon atd thele writers has, if we mifake not, tle very fpirit and air of Anacreon.

Evening now from purple wings
Sheds the grateful gitts the brings:
Brilliant drops bedeck the mead;
Cooling breezes thate the reed;
Shake the reed, and curl the frean
Silver'd o'cr with Cynthia's beam ;
Near the chequer'd lonely grove
Hears, and kecps thy fecrets, Love.
Stella, thither let us fray !
Lightly o'er the dewy way.
Phobus drives his burning car Hence, my lovely Stella, far.
In his ftead the queen of night
Round us pours a lambent light;
Light that feems but jult to fhow
Breafts that beat, and cheeks that glow:
L.et us now, in whifper'd joy,

Evening's filent hours employ;
Silence beft, and confcious fhades,
Pleafe the hearts that love invades:
Other pleafures give them pain;
Lovers all but love difdain.
But of all the imitations of the playful bard of Greece that we have ever met with, the molt perfect is the following Anacreontic by the regent Duke of Orleans.

## I.

Je fuis né pour les plaifirs ;
Bien fou qui s'en paffe:
Je ne venx pas les choifir;
Souvent le choix m'embarraffe :
Aime t'on? J'aime foudain;
Bois t'on? J'ai le verre à la main ;
Je tiens par tout ma place.
II.

Dormir eft un temps perdu; Faut il qu'on s'y livere?
Sommeil, prends ce qui t'elt du;
Mais attends que je fois yvre:
Saifis moi dans cet inftant;
Fais moi dormir promptement;
Je fuis preffé de virre.
III.

Mais fi quelque objet charmant,
Dans un fonge aimable,
Vient d'un plaifir feduifant
M'offrir l'image agréable;
Sommeil, allons doucement ;
L'erreur eft on ce moment
Un bonheur veritable.
Ee
Tiranjiatiois

Tranflution of the Regent's Anacreontic ( E )
Frolic and free, for pleafure born
The felf-denying fool I fcorn : The proffer'd joy I ne'er refire; 'Tis oft-times troublefome to chufe. Lov'ft thou, my friend? I love at fight: Drink'f thou? this bumper does thee right. At random with the Atresm I flow And play my part where'er I go.
Great God of Sleep, fince we mult be Oblig'd to give fome hours to thee, Invade me not till the full bowl Glows in my chee':, and warms my foul. Be that the only time to fnore, When I can love and drink no more: Short, very fhort, then be thy reign; For I'm in hafte to live again.
But, O ! if melting in my arms, In fome foft dream, with all her charms, The nymph belov'd fhould then furprife, And grant what waking fhe denies; Then prithee, gentle Slumber, flay; Slowly, ah flowly, bring the day: Let no rude noife my blifs deftroy ; Such fweet delufion's real joy.
We have mentioned Prior as an imitator of A nacreon; but the reader has by this time had a fufficient fpecimen of Anacreontics. The following Anfwer to Cloe jealous, which was written when Prior was fick, has much of the elegant tendernefs of Sappho.

Yes, fairelt proof of beauty's pow'r,
Dear idol of my panting heart,
Nature points this my fatal hour: And I have liv'd: and we mult part.
While now I take my latt adien, Heave thou no figh, nor fled a tear;
Left yct my half-clos'd eye may view On earth an object worth its carc.
From jealouly's tormenting ftrife For ever be thy bofom treed;
That nothing may difturb thy life, Content I haften to the dead.
let when fome better-fated youth Shall with his am'rous parly move thee,
Reflect one moment on his truth Who, dying, thats perfifts to love thee.
There is much of the foftnefs of Sappho, and the fweetnefs of Anacreon and Prior, in the following ode, which is afcribed to the late unfortunate $\operatorname{Dr}$ Dodd; and was written in compliment to a lady, who, being fick, had fent the author a mofs rofe-bud, inftead of making liss family a vifit. This piece is particulaly to be efleemed for the jut and Atiking moral with which it is pointed.

The flightelt of favours beftow'd by the fair, With rapture we take, and with triumph we wear:

## T R Y.

But a mofs-woven rofebud, Eliza, from thee, A well-pleafing gitt to a monarch would be.
-Ah! thai illn ts, too cruel, forbidding thould fland, And refu!e me the gift from thy own lovely hand! With joy I receive it, with pleafure will view, Reminded of thee, by its odour and hue:
"Sweet rofe, let me teil thee, tho' charming thy bloom, 'Tho' thy fragrance excels Seba's richelt perfume; Thy breath to Eliza's no fragrance hath in't, And but dull is thy blonm to her cheek's blufhing tint. Yet, alas! my fair flow'r, that bloom will decay, And all thy lov'd beauties foon wither away; Tho' pluck'd by her hand, to whofe touch we mutt own, Harfh and rough is the cignet's moft delicate down:" Thou ton, fnowy hand; nay, I mean not to preach; But the rofe, lovely moralift, fuffer to teach,
"Extol not, fair maiden, thy beaties o'er mine; 'They too are fhort-liv'd, and they too mult decline; And fmall, in conclufion, the diff'rence appears, In the bloom of few days, or the bloom of few years! But remember a virtue the rofe hath to boalt,
-Its fragrance remains when its beauties are loft!"
We come now to thofe odes of the morc florid and Odesmis figurative kind, of which we have many in our lancuage florid at that deferve particular commendation. Mr Warton's figurati Ode to Fancy has been uftly adnired by the beft judges; for though it has a diltant refemblance if Milton's L'Allegro and 11 Penferofo, yet the work is original; the thoughts are moftly newand various, and the language and numbers elegant, exprellive, and harmonions.

## O parent of eac's lovely mufe,

Thy fpirit o'er my foul diffufe!
O'er all my artlefs fongs prefide,
My footfteps to thy tomple guide!
To offer at thy turf-built thrine In golden cups no coftly wine.
No murder'd fatling of the fock, But flow'rs and honey from the rock. O nymph, with loofely fowing hair, With bufkin'd leg, and bofom bare; Thy wait with myrtle-girdle bound, Thy brows with Indian feathers crown'd:
Waving in thy fnowy hand
An all-commanding magic wand, Of pow'r to bid ficlh gardens blow, 'Mid cheerlefs Lapland's barren fnow ; Whofe rapid wings thy flight convey, Through air, and over earth and fea; White the valt various landfcape lics Confpicunus to thy piercing eyes. O lover of the defert, hail! Say, in what deep and pathlefs vale, Or on what hoary monntain's fide, Midft falls of water, you refide;
'MidR broken rocks, a rugged foenc, With green and gr fly dales between ; 'Midnt forelts dark of aged oak, Ne'er cehoing with the woodman's Itroke;

Where
(E) We give this tranflation, both becaufe of its excellence and becaufe it is faid to have been :be productions of no lefs a man than the late Lord Chatham.

Where never hum:an art appear'd, Nor ev'n one fraw.roof'd cott was scar'd; Where Nature feems to fit alone, Majeflic on a craggy throne.
'Te!] me the path, wweet wand'rcr! tell, To thy unknown fequefter'l cell, Where woolbines clufter round the toor, Where fhells and mofs n'erlay the floor, And on whofe top an havethorn blows, Amid whofe thicl:!y-woven boughs Some nightingale fill bailds her neft, Each ev'ning warbling thee to refl. Then lay me by the haunted fream, Wrapt in fome wild poetic dream; In converfe while methinks 1 rove With Spenfer through a fairy grove; 'Till fuddenly awak'd, I hear Strange whifper'd mufic in my ear ; And my glad foul in blifs is drown'd By the fweetly foothing found! Me, goddefs, by the right-hand lead, Sometimes through the yellow mead; Where Joy and white-rob'd Peace refort, And Venus keeps her feltive court ; Where Mirth and Youth each ev'ning meet, And lightly trip with nimble feet, Nodding their lily-crowned heads, Where Laughter rofs-lip'd Hebe leads;
Where Echo walks feep hills among,
Lif'ning to the fhepherd's fong.
Yet not thefe flow'ry fields of joy
Can long my penfive mind employ;
Hafte, Fancy, from the fcenes of Folly,
To meet the matron Melancholy!
Goddefs of the tearful eye,
That loves to fold her arms and figh.
Let us with filent footfteps go
To charnels and the houfe of wo;
To Gothic churches, vaults, and tombs,
Where each fad night fome virgin conies,
With throbbing breaft and faded cloeek,
Her promis'd bridegroom's ura to feek:
Or to fome abbey's mould'ring tow'rs,
Where, to avoid cold wintry fhow'rs,
The nated beggar fhivering lies,
While whinfling tempefs round her rife,
And trembles left the toit'ring wall
Should on her fleeping infants fall.
Now let us louder ftrike the lyre,
For my heart glows with matial fire:
I feel, I feel, with fudden heat,
My big tumultuous bofom beat;
The trumpet's clangors pierce my ear, A thoufand widow's fhrieks I hear:
Give me another horfe, I cry;
Lo, the bare Gallic fquadrons fly ! Whence is this rage !-what fipirit, fay, 'To bittle hurries me away?
'Tis Fancy, in ber fiery car, Tranfports me to the thickeft war ; There whirls me o'er the hills of flain, Where tumult and deftruction reign; Where, mad with pain, the wounded ftced, Tramples the dying and the dead;

Where giant Tenor ftalks arsund,
With fullen joy furveys the ground, And pointing to th' enfanguin'd fied, Shakes his dreadful gorgon fhield! O guide me irem this horrid feene
To high-arch'd walks and alleys green,
Which lovely Laura feeks, to flum
The fervours of the mid-day fun.
The pangs of abience, O rembve,
For thou canft place me near my love ;
Can'ft fold in vifionary blits,
And let me think I fteal a kifs;
While her ruby lips difipenfe
Lufcious nect.ar's quinteffence!
When young-cy'd Spring profufely throws
From her green lap the pink and rofe;
When the foft turtle of the dale
To Summer tellis her tender tale ;
When Autumn cooling caverns feeks,
And flains with wine his jolly cheeks;
When Winter, like poor pilgrim eld,
Shakes his filver beard with cold;
At ev'ry feafon let my ear
Thy folemn whifipers, Fancy, hear.
O warm enthufiaftic maid!
Without thy powerful, vital aid,
That breathes an energy divine,
That gives a foul to ev'ry line,
Ne'er may I frive with lips profane,
To utter an unhallow'd Atrain;
Nor dare to touch the facred fering,
Save when with fmiles thou bid'tit me fing.
O hear our pray'r, O hither come
From thy lamented Shakefpeare's tomb,
On which thou lov'f to fit at eve,
Mufing o'er thy darling's grave.
O queen of numbers, once again
Animate frme chofen fwain,
Who, fill'd with unexhaulted fire,
May boldly fmite the founding lyre;
Who with fome new, unequal'd fong,
May rife above the rhyming throng;
O'er all our lift'ning paffions reign,
O'erwhelm our fouls with joy and pain;
With terror fhake, with pity more,
Rouze with revenge, or meit with love.
O deign t' attend his evening walk, With him in groves and grottocs talk;
Teach him to foorn with frigid art,
Feebly to touch th' enraptur'd heart ;
Like lightning, let his mighty verfe
The bofom's inmoft foldings pierce;
With native beaucies win applitufe,
Beyond cold critics ftudied laws:
O let each-mufe's fame increafe!
O bid Britannia nival Greece !
The following ode, written by Mr Smart on the 5 th of December (being the birth-day of a beautiful young lady), is much to be admired for the variety and harmony of the numbers, as well as for the beauty of the thoughts and the elegance and delicacy of the compli. ment. It has great fire, and yet great fwcetnefs, and is the happy iflue of genius and judgment united.

I: e 2
of I.jric「uetry:

Fail eldeft of the monthly train, Sire of the winter drear,
December! in whofe iron reign Expires the chequer'd year.
Huth all the blult'ring blats that blow,
And proudly plum²d in filver finow, Snile gladly on this bleft of days;
The livery'd clouds fhall on thee wait, And Phobus fhine in all his ftate With more than fummer rays.
I hough jocund June may juftly boaft Long days and happy hours; Though Augult be Pomona's hoft, And May be crown'd with flow'rs:
Tell June his fre and crimfon dies, By Harriot's blulh, and Hariot's eyes, Eclips'd and vanquifh'd, fade away ;
Tell Augult, thou cantt let him fee
A richer, siper fruit than he, A fweeter flow'r than May. A patoral The enfuing ode, written by Mr Collins on the death and elegiae of Mr Thomplon, is of the pattoral and elegiac kind, and *de. both picturefque and pathetic. To perceive all the beauties of this little piece, which are indeed many, we mutt fuppofe them to have been delivered on the siver Thames near Richmond.

In yonder grave a Drui llies, Where flowly winds the fealing wave;
The year's beit fweets fhall dutenus rife To deck its poet's hilvangrave!
In yon deep bed of whip'ring reeds His airy harp * fhall now be laid,
That he, whofe heart in forrow ble ds, May love through life the fouthing fhade.
Then maids and youth fhal linger here, And, while its founds at diftance fwell, Shall fadly feem in pity's car To hear the woodl:nd pilgrim's knell.
Refemblance oft thal! haunt the fhore, When Thames in fummer wreaths is dreft,
And oft fufpend the dafhing oar, To bid his gentle fpirit reft
And oft as eafe and health retire To breezy lawn, or fureft deep,
$\dagger$ Rich-
nond
chureb.

The friend thall view yon whitening fire And 'mid the varied landfcape weep
But thou, who own't that earthy bed, Ah! what will ev'ry dirge avail ?
Or tears, which love and pity thed, That mourn beneath the gliding fail?
Yet lives there one, whofe heedleis eye, Shall fcorn thy pale fhrine glimm'ring near?
With him, fweer bard, may fancy die, And $j$ y defert the blonming year.
But thon, 1 m ftream, whote fullen tide No Tedge-crown'd filters now attend,
Now waft me from the green hill's fide, Whofe cold turf hides the buried friend.
And fee, the fairy valleys fade, Dim night hat veil'd the folemn view!
Yet or ce ag in, dear parted fhade, Meex nature's child, again adreu!
The genial meads, allign'd to blcfs 'Iny life, hall mourn thy early doom ;

## ' $\mathbf{R}$ Y.

Their hinds, and thepherd girls, thall civess, With fimple hands, thy rural tomb.
Long, iong, thy fone and pointed clay Shall melt the mufing Briton's eyes;
O vales and wild woods, thall he fay, In yonder grave your Druid lies!
Under this fpecies of the ode, notice ought to be The hy taken of thofe written on divine fubjects, and which are ufiually called bynzts. Of thefe we have many in our language, but none $p$, rhaps that are fo moch admired as Mr Addifon's. The beauties of the following hymn are too well known, and too obvious, to need any eommendation ; we thall only obferve, therefore that in this hymn (intended to diiplay the power of the Almighty) he feems to have had a palm of Dav:d in his v.ew, which fays, that " the heaven, declare the glory of God, and the firmament fheweh his handywork."

The fpacious firmament on ligh, With all the b'ue etherial fky,
And fpangled heav'ns, a thining frame,
Their grea riginal proctaim:
Thi' unwearied fun, frim dis to day,
11 es his Crator's pow'r difplay, And publifies to ev'ry land
The work of an Alnighty hand.
Soon as the ev'ning thaces prevail,
The moon takes up the wond'ruus tale,
And nighly to the lift'ing eath
Repeats the flory of ther bith :
While all the fars that round her burn,
And all the planess in their turn,
Confirm the tiding as they roll,
And fpread the truth from poic to pole.
What tho' in fijemn filence all
Move round the dark terreftrial ball ?
What tho' nor real voice or found
A mid their radiant orbs be fo und?
In reaf n's ear they all rejoice,
And utter forth a glorious voiee,
For ever finging a they fhine,
"The hand that made ns is divine."
The following paftoral hymn is a vertion of the $23 \mathrm{a}^{\text {a }}$ Pfolm by Mr Additon; the peculiar benuties of which have occafioned many tranllations; but we have feen none that is 10 poetical and perfect as this. And in jultice to Dr Boyce, we mult obferve, that the mutic he has ad fited to it is fo fweet and exprefiive, that we knew unt which is to be moft admired, the poet or the mafican.

The Lord my panure tha'l prepare, is And feed me with a her herd's care ; His preence thall my wats firply,
And grard me wi h a watchiul eye;
My no in day walks lee fhall attend,
And ail my mide ight hours defend.
When in the fo try g'ebe I faint,
Or on the thinfy mone tain pant,
To fertile vales and dewy meals My weary wand'ri g flops he leads; Where peactinl in eis foft and ficw Amid the verdant landfcape flow.
Thon' in the p.ths of death I tread,
With gloomy horrors overipread,

My Itendfat heart fhall fear no ill： For thou，O Lord，art with me lill ； Thy friendly crook fhall give me aid， And guide me through the dreadful fhadc． Tho in a bare and rugged way． Through devious lonely wilds I fray， Thy bounty thall my pains ie ruile ： The barren wildernets fhall timile， With fudden greens and herbage crown＇d； And ftreams thall murmur all around．
III．We are now to fpeak of thefe odes which are of the fublime and noble kind，and dittingu：fhed from others by their ele vation of thought and diction，as well by the variety or irregularity of their numbers；as the frequent tranfitions and bo d excurfions with which they are enriched．
＇To give the young fudent an iclea of the fulden and frequent tranfitions，digrelfions，and excurfions，which are admitted into the odes of the ancients，we cannot do better than refer him to the clebrated fon；or ode of Mofes which is the older that we know of，and was penned by that divine author immediately after the children of Irrael crolled the Red－Sea．
At the end of this fong，we are told，that＂Miriam the prophetefs，the tifter of Aaron，t．ok a timbeel i：l hr hand，and all the women went out after her with timbrels and with dances．And Miriam aniwered them， Sing ye to the Lord，for he hath triumplied glorioufly： the horfe and his rider hath he thrown into the fea．＂

From this laft palfage it is plan，that the ancients very early called in mulic to the aid of poctry ；and that their odes were ufuilly fung and accompanied with their＇utes，harps，！res，timbrels，and other initruments： nay，fo etfential，ard in fuch reputation，was mufic held by the ancien：s，that we often find in their lyric poets， addrefles or invocations to the harp，the lute，or the lyre？an 1 it was probably（ wing to the fiequent ufe mate of the laft－mentimed infrument with the ode， that this fpecses of writing obtained the name of Lyric pre＇ry．

This nde，or hymn，which fome believe was compo－ fed by $M$ ees in Hibrew verfe，is incomparably better than any thing the heathen pets have produced of the kind，and is by all good jus es confidered as a mafter－ pizce of andient eloquence．The thoughts are noble and fu．lime：the Atyle is magnificent and exprefive ： the figures are boll land animated：the tranfitions and excurfionsare fudden and fiequent：but they are hort， and the poet，having digreffell fur a moment，returns im－ mediately to the great（bjeet that excited his wonder， and elevated hi．foul with joy and grat：tude．The images fill the mind with their greatrets，and Itrke the imagination in a manner not tw be exprefed．

If there be any thing that in fublim：ty approaches to it，we mult lock for it in the eaft，where perhaps we flall find nothing fuperior to the frllowing Hindno hyma to Narrayna，or＂the feitit of Go3，＂talen，as Sir William J nes informs us，from the writings of the ancient Bramins．

Epirit of fririts，who，through cvely part
Of farace expanded，and of endlefs time，
lieyond the reach of lab＇ring thought lublime，
laadll uptoar into beautenus order ftart；
Defore heav＇n was，thou art．
Ere fpheres be：teath us rill＇d，or \｛千 hercs above， Eve earth in firmamental zether hung，
Thou fat＇lt alone，till，through thy myfic love，
Things unexiliting to exiftence fprung，
And grateful defcant funcr．
Omnifcient Spirit，whofe all－ruling pow＇r Bids from each fenfe briglt emanations beam： Glows in the rainbow，fpartles in the fream， Smiles in the bud，and glitens in the flow＇r：
＇That crowns each vernal how＇r； Sighs in the gale，and warbles in the throat Of every bird that laiis the bloomy foring， Or tells his love in many a liquid－note， Whilft envious artilts touch the rital Atring， Till recks and firefts ring ；
Breathes in rich tragrance from the Sandal grove， Or where the precious mulk deer playful rove； In duicet juice，from cluat＇ring fruit diftis， And barns falubrious in the tatteful clove ： Soft brinks and ver＇drous bills Thy pre＇ent influence fills； In air，in floods，in caverns，woods，and plains， Thy will infipirits all，thy fovereign Maya reigns． Blue cryfal vault，and elemental fires， That in th＇ethereal fuid blaze and breathe ； Thou，toffing main，whofe fnaky branches wreathe This penfile orb with intertwilling gyres； Mount ins，whofe lofty fpires， Prcfumptuous，rear their fummits to the $\mathbb{R}$ ies， And blend their em＇rald hue with fapphire light； Smooth meads and lawns，that glow with varying dyes Of dew be－fangied leaves and blofoms bright， Hence！vanifh from rny fight
Delufive piftures！unfubftantial fhows！
My foul abforb＇d one only Being knows，
Of all perceptions one abundant fource，
Whence ev＇ry objeat，ev＇ry moment flows：
Suns hence derive their force，
Hence planets learn their courfe；
But fums and fading worlds I view no more；
God only I perceive；God only I adore（F）．
We come now to the Pirdaric ode，which（if we ex．The lioun cept the hymns in the Old Tcfament，the pfalms of daric ode． king David，and fuch hymns of the Hiadoos as that ju？t quoted）is the moft exalted part of Lyric poetry ；ind was fo called from Pirdar，an ancicnt Greek poet，who is celebrated for the boldnefs of his fliehts，the impen－ ofity of his fyle，and the feeming wiidnefs and irregu－ larity that runs through his compofitions，and which are faid to be the effect of the greatell art．See Pis－ dar．
The oces of Pindar were held in fuch high eftima－ tion by the ancients，that it was fabled，in honour of their weetnefs，that the becs，while he was in the cracle， brought
（f）For the pliilofophy of this ode，which reprefents the Deity as the foul of the world，or rather as the only Being（the roiv of the Grecks），fee Metaphysics，$n^{\circ} 2$ g．and Philosophy， $1^{\circ}$ 6．

UlI.pric brought honey to his lips: nor did the vietors at the loutry. Olympic and other games thiak the crown a fifficient reward for their merit, unlets their atchievements were celebrated in l'indar's fongs; moft wifely prelaging, that the frit would deeay, but the other endure for ever.

This poet did not alwars write his odes in the fame menfure, or with the fame intention with regard to their being fung. For the ode inferibed to Diagoras (the concluding flanza of which we inferted at the beginning of this tection) is in heroic meafure, and all the ftamzas are equal : there are others alfo, as Mr Weft obferves, made up of firoples and antifiofloes, without any epode; and fone compofed of firophes only, of differene lengths and masares: but the grearelt part of his odes are divideal into froph, antifioole, and rade; in order, as Mr Congreve conjectuses, is their beng fung and addeted by the pertormers to different parts of the audience. "They ware fung (fiys ho) by a choris, and andapted to the lyre, and foretimes to the lyre and pipe. They confited ofteneit of three Atanzas. The firt was called the frople, from the verfion or circular motion of the fingers in that flanza from the right hand to the left. The fecord Itanza was called the ewt floppe, from the contraverlin of the chorus; the fungers in periorming that, turning from the left hand to the right, contrary always to their motion in the firoshe. The third flanza was called the epode (it may be as being the after-fong), which they fung in the middle, neither curning to one hand *Vid. l'ref. nor the other. But Dr Weft's* friend is of opinion, to Weft's pindar. that the performers alfo d.inced one way while they were linging the firophe, and danced back as they fung the ansiflophe, till they came to the fame place agan, and then ftanding till they fung the epode. He has tranflated a paffige from the Scbelia on Hepboliun, in proof of his opinion; and obferves, that the dancing the frophe and antiffrophe in the fame fpace of ground, and we may fuppofe the fame face of time aifo, fhows why thote two parts confifed of the fame length and meafure.

As the various mentures of Pindar's odes have been the means of fo far milleading fome of our modern poets as to induce thern to call compofitions Pindaric odes, that were not written in the method of Pindar it is neceflary to be a little more particular on this head, and to give an example from that poet, the more effetually to explain his manser; which we that take from the tramation of Dr Weft.

## The elcrenth Nemean One.

This ode is inferibed to Ariftagoras, upon oceafion of his entaring on his olfice of prelidenin governor of the ifland of Tenseos: fo that although it is placed among the Nemean odes, it has no fort of relation to thofe game : and is indeed properly an inausuration ode, compoied to be lung by a chorus at the facrifices and the fealts made by Aritagoras and his colleagucs, in the town-hali, at the time of their bei:g invelted with the magittracy, as is evident from many exprefions in the frit fircphe and catiflronle.

## Argument.

Pindar opens this ode with an invocation to Tefta (the goidefs who prefided over the courts of jutice, and whofe latue and altar we:e for that reafon placed in the town hails, or Pıtanesme, as the Creslis cai!ed them),
befeecling her to receive favourably Ariltagoras and his colleagues, who were then coming to offer facrifices to her, upon their entering on their office of Prytans or magiftrates of Tenedos; which office conlinuing for a year, he begs the goddefs to take Ariftazoras under her protection during that time, and to coaduet him to the end of it without trouble or difrrace. I'rom Ariflagoras, Pindar turns himfeif in the nest place to his father Arcefilas, whom he pronounces happy, as well upon account of his fon's merit and honour, is upon his own great endowments and good fortune; fuch as beauty, ftrength, courage, riches, and glory, refulting from his many victories in the games. Wut left he fhould be t: o much puffed up with thefe praires, he reminds him at the fame time of his mortality, and telis him that his clo:hing of feff is perifhable, that he mult e'er long be clothed with eath, the end of all things: and yet, cortinues he, it is but juftice to praife and celebrate the worthy and deferving, who from grood citizens ough: to receive all kinds of honour and commendation; as Ariltagcras, for inftance, who hath rendered bohn himelf and his country illutrious by the many vitories he hath obtained, to the number of fisteen, over the neighbouring youth, in the games exhibited in and abouthis own country. From whence, fays the poet, I conclude he would hive conse of victorions even in the l'ythian and Olympic games, had he not been reftrained from engaging in thofe famous lifts by the too timid and cautious love of his parents. Upon which he falls into a moral reflection upon the vanity of man's hopes and fears; by the former of which they are oftentimes excited to attempts bej ond their Atrength, which accordingly ifue in their difyrace; $a^{\varepsilon}$, on the other hand, they are frequently reltrained, by unreafonable and ill-grounded fears, from enterpifes, in which they would in all probability have come off with honour. This reflection he applies to Ariftagoras, by faying it was very eafy to forefee what fuccel's he was like to meet with who both by father and mother was defcended from a long train of great and valiant men. But where again with ic very artful turn of flattery to his father Arcelilas, whom he had before reprefented as Atorg and valiant, and famous for his vietories in the games, he obferves that every generation, even of a great and glorious family, is not equally illuftrious any more than the fields and trees are every year equally fruitful; that the gods had not given mortals any certain tukens by which they might foreknow when the rich years of cirtue foould fuccerd; whence it comes to pafs, that men, out of felf-conceit and prefumption, are perpettally laying fchemes, and forming enterprifes, without previoufly confulting prudence or wifdam, whofe flreans, fays he, lie remote and ont of the common road. From all which he infers, that it is better to moderate our defires, and fet bounds to our avarice and ambition; with which moral precept he conchides the ode.

## Strophe I.

Daughter of Rhea! thou, whofe holy fire Before the awfol feat ot jutice flames! Sifter of heav'n's almighty fire! Sifter of Juno, who coequal claims With Jove to fhare the empire of the gods ! O virgin Vefa! to thy dread abodes,

Lo: Ariflagoras directs his pace! Receive and near thy facred feeptre place Him and his colleagues, who, with horeft zeal, O'er 'l'enedos prefide, and guard the public weal.

## AntistropHEI.

And lo! with frequent offr'ngs, they adore
Thee*, firf involi'd in ev'ry folemn priy'r! 'I'o thee unmix'd libations pour,
And fill with od'rous fumes the fragrant air.
Around ia feftive fongs the hymning choir Mix the melodious voice and founding lyre, While \{till, prolong'd with hofpitable love, Are folemnized the rites of genial Jove: Then guard him, Velta through his long carcer And let him clofe in joy his minifterial year.
EPODE I.

But hail, Arcefilas! all hail
To thee, blefs'd father of a fon fo great ! Thout whom on fortune's higheft fide
The favourable hand of heav'n hith fet, Thy manly torm with beauty hath refin'd, And match'd that beauty with a valiant miad. Yet let not man too much prefume, Tho' grac'd with beauty's faireft blonm : Tho' for fuperior flrength renown'd; Tho' with triumphal chaplets crown'd:
Let him remember, that, in H th array' d ,
Soon fhall he fee that mertal veltment fade; Till loft imprifon'd in the mould'ring urn, To earth, the end of all things, he return.
STROPHE. II.

Yet fhould the worthy from the public tongue Receive the recompenfe of vircuous praife ;

By ev'ry zealous patriot fung, And deck'd with ev'ry flow'r of heav'nly lays. Such retribution in return for fame, Such, Arifagoras, thy virtues claim, Claim from thy country; on whole glorious brows
The wrettier's chaplet ftill unfaded blows;
Mix'd with the great Pancratidftic crown,
Which from the neighb'ring youth thy early valour won.

> ANTISTROPHE. II.

And (but his timid parents' cautious love, Dillurbing ever his too forward hand,

Furbad their tender fon to prove The toils of Pythia or Olympia's fands), Now by the Gods I fwear, his valorous might Had 'fcap'd vietorions in each bloody fight; And from Cattaliat, or where dark with thade The mount of Saturn $\ddagger$ rears its olive head, Great and illudrions home liad he return'd; While, by his fame eclips'd, his vanquiflid foes had [mourn'd.

## Epode II.

Then his triumphal treffes bound
With the dark verdure of th' Olympic grove,
Will joyous banquets bad he crown'd The great quinquennial feltival of Jove ; And cheer'd the folemn pomp with choral lays, Sweet tubute, which the mule to vistue pays.

But, fuch is man's prepoftrous fate !
Now, with o'er-weening pride elate,
Too far he aims his thaft to throw.
And Araining burfls his feeble bow:
Now pufillanmous deprefo'd with fear, He checks his virtue in the mid career ; And of his fteng h diftruftul, coward flie:
The contelt, tho' empow'rd to gain the pri:s.

> Strophe IIf.

But who could err in prophefying good Of him, whofe undegenerating breatt

Swells with a tide of Spartan blood,
From fire to fire in long fuccefion trac'd
Up to Pifander; who in clays of yore
From old Amycla to the Leßian thore
And Tenedos, colleagu'd in high command
Witl great Oreftes, led th' Aolian band?
Nor was his mother's race lefs Atrong and brave,
Sprung from a fock that grew on fair * Ifmenus' wave. - Ifmenoa

## Antistrophe ill.

Tho' for long intervals obicur'd, again
Oft-times the feeds of lineal worth appear.
For neither can the furrow'd plain
Full harvelts yield with each returning year;
Nor in each period will the pregnant bloom
Invelt the fmiling tree with rich perfume.
So barren oftell, and inglorious pafs
wasa river of beotia, of which cuantry was Menalippus, the anceftor of Ariftagoras by the mother's
'Ihe generations of a noble race;
While naturc's vigour, working at the root,
In after-ages fwells, and bloffoms into fruit.

## Efode III.

Nor hath Jove giv'n us to foreknow
When the rich years of virtue fhall fucceed:
Yet buld and daring on we go,
Contriving fohemes of many a mighty deed;
While hope, $f$ id inmate of the human mind.
And felf opinion, asive, rall, and blind,
Hold u- a fare illufive ray,
That leads our dazzled feet antray
Far from the fiprings, where, calm and flon, The fecret ftreams of wifdom flow.
Hence fhould we learn our ardour to reftain, And limit to due bounds the thirt of gain.
To rage and madnefs oft that pamion turins,
Which with forbidden tlames defpainiag buns.
From the above fpecimen, and from what we have Diftinalready faid on this fubject, the reader will perceive, guifhing that odes of this fort are diftinguifhed by the happy characteos tranfitions and digreflions whech they admit, and the of it, furprifing yet natural returns to the fubject. This requires great judgment and genius; and the poet who would excel in this kind of writing, fhould draw the plan of his poem, in manner of the argument we have above inferted, and mark out the place; where thafe elegant and beautiful fallies and wanderings may be made, and whe:e the returns will be ealy and proper.

Pindar, it is univerfally :llowed, had a poetical and fertile imasination, a warm and enthulaltic genius, a bold and figurative expreflion, and a concise and fententious flyle: but it is se erally fuppofed that $m$ my of thofe preces which procured him fuch extravagant foeiry.
$\qquad$

132 Moderis odes com. monly call. ed lin. davic.
of Lyric praifes and extraordinary tellimonies of elteem from the ancients are lof ; and if they were not, it would be perhaps imponible to convey them into our language; for beatities of this kind, like plants of an odoriferous and delicate nature, are not to be tranfplanted into another clime without lofe g much of their fragrance or effential quatiity.

With regard to thofe compofitions which are ufually called Pinitoric oths, (but which ought rather to be diItinguithed by the name of irregzlar oles), we have many in our language that deferve particular commendation: and the criticifm Mr Congreve has given us on that fubjeit, has too much atperity and too great 1atitule: for if other writers have, by miftaking Pindar's meafures, given their odes an improper title, it is a crime, one would think, not fo dangerous to the commonweal:h of letters as to deferve fuch fevere reprocf. Belide which, we may fuppofe that fome of thefe writers did not devinte from Pindar's method through ignotance, but by choice; and that as their odes were not to be performed with both finging and dancing, in the manner of Pindar's, it feemed unneceflidy to confine the firlt and fecond Atanzas to the fame exaf numbers as was dune in his floophes and antiftrophes. The poet therefore had a right to indulge himidf with more liberts: and we cannot help thinking, that the ode which Mr Drgden has given us, intitled, A'exander's Feaff, or the Poster of Minfic, is altogether as valuable in loofe and wild numbers, as it could have been if the ltanzas werc more regilar, and written in the manner of Pindar. In this ade there is a wonderful fublinity of thonght, a loftinefs ard fiveetnefs of expreftion, and a molt pleating variety of numbers.
'Twas at the royal feaft, for Periia won
By Plilip's watlike for,
Alcft, in awful fate,
The god-iike hero fate
On his imperial throne:
His valiant peers werc plac'd around:
Their brors with rofes and with myrtles bound,
(So thould defert in arms be crown'd:)
The lovely Thais by his fide
Sat like a blooming taftern bride,
In flow'r of youth and beauty's jride.
Happy, happy, happy pair !
None but the brave,
None but the brave,
None but the brave deferve the fair. Chor. Happy, kappy, \&c.
Timotheus, plac'd on high
Amid the tuneful quire,
With flying fingers touch the lyre:
The trembling notes afcend the iky,
And henv'nly joys infpire.
The fong began from Jove,
Who left his blisifil feats above,
(Such is the pow'r of mighty love!)
A dragon's tiery form bely'd the God:
Sullime on radiant fpires he rode,
When he to fair Olympia prefis'd;
And while he fought her finowy breaf:
Then round her flender wait he curl'd,
And tiamp'dan image of himfelf, a tov'reign of the world.
The lift'ning crowd admire the lofty found.

A prefint deity, they fhotit around:
A prc!ent, deity the vaulted roots rebound :
With ravifh'd ears.
The monarch hears,
Allumes the God,
Affects to nod,
And feems to thake the fpheres. Chor. With ravifod cars, Scc.
The praife of Bacchusthem the fweet mufician fung;
Of Bacchus ever fair and ever young:
The jolly God in triumph comes;
Sound the trumpets, beat the drums:
Flufh'd with a purple grace,
He fhows his honefl face :
Now give the hautboys breath; he comes he comes!
Bacchus, ever fair and young,
Drinking joys did firlt ordain :
Bacchus' bleflings arc a treafure,
Drinking is the foldier's pleature:
Rich the treafure,
Sweet the pleafure :
Sweet the pleature after pain.
Chor. Bacchus' wifinss, \&c.
Sooth'd with the found, the king grew vain,
Fought all his battles o'er again;
And thrice be routed all his ioes, and thrice he flew the flain.
The mafter faw the madnefs rife :
His glowing cheeks, his ardent eyes;
And while he heav'n and earth defy'd,
Chang'd lis hand, and check'd his pride.
He chofe a mournful mufe
Soft pity to infufe :
He fung Darius great and good,
By too fevere a fate,
Fallen, fallen, fallen, fallen,
Fallen from his high e!late,
And welt'ring in his b ood;
Deferted ar his utmoft need,
By thofe his former bunity fed,
On the bare earth expos'd he lies,
With not a friend to clore his eyes.
With down-caft looks the jollefs victor fat,
Kevolving in his alter'd ful
The varions turns of chance below;
And now and then a fi he fole,
And tears began to flow,
Cho. Revolving. הc.
The mighty malter fmil'd to fee
That love was in the next deyree:
'Twas but a kindred found to move;
For pity melts the mind to love, Softly fweet, in Lvdian mealires:
Soon he footh'd his foul to pleafures.
War, he fung, is toil and trouble;
Honour but an empty bubble, Never ending, fill beginning,
Fighting Aill, and fill deltroying.
If the woild be worth thy winning,
Think, Othink, it worth enjoying. Lovely Thais fits befide the?, Take the good the gods provide thes.
The many rend the fkiss with loud applafe;
So love was crown'd, but mulic won the caule.
The prince, unable to conceal his pain,

Gax'd on the f.ur, Who caus'd his care, And figh'd and look'd, figh'd and look'd, Sigh'd and look'd, and figh'd again: At length with love and wine at onec opprefs'd, The vanquith'd viqor funk upoa her breatt. Chor. The Prince, \&c.
Now frike the goldea lyre again;
A londer yet, and yet a louder frain.
Break his bands of feep afunder,
And roufe him, like a rattling peal of thunder.
Hark! hark! the horrid found
Has rais'd up his hoad,
As awake from the dead,
And amaz'd he fares round.
Revenge, revenge, 'Timotheus cries, See the furies arife:
Siee the firakes that they rear, IIow they hifs in their hair,
And the fparkles that fiafh from their eyes; lichold a ghanly band, Each a terch in his hand!
Thofe are Grecian ghofs that in battle wcre flain, And urbury'd remain, Inglorious on the plain. Give the vengeance due To the valiant crew.
Behold how they tnfs their torches on high, How they point to the Perlian abodes,
And rlitt'ring temples of their hoflile gods.
The princes applaud with a furious joy;
And the ling feiz'd a flambeau, with zeal to deftroy; Thais led the way To light him to his prey,
And, like another Helen, fhe fir'd another Troy. Chor. And the king feiz'd, \&c.
Thus long ago,
While organs yet were mute;
Timotheus, to his breathing flute, And founding lyre,
Could fwell the foul to rage, or kindle foft defire. At laft divine Cecilia came, Inventrefs of the vocal frame;
The fwect enthufiaft, from her facred fore, Enlarg'd the former narrow bounds, And added length to folemn founds,
With nature's mother-wit, and arts unknown before.
Let old Timotheus yield the prize
Or both divide the crown;
He rais'd a mortal to the n:tes:
She drew in angcl down.
Grand chor. At laf, sic.
There is another poom by Dryden, on the death of Mrs Anne Fillegretr, a young lady eminent for her Ekill in poctry and painting, which a great critic "has pronounced to be "undoubtedly the nobleft ode that our language has ever produced. He owns, that as a whole it may perhaps be inferior to Alexander's Feaft; but he affirms that the firt flanza of it is fuperior to any fingle part of the crher. This famons ftanza, he fiys, flows with a torient of enthuliafm. Fereet immenfufqus ruit. How far this criticifn is juft, the public mult determine.

Vol. XV.

Thon youngef virgin-daughter of the flises, Made in the laft promotion the ble's'd;
Whofe palms, new-pluck'd frum Paradife,
In fpreiding, bran thes more fublimely rife,
Rich with immortal green above the reft ;
Whether, adnpted to fome neighb'ring ftar,
Thou roll'it above us, in thy wand'riag race,
Or in procetlion fix'd ans regular,
Mov'd with the heay'n's majeftic pase;
Or, calld to more fupcrior blifs,
Thou tread'it with feraphims the raft abyfs:
Whatever happy region is thy place,
Ceafe thy celeftial fong a little ipace;
Thou wilt have time enough for hymns divine,
Since heaven's cternal year is thine.
Hear then a mortal mule thy praif: rehearle
In no ignoble verfe;
But fuch as thy owa veice did prasife here,
When thy firlt fruits of posfy were giv'n
To make thyfelf a welcoma inmate there ;
While yet a young probationer,
And candidate of heav'n.
II.

If by tracuacion came thy mind,
Our wonder is the lefs to find
A foul to charming from a toock fo good;
Thy father was transfus'd into thy blood,
So wert thou born into a tuneful Arain.
An early, rich, and ine..haufted vein.
But if thy preexifting foul
Was form'd at firft with myriads more,
It did through all the mighty poets roll, Who Greek or Latin laurels wore,
And was that Sappho laf which once it was before,
If fo, then ceale thy flight, O heaven-born mind!
Thou baft no drofs to purge from thy rich ore,
Nor can thy foul a fairer manfion find,
Than was the beauteous frame fhe left behind:
Return to fill or mend the choir of thy celeftial kind. $\int$
III.

May we prefume to fay, that, at thy birth,
New joy was fprung in heav'n, as well as here on earth?
For fure the milder planets did combine
On thy aufpicious horofcope to fhine,
And e'en the molt malicious were in trine.
Thy brother angels at thy birth
Strung each his lyre, and tun'd it high,
That all the people of the fky
Might lanow a poetefs was born on carth.
And then, il ever, mostal ears
Had heard the mufic of the fpheres.
And if no cluttring fwarm of bees
On thy fiweet mouth difill'd their golden dew,
'Twas that fuch vulgar miracles
Heav'n had not leifure to renew:
For all thy blefs'd fraternity of love
Solemniz'd there thy birth, and kept thy holy dar above.
IV.

O gracious God! how far have wr
Profan'd thy heavn'ly gift of poefy ?
Made pronitute and profligate the inare,
Debas'd to each obfcene and impious ufe,

Whofe harmony was fort ordained above
For tongues of angels, and for hymns of love?
O wretched we! why were we hurry'd down
This lubrique and adulterate ape,
(Nay added fat pollutions of our own)
Thincrate the dreaming ordures of the face!
What can we fay t'evalue our fecond fall? Let this thy veftal, Heaven, atone for all : Her Arethufian fleam remains unfoil'd, Unmix'd with foreign fitch, and undefi'd; Her wit was more than man, her innocence a child. $\}$ V.

Art file had none, yet wanted none; For nature did that want fupply : So rich is treafutcs of her own, She might our boated fores defy : Such noble vigour did her verfe adorn, That it feem'd borrow'd where 'twas only born. Her morals, tho, were in her bofom bred, By great examples daily fed.
What in the bet of books, her father's life the read. And to be read herself, the need not fear; Each tefl, and every light, her Mure will bear, Tho' Epiatus with his lamp were there. E'en love (for love fometines her Mule expref's'd)
Was but a lambent flame which play'd about her beat, Light as the vapours of a morning dream,
So cold herfelf, while the fuck warmth exprefs'd,
'Twas Cupid bathing in Diana's Atream.
VI.

Born to the fpacious empire of the Nine,
One would have thought fie fhould have been content
To manage well that mighty government;
But what can yong ambitious fouls confine?
To the nest realm the fretch'd her fivay,
For Painture near adjoining lay,
A plenteous province and alluring prey. A Cbainber of $D$.pendencies was fran'd,
(As conquerors will never want pretence, When arm' ld, to jultify th' offence)
And the whole fief, in right of poetry, the claimed.
The country open lay without defence:
For poets frequent inroads there had made, And perfectly could represent The flame, the face, with ev'ry lineament,
And all the large domains which the dumb fifer fway'd. All bow'd beneath her government, Received in triumph whercfoc'er the went.
Her pencil drew whate'er her foul defign'd, [mind.
And (ft the happy draught furpais'd the image in her The fylvan feenes of herds and flocks, And fruitful plains and barren rocks, Of hallow brooks that flowed fo clear,
The bottom did the top appear ; of deeper too, and ampler floods, Which, as in mirrors, thow'd the woods: Of 1 fry trees, with Sacred Shades, And perfectives of pleafant glades, Where nymphs of brishtelt form appear, And flaggy satyrs tanking near, Which them at once admire and fear. The ruins too of tome majestic piece, Boating the power of ancient Rome or Greece, Where itatues, freezes, columns, broken lie, Aus, though defaced, the waler of the eye;

What nature, art, bold fiction, e'er durf frame,
Her forming hand gave feature to the name.
So ftrange a concourfe ne'er was fee before,
But when the peopled ark the whole creation bore. VII.

The feme then chang'd, with bold erected look Our martial king the fight with rev'rence ftruck ;
For not content t'exprefs his outward part
Her hand call'd out the image of his heart:
His warlike mind, his foul devoid of fear,
His high-defigning thoughts were figur'd there,
As when, by magic, gholts are made appear.
Our phoenix queen was pourtray'd too fo bright,
Beauty alone could beauty take fo right :
Her drefs, her fhape, her matchlefs grace,
Were all obferv'd, as well as heav'nly face.
With fuck a peerless majesty the flands,
As in that day the took the crown from faced hands;
Before a train of heroines was feer,
In beauty foremof, as in rank, the queen.
Thus nothing to her genius was denied,
But like a ball of fire the further thrown,
Still with a greater blaze the tone,
And her bright foul broke out on cv'ry fides.
What next the had defign'd, Heaven only knows :
To fuch immod'rate growth her conqueft roe, That fate alone its progress could oppose. VIII.

Now all thole charms, that blooming grace,
The well proportion'd flite, and beauteous face, Shall never more be fen by mortal eyes;
In earth the much lamented virgin lies.
Nor wit nor piet 5 could fate prevent;
Nor was the cruel Deffiny content
To finish all the murder at a blow,
To fiveep at once her life and beauty too ;
But, like a harden'd felon, took a pride
To work more mifchievoufly flow,
And plunder'd frt, and then deftroy'd.
O double facrilege on things divine,
To rob the relict, and deface the florine!
But thus Orinda died:
Heav'n, by the fame difeafe, did both tranflate ;
As equal were their fouls, fo equal was their fate IX.

Meantime her warlike brother on the fens
His waving freamers to the winds displays,
And vows for his return, with vain devotion, pays.
Ah generous youth! that with forbear
The winds too foo will waft thee here!
Slack all thy fails, and fear to come,
Alas, thou know'ft not, thou art wreck'd at home!
No more flat thou behold thy fifer's face,
Thou haft already had her lat t embrace.
But look aloft, and if thou ken'? from far, Among the Pleads a new-kindled tar, If any parkles than the reft more bright,
'Wis the that fines in that propitious light. X.

When in midair the golden trump fall found,
To raise the nations under ground;
When in the valley of Jchofhaphat,
The judging God fall clone the book of fate;
And there the lift afizes keep
For thole who wake and thole who deep :

When ratiling hores together fly
From the four corners of the fly;
When finews o'cr the fieletons are fipread, Thof ecloth'd with theth, and lite infperes the deat; The facred poets firf thall hear the found, And forenomf fion the tomb thall bound, For they are cover'd with the lighteit ground; And Araight wi:h in-born vigour, on the wing, Like mounting larks to the new morning fing. There thou, fweet faint, before the quire thall go, As harbinger of heav'n, the way to thow, The way which thou fo well hat learnt below.

That this is a fine ode, and not unworthy of the genius of Dryden, mult be acknowledged; but that it is the nobleft which the Englifh language has produced, or that :3ny part of it :uns with the torrent of enthuliafm which characterizes $A l$ 'xander's Feafl, are politions whinh we feel not ourfelves inclined to admit. Had the critic by whom it is fo highly praifed, infpected it with the cyewhich fanned the odes of Gray, we cannot help thinking that he would have perceived fome parts of it to be tediounly minute in defcription, and others not very perficuous at the firt perufal. It may perhaps, upan the whole, rank as high as the following ode by Collins on the Popular Superftitions of the Fighlands of Scotand ; but to a higher place it has furely no claim.

## I.

Home, thon retum'it from Thames, whofe Naiads long Have feen thee ling'ring with a fond delay,
Mid thofe foft friends, whofe hearts fome future day, Shall melt, perhaps to hear thy tragic fong, Go not unm indful of that cordi.l youth (c) Whom, long endear'd, Lhoul leav'it by Lavant's fide;
Together let us with him lalting truth, And joy manted with his defined bride.
Go! nor regardlefs, while thefe numbers boat My fhort-liv'd blifs, ferget my focial name;
But think, far off, how, on the fouthern coaft, I met thy friendfhip with an equal flame!
Frefh to that foil thou turn' f , subere * ev 'ry vale Shall prompt the poet, and lis fong demand:
To thee thy copious fubjects ne'er thall fail ;
Thou need'it but take thy pencil to thy hand, And paint what all believe who own thy genid land. II.

There muft thou wake perforce thy Doric quill ; 'Tis fancy's land to which thou fett'ft thy fect ; Where fill, 'tis faid, the Fairy people meet,
Beneath each birken thade, on mead or hill.
There, each trim lafs, that fkims the milky Rore,
To the fwart, tribes their creamy bowl allots;

Or, ftecteht on carth, the heat-fn it lietierslic.
Such airy beirgs awe th' untutor'd iwain:
Nor thou, tho' kuand, his hemelier thenglits negled :
Let thy fivect Mufe the rumal fath fuftain;
Thete are the themes of fimple, fure effect,
That add new conqueits to her boundlefs reign,
And fill, with double force, her herrt-commanding

## III.

[Atrain.
Ev'n yet preferv'd, how often may'f thou hear,
Where to the pole the Boreal mourtains run,
'I':ught by the fatlier to his liftning fon,
Strange lays, whofe pow'r had charni'd a Spencen's ear.
At every paufe, before thy mind polfon,
Old Runic hards fhall ieem to rile around,
With uncouth lyres in many-coluur'd vef,
Their matted hair with boughs fantafic crown'd:
Whether thou bid't the well taught hind repeat
The choral dirge that moums fome chieftain brave,
When cv'ry thrieking maid her bofom beat, And ftrew'd with choicelt herbs his feentell grave ;
Or whether fitting in the the pherd's hiel ( H ), Thou hear't fome founding tale of war's alarms,
When, at the bugle's call, with fire and iteel,
The furdy clins pour'd forth their brawny $\ddagger$ fwarins, $\ddagger$ bouy.
And holtile brothers met to prove each other's arms.

## IV.

'Tis thine to fing how framing hideous fpell:, In Sky's lone ifle the gifted wizzard-fer f, § fit:
Lodg'd in the wintry cave with Fate's foll fpear (1),
Or in the depth of Uif's dark foref dwells: How they whofe fight fuch dreary dreams engrof3,
With their own vifions oft aftonith'd droop, When, o'er the wat'ry frath, or quagzy mofs,
They fce the gliding ghofts unbodisd $\ddagger$ troup. $\ddagger$. Or, it in fports, or on the feltive green,
Their defin'd + glance fome fated youth defory, fpicring Who now, perhaps, in lufty vigour feen,
And rofy health, fhall foon lamented die. Far them the viewlefs forms of air obey;
Their bidd ng heed, and at their beck repair. They know what fpirit brews the forminul day,
And heartlets, of like moody madnefs, Aare
'I'o fee the phantom train their lecret work prepare. V.

Io monarchs dear (k), fome hundred miles attray, Oft have they feen Fate give the fatal blow! The feer in Sky fhriea'd as the blood di.iflow
When headlefs Charles warm on the feaffold lay!
Ff 2
(c) A gentleman of the name of Barrow, who introduced Home to Collins.
(н) A fummer hut, built in the high part of the mountains, to tend their flocks in the warm feafon, when the ralture is fine.
(1) Waiting in wintery cave his wayward fit.
(к) Of this beautiful nde two copies have been printed : one by Dr Carlyle, from a namufcript which he acknowledges to be mutilated; another by an editor who feems to hope that a namelefs lomebody will be belicved, when he declares, that "he difcovered a perfea cofy of this admirable ole among fome old papers in the concealed drawers of a burcau left him by a relation." The prefent age has been already too much amufed with pretended difcoveries of poems in the bottems of old chejts, to pay full credit to an affertion of this kind, cecu thourh

Of Lyrie As bureas threw his young Aurora ( L ) forth,
l'oury. In the firt year of the firlt George's reign, And battles rag'd in welhin of the North, 'They morm'd in air, fell, fell rebellion flain! And as if late they joy'd in Preflon's fight, Saw at fad Falkirk all their hopes near crown'd!
'IMeg rav'd divining through their fecond-fight ( m ), Pale, red Culloden, where thele hopes were drown'd!
Illuatrious Whlliam ( N )! Britain's guardian name? Cne William fav'd us from a tyrant's ftroke ;
He, for a fceptre, gain'd heroic fame, But thou, more glorions, Shavery's chain halt hroke,
To reign a private man, and bow to Frecdom's yoke! VI.

Thefe, too, hou'lt fing! for well thy magie mufe Cim to the topmoft he:v'a of grandeur foar! Or foop to wail the fiwain that is no more!
Ah, homely fwains! your homeward neps ne'er lofe; Let not dank lfill (o) miflead you to the heath:
Danciag in mirky niglat, o'er fen and lake, Heglows, to draw you downward to your death,
In his bewitch'd, low, marfhy, willow brake!
What though far off, from iome dark dell efpied, His glin'ring mazes cheer th' excurfive fight,
Yet tuin, ye wand'ers, turn your fleps afide, Nor trult the guidance of that faithlefs light ;
For watchful, lurking, 'mid th' unrufling reed, At thofe mirk hours the vily monfler lies,
And lifens oft to hear the patfing lleed. And frequent round him rolls his fullen eyes,
If chance his favage wrath may fo me weak wretchfurprifo. vil.
Ah, Iucklefs fivain o'cr all unbleft, indeed! Whom late bew:ldcr'd in the dark, dark fen, Far frum lis floeks, and tmoking hamlet then!
-his wayw:orl fate fuall lcar!.

On bim, enrag'd, the fiend in angry mood,
Shall never look with pity's kind concern, But inftant, furious, raife the whelming flood,
O'er its drown'd banks, forbidding all return! Or, if he meditate his wilh'd elcape,
To fome dim hill that feems uprifing near, To lis faint eye, the grim and grilly flape, In all its terrors clad, thall wild appear. Meantime the wat'ry furge fhall round him rife,
Pour'l fudden forth from ev'ry fiwelling fource! What now remains but tears and hopelef tighs? His fear-fhook limbs have lolt their youtliful force, And down the waves he foats, a palc and breathlei's corfe! VIII.

For him in vain his an:ious wife fhall wait, Or wander forth to meet him on his way;
For him in vain, at to-f.ll of the day; His babes thall linger at the unclofing gate! Ah, ne'er fhall he return! Alone, if night, Her travell'd limbs in broken flumbers fteep?
With drooping willows dreft, his mournful fprite Shall vifit fidd, perchance, her fileit fleep:
Then he perlhaps, with moilt and wat'ry hand, Shall fondly feem to prefs her fhudd'ring cleezk,
And with his bluc-fivoln face before her fand, And, fhiv'ing cold, the fe piteous accents fpeak :
" Purfue, dear wife, thy daily toils purfue, "At dawn or dufk, induftrious as before;
" Nor e'er of me one *helplefs thought renew, "While I lie well'ring on the ozier'd hore,
"Drown'd by the kelpie's $\dagger$ wrath, nor e'er thall aid thee $t$ the wate IX. [more!", fiend.

Unbounded is thy range ; with varied fill * From their rude rocks, extend her fkitting wing
Round the moift marge of each cold Hebrid ifte,
To
the fecne of difeovery be laid in a burcau. As the ode of the anonymons editor difers, however, very little from that of Dr Carlyle, and as what is affrmed by a gentleman may be trne, though " he choofes not at prefent to publilh his name," we have inferted into our work the copy which pretends to be perfect, noting at the bottom or margin of the page the different readings of Dr Carlyle's cdition. In the Doctor's manucript, which appeared to have been nothing more than the prina cura, or firt fketeh of the poem, the fifth Itanza and lialf of the fixth were wanting ; and to give a continued context, he prevailed with Mr M'Ken\%ie, the ingenions author of the Man of Feeling, to fill up the chafm. This he did by the following beautiful lines, which we cannut help thinking much more happy than thofe which occupy their place in the copy faid to be perfect :
"Or on fome bellying reck that flades the deep, They view the lurid ligns that crofs the iky, Where in the weft the brooding tempelts lie:
And leerr their firt, faint, rufting pennons fweep. Or in the arched cave, where deep and dark The broad nubroken billows heave and fwell,
In horrid mulings wrapt, they fit to mark
The labring monn ; or lift the nightly gell
Of that dread-fpirit, whore gigantic form
The feer's entrmeed eye can well furver,
Though the dimair who gnides the driving form, And peints the wretched bark its deftin'd prey.
Or him who hevers on his flagging wing,
O'er the dire whirlpool, that in ncean's watte,
Draws inftant down whate'er devoted thing
The falling breeze within its reach hath placenThe difant feananhears, and Hies with trembling haft.

Or if on land the ficmel exerts his fway;
Silent he broods o'er quickfand, bog, or fen,
Far from the the't'ring roof and haunts of men,
When witched darkers thuts the eye of day,
And throuds each far that wont to cheer the night ; Crif the drifted fnow perplex the way,

With treach'rous gleam he lures the fated wight; And leads him flowdring on and quite aftray."
(L) By joung Aurcra, Collins undoubtedly meant the firt appsarance of the rorthera lights, which is commenly faid to liave happened a'out the year 1715 ,
(m) Second-light is the term that is ufed for the divination of the Highlanders.
(n: The late duke of Cumberland, who defeated the Pretender at the battle of Culloden.
(a) A fiery meteor, called by various names, fuch as Will avith the Wiff, fack quith the Lantiorn, \&ac. It horers in the air over marthy and fenny places.

To that hoar piic (f) which fill its ruin flows: In whofe fmall vaults, a pigmy-folk is foun!,

Whofe bones the delver vith his fpade upthrows, And culls them, wond'ring, from the hallow'd ground : Or thither (e), where bencath the fows'sy wefl,

The mighty kings of three fair realms are haid:
Once foes perhaps, together now they reft, No flaves revere them, and no wars invade: Yct frequent now, it midnight folems hour, The rifted mounds their yawning cells unfold, And forth the monarchs ftalk with for'reign po:v'r

In pageant robes; and, wreath'd with theeny gold, And on their twilight tombs acrial conncil hold.

## X.

But, oh ! o'er all, forget not Kilda's race,
On whofe bleak rocks, whith brave the walting tides,
Fair Nacure's daughter, Virtue, yet abides.
Go! jult, as they, their blamelefs manners thate!
Then to my ear tranfmit fome gentle fong,
Of thofe whofe lives are jet fincere and plain,
Their boundeal walks the rugged cliffs along,
And all their profpect but the wintery main.
With fparing temperance of the needful time,
They drain the fented fpring ; or, hunger-pref,
Along th' Atlantic rock, undreading, climb, ird- And of its cggs defpoil the Solan's neft.

Thus, bleft in primal innocence, they live,
Suffic'd, and happy with that frugal fare
Which tafteful toil and hourly danger give.
Hard is their fhallow foil, and bleak and bare ;
Nor ever vernd bee was heard to murmur there : XI.

Nor need't thou blufh that fuch fale themes engage
Thy gentle mind, of fairer Rores polleft;
For not alonc they touch the village brealt,
But fill'd in elder time th' hiftoric page.
There, Shakefpeare's felf, with everygarland crown'd, Flew to thofe Fairy climes bis funcy fiseris ( R ),
In muling hour; his wayward fifters found,
And with their terrors drefs'd the magic feene.
From then he fung, when, 'mid his bold defign,

- Before the Scot, afflicted, and aghant

The fhadowy kings of Banquo's fated line,
Thro' the dark catre in gleamy pageant paf'd.
Proceed! nor quit the tales which, fimply told, Could nnce fo well my enfw'ring bofom pierce; Proceed, in forceful founds, and colours bold, The nutive legends of thy land reheare;

To fuch adapt the lyre, and fuit thy pow'rful verfe. XII.

In feenes like thefe, which, daring to depait From foler truth, are fill to nature true, And call forth frefh delight to fancy's view,
Th' heroic mufe employ'd her Tafo's art !

How have I trenufld, when, at Tancred's Aroke, Its grlaing bitond the graping cyprefs pour'd,
Whan cach live platit widh mortal aecents fonke,
And the wild blan upherv'd the ranifh'd fword!
How have 1 lit, when pip'd the penfive wind,
To lienr his harp hy Britifa Fairax thrung!
Picvailing poet! whofe madoubting mind,
Delev'd the magic wenders which he fure:
Hence, at caclifound, imanimation glows !
Ifrice, at each sidure, sivid lififfurts bere! (s)
Hence his varm lay with foftelt fweetnefs llows!

And fills th' impafioned heart, and wins the larmonicus ous.

Dr Johnfon, in his life of Collins, informs us, that Dr Warton and his brother, who had feen this cele in the author's poffeffion, thought it fuperior to his other works. The tafte of the Wartons will hardly be queftioned; but we are not fure that the following Ode so the Paflons has much lef's merit, though it he ricrit of : different kind, tham the Ode on the Sunerlitions of the Highlands:
Tivame Mufic, heay'nly maid was young,
While yet in early Greece the funs,
The Paffions oft to hear her thell,
Throng'd around her magic cell,
Exulting, trembling, raging, fainting,
Yofieft beyord the Mufe's painting;
By turns they felt the glowing nind
Dilturb'd, delighted, rais'd, refn'd.
Till once, 'tis said, when all were fir'd,
Fill'd with fury, rapt, infir'd,
From the fipporting myrtles round
They fnateh'd her inftruments of found:
And as they of had heardapart
Sweet lefions of her foreefulart,
( P ) One of the Hebrides is called the Ifle of Pigmies, where it is reported, that feveral miniatura bones of the human fpecies have been dug up in the ruins of a chapel there.
(e) Icolmkill, one of the Hebrides, where many of the ancient Scotifh, Irifh, and Norwegina kings, are faid to be interres.
(R) This line wanting in Dr Carlyle's edition.
(s) This line wanting in Dr Carlyle's edtition.
(T) This line wanting in Dr Carlyle's edition.
(u) Ben Jo, fon puid a vifit on foot in igrg to the Scotch post Drummond, at his feat of Havthornden, wi: Lein feven miles of Edinburgh.
(s) Barro:v, it feems, was at the univerfity of Edindurgh, which is in the county of Lethian.

Satyrs and fylvan boys were feen, leeping from forth their alleys green ;
Brown Exercile rejoic'd to hear,
And Sport leapt up, and feiz'd his beechen fpear.
Lant came Joy's ecfeatic trial ;
He, with viny crown advaucing,
Firit to the lively pipe his hand aderrent,
But foou he faw the brifk awakening viol,
Whofe fiweet entrancing voice he lov'd the belt.
They would have thought wlio heard the ftrain, They faw in Tempe's vale her native maids, A midft the feftal founding haales,
To fome unwearjed minftrel dancing,
While, as his flying fingers kifs'd the ftrings,
Love fram'd with Nirth a gay fantaftic round:
Loole were her trafes feen, her zone urbound
And he, amidit his irolic play,
As if lee would the charming air repay,
Shook thoufand odours from his dewy wings.
O Mufic! fphere-defcended maid, Friend of plealure, wifdom's aid,
Why, Goddefs, why to us denied?
Lay'f thou thy ancient lyre afide?
As in that lov'd Athenian bower,
You learn'd an all-commanding power :
Thy mimic foul, O Nymph endeay' ${ }^{\prime}$,
Can well recal what then it heara.
Where is thy mative fimple heart,
Devote to virtue, fancy, art?
Arile, as in that elder time,
Warm energic, chafte, fublime!
Thy wonders, in that god-like age,
Fill thy recording fitter's page-
'Tis faid, and I believe the tale,
Thy humbleft reed could nore prevail,
Had more of ftrength, diviner rage,
Than all which charms this laggard age ;
Ev'n all at once together found
Cacilia's mingled world of found-
O! bid our vain endeavours ceale,
Revive the jult defigns of Greece,
Return in all thy fimple fate!
Confirm the tales her fon's relate.
We fhall conclude this fection, and thefe examples, with Gray's Progrefs of Poefy, which, in fite of the feverity of Johnion's criticifin, certainly ranks high among the odes which pretend to fublimity. The firlt ftanza when examined by the frigid rules of $f$ rainmatical criticifm, is certainly not faultlefs; but its faults will be overlooked by every reader who has any portion of the author's fervor :

## I. 1.

Awake, Eolian lyre, awake,
And give to rapture all thy trembling ftrings,
From Helicon's harmonious fprings
A thoufand rills their mazy progrefs take:
The langhing fowers, that round them blow,
Dink life and fragrance as they fow.
Now the rich ftream of mufic winds along,
Deep, majeftic, fmooth, and ftrong,
'Thro' verdant vales, and Ceres' golden reign :
Now rolling down the fecp amain,
Headlong, impetuous, fee it pour :
The rocks, and nodling groves, rebellow to the roar.
$\mathrm{Ol}_{1}$ ！Sovereign of the willing foul， Parent of fivect and folemn－breathing airs， Enchanting thell！the fullen cares， And frantic pallions，hear thy foft controul， On＇Thracia＇s hills the lord of war Has curb＇d the fury of his car， And dropp＇d his thirfy lance at thy command． Perching on the fecptred hand Of Jove，thy magie lulls the feather＇d king With ruffed plames，and flagging wing ： Quench＇d in dark clouds of flumber lie
The torror uf his beak，and lightnings of his eye．

$$
\text { I. } 3
$$

Thee the voice，the dance，obey，
Temper＇d to thy warbled lay ：
O＇er Italias velvet－green
The roty－crowned loves are feen．
On Cytherea＇s day，
With antic fports，and blue－ey＇d pleafures，
Frifing light in frolic meafures ；
Now purfuing，now retreating，
Now in circling troops they meet；
＇lo brik notes，in cadence beating， Glance their many－twinkling feet．
Slow melting frains their queen＇s approach declare ：
Where＇er the turns，the graces homage pay．
With arms fublime，that float upon the air，
In gliding fate fhe wins her eafy way：
O＇er her warm cheek，and rifing bofom，move
The bloom of young defire，and purple light of love
II．I．
Man＇s feeble race what ills await ；
Labour，and penury，the racks of pain，
Difeafe，and forrow＇s weeping train，
And death，fad refuge from the forms of fate！
The fond complaint，my fong，difprove，
And jultify the laws of Love．
Say，has he giv＇n in vain the heav＇nly mufe ？
Night，and all her fickly dews，
Her ipectres wan，and birds of boding cry，
He gives to range the dreary fky；
Till down the eaftern cliffs afar
Hyperion＇s march they fpy，and glitt＇ring fhafts of war．

$$
\text { II. } 2 .
$$

In climes beyond the folar road，
Where thaggy forms o＇er ice－built mountains roam，
The Mufe has broke the twilight－gloom，
To cheer the fhiv＇ring native＇s dull abode．
And oft，beneath the od＇rous fhade
Of Chili＇s boundlefs forefts laid，
She deigns to hear the favage youth repeat，
In loofe rumbers wildly fweet，
Their feather－cinctur＇d chiefs，and dufky loves．
Her tract，where＇er the goddefs roves，
Glory purfue，and gen＇rous fhame，
Th＇unconquerable mind，and freedom＇s holy flame．

## II． 3.

Woods that wave o＇er Delphi＇s fteep，
Ifles，that crown th＇Egean deep，
lields，that cool liiffus laves，
Or where Mæ．nder＇s amber waves
In ling＇ring lab＇rinths creep，
How do your tuneful echoes languifh
Mate，but to the roice of anguifh！

Where each old puetic monetain
Infpiration breath＇d around；
Ev＇ry fhade and hallow＇d fountain
Murmur＇d deep a felemn found ：
＇Till the fad nine，in Greece＇s esil hrur，
I．cft their Parnaflus for the Iatian planis，
Alike they foom the jomp of tyrane power，
And coward vice that revels in her chains．
When Latium had her lofy finit loht，
They fought，olf Albion！next thy fea ercircled coan．
111． 1.
Far from the fun，and fummer－gale，
In thy green lap was nature＇s＊darling laid，
What time，where lucid Aron fuay＇d，
－Shake－
fucare．
To him the miglaty mother did mural
Her awfol face ：the dumelefs chitd
Stretch＇d forth his little arms，atid fmil＇d．
This pencil take（fhe faid）whofe colours clear
Richly paint the vernal year：
Thine too thefe golden keys，immortal boy！
This can unlock the gates of joy ；
Of horror that，and thrilling fears，
Or ope the facred fource of fympathetic tears．
III． 2.
Nor fecond he $\dagger$ ，that rode fublime
$\dagger$ Miltor．
Upon the ferapl－wings of ectafy，
The fecrets of th＇abyfs to fpy．
He pafs＇d the flaming bounds of place and time：
The living throne，the fapphire blaze，
Where angles tremble while they gaze，
He faw；but blafted with excefs of light，
Clos＇d his eyes in endlefs night．
Behold，where Dryden＇s lefis prefumptuous car，
Wide o＇er the fields of glory bear
Two courfers of ethereal race，
With necks in thander cloth＇d，and long refounding
III．3．［race．
Hark，his hands the lyre explore！
Bright－ey＇d fancy，huv＇ring n＇er，
Scatters from her pictur＇d urn
Thoughts that breathe，and worls that burn．
But ah！＇tis heard no more－
Oh：Lyre divine，what daring firit
Wakes thee now ？tho＇he inherit
Nor the pride，nor ample pinion，
That the Theban eagle bear，
Sailing with fupreme dominion
Through the azure deep of air：
Iet of before his infant eyes wonld rum
Such forms as glitter in the Mufe＇s ray，
With orient lues，unborraw＇d of the fiun：
Yet fhall he mount，and keep his diftant way
Beyond the limits of a vulgar face，
Beneath the good how far－but far above the great．
Sect．III．Ofilie Elegy．
The Elegy is a mournful and plambive，but yet fweet ${ }^{12} 3^{3}$ and engaging，kind of poem．It was firf invented to bewail the death of a friend；and afterwards ufed to ex－ peefs the complaints of lovers，or any other me．anchol－ fubject．In procefs of time，not cnly matters of grief， but joy，withes，prayers，expoltulations，reprcaches，ad－ monitions，and almoft every nther fubjeef，were admitied into elegy ；however，funcmiblamentations and affitis of

Eleey.

Inefecm mandreable to its chaiater, which is gentlenefs and tenuity.

The plainive clegy, in moumful fate, Difherelihd weeps the fern decrees of fate : Now paints dieloven's turncuts and dalights; Now the nymph flatters, thicatens, or invites. Wut le, wh. ㅎould thefe putions woll exprets. Murt more of love than poctry P ? ff fs, I hate thofe lifele's whiters whofe furc'd fire In a cold dyle defribes a lat defire ; Who figh by yu!c, and raging in cold blood. Their fluggith mufe fpur to art an'rous mood. Their ectuinfes in?pidly they feign;
And always finc, and fordly luy their chain; Ache their pritun, and their fuftrings bief, Irrate fenfe ans reafon quarrel as they pleate. 'Twas not of old ia this affetted tone, That finoo:l Tilbulles made l.is anmotis mont ; Or tende: Ovic, in melodious fleanis, Of love's dear art the pleafing rules explains. You, who in elegy would jutly write, Confult your heart; let that alone endite:
[From the Frcrill of Defprecix.] Sonares.
The phan of an clegry, as insecd of all other poem", ought to be made belore aline is written; or elfe the
ather will ramble in the dat, and, his verfes have no dependance on each cther, No cfigrammatic points or conceits, none of the fe fine things which moft people are fo fond of ia every fort of poem, can be allowed in this, but mult give place to nobler beauties, thofe of nature and the frifins. Elegy rejeqts whatever is facetious, fatirical, wh majeltic, and is content to be plain, decent, and unaffected; yet in this hanble ftate is the fweet and engaging, elegant and attractive. This poem is adoncd with frequent commiferations, complaints exclawations, addrefes, to things, or ferfons, flort and proper digrerfions, allufions, comparijours, profopopaias or feigned perfons, and fometimes with thort defcriptions. The distion ought to be free from any bar/bnefs; neat, eafy, perficumus, expreffice of the manneers, tender, and pathetic; and the numbers fhould be finooth and flowing, and captivate the ear with their uniferm fireetnefs and delicacy:

Of elegies on the fubject of death, tinat by Mr Craj, veriten in a country church-gard, is one of the beft that has appeared in our language, and may be jufty etteened a mater-piece. Dui being fo generally known, it would be fuperfunus to infert it here.

On the fubject of love, we tha!! give an example from the elegies of Mr Hammond.

Let others boaft their heaps of fhining gold,
And view their fields with waving plenty crown'd, Whom neighb'ring foes in conflant tersor hold, And trumpets break their flumbers, never found: While, calmly poor, I tifle life away, Enjoy fweet leifure by my cheerful fire,
No wanton hope my quiet thall betray, But cheaply blef'd l'll feorn each vain defire. With timely care Ill fow my little field, And plant my orchard with its malter"s hard;
Nor blufh to feread the has, the hook to vield, Or range my fheaves along the funny land.
If late at durk, while carele.siy I roam,
I meet a frolling kid or bleating lamb,

T R Y.
Under my arm I'll bring the wand'rer home, And not a little chide its thourhtlefs dan.
What joy to hear the tempef howl in vain, And clafp a fearful miltrefs to my breatt ?
Or lull'd to flumber by the leating rain, Secure and happy fink at laft to reft.
Or if the fun in flaming Leo ride, By fhady rivers indolently ftray,
And, with my Demia walding fide by fide, Hear how they murmur, as they glide away.
What ioy to wind along the cool retreat, To top and gaze on Dreta as I go!
To mingle fweet difcourfe with kilifes fweet, And teaclm my lovely fcholar all I know!
Thus Fleas'd at heart, and not with fancy's dreani, In filent happinefs I reft unknown;
Content with what I am, not what Ifeem I live for Delaa and myfelf :lone.
Ah foolith man! who, thus of her poffers'd, Could float and wander with ambition's wind,
And, if his outward trappings fooke him bleft, Not heed the ficknefs of his confcious mind.
With her I foom the idle breath of praic, Nor trult to happinefs that's not our own;
The finile of fortune might fufpicion raife, But here I know that I am low'd alone.
Stanhofe, in wifdom as in wit divine, May rife and ple.d Britannia's glorious caufe,
With fleady rein his eager wit confine, While manly fenfe the deep attention draws.
Let Stanhope fpeak his lift'ning country's wrong, My humble voice fhall pleafe one partial maid;
For her alone I pen my tender fong, Securely fitting in his friendly flade.
Stinhope fhall come, and grace his rural friend; Delia fhall wonder at her noble gueft,
With blufhing awe the riper fruit commend, And for her huband's patron cull the beft.
Her's be the care of all my little train, While I with tender indolence am blet,
The fivourite fubject of her gentle reign, By love alone diltinguifh'd from the ref.
For her I'll yoke my oxen to the plough, In gloomy forefts tend my lonely fluck,
For her a goat-herd climb the monntan's brow, Aid fleep extended on the naked rock.
Ah! what avails to prefs the flately bed, And far from her midat taftelefs grandeur weep,
By marble fountains lay the penfive head, f.nd, while they murmur, frive in vain to fleep!

Delia alone can pleafe and never tirc, Exceed the print of thought in true delight;
With her, enjoyment wakens new defire, And equal rapture glow's thrn' ev'ry night.
Deauty and worth in her alike contend To charm the fancy, and to fix the mind;
In her, my wife, my mintels, and my friend, I tathe the joys of fente and reaton join's.
On her ill gaze when others' loves are n'er, And dying prefs her with my clay-cold hand-
Th in weep't already, as I were no more, Nor can that gentle breaft the thought withetand,
Oh! when I die, my latelt moments fare, Nor let thy grief with fharper torments kill:
Wound not thy cheeks, nor hurt that flowing hair ; Tho' I am dead, my foul hall love the atill.

Oh q̧uit the room, oh quit the deathrul bed, Or thou wilt die, fo tender is thy heart! Oh leave me, Delia! cre thou fee me dead,

Thefe weeping friends will do thy mourmful part.
Let them, extended on the decent bier, Convey the corfe in melancholy fate,
Thro' all the village fpread the tender tear, While pitying maids our wond'rous love relate.

## Suct. IV. Of the Paftoral.

This poem takes its name from the Latin word paRor, a "thepherd;" the fubject of it being fomething in the paftoral or rural life; and the perfons, interlocutors, introduced in it, either fhepherds or other rultics.
Thefe poems are frequently called eclogues, which fignifies "felect or choice pieces;" though fome accunt for this name in a different manner. They are alio called bucolicks, from Exкo八 $Q$, " a herdfman."
This kind of poem, when happily executed, gives great delight; nor is it a wonder, fince innocence and fimplicity generaliy pleafe : to which let us add, that the feenes of paftorals are ufually laid in the country, where both foct and painter have abundant matter for the exercife of genius, fuch as enchanting profpects, purling ftreams, hlady groves, enarnelled meads, flowery lawns, rural amufements, the bleating of flocks, and the mufic of birds; which is of all melody the mott fweet and pleafing, and calls to our mind the wifdom and tafte of Alexander, who, on being importuned to hear a man that imitated the notes of the nightingale, and was thought a great curiofity, replied, that he had bad the happinefs of bearing the nighting ale herSelf.

The character of the paftoral confits in fimplicity, brevity, and delicacy; the two firft render an eclogue natural, and the laft dclightful. With refpee to nature, indeed, we are to confider, that as a paltoral is an image of the ancient times of innocence and undefigning plainnefs, we are not to defcribe Chepherds as they really are at this day, but as they may be conceived then to have been, when the beft of men, and even princes, followed the employment. For this reafon an 2 ir of piety fhould run through the whole poem; which is vifible in the writings of antiquity.

To make it natural with refpect to the prefent age, fome knowledge in rural affairs fhould be difcovered, and that in fuch a manner, as if it was done by chance rather than by defign; lefl, by too much pains to feem natural, that fimplicity be deftroyed from whence arifes the delight; for what is fo engaging in this kind of poefy procecds not fo much from the idea of a country life ittelf, as in expofing only the beft part of a thepherd's life and concealing the misfortunes and miferics which fometimes attend it. Befides, the fuhject muft contain fome particular beauty in itfelf, and each eclogue prefent a fcene or profpect to our view enriched with variety: which variety is in a great meafure obtained by frequent comparifons drawn from the moit agreeable objects of the country; by interrogations to things inanimate; by fhort and beautiful digreflions; and by elegant turns on the words, which render the numbers more fweet and pleafing. To this let us add, that the connections muft be negligent, the narrations and defcriptions fhost, and the periods concife.

Vos. XV.

Riddics, parabics, proverbs, antique phrafes, and fin- Paforal. perfitious fables, are fit materials to be intermixed with this kind of poens. They are here, when prop rly applied, very on namental; and the more fo, as they give our modern compofitions the air of the anzieme manner of writing.

The fyle of the paftoral ought to be humble, yet pure; neat, but not florid; eaty, and yet lively: and the numbers foould be fmonth and flowing.

This poem in gencral fhould be fhort, and ought never much to exceed 100 lines; for we are to conff. der that the ancients made this fort af compofitions their amufement, and not their bufinefs: but however thort they are, every cclogue mult contain a plot or fable, which mult be fimple and one; but yet fo managed as to admit of fhort digreflions. Virgil has al. ways obferved this.-We thall give the plot or argumeat of his firft paftoral as an example. Melihocus, an unfortunate /hepherd, is introduced zeith 'Tityrus, one in more fortunate circumflances; the former addrefts the complaint of his fufferings and baniffoment to the latter, who enjoys his flocks and folds in the midff of the pullic calamity, and therefore expreffes his gratitude to the lenefalar from zoloom this farour flowed: but Melibœus accufes fortune, civil wars, and bids adieu to bis natize country. This is therefore a dialogue.
But we are to obferve, that the poet is not always obliged to make his eclogue allegorical, and to have real perfons reprefented by the fictitious characters introduced ; but is in this 1 elped entirely at his own liberty.

Nor does the nature of the poem require it to be al. ways carried on by way of dialogue; for a thepherd may with propriety fing the praifes of his love, complain of her inconftancy, lament her abfence, her death, \&c. and addrefs himfelf to groves, hills, rivers, and fuch like rural objects, even when alone.

We fhall now give an example from each of thofe authors who have eminently diftinguifhed themfelves by this manner of writing, and introduce them in the order of time in which they were written.

Theocritus, who was the father or inventor of this Example kind of poetry, has been defervedly elleemed by the of the parbeft critics; and by fome, whofe judgment we cannot toral from difpute, preferred to all other paftoral writers, with Theocritus. perhaps the fingle exception of the tender and delicate Gefner. We fhall infert his third idillyum, not becaufe it is the beft, but becaufe it is within our compafs.

To A maryllis, lovely nymph, I fpeed, Meanwhile my goats upon the mountains feed,
O Tityrus tend them with afliduous care,
Lead them to crytal fiprings and patures fair, $\}$
And of the ridgling's buttings horns beware.
Sweet Amaryllis, have you then forgot
Our fecret pleafures in the confcious grott,
Where in my folding arms you lay reclin'd?
Bleft was the fhepherd, for the nymph was kind,
I whom you call'd your Dear, your Love, to late,
Say, am I now the object of your hate?
Say, is my form difpleafing to your fight?
This cruel love will furely kill me quite.
Lo! ten large apples tempting to the view,
Pluck'd from your favourite tree, where late they grew.
Accept this boon, 'tis all my prefent flore;
To-morrow will produce as many more.
Gg
Meanwite

13ntoral. Meanwhile thefe heart-confuming pains remove, And give me gentle pity for my love. Oh! was I made by fome transforming power A bee to buzz in your fequefter'd bow'r! To pierce jour ivy thade with murmuring found, And the light leaves that compafs you around. I know thee, Love, and to my forrow find, A god thou art, but of the favage kind; A lionefs fure fuckled the fell child, And with his brothers nurft him in the wild ; On me his fcorching flames inceflant prey, Glow in my bones, and melt my foul away. Ah, nymph, whofe eyes deftructive glances dart, Fair is your face, but flinty is your heart : With kiffes kind this rage of love appeafe; For me, fond lwain! ev'n empty kifles pleafe, Your fcorn diftracts me, and will make me tear The flow'ry crown I wove for you to wear, Where rofes mingle with the ivy-wreath, And fragrant herbs ambrofial odours breathe. Ah me! what pangs I feel; and yet the fair Nor fees my forrows nor will hear my pray'r.
l'll doff my garment, fince I needs mult die, And from yon rock that points its fummit high, Where patient Alpis fnares, the finny fry, I'll leap, and, though perchance I rife again, You'll laugh to fee me plunging in the main. By a prophctic poppy-leaf I found Your chang'd affection, for it gave no found, Thongh in my hand ftruck hollow as it lay, But quickly wither'd like your love away. Anold witch brought fad tidings tomy cars, She whotells fortunes with the fieve and fheers; For leafing barley in my field of late, She told ne, I thould love, and you fhould hate ! For you my care a milk-white goat fupply'd, Two wanton kids run frifking at her fide; Which oft the nut-brown maid, Erithacis, Has begg'd and paid before-hand with a kifs; And frince you thus my ardent paffion flight, Her's they flall be before to-morrow night. My right eye itches; may it lucky prove, Perhaps I foon fhall fee the nymph I love; Beneath yon pine I'll fing ditinet and clear, Perlaps the fair my tender notes thall hear ; Perlaps may pity my melodious moan ; She is not metamorphos'd into fone.
Hippomenes, provol'd by noble Atrife, To wm a mitrefs or to lofe his life, Threw golden fruit in Atalanta's way: The bright temptation caus'd the nymph to ftay; She look'd, fhe languinh'd, all her fonl took fire, She plung'd into the gulph of deep defirc.
'to Pyle from Othrys fage Melampus cane, He drove the lowing herd, yet won the dame; Fair Pero blef his brother Bias' arms, And in a viriuous race diffes'd unfading charms.

Adonis fed his cattic on the plain, And fa born Vcnus lov'd the reral fwain; She mourn'd him wounded in the fatal chace, For dead dffinis'd hin from her warm embrace. Though ynung Endymion was by Cynthia blef, I enve mothing but his lafting reft.
Jafion flumb'ring on the Cretan plain Ceres once faw, and bleft the happy fiwain With plafures too divine for cars profane.

My head grows giddy, love affects me fore; Yet you regard not ; fo I'll fing no moreHere will I put a period to my careAdieu, falfe nymph, adieu ungrateful fair; Stretcl'd near the grotto, when I've breath'd my laft, My corfe will give the wolves a rich repalt, As fiveet to them as honey to your tafte.

FAwkes.
Virgil fucceeds Theocritus, from whom he has in fome places copied, and always imitated with fucceis. As a fpecimen of his manner, we flall introduce his firft paftoral, which is generally allowed to be the moft perfeet.

## Meliboeus and Titsrus.

Mel. Beneath the fhade which beechen boughs diffure, Virg You, Tityrus, entertain your fylvan mufe.
Round the wide world in banifkment we roam, Forc'd from our plea'ing fields and native home; While ftretch'd at eafe you fing your happy loves, And Amaryllis fills the fhady groves.

Tit. Thefe bleffings friend, a deity beftow'd; For never can I deem him lefs than god. The tender firtlings of my woolly breed Shall on his holy altar often bleed.
He gave me kine to graze the flow'ry plain,
And fo my pipe renew'd the rural ftrain.
Mel. I envy not your fortune; but admire, That while the raging fword and wafteful fire Deftroy the wretched ncighbourhood around, No hoftile arms approach your happy ground. Fur diff'rent is my fate; my feble goats With pains I drive from their forfaken cotes: And this you fee I fcarcely drag along, Who yeaning on the rocks has left her young, The hope and promife of my falling fold, My lofs by dire portents the gods foretold; For, had I not been blind, I might have feen You riven oak, the fairelt on the green, And the hoarfe raven on the blatted bough. By croaking from the left prefag'd the coming blow. But tell me, Tityrus, what heavenly pow'r Preferv'd your fortunes in that fatal hour?

Tit. Fool that I was, I thought imperial Rome Like Mantua, where on market-days we come, And thither drive our tender lambs from home. So kids and whelps their fires and dams exprefs; And fo the great I meafur'd by the lefs: But country-towns, compar'd with her, appear Like fhrubs when lofty cypreffes are near.

Mel. What great occafion call'd you hence to Rome ?
Tit. Freedom, which came at length, tho' flow to come: Nor did my fearch of liberty begin
Till my black hairs were chang'd upon my chin; No: Amaryllis would vouchfafe a look, Till Galatea's meaner bonds I broke. Till then a helplefs, hopelefs, homely fwain, I fought not freedom, nor afpir'd to gain : 'Jho' many a viatim from my foid, was bought, And many a cheefe to country markets brought, Yet all the little that I got I fpent, And fill return'd as empty as I went.

Mel. We food amaz'd to fee your miftrcfs mourn, Unknowing that the pin'd for your return;
We wonder'd why fhe kept her fruit fol long, For whom fo late th' ungather'd appleshung;

1'sral. But now the wonder ceafos, fince I fee She kept them only, 'lityrus, fur thee: For thee the bubbiing forings appear'd to mourn, And whifp'ring pines made vows for thy retnon.

Tis. What llould I do? while here I was enchain'd, No glimpie of godlike liberty remain'd; Nor could I hope inany place but there To find a god fo ptefent to my pray'r. There firt the youth of heav'nly birth I view'd, For whom our monthly victims are renew'd. He heard my vows, and gracionfly decreed $M_{y}$ grounds to be rettor'd my former flocks to feed.

Mel. Ofurtunate old man! whofefarm remains For you fufficient, and requites your pains, Thongh rufhes overfpread the neighb'ring plains, '1'ho' here the marfhy grounds approach your fields, And there the foil at tony harveft yields.
Your teming ewes fhall no Atrange meadows try, Nor fear a rot from tainted company.
Behold yon bord'ring fence of fallow trees. [bees:
Is fraught with flow'rs, the flow'rs are fraught with The buiy bees, with a foft murm'ring ftrain, Invite to gentle fleep, the lab'ring fwain : While from the neighb'ring rock with rural fongs The pruner's voice the pleafing dream prolongs; Stock-doves and turtles tell their am'rous pain, And, from the lofty elms of love complain.

Tit. Th' inhabitants of feas and tkies fhall change, And fith on fhore and fags in air fuall range, The banifh'd Parthian dwell on Arar's brink, And the blue German fhall the Tigris drink; Lire I, forfaking gratitude and truth, Forget the figure of that godlike youth.

Alel. But we mult beg our bread in climes unknown, Beneath the fcorching or the freezing zone ; And fome to fair Oaxis flall be fold, Or try the Libyan heat or Scythian cold; The rett among the Britons be confin'd, A race of men from all the world disjoin'd. O! mult the wretched exiles ever mourn? Nor after length of rolling years return? Are we condemn'd by Fate's unjuft decree, No more our houfes and our homes to fee? Or fhall we mount again the rural throne, And rule the country, kingdoms once our own Did we for thefe barbarians plant and fow, On thete, on thele our happy fields beftow? Good heav'n what dire effects from civil difcord flow? $\}$ Now let me graft my pears, and prune the vine ; The fruit is theirs, the labour only mine. Farewell my paitures, my paternal tock! My fruitful fields, and my more fruitful flock! No more, my goats, fhall I behold you climb The Iteepy clifts, or crop the flow'ry thyme; No more extended in the grot below, Shall fee you browzing on the mountain's brow The prickly fhrubs, and alter on the bare I.ean down the deep abyfs and hang in air! No mone my lheep thall fip the morning dew; No more my fong fhall pleate the rural crew: Adieu, my tonelinl pipe! and all the world, adieu!

Tit. This night, at leaft, with me forget your care; Chefnuts and curds and cream thall be your fare: The carpet-ground fhall be with leaves c'cr-fpread, And boughs thall weare a cov'ring for your head:

For fee yon funny hill the floade extends, And curling fmoke from coltages aterads.

Spencer was the firft of his countrymen who acguired any confiderable 1eputation hy this method of writing. We fhall intert his fixth eclogus, or that for June, which is allegorical, as will be feen by the

Argument, "Hobbinol, from a defcription of the pleafures of the place, excites Colin to the enjoyment of them. Colin declares himfelf incapable of delight, by reafon of his ill fuccefs in love, and his lofs of Rofaind, who had treacheroully forfaken him for Menalcas ano. ther fhepherd. By Tityrus (mentioned before in Spercer's fecond eclogue, and again in the twelfth) is plainly meant Chaucer, whom the author fometimes profeffed to imitate. In the perion of Colin is reprefented the author himfelf; and Hobbinol's inviting him to lave the hill country, feems to allude to his leaving the North, where, as is mentioned in his hile, he had for fome time refided."

Hob. Lo! Colin, here the place whofe pleafant fight speneer.
From other hades hath wean'd my wand'ring mind:
Tell me, what wants me here, to work delight?
The fimple air the gentle warbling wind,
So calm, fo cool, as nowhere elfe I find:
The grafly ground with dainty dailies dight,
The bramble-bufh, where birds of every lind
To th' water's fall their tunes attemper right.
Col. O! happy Houbinol, I blefs thy ftate, That paradife laft found which Adam loft. Here wander may thy flock early or late, Withouten dread of wolves to been ytalt;

Thy lovely lays here mayt thou freely boaf:
But I, unhappy man! whom ciuel fate,
And angry gods, purfue from coalt to coalt,
Can nowhere find to fhrond my lucklefs pate.
Hob. Then if by me thou lift advifed be,
Forfake the foil that fo doth thee bewitch:
Leave me thofe hills, where harbroughnis to fee,
Nor holly-buth, nor brere, nor winding ditcl?;
And to the dales refort, where fhepherds rich,
And fruitful flocks been everywhere to fee:
Here no night-ravens lodge, more black than pitcl,
Nor elvilh ghofts, nor ghafly owls do flee.
But friendly fairies neet with many graces,
And light-foot nymphs can chace the ling'ring night,
With heydeguies, and timely trodden traces;
While filters nine, which dwell on Parnafs height,
Do make them nufic, for their more delight ;
And Pan himfelf to kifs their cryftal faces.
Will pipe and dance, when Pheebe flineth bright:
Such peeriefs pleafures have we in thefe places.
Col. And I whilft youth, and courfe of carelefs years,
Did let me walk withouten links of love,
In fuch delights did joy amongit my peers:
But riper age luch pleafures doth reprove,
My fancy eke from former follies move
To ftrayed tteps: for time in paling wears
(As garments doen, which waxen old above)
And draweth new delights with hoary hairs.
Though couth I ling of love, and tune my pipe
Unto my plantive pleas in verfes made:
Thougli would I feek for queen-apples umipe
Togive my Rofalind, and in fommer thade
Gg2
Dight

Diglit eatwdy gilonds was my common trade, To crown her golden locks: but years more rips, And lofs of her, whofe love as life I wayde, Thofe weary wanton toys away did wipe. Hob. Colin, to hear thy rhymes and roundelays, Which thou wert wont on walteful hills to fing, I more delight, than lark in fommer days:
Whofe echo made the neighbour groves to ring, And taught the birds, which in the lower fpring
Did fhroud in fhady leaves from funny rays, Frame to thy fong their cheerful cheriping,
Or hold their peace, for thame of thy fweet lays. I faw Calliope with mufes moe,
Soon as thy oaten pipe began to found, Their ivory lutes and tamburins forego,
And from the fountain, where they fate around, Ren after haftily thy filver found.
But when they came, where thou thy fkill didt foom, They drew aback, as half with fhame confound,
Shepherd to fee, them in their art out-go. Col. Of mufes, Hobbinol, I con mo ikill,
For they been daughters of the higheft Jove, And holden fcorn of homely thepherds quill:
For fith I heard that Pan with Phoobus ftrove Which him to much rebuke and danger drove,
I never lift prefume to Parnafs' hill, But piping low, in ihade of lowly grove,
I play to pleafe myfelf, albeit ill. Nought weigh I, who my fong doth praife or blame,
Ne Atrive to win renown, or pafs the reft: With thepherds fits not follow flying fame,
But feed his flocks in fields, where falls him beft. I wot my rimes been rough, and rudely drelt;
The fitter thes, my careful cafe to frame: Enough is me to paint out my unreft,
And pour my piteous plaints out in the fame. The god of fhepherds, Tityrus, is dead,
Who taught me homely, as I can, to make: He , whillt he liv'd, was the fovereign head
Of fhepherds all, that been with love ytake. Well couth he wail his woes, and lightly flake
The flames which love within his heart had bred, And tell us merry tales to keep us wake, The while our fheep about us fafely fed. Now dead he is, and lieth wrapt in le:d, (Oh why fhould death on him fuch outrage fhow!) And al! his rafing fkill with him is fled,
The fame whereof doth daily greater grow. But if on me fome little drops would flow
Of that the fpring was in his learned hed, I foon would learn thefe wonds to wail my woe, And teach the trees their trickling tears to fhed. Then thould my plaints, caus'd of difcourtefee, As meffengers of this my painful flight, Fly to my love, wherever that the be,
And pierce her heart with point of worthy wight;
As fle deferves, that wrought fo deadly fight.
And thon, Menalcas, that by treachery
Didft underfong my lafs to wax fo light,
Should't well be known for fuch thy villany. But fince $I$ am not, as I wid $I$ were,
Ye gentle thepherds, which your flocks do feed, Whether on hills or dales, or other where,
Bear witnefs all of this fo wicked deed: And tell the lafs, whofe flower is woxe a weed,

T R Y.
And faultefs faith is turn'd to faithlefs feere,
That the the trueft fhephee d's heart made bleed,
That lives on eat th, and loved her molt dear.
Hob. O! careful Colin, I lament thy cafe, Thy tears would make the hardeff flint to fow! Ah! faithlefs Rcfalind, and void of grace, That art the root of all this rueful woe!

But now is time, I gnefs, homeward to go ;
Then rife, ye bieffed flocks, and home apace,
Lel night with tealing fteps do you foreflo,
And wet your tender lanibs that by you trace.
By the following eclogue the reader will perceive that Mr Philips has, in imitation of Spencer, preferved in his paftorals many antiquated words, whi h, though they are difcarded from polite converfation, may naturally be fuppofed till to have place among the thepherds and other ruftics in the country. We have made choice of his fecond eclogue, becaufe it is brought home to his own bufinefs, and contains a complaint againft thofe who had fpoken ill of him and his witings.

> Thenor, Colinet.

Thb. Is it not Colinct I lonefome fee
Leaning with folded arms againft the tree?
Or is it age of late bedims my fight?
'Tis Colinet, indeed in woful plight.
Thy cloudy look, why melting into tears, Unfeemly, n यw the ik r fo bright appears?
Why in this mournful manner art thou found,
Unthankful lad, when all things fmile around?
Or hear'ft not lark and linnet jointly fing,
Their notes blithe-warbling to falute the fpring?
Co. Tho' blithe their notes, not fo my wayward fate;
Nor lark would fing, nor linnet, in my fate.
Each creature, Thenot to his tafk is boin;
As they to mirth and mufic, I to mourn.
Waking, at midnight, I my woes renew,
My tears of mingling with the falling dew.
Th. Small caufe, I ween, has lufty youth to plain;
Or who may then the weight of eld fuftain,
When ev'ry flackening nerve begins to fail,
And the load preffeth as our days prevail?
Yet though with years my body downward tend.
As trees beneath their fruit in autumn bend,
Spite of my flowy head and icy veins,
My mind a cheerful temper fitill retains:
And why thould man, miihap what will, repine,
Sour ev'ry fiveet, and mix with tears his wine?
But tell me then; it may relieve thy woe,
To let a friend thine inward ailment know.
Co. Idly 'twill walte thee, Thenot, the whole day,
Should't thou give ear to all my grief can fay.
Thine ewes will wander; and the heedlefs lambs,
In loud complaints, require their abfent dams.
Th. Sce Lightfoot; he fhall tend them clofe: and I,
'Tween whles, acrofs the plain will glance mine eye.
Co. Where to begin I know not, where to end.
Does there one fmiling hour my youth attend?
Though few my dass, as well my follies fhow,
Yet are thofe days all clouded o'er with wo:
No happy glean of funfhine doth appear,
My low'ring olky and wintry months to cheer.
My pitenus plight in yonder naked tree,
Whiclı bears the thunder-fear too plain, I fee:
Quite deflitute it Rands of fhelter kind,
The mark of forms, and fort of every wind:
coral. The riven trunk feels not the approach of fpring;
Nor birds amoug the leaflefs branches fing:
No more, beneath thy thade, thall thepherds throng With jocund tale, or pipe, or plealing fong. Ill fated tree! and nore ill fated I! From thee, from me, alike the thepherds fly.
$T h$. Sure thou in haplefs hour of time waft born, When blightning mildews fprit the rifing com, Or blating winds o'er bloffim'd hedge.rows pafs, To kill the promis'd fruits, and foorch the grafs; Or when the moon, by wizzard charm'd, forefhows, Blood-ftain'd in foul eclipfe, impending woes. Untimely born, ill luck betides thee fiil.
Co. And can there, Thenot, be a greater ill?
Th. Nor fox, nor wolf, nor rot among our theep: From thefe good fhepherd's care his flock may keep: Againft ill luck, alas! all forecalt fails; Nor toil by day, nor watch by night, avails.

Co. Ah me the while! ah me the lucklefs day! Ah lucklefs lad! befits me more to fay. Unhappy hour! when freth in youthful bud, I left, Sabrina fair, thy filv'ry flood. Ah filly I! more filly than my fheep, Which on thy flow'ry banks I wont to keep. Sweet are thy banks; oh, when fhall I once more With ravifh'd eges review thine amell'd fhore? When, in the cryftal of thy waters, fcan Each feature faded, and my colour wan? When thall I fee my hut, the fmall abode Myfelf did raife and cover o'er with fod? Small though it be, a mean and humble cell, Yet is there room for peace and me to dwell.
Th. And what enticement charm'd thee fir away From thy lov'd home, and led thy heart altray?
Co. A lewd defire ftrange lands and fwains to know. Ah me! that ever I Thould covet wo! With wand'ring feet unbleft, and fond of fame, I fought 1 know not what befides a name.

Th. Or, footh to fay, didft thou not hither rome In fearch of gains more plenty than at home? A rolling fone is ever bare of mols; And, to their coft, green years old proverbs crofs.

Co. Small need there was, in random fearch of gain, To drive my pining flock athwart the plain To diftant Cam. Fine gain at length, I trow, To hoard up to myfelf fuch deal of wo ! My feep quite fpent through travel and ill fare, And like their keeper, ragged grown and bare, The damp cold green fward for my nightly bed, And fome flaunt willow's trunk to relt my head. Hard is to bear of pinching cold the pain; And hard is want to the unpradis'd fwain; But neither want, nor pinching cold is hard, To blafting forms of calumny compar'd: Unkind as hail it falls; the pelting fhow'r Deftroys the tender herb and budding flow'r.

Th. Slander we fhepherds count the vileft wrong:
And what wounds forer than an evil tongue?
Co. Untoward lade, the wanton imps of fpite Make mock of all the ditties I endite. In vain, O Colinet, thy pipe, fo fhrill, Charms every vale, and gladdens every hiil: In vair thou feek'ft the coverings of the grove, In the cool thade to fing the pains of love:

Sing what thon wilt, ill-nature will prevail ;
And cvery elf hath fill enough to rail.
But yet, though poor and artleis be my vein.
Menaleas feems to tile my fimple frain:
And while that he delighte! in my fong,
Which to the grood Menalcas doth beling,
Nor night nor day thall my rude mufic ceafe ;
I afk tio more, io I Menalcas pleafe.
Th. Menalcas, lord of theie fair fertile plains,
Preferves the thecp, and o'er the fhepherds reig:s:
For him our jearly wakes and featts we hold,
And choofe the faireft firtlings from the fold;
He, good to all who good deferves, fhall give
Thy Hock to feed, and thee at earc to live,
Shall curb the malice of unbridled tengues,
And bounteoufly reward thy rural fongs.
Co. Firft then flall lightiome birds forget to fiy, The briny ocean turn to palures dry,
And every rapid niver ceafe to low,
Ere I unmindful of Menalcas grow.
Th. This night thy care with me forget, and foid
Thy flock with mine, to ward th' injurious cold.
New milk, and clouted cream, mild cheefe and curd ,
With fome remaining fruit of laft year's hoard,
Shall be our ev'ning fare; and for the night,
Sweet herbs and mofs, which gentle fleep invite:
And now behold the fun's departing ray,
O'er yonder hill, the fign of ebbing day :
With fongs the jovial hinds return from plow;
And unyok'd heifers, loitering homeward, low.
Mr Pope's Paftorals nest appeared, but in a different drefs from thofe of Spencer and Philips; for he has difcarded all antiquated words, drawn his fwains more modern and polite, and made his numbers exquifitely harmonious: his eclogues therefore may be called letter poems, but not better paftorals. We hall infert the eclogue he has infcribed to Mr Wycherly, the begimning of which is in imitation of Virgil's firft pattoral.

Beneath the faade a fpreading beech difplays,
Hylas and Ægon fung their rural lays:
This mourn'd a faithlefs, that an abient love,
And Delia's name and Doris fill'd the grove,
Ye Mantuan nymphs, your facred fuccour bring ;
Hylas and Egon's rural lays I fing.
'Thou, whom the nine with Plautus' wit infpire,
The art of Terence, and Menander's fire :
Whofe fenfe inltructs us, and whofe humour charms,
Whofe judgment fways us, and whofe fpirit warms!
Oh, Rxill'd in nature! fee the hearts of fwains, Their artlefs paffions, and their tender pains.

Now fetting Phochus thone ferencly bright,
And feecy clouds were ftreak'd with purple light ; When tuneful Hylas, with meiodious moan,
Taught rocks to weep, and made the mountains groan,
Go, gentie gales, and bear my fighs away!
To Delia's ear the tender notes convey,
As fome fad turtle his loft love deplores,
And with deep murmurs fills the founding fhores; Thus, far from Delia, to the winds I mourn,
Alike unheard, unpity'd, and forloın.
Go, gentle gales, and bear my fighs along!
For her the feather'd quires negleci their fong;
For her, the limes their pleafing flades deny;
For her, the lilies hang their head and die,

Thou wert from Retna's burning entrails torn, Got by fierce whirlwinds, and in thunder born. Refound, ye hills, refound my mournful lay! Farewell ye woods, adieu the light of day ! One leap from yonder cliff thall end my pains. No more, ye hills, no more refound my ttrains !

Thus fung the thepherds till th' approach of night, The ikies yet blunhing with departing light, When falling dews with fpangles deck'd the glade, And the low fen had lengthea'd ev'ry fhade.

To thefe partorals, which are written agreeably to the tafe of antiquity, and the rules abovepreferibed, we fhall beg leave to fubjoin another that may be called lurlefque paforal, wherein the ingenious author, Mr Gay, has ventured to deviate from the beaten road, and delicribed the flepherds and ploughmen of our own time and country, inflead of thofe of the golden age, to which the modern critics confine the paftoral. His fix paftorals, which he calls the Slepherd's IWeek, are a beautiful and livelyreprefentation of the manners, cuftoms, and notions of our ruftics. We fhall infert the firf of them, intitled The Squabble, wherein two clowns try to outdo each other in finging the praifes of their fweethearts, leaving it to a third to determine the controverfy. The perfons named are Loollin Clout, Cuddy, and Clodlipole.

Lob. Thy younglings, Cuddy, are but jult awake;
No throfte fhrill the bramble-bufh forfake;
No chirping lark the welkin fheen * invokes;
No damfel yet the fwelling udder frokes;
O'er yonder hill does feant $\dagger$ the dawn appear ;
Then why does Cuddy leave his cott fo rear $\ddagger$ ?
Cud. Als Lobbin Clout! I ween || my plight is guef For be that loves, aftranger is to reft.
Slie comes, my Delia comes!-now ceafe, my lay ;
And ceafe, je gales to bear my fighs away !
Next Fegon fing, while Windfor groves admir'd ;
Rehearfe, ye mules, what yourfelves infpir'd.
Refound, ye hills, refound my mournful frain !
Of perjur'd Doris, dying, I complain:
Here where the mountains, lefs'ning as they rife,
Lofe the low, vales, and fleal into the flkies;
While lab'ring oxen, feent with toil and heat, In their loofe traces from the field retreat; While curling fmokes from village tops are feen, And the tleet thades glide o'er the dufky green.

Refound, ye hills, refound my mournful lay !
Beneath yon poplar oft we pafs'd the day: Oit on the rind I carv'd her am'rous vows, While the with garlands hung the bending boughs: The garlands fade, the boughs are worn away ; So dies her love, and fo my hopes decay.

Refound, ye hills, refound my mourniul frain!
Now bright Arequrus glads the teeming grain ; Now golden fruits in loaded branches fhine, And grateful clutters, fwell with Hoods of wine ; Now blulhing berries paint the yellow grove:
Juf Gods! Chall all things yield returns but love?
Refound, ye hiils, refound my mourniul lay !
The thepherds cry," Thy Hocks are left a prey."
Ah! what avails it me the focks to keep,
Wha lof mey heart, while I preferv'd my thecp, Pan came, and akk'd, what magic caus'd my timart, Or what ill eyes mullignant glances dart? What eyes but hers, alas! have pow'r to move? And is there magic but what dwells in love?

Refound, ye hills, refound my mournful Aiains! I'll fy from thepherds, focks, and flow'ry plains. From fhepherds, focks, and plains, I may remove, Forfake mankind, and all the world-but love! I hno thec, Love! wild as the raging main, More tell than ty'gets on the Lybian plain :

If fwains belye not, thou haft prov'd the fmart, And Blouzalinda's miftrefs of thy heart. This rifing tear betokeneth well thy mind; Thofe arms are folded for thy Blouzalind. And well, I trow, our piteous plights agree; Thee Blouzalinda fmites, Buxoma me.
L.ob. Ah Blouzalind! I love thee more by half, Than deer their fawns, or, cows the new-fall'n calf, Woe worth the tongue, may hifters fore it gall, That names Buxcoma Blouzalind withal!

Cud. Hold, witlefs Lobbin Clout, I thee advife, Left blifers fore on thy own tongue arife. Lo yonder Cloddipole, the blithfome fiwain, The wifell lout of all the neighb'ring plain! From Cloddipole we learnt to read the fkies, To know when hail will fall or winds arife. He taught us erft * the heifer's sail to view, When ituck aloft, that flow'ts would Atraight enfue: He firlt that ufeful fecret did explain, That pricking.corns fortold the gath'ring rain. When frallows fleet foar high and fport in air, He told us that the welkin would be clear. Let Cloddipole then hear us twain reliearfe, And praife his fiveetheart in alternate verfe. Ill wazer this fame oaken faff with thee, That Clod dipole fhall give the prize to me.

Lob. See this tobacco pouch, that's lin'd with hair, Made of the ikin of fleekelf fallow deer: This ponch, that's tied with tape of redieft hue, I'll wager, that the prize thail be ny due.

Cud. Begin thy carrols, then, thou vaunting-flonch; Be thine the oaken ftaff, or mine the pouch. Lob. My Blouzalinda is the blithelt lafs, Than primrofe fweeter, or the clover-grafs. Fair is the king-cup that in meadow blows, Fair is the daify that befide her grows; Fair is the gilly-flow'r of gadens firect; Fair is the marygold, for pottage meet : But Blouzalind's than gilly-flow'r more fair, Then daify, marygold, or king cup rare. Cud. My brown Buxoma is the feateft maid That e'er at wake delight fome gambel play'd; Clean as young lambkins, or the goofe's down, And like the goldfinch in her Sunday gown. The witlefs lamb may fport upon the plain, The friking kid delight the gaping fwain: The wanton calf may ikip with many a bound, limblef. And my our Tray play deftelt + feats around: But neither lamb, nor kid, nor calf, nor Tray, Dance like Buxoma on the firt of May.

Lob. Sweet is my toil when Blouzalind is near; Of her bereft, 'tis winter all the jear. With her no fultry fummer's heat I know; In winter, when the's nigh, with love I glow. Come, Blouzalinda, eafe thy fwain's defire, My fummer's fhadow, and my winter's fire!

Cud. As with Buxoma once I work'd at hay,
E'en noon-tide labour feem'd an holiday;
And holidays, if haply fhe were gone,
Like work-days I wifh'd would foon be done.
Efffoons $\ddagger$, O fweetheart kind, my love repay,
And all the year fhall then be holiday.
Lob. As Blouzalinda, in a gamefome mood,
Behind a haycock loudly laughing food,
I Eily ran and fnatch'd a halty kifs;
She wip'd her lips nor took it much amifs.
Believe me, Cuddy, while I'm bold to faj,
Her breath was fweeter than the ripen'd hay.
Cud. As my Buxoma, in a morning fair,
With gentle finger ftroak'd her milky care,
I quaintly || ftole a kifs; at firft, 'tis true,
She frown'd, yet after granted one or two,
Lobbin, I fwear, believe who will my vows,
Her breath by far excell'd the breathing cows.
Lob. Leek to the Welfh, to Dutchmen butter's dear,
Of Irifh fwains potatoes are the cheer;
Oats for their fealts the Scottifh thepherds grind,
Sweet turnips are the food of Blouzalind:
While fhe loves turnips, butter I'll defpile,
Nor leeks, nor oatmeal, nor potatces prize.
Cud. In good roalt beef my landlurd fticks his knife,
The capon fat delights his dainty wife ;
Pudding our parfon eats, the fquire loves hare;
But white-pot thick is my Buxoma's fare.
While the loves white-pot, capon ne'er thall be,
Nor hare, nor beef, nor pudding, food for me.
I.ob. As once I play'dat blind man's buff, it hapt

About my ejes the towel thick was wrapt :
I mif: $d$ the fwains, and feiz'd on Blouzalind;
True fpeaks that ancient proverb, Love is blind.
Cu\%. As at hot cock'les once I laid me down,
And felt ihe weighty hand of many a ciown;
Buxoma gave a gentle tap, and I
Quick ofe, and read fott mifesef in her eye.
Lob. Ontwo near elms the flacken'd cord I hung;
Now high, now low, my Blouzalinda fivung;

## T R Y.

With the rude wind her rumpled garment rofe,
And thow'd her taper leg and facrlet hofe.
Cud. Acrofs the fallen oak the plank I laid, And myself pois'd againt the tott'ring maid! High leapt the plank, and down Buxoma fell; I foy'd-but faithful fweethearts never tell.

Lob. This riddle, Cuddy, if thon canft, explain, This wily riddle, puzzles every fwain:
What forw'r is that which bears the quirsin's name, The richef metal joined auith the fame*? "Mary-

Cud. Anfiver, thou carle, and judge this riudle right, gold. I'll frankly own thee for a cunning wight.
What flow'r is that swhich royal honour craves,
Adjoin the virgin, and 'tis frown on gravest?
Rofc-
Clod. Forbear, contending louts, give o'er your Atrains; mary, An oaken taff each merits for his pains.
But fee the fun-beams bright to labour warn,
And gild the thatch of goodman Hodge's barn
Your herds for want of water itand a-dry ;
They're weary of your fongs-and fo am I.
We have given the rules ufually laid down for paftoral writing, and exhibited fome examples written on this plan ; but we have to obferve, that this poem may take very different forms. It may appear cither as a comedy or as a ballad. As a paftoral comedy, there is perhaps nothing which poffeffes equal merit with Ramfay's Gentle Sbepherd, and we know not where to find in a:1y language a rival to the Pafloral Ballad of Shenitone. That the excellence of this poem is great can hardly be queftioned, fince it compelled a critic, who was never lavih of his praife, and who on all occafions was ready to vilify the paftoral, to exprefs himfelf in terms of high encomium, "In the firlt part (fdys he) are two paffages, to which if any mind denies its fympathy, it has no acquaintance with love or nature:

I priz'd every hour that went by,

But now they are palt, and I figh, And I grieve that I priz'd them no more.
When forc'd the fair nymiph to forego, What anguifh I felt in my heart!
Yet I thought-but it might not be fo, 'Twas with pain that the faw me dep art
She gaz'd, as I flowly withdrew,
My path I could harly difcern;
So fweetly fhe bade me adieu, I thought that the bade me return.
"In the fecond (continues the fame critic) this paf. g : has its prettinefs, though it be not equal to the former:"

Thave found out a gift for my fair; I have found where the wood-pigeons breed;
But let me that plunder forbear, She would fay'twas a barbarous deed :
For he ne'er could be true the avern'c, Who could rob a poor bird of its young;
And I lov'd her the more when I heard Such tenderreefs fall from her tongue.

Sect. V. Of Di:ladic or Precestive Posfry.
146
The method of writing precepts in verie, and cm- Origin and bellifhing them with the graces of poetry, had its pife, we of we may fuppofe, from a due conlidiration of the frail. didatt c tie; poetry.

Didagic.
ties and perverfenefs of human nature ; and was intended to engage the affections, in order to improve the mind and amend the heart.

Didactic or preceptive poetry, has been ufually employed cither to illultate and explain onr moral duties, our philofophical inquities, our bufness and plealures; or in teaching the art of criticifm or poetry itfelf. It may be adilpted, however to any other fubject; and may in all cafes, whore inftruction is defigned, be employed to good purpofe. Some fubjeets, indeed, are more proper than others, as they admit of more poetical ornaments, and give a greater latitude to genius: but whatever the fubject is, thofe precepts are to be lad down that are the moft ufeful; and they fhould follow each other in a nacural ealy method, and be delivered in the moft agrecable engaging manner. What the profe writer tells you ought to be done, the poet often conveys under the form of a marration, or fhows the necclity of in a defcription; and by reprefenting the action is done, or doing, conceals the precept that hould enfuce it. 'I he poet likewife, intead of telling the whole truth, or laying down all the rules that are requilite, feleets fuch parts only as are the molt pleafing and communicates the ref indirectly, without giving us an open view of them; yet takes care that nothing fhall efcape the reader's notice with which he ought to be acquainted. He difclofes jufl enough to lead the imarination into the parts that are concealed; and the mind, ever gratified with its own difcoveries, is complimented with exploring and finding them out ; which thourh done with eafe, feems fo confiderable, as not to be obtained but in confequence of its own 147 adroitnels and fingacity.
Rulcs to be But this is not fufficient to render didactic poetry obferved in always pleafing: for where precepts are laid down one its compoEtion.
after another, and the poem is of confiderable length, the mind will require fome recreation and refrefhment by the way; which is to be procured by feafonable moral reflections, pertinent remarks, familiar fimilies, and defcriptions naturally introduced, by allufions to ancient hillories or fables, and by frort and pleafant digreflions and excurfions into more noble fubjeets fo aptly brought in, that they may feem to have a remote relation, and be of a piece with the poem. By thus varying the form of infruation, the poet gives life to his precepts, and awakens and fecures our attention without permitting us to fee by what means we are thus captivated: and his art is the more to be admired, becaufe it is fo concealed as to efcape the reader's obfervation.

The fyle, too, muft maintain a dignity fuitable to the fubject, and every part be drawn in fuch lively colours, that the things defcribed may feem as if prefented to the reader's view.

But all this will appear more evident from example; and though entire poems of this kind are not within the compafs of our defign, we fhall endeavour to feleet fich pafinges as will be fufficient to illuftrate the rules we have here laid down.

We. have already obferved, that, according to the ufuat divifions, there are four kinds of didactic poems, viz. thofe that refrect our moral duties, our philofophical fpeculations, our bufinefs and pleafures, or that give precepts fur poetry and criticiim.
I. On the firtt fubject, indeed, we have fearse any thing
pocery

Can wealch, or grandeur, fatisif the mind?
Of all thofe pleafures mortals mof admire, Is there one joy fincere, that w 1 ln not tire? Can love itfeif endure ? or beauty's charms Afford that bliis we fancy in its aıms?Then, let thy foul more glorious a:ms purfue: Have thy Creator and his works in view. Be thefe thy ftudy: hence thy pleafures bring: And drink large draughts of wifdom from its ipring ; That fpring, whence perfect joy, and calm repofe. And bleft content, and peace eternal, flows.

Obferve how regular the planets run,
In fated times, their courfes round the Sun.
Diff'rent their bulk, their diflaice, their career,
And diff'rent much the compafs of their year:
Yet all the fame eternal laws obey,
While God's unerring finger points the way: Firft Mercury, amidt full tides of light, Rolls next the fun, through his fmall circle bright. All that dwell here muft be refin'd and pure: Bodies like ours fuch ardour can't endure: Our earth would blaze beneath to fierce a ray, And all its marble mountains melt away. Fair Venus, next, fulfils her larger round, With fofter beams, and milder glory crown'd. Friend to mankind, flie glitters irom afar, Now the bright ev'ning, now the morning Itar. More diftant fill, our earth comes rolling on, And forms a wider circle round the Sun: With her the moon, companion ever dear!
Her courfe attending through the fhining year. See, Mars, alone, runs his appointed race, And meafures out, exant, the deflin'd frace: Nor nearer does be wind, nor further ftray, But finds the point whence firt he roll'd away. More yet remote from day's all cheering fource, Vaft Jupiter performs his conftant courfe: Four friendly moons, with bor:ow'd luftre, rife, Beftow their beams divine, and light his fkies. Fartheft and lant, fcarce warm'd by Phebus' ray, Through his valt orbit Saturn viheels away.

How great the change cotid we be wafted there! How flow the feafons! and how long the year! One moon, on us, reflent its clicerful light : There, five attendants brighten up the night. Here, the blue firmament bedeck'd with tars; 'there, over-head, a lucid arch appears.
From hence, how large, how Arong, the fun's bright But feen from thence, how languid and how fmall ! When the keen north with all its fury blows, Congeals the floods, and forms the fleecy finows, 'Tis heat intenfe to what can there be known: Warmer our poles than is its burning zonc.

Who there inlabit mult have other pow'rs, Juices, and veins, and fenfe, and life, than ours. One moment's cold, like theirs, would pierce the bone, Freeze the heart-blood, and turn us all to fone.

Strange and amazing mut the diff'rence be
'Twist this dull planet and bright Mercury :
Yet reafon fays, nor can we doubt at all, Millions of beings dwell on ei her ball, With confitutions fitted for that \{pot, Where Providence, all-wife, has fix'd their lot.

Wondrous art thou, O God, in all thy ways!
Their eyes to thee let all thy creatures raife;
Adore thy grandeur, and thy goodnefs praife.
Ye fons of men! with fatisfaction know, God's own right hand difpenfes all below: Nor good nor evil does by chance befall; He reigns fupreme, and he directs it all.

At his command, affrighting human kind,
Comets drag on their blazing lengths behind:
Nor, as we think, do they at random rove,
But, in determin'd times, through long ellipfes move.
And tho' fometimes they near approach the fun,
Sometimes beyond our yyftem's orbit run ;
Throughout their race they act their Maker's will, His pow'r declare, his purpofes fulfi.
III. Of thofe preceptive poems that treat of the bufinefs and pleafures of mankind, Virgil's Georgics claim our firft and principal attention. In thefe he has laid down the rules of hufbandry in all its branches with the utmolt exactnefs and perfpicuity, and at the fame time embellifhed them with all the beauties and \$races of poetry. Though his fubject was hurbandry, he has delivered his precepts, as Mr Addifon obferves, not with the fimplicity of a ploughman, but with the address of a poet: the meaneft of his rules are laid down with a kind of grandeur ; and be lreaks the chads, ard iofles about the dung, with an air of gracefulnefs. Of the different ways of convering the farme truth to the mind, he takes that which is pleafantell ; and this chief. ly diftinguifhes poetry fron profe, and renders Virgil's rules of hufandry more deligtful and valuable than any other.

Thefe poems, which are eftecmed the moll perfect of the author's works, are, perhape, the beft that can be propofed for the young fludent's imitation in this manner of writing; for the while of his Georgics is wrought up with wonderful art, and decorated with all the fiowers of poctry.
IV. Of thofe poems whichgive precepts for the recreations and pleatires of a country life, we have fevcral in our own langunge that are jualy admired. As the moft enfiderabic of thefe diverfions, however, are Vor. XV.
fincly treated by Mr Gay in his Rural Sports, we par- Didanic. ticularly refer to that poem.

We thould here treat of thofe preceptive poems that teach the art of poctry itfelf, of which thete are many that deferve particular attention; but we have antictpated our defign, and rendered any farther, notice of them in a manner ufelefs, by the obfervations we have made in the courfe of this treatife. We ought however to remark, that Horace was the only poct amony the ancients who wrote precepts for pectry in verfe; at leaf his cpifle to the Pifos is the only piece of the kind that has been handod down to us; and that is fo perfer, it feems almoft to have precluded the necellity of any other. Among the moderns we have feveral that are junly admired; as Boileau, Pope, \&cc.
Pocts who write in the preceptive manner hould take eare to choofe fuch fubjects as are worthy of their mufe, and of confequence to all mankind; for to he. fow both parts and pains to teach people trifles that are unworthy of their attention, is to the laft degree ridiculous.

Among poems of the ufeful and interefling kind, Dr Armitrong's Art of Prefirving Heallh deferves particular recommendation, as well in confideration of the fubjeet, as of the elegant and maferly manner in which he has treated it ; for he has made thofe things, which are in their own nature dry and unentertaining, perfectly agreeable and pleafing, by adhering to the rules oblerved by Virgil and others, in the conduat of thefe poems.
With regard to the fyyle or drefs of there peems, Its, proper it fhould be fo rich as to hide the nakednefs of the fyle. fubject, and the barrennefs of the precepts fhould be lof in the lunte of the language. "It ought to a- Warton on bound in the moft bold and forcible metaphors, the Dilaais molt glowing and picturcfque epithets; it ought to be Poct. yo clevated and enlivened by pomp of numbers and majefty of words, and by every figure that can lift a lan. grage above the vulgar and current expreffions." One may add, that in no kind of poetry (not even in the fublime ode) is beauty of exprefion fo much to be regarded as in this. For the epic writer flould be very cautious of indulging himelf in too florid a manner of expreflion, efpecially in the dramatic parts of his fable, where he introduces dialogue: and the writer of tragedy cannot fall into fo naufeous and unnatural an afiectation, as to put laboured defcriptions, pompous epithets, fudied phrafes, and high-flown metaphors, into the mouths of his charaters. But as the didactic poet fpeaks in his own perfon, it is neceflary and proper for him to ufe a brighter colouring of Ayle, and to be more fudious of ornament. And this is agrecable to an admirable precept of Aritotle, which no writer fhould ever forget, " That diftion ought molt to be laboured in the unactive, that is, the defcriptive, parts of a poem, in which the opinions, manners, and paffions of men are not reprefented; for too glaring an exprefion obfares the manners and the fentiments."

We have already obferved that any thing in nature may be the fubject oi this poem. Some things how. ever will appear to more advantage than others, as they give a greater latitude to genius, and admit off more poetical ornaments. Natural hiffory and philofoply atc copious fuljeets. Precepts in thefe might Hh

242
Ipifle.
be decorated with all the flowers in poctry; and, as Dr Trap obfirves, how can foctry be better employed, or more arrceably to its nature and dignity, than in celebrating the works of the great Creator, and defribing the nature and generation of animals, vegetables, and minerals; the revolutions of the heavenly bodies; the motions of the earth; the flux and reflux of the fea; the caufe of thunder, lightning, and other metens ; the attraction of the magnet ; the gravitation, cohefion, and repulfion of matter; the impulfive motion of light ; the flow progrefion of founds; and other amazing phocomona of nuture? Moft of the arts and ficiences are alfo proper fubjects for this poem; and none are more fo than its two fifter arts, painting and mufic. In the former, particularly, there is room for the moft entertaining precepts concerning the difpofal of colours ; the arrangement of lights and fhades; the fecret attractives of beauty; the various ideas which make up the one; the ditinguilhing between the attitudes proper to either fex, and every paflion; the reprefenting profpects of buildings, battles, or the country; and laftly, concerning the natare of imitation, and the power of painting. What a boundlefs field of invention is here? What room for defcription, comparifon, and poetical fable? How eafy the tranfition, at any time, from the draught to the original, from the thadow to the fubtance? and from hence, what noble excurfions may be made into hiftory, into panegyric upon the greatelt beauties or heroes of the palt or prefent age?

## Sect. VI. Of the Epifle.

This fpecies of writing, if we are permitted to lay down rules from the examples of our beft pocts, admits of great latitude, and folicits ornament and decoration : yet the poct is fill to confider, that the true charncter of the epifle is cafe and elegance; nothing therefore thould be forced or unnatural, laboured, or affected, but every part of the compufition thould breathe an eafy, polite, and unconftrained freedom.

It is fuitable to every fubject; for as the epiftle takes place of difcourfe, and is intended as a fort of diataniconver\{ation, all the affairs of life and refearches into nature may he introduced. Thofe, however, which :tre franght with compliment or condolenee, that contain a deleription of places, or are full of pertinent remarks, and in a familiar and humourous way defcribe the manners, vices, and follies of mankind, are the beft ; becaufe they are moft fuitable to the true character of epiltolary writing, and (bufinefs fet apart) are the ufial fubject apon which our letters are em. ployed.

All farther rules and directions are unneceffary; for this kind of writing is bette: learned by example and pradice than by precept. We flatll therefore in conformity to our pla7, felect a few cpifles for the reader's imitation; which, as this methed of writing las of late much prevailed, may be belt taken, perlaps, from cur modern poets.

The fullowing let:er from Mir Addifon to Lord Halifar, contains :on elegant defuiption of the curiofities and places about Rome, together with fuch reflections on the ineftimable blefings of liberty as mutt give pleafure to every Briton, efpecially when he fees them thus

T R Y.
placed in direct oppofition to the baneful influence of flavery and opprellion, which are ever to be feen among the miferable inhabitants of thofe countries.

While you, my lord, the rural fhades admire, And from Britannia's public pofs retire, Nor longer, her ungrateful fons to pleate, For their advantage facrifice your eafe;
Me into foreign realms my fate conveys, Through nations fruitful of immortal lays, Where the foft feafon and inviting clime Corfpire to trouble your repofe with rlime.

For wherefoe'er I turn my ravilh'd eyes, Gay gilded feenes and fhining profpects rife, Poetic fields encompafs me around,
And fill I feem to tread on claffic ground; For here the mufe fo of her harp has ftrung, That not a mountain rears its head unfung, Renown'd in verfe each flady thicket grows, And ev'ry ftream in heav'nly numbers flows.

How am I pleas'd to fearch the hills and woods For rifing fprings and celcbrated floods; To view the Nar, tumultuous in his courfe, And trace the fmooth Clitumnus to his fource; To fee the Mincia draw its wat'ry fore Through the long windings of a fruitful fhore, And hoary Albula's infected tide
O'er the warm bed of fmoking fulphur glide!
Fir'd with a thonfand raptures, I furvey Eridanus thro' flow'ry meadows Atray, The king of floods! that, rolling o'er the plains, The tow'ring Alps of half their moifture drains, And proudly fwoln with a whole winter's finows, Diftributes wealth and plenty where he flows.

Sometimes, mifguided by the tuneful throng, I look for fteams immortaliz'd in fong,
That loft in filence and oblivion lie,
(Dumb are their fountains and their channels dry) Yet run for ever by the mufe's fill,
And in the fmooth defcription murmur fill.
Sometimes to gentie Tiber I retire, And the fam'd iiver's empty fhores admire, That, deftitute of Atrength, derives its courfe From thirfty urns, and an unfruifful fource ; Yet fung fo often in poetic lays, With forn the Danube and the Nile furvcys; So high the deathlefs mufe exalts her theme ! Such was the Boyn, a poor inglorious Atream, 'That in Hibernian vales obfcurely ftray'd, And unoberers'd in wild meanders play'd; Till, by your lines, and Naffau's fivord renown'd, Its rifing billows through the world refound, Where'er the hero's godlike åts can pierce, Or where the fame of an immortal verfe.

O cou'd the mute my ravifl'd brealt iufpire With warmth like yours, and raife an equal fire, Unnumber'd beauties in my verfe thould thine, And Virgil's Italy fhould yield to mine !

Sec how the golden groves around me fmile, That flum the coats of Britain's ftormy ilie, Or when tranfplanted and preferv'd with care, Curfe the cold clime, and fatve in northern air. Here kindly warmth their mounting juice ferments To nobler taftes, and more exalted fents: Ev'n the rough rocks with tender myrtles bloom, And trodden weeds fend out a tich perfume.

IMc. Bear me, fome god, to Baia's gentle fents, Or cover me in Umbria's green retreats; Where weitern gales eternally refide, And all the featons lavifh all their pride : Bloffons, and fruits, and how'rs together rife, And the whole year in gay confufion lics. Immortal glories in my mind revive, And in my foul a thoufand paffions ftrive, When Rome's exalted beanties I defery Magnificent in piles of ruin lie. An amphitheatic's amazing height Here fills my eye with terror and delight, That on its public fhows unpeopled Rome, And held uncrowded nations in its womb: Here pillars rough with fculpture pierce the fkies; And here the prond triumplal arches rife, Where the old Romans deathlefs afts difplay'd, Their bafe degenerate progeny upbraid: Whole rivers here forfake the fields below, And wond'ring at their height thro' airy channels flow.

Still to new fecnes my wand'ring mufe retires;
And the dumb thow of breathing rocks admites;
Where the fmooth chiffel all its force has thown, And foften'd into flefh the rugged fone. In folemn filence, a majeftic band, Heroes, and gods, and Roman confuls ftand, Stern tyrants, whom their cruelties renown,

- And emperors in Parian marble frown;

While the bright dames, to whom they humbly fu'd,
Still fhow the charms that their proud hearts fibdu'd.
Fain would I Raphael's godlike art rehearfe, And thow th' immortal labours in my verfe, Where from the mingled ftrength of fhade and light A rew creation ries to my fight,
Such heav'nly figures from his pencil flow, So warm with life his blended colours glow.
From theme to theme with fecret pleafure tof, Amidft the foft variety l'm lof.
Here pleating airs my ravih'd foul confound With circling notes and labyrinths of found; Here domes and temples rife in ditant views, And opening palaces invite my mure.

How has kind heav'n adorn'd the happy land, And fcatter'd bleffings with a wafteful hand! But what avail her unexhaufted fores, Her blooming mountains, and her funny fhores, With all the gifts that heav'n and earth impart, The imiles of nature, and the charms of art, While proud oppteflion in her valleys reigns, And tyranny ufurps her liappy plains ! The poor inhabitant beholds in vain The red'ning orange and the fwelling grain: Joylefs he fees the growing oils and wines, And in the myrtle's fragrant flade repines: Starves, in the midft of nature's bounty curf, And in the loaded vineyard dies for thirit.

O liberty thou goddefs he:a'nly bright, Profufe of blifs, and pregnont wich delight !
Etcrnal pleafures in thy prefence reign, And fmiling plenty leads thy wanten train; Las'd of her load, fuhjection grows more light, Ald poverty looks cheerful in thy fight; Thou mat'it the gloomy lace of nature gay, Giv'r beauty to the fun, and pleafure to the day.

Thee, goldefs, thee, Britannia's ilice adore:;
How has the oft exhaulted all her ftores,
How oft in fields of death thy prefence föght,
Nor thinks the mighty prize too dearly bought
$\mathrm{O}_{11}$ foreign monntains may the fun refine
The grape's foft juice, and mellow it to wine, With citron groves adorna diflant foil,
And the fat olive fiwell witts frods of nit :
We envy not the warmer cl'me, that lies

Nor at the coarfenefs of our teav'n repine,
Tho' o'er our heads the frozen Pleiads fline :
'Tis liberty that crowns Britannia's ifle,
[fmilc.
And makes her barren rocks and her bleak mountains
Others with tow'ring piles may pleafe the light,
And in their proud atpiring domes delight;
A nicer touch to the ftretch'd canvas give,
Or teach their animated rocks to live:
'Tis Britain's care to watch o'er Europe's fatc,
And hold in balance each contending ftate,
To threaten bold prefumptuous kings with war,
And anfwer her aflifted ncighbour's pray'r.
The Dane and Swede, rous'd up by fierce alarms,
Blefs the wife conduat of her pious arms :
Soon as her fleets appear, their terrors ceafe,
And all the northern world lies huth'd in peace.
Th' ambitious Gaul beholds with fecret dread
Her thunder aim'd at his afpiring head,
And fain her godlike fons would difunite
By foreign gold, or by domeftic fpite;
But frives in vain to conquer or divide,
Whom Naffau's arms defend and counfels guide.
Fir'd with the name, which I fo oft have found
The diftant climes and diff'rent tongues refound,
I bridle in my ftruggling mufe with pain,
That longs to launch into a bolder ftrain.
But I've already troubled you too long,
Nor dare attempt a more advent'rous fong:
My humble verfe demands a fofter theme,
A painted meadow or a purling ftream;
Unfir for heroes; whom immortal lay:,
And lines like Virgil's, or like yours, thould praife.
There is a fine pirit of freedom, and love of liberty, difplayed in the following letter from Lord Lyttletno to Mr Pope; and the meflige from the liade of Virgil, which is truly poetical, and juflly preceptive, m.ly prove an ufeful lefion to future bards.

Frain Rome, $173^{\circ}$.
Immortal bard! for whom each mule has wove Lytelcon. The faireft garlands of the Aonian grove;
Preferv'd, our drooping genius to reftore,
When Addion and Congreve are no muse; After fo many fars extinet in night,
The darken'd age's laft remaining light!
To thee from Latian realms this verfe is writ, Infin'd by memory of ancient wit:
For now no more thefe climes their influence boan,
Full'n is their glory, and their virtue lolt ;
From tyrante, and from priefts, the mules Ay,
1)anghters of reaton and of liberty.

Nor Baix now nor Umbria's plain they luve, Nor on the banks of Nar or Mincia rova; To 'Thames's flow'ry borders they re:tire, And kindle in thy breaft the Roman fiec.

Epinte. So in the fhades, where cheer'd with fummer rays
Melodious linnets warbled fprightly lays,
Soon as the faded, falling leaves complain
Of gloomy winter's inaulpicious reign, No tuncful voice is heard of joy or love, But mournful filence faddens all the grove. Unhappy Italy! whofe aiter'd fate Has felt the worf feverity of fate: Not that barbarian hands her fafces broke, And bow'd her haughty neck beneath their yoke; Nor that her palaces to earth are thrown, Her cities defert, and her fields unfown; But that her ancient fpirit is dec:ay'd, That facred wifdom from her bounds is fled, That there the fource of frence flows no more, Whence its rich freants fupply'd the world before. Illufions names! that once in Latium fhin'd, Born to inftruef and to command mankind; Chiefs, by whofe virtue mighty Rome was rais' $d_{\text {, }}$ A nd poets, who thofe chiefs fablimely prais'd! Oft I the traces you have left explore, Yourafhes vifit, and your uras adore; Oft kifs, with lips devout, fome mould'ring flone, With ivy's vencrable thade o'ergrown; Thofe hallow'd ruins better pleas'd to fee, Than all the pomp of modern luxury. Aslate on Virgil's tomb frefl flow'rs I itrow'd, While with the infpiring mufe my bofom glow'd, Crown'd with eternal bays, my ravih'd eyes Behold the poer's atiful form arife: Etranger, he faid, whofe pioushand hiss paid Thefe grateful vites to my attentive fhade, When thon thalt breathe thy happy native air, To Pope this meflige from his mater bear.

Great bard, whofe numbers I myfelf infpire, To whom 1 gave my own harmonious lyre, If high exalted on the throne of wit, Near me and Homer thon afpire to fit, No more let meaner fatire dim the rays That fow majeltic from thy nuble bass. In all the flow'ry paths of Pindus ftray : But thun that thon ny that unpleafing way; Nor, when eacls foft eng:sing mufe is thine, Addrefs the leaft attractive of the nime.

Of thee more worthy were the tak to raife
A lalting colums to thy country's praife,
Tn fing the land which yct alone can boalt That liberty corrupted Rome has loft; Where feierce in the arms of peace is laid, And plants her paim beneath the olive's fhade. Sach was the theme for which my lyre I Atrung Such was the people whofe cxploits I fung; Brave, yet refin'd, for arms and arts renown'd, With diff'rent bays by P.fars and Phocbus crown'd, Dauntlefs oppefers of tyrannic fivay, Dut pleas'd a mild Avgustus to obcy. If thefe command; fubmifive thou receive, Im mortal and unblam'd thy name fhall live. Envy to black Cocytus fhall retire, And howl with furies in tormenting fire ; Approving time fhall confecrate thy lays, And join the patriot's to the poet's praife.

The following letter from Mr Philips to the earl of Dorfet is entirely defcriptive; but is one of thofe defurip. tions which will be ever 1 ead with delight.

Copenbagen, Marclı 5, 1709.
From frozen climes, and enclefs tracts of fanw,
From freams which northern winds forbid to flow,
What prefent fhall the mufe to Dorfet bring,
Or how, fo near the pole, attempt to fing ?
The hoary winter here conceals from fight All pleafing objects which to verfe invite. The hills and dales, and the delightful woods, The flow'ry plains, and filver-Atreaming floods, By fiow difguis'd, in bright confufion lie, And with one dazzling vatte fatigue the eye.

No gentle breathing breeze prepares the fpring:
No birds within the defert region fing:
The fhips, unmov'd, the boit'rous winds defy,
While rattling chariots o'er the ocean fly.
The valt Leviathan wants room to play, And fpout his waters in the face of day: The farving wolves along the main feal fprowl, And to the moon in icy valleys howl. O'er many a fhining league the level main Herc fpreads itfelf into a glafy plain : There folid billows of cnormous fize, Alps of green ice, in wild diforder rife. And yet but lately have I feen, ev'n here, The winter in a lovely drefs appear. Ere yet the clouds let fall the treafur'd fnow, Or winds began through hazy flies to blow, At ev'ning a keen eaftern breeze arofe, And the defcending rain unfully'd froze; Soon as the filent fhades of night withdrew, The ruddy morn difclos'd at once to view The face of nature in a rich difguife, And brighten'd cv'ry object to my eyes : For ev'ry fhrub, and ev'ry blade of grafs, And ev'ry pointed thorn, feem'd wrought in glafs; In pearls and rubies rich the hawthorns fhow, While through the ice the crimfon berries glow.
The thick fprung reeds, which watery marthes yield, Seem'd pelifh'd lances in a hoftile field.
The flag in limpid currents with furprife, Sees cryflal branches on his forehead rife:
The fpreading oak, the beech, and tow'ring pine, Glaz'd over, in the freezing xther fhine.
The frighted birds the rattling branches fhun, Which wave and glitter in the diftant fun.

When if a fudden guft of wind arife,
The brittle foreft into atoms flies,
The crackling wonds beneath the tempeft bends, And in a fpangled fhower the profpect ends:
Or, if a fouthern gale the region warm, And by degrees unbend the wint'ry charm, The traveller a miry country fees, And journey fad beneath the dropping trees: Like fome deluded peafant Merlin leads Thro ${ }^{2}$ fragrant bow'rs and through delicious meads, While here enchanted gardens to him rife, And airy fabrics there attract his eyes, His wandering feet the magic paths purfue, And while he thinks the fair illufion trne, The tracklefs feenes difperfe in fluid air, And woods, and wilds, and thomy ways appear ; A tedions road the weary wretch returns, And as he goes, the tranfient vifion mourns.
The great ufe of medals is properly defcribed in the enfuing clegant epitite from Mr Pope to Mr Addifon;
and the extravarsant paffion which fome people entertain only for the colour of them, is very agreeably and very juftly ridiculed.

Ses the wild watte of all devouring years! Ilow Rome licr own fid fepu'chre appears! With nodding atchos, brohen temples fipead! The very tombs now vanifh like their dead! Imperial woaders rais'd ou nations fpoil'd, Where mix'd with llaves the groaning marty r toil'd! Huge theatres, that now unpeopled woods, Now drain'd a diftant country of her floods ! Fanes which admiring gods with pride furvey, Statues of men, fearce lefs alive than they! Some felt the tilent froke of mould'ing age, Some hoflile fury, fome religious rance: Barbarian blinċnef, Chriftian zeal confpire, And papal piety, and Gothic fire. Pe.haps, by its own ruin far'd from flame, Some bury'd marble half preferves a name: That name the learn'd with fierce difputes purfue, And give to Titus old Yerpafian's due.

Anibition figh'd: She found it vain to trult The faithlefs columu and the crumbling buit; Huge moles, whofe fhadow Aretch'd from flore to fhore, Their ruins perilh'd, and their place no more! Convinc'd, the now ecntrafts her vaft defign, And all her triumphs flurink into a ccin. A narrow orb each crowded conqueft keeps, Beneath her palm here fad Judea weeps; Now feantier limits the prond arch confine, And farce are feen the proftrate Nile or Rhine; A fmall Euphratesthrough the piece is roll'd, And little eagles wave their wings in gold.

The medal, faithful to its charge of fame, Through climes and ages bears each form and name: In one flort view fubjected to our eye, Gods, emp'rors, heroes, fages, beauties, lie. With fharpen'd fight pale antiquaries pore, 'Th' infeription value, but the ruft adore. This the blue varnith, that the green endears, The facred rult of twice ten huadired jears ! To gain Prefcennius one employs his fchemes, One grafps a Cecrops in ecftatic dreams. Poor Vadius, long with learned fpleen devour'd, Can tafte no pleafure fince his fhicld was foour'd: And Curio, reflefs by the fair one's fide, Sighs for an Otho, and negleats his bride.

Their's is the vanity, the learning thine: 'Touch'd by thy hand, again Rome's glories fhine; Her gods and god.like herces rife to view, And all her faded garlands bloom anew. INor blufh thefe fudies thy regard engage; Thefe pleas'd the fathers of peetic rage; The verfe and fculpture bore an equal part, And art reflected images to art.

Oh when fhall Britain, con?cious of her claim, Stand emulous of Greek and Roman fams? In living medals fee her wars cnroll'd, And vanquif'd realms fupply recording gold? Here, rifing boll, the patriot's honeft face; There, warriors frowning in hiforic brafs? Then future ages with delight fall fee
How Plato's, Bacon's, Newton's, looks agree ;
Or in fair feries laurell'd bards be lhown, A Virgil there, and bere an Addifon.

Then fhall thy Cragos (and let me call him nine)
On the caft ore, another Prollio thine;
With arpeet open fh. 111 cret his head,
And round the orb in latting notes be read, "Statcfman, yet friend to truth! of foul lincere,
"In action faicliful, and in ionour clear;
"Who broke no promife, ferv'd ruo private end,
"Who gain'd no titc, and who loft no friend;
"Eanobled Ly himiclf, by all approv'd,
"Prais'd, wept, and honour'd, hy the mufe he lev'd."
We have already obferved, that the effertial, and indeed the truc charateriftic of epifolary writing, is eafe; and on this account as well as others, the foll. lowing letter from Mr Pope to Miis Blount is to be admired.

## To Mififs Blount, on her leaving the Turun after die Com ronation.

As fome fond virgin, whom her mother's care
Drags from the town to wholefome country air ;
Jutt when fhe learns to roll a melting eye,
And hear a faark, yet think no danger nigh;
From the dear man unwilling the mutt fever,
Yet takes one kifs before the parts for ever:
Thus from the world fair Zephalinda flew,
Saw others happy, and with fighs witl:drew:
Not that their pleafures caus'd her difcontent;
She figh'd, not that they fay'd, but that fhe went.
She went, to plain-work, and to purling brooks,
Old-fafhion'd halls, dull aunts, and croaking rooks:
She went from op'ra, park, affembly, play,
To morning-walks, and pray'rs three hours a-das;
To part her time twist reading and bohea,
To mufe, and fill her folitary tea,
Or o'er cold coffee trifle with the fpoon,
Count the flow clock, and dine exact at noon;
Divert her eyes with pi\&tures in the fire,
Hum half a tune, tell fories to the 'fquire;
Up to her godly garret after feven,
There farve and pray, for that's the way to heav'n.
Some 'fquire, perhaps, you take delight to rack;
Whofe game is whifk, whofe treat's a toaft in fack;
Who vifits with a gun, prefents you birds,
Then gives a fmacking bufs, and cries,-no words !
Or with his hound comes hollowing from the ftable,
Makes love with nods, and knees beneath a table;
Whofe laughs are hearty, tho' his jefts are coarfe,
And loves you beft of all things-but his hurfe.
In fome fair ev'ning, on your elbow laid,
You dream of triumphs in the rural fhade;
In penfive thought recall the fancy'd fcene,
Sec coronations rife oul every green;
Defore you pafs th' imaginary fights
Of lords, and earls, and dukes, and garter'd knights, While the fpread fan o'er flades your cloling cyes: Then give one flirt, and all the vifion flies. Thus vanifh fceptres, coronets and balls, And leave you in lone woods or empty walls !

So when your flave, at fome dear idle time, (Not plagu'd with head-achs, or the want of rhyme) Stands in the fircets, abffrated from the crew, And while he feems to fudy, thinks of yon; Juft when his fancy points your fprightly eyeg, Or fees the bluf of foft Pazthenia rife,

Defriptive Gay pats my fhoulder, and you vanifh quite, Streets, chairs, and coxcombs, rufh upon my fight ? Vex'd to be ftill in town, I knit my brow, Look four, and hum a tune, as you m.y now.

## Sect. VII. of Defcriptive Poetry.

155
Defiptive. Descriptive poetry is of univerfal ufe, fince there poetry. is nothing in mature but what may be defcribed. As
poems of this kind, however, are intended more to delight than to inftruet, great care fhould be taken to niake them agreeable. Defriptive poens are made beautiful by fimiles properly introduced, images of feigned perfons, and allufions to ancient fables or hiltorical facts; is will appear by a perufal of the beft of thefe poems, efpecially Milton's L'Allegro and Il Penferofo, Denham's Cooper Hill, and Pope's Windfor Forefl. Every body being in poffeffion of Milton's works, we forbear inferting the two former; and the others are too long for our pupofe. That inimitable poem, The Seafons, by Mr Thomion, notwithfanding fome pats of it are didactic, may be alfo with propriety referred to this head.

## Sect. VIII. Of Allegorical Poitry.

156
Origin of allegrorical peetry.

Could truth engage the affections of mankind in her native and fimple drefs, fhe would require no ornament or aid from the imapination; but her delicate light, though lovely iaitifelf, and dear to the molt difcerning, does not ftrike the fenfes of the multitude fo as to fecure their eftem and attention: the poets therefore drefied her up in the manner in which they thought the would appear the moft amiable, and called in alle. gories and airy difguifes as her andiliaries in the caufe of virtue.

An allegrory is a fable or Rory, in which, under the difguife of imaginaty perfons or things, fome real action or infructive moral is conveyed to the mind. Every allegory therefore has two fenfes, the one literal and the other myltical; the firf has bcen aptly enough compared to a dream or vifion, of which the laft is the true
meaning or interpretation.

From this definition of allegorical poetry the reader will perceive that it gives great latitude to genius, and affords fuch a boundlefs fcope for invention, that the poct is allowed to foar beyond all creation; to give life and action to virtues, vices, paffions, difeafer, and m. tural and moral qualities; to raife floating iflands, enchanted palaces, caltles, \&c. and to people them with the creatures of his own imagination.

The poet's eye, in a fine fremzy rolling, 1)oth glance from heav'n to earth, from earth to lienv'n; And, as imagination bodee forth
The forms of things unknown, the poet's pen Turns them to flope, and gives to airy nothing A local habitation and a name.

Sharespeare.
But whatever is thas rain'd ly the magic of his mind nual be vifionary and typical, ind t e mytical fenfe muft afpear obvious to the reader, and inculcate fome m rat ufenul lulion in life ; otherwite the whole will be deened rather the effeets of a dittempered brain, than the productions of real wit and genius. The poet, like Jafon, may fuil to parts unexplored, but will meet with
no applaufe if he returns without a golden fleece; for Allegori thefe romantic reveries would be unpardonable but for the my:tical meaning and moral that is thus artfully and agreeably conveyed with them, and on which account only the allegory is indulged with a greater liberty than any other fort of writing.

The ancients juftly confidered this fort of allegory as the moft effential part of poetry ; for the power of raifing images of things not in being, giving them a fort of life and action, and pretenting them as it were before the eyes, was thonght to have omething in it like creation: but then, in fuch compolitions, they always expected to find a meaning couched under them of confequence; and we may reaforably conclude, that the allegories of their pnets would never have been handed down to us, had they been deficient in this reipect.
As the fable is the part immediately offered to the rifential 188 reader's confideration, and intended as an agreeable ve- of a jurt hicle to convey the moral, it ought to be bold, lively, and furprifing, that it may excite curiofity and fupport attention ; for if the fable be firitlefs and barren of invention, the attention will be difengaged, and the moral, however uleful and importint in ifflf, will be little regarded.

There mult likewife be a juftnefs and propriety in the fable, that is, it mutt be clofely connected with the fubject on which it is employed; for notwithifanding the boundlefs compars allowed the imagination in thefe writings, nothing abfurd or ufelefs is to be introduced. In epic poetry fome things may perhaps be admitted for no other reafon but to fiurprife, and to raife what is called the zoonderful; which is as neceflary to the epic as the proballe: but in allegrories, however wild and extravagant the fable and the perfons introduced, each mutt correspond with the fubject they are applied to, and, like the members of a well-written fimile, bear a due proportion and relation to each nther: for we are to confider, that the allegory is a fort of extended or rather multiplied fimile, and therefore, like that, fhould never lofe the fubject it is intended to illutrate. Whence it will appear, that genius and fancy are here infufficient without the aid of talte and judgment : thefe firt, indeed, may produce a multitude of ornaments, a wildernefs of fiveets ; but the laft muft be employed to accommodate them to reafon, and to arrange them fo as to produce pleafure and profit.

But it is not fufficient that the fable be correfpondent with the fubjeat, and have the properties above deferibed; for it mult alfo be confiftent with itflf. The pcet may invent what tlory he pleales, and form any imaginary beings that his fincy hall fuggeft ; but here, as in dranatic wriings, when perfons are once introduced, they mult be fiupported to the end, and all fpeat and at in charafer: for notwithtanding the general licence here allowed, fome order mut be obferved; and however wild and extravagant the charaters, they thould not he abfurd. To this let me add, that the whole muft be clear and intelligible; fir the " table (as Mr Iughes obferves, heing defierned only to clothe and ado:n the moral, but mit to lide it, hould $1 e-$ femble the draperics we admire in lome at the ancient ftatues, in which the finds are not too many nom too thick, but in judiciuntiy ordered, that the thape and beauty of the limbs may be fen through them."But this will more obvioully appear froma aferual of
rical the beft compofitions of the clafs: fuch as Spencer's Fiary Quecn, 'Thomfon's Catte of Indolence, Addifon and Johion's bautiful allegories in the Spectator and Rambler, \&c. \& c.
The word all gory hats been ufed in a more extenfive fenfe than that in which we have here applied it ; for all writings, where the moral is conveyed under the cover of borrowed characters and actions, by which other characters and astions (that are real) are reprefented, have obtained the name of allegories; though the fable or fory contains nothing that is vifionary or romantic, but is made up of real or hiftorical perfons, and of actions cither probable or poffible. But thefe writings thould undonbteily be diftinguihed by fome other name, beciule the literal fenfe is confillent with right reafon, and may convey an ufeful moral, and fatisfy the reader, witbout putting him under the neceffity of fecking for another.
Some of the ancient critics, as Mr Addifon obferves, were fond of giving the works of their poets this fecond or concealdd meaning, though there was no apparent neceffity for the attempt, and often but litcle fhow of reafon in the application. Thus the Iliad and Odyffey of Homer are faid to be fables of this kind, and that the gods and heroes introduced are only the affections of the mind reprefented in a vifible thape and charatter. They tell us, fays he, that Achilles in the firft Iliad reprefents anger, or the irafcible part of human nature: that upon drawing his fword againt his fuperior, in a full affembly, Pallas (which, fay they, is another name for reafon) checks and advifes him on the occafion, and at her firt appearance touches him upon the head ; that part of the man being looked upon as the feat of reafon. In this fenfe as Mr Hughes has well obferved, the whole Æneis of Virgil may be faid to be an allegory, if you fuppofe Reneas to reprefent Angufus Cæfar, and that his conducting the remains of his countrymen from the ruins of Troy, to a new fettlement in Italy, is an emblem of Augufus's forming a new covernment out of the ruins of the aritocracy, and eltablifhing the Romans, after the confufion of the civil war, in a peaceable and flourifhing condition. However ingenions this coincidence nay appear, and whatever defign Virgil had in view, he has avoided a particular and direct application, and fo conducted his poem, that it is perfect without any allegorical interpretation; for whether we confider Fineas or Augultus as the hero, the morals contained are equally inftructive. Aud indeed it feems abfurd to fuppole, that becaufe the epic poets have introduced fome allegories into their works, every thing is to be underfond in a mytical manner, where the fenfe is plain and evident without any fuch applic:ation. Nor is the attempt that Taffo made to turn his Jerufalem into a myftery, any particular recommendalion of the work: for notwithflanding he tells us, in what is called the allegory, printed wihh it, that the Chritian: army reprefents man, the city of Jerufatem civil happincfs, Godfrey the underttandins:, Rinaluo and Tancred the other powers of the foul, and that the body is typified by the common foldiers and the like; yet the seader will find himfelf as little delighted as edified by the explication: for the mind has itule pleafure in an allegory that cannot be npenel without a key made by the band of the fame artif? ; and indeed evely allegory that is fo dark, and, as it were, inesplicable, lofes its
very cfience, and becomes an enigma or riddle, that is Allegorical left to be interpreted by cvery caude imagination.
This lalt feccies of witing, whether called an allo- The ancigary, or by any other name, is not lefs eminent and ent pariufeful; for the introducing of real or hiftorical perfons ble. may not abridge or leflen cither our entertainment or inflruation. In thefe compofitions we often meet with an uncommon moral conveyed by the tablic in a now and catertaining mamer ; or with a known trul fo attfully decorated, and phaced in fuch a new and beautiful light, that we are anazed how any thing fo charming and ufeful fhould fo long have efcaped our obfervation. Such, for example, are many of Johnfon's pieces publifhed in the Rambier under the title of Eafern Stories, and by Hawkefworth in the Adventurer.

The ancient parables are of this fpccics of witing: and it is to be obferved, that thofe in the New Teflament have a moft remarkable elegance and propriety; and are the molt ftriking, and the moft inftructive, for being drawn from objects that are familiar.-The more ftriking, becaufe, as the things are feen, the moral conveyed becomes the objeet of our fenfes, and requires little or no refleaion :-the more infructive becaufe every time they are feen, the memory is awaLened, and the fame moral is again cxhibited with pleafure to the mind, and accuftoms it to reafon and dwell on the fubject. So that this method of inftruction improves nature, as it were, into a book of life; fince every thing before us may be fo managed, as to give leffons for our advantage. Our Saviour's parables of the fower and the feed, of the tares, of the multardfeed, and of the leaven (Matthew xiii.), are all of this kind, and were obvioully taken from the harvelt juft ripening before him; for bis difaiples plucked the ears of corn and did eat, rubling them in their honds. See the articles Allegory, and Metaphor and Alligory, in the general alphabet.

## Sect. IX Of Fables.

160
No method of inftrustion has been more ancient, The apomore univerfal, and probably noue more effectual, than logue or that by apologue or fable. In the firt ages, amorigtt fable. a rude and fierce people, this perhaps was the only method that would have been borne; and even fince the progrefs of learning has furnifhed other helps, the fable, which at firlt was ufed through necellity, is retained from choice, on account of the elegant happinefs of its manner, and the refined addrefs with which, when well conducted, it infinuates its moral.

As to the actors in this little drama, the fabulif lias authority to prefs into his fervice every kind of exifence under heaven; not only beafts, birds, infects, and all the animal creation ; but flowers, flarubs, trees, and all the tribe of vegetables. Even mountains, folifis, mincrals, and the inanimate works of nature, difcourfe articulately at his command, and ast the part which he affigns them. The virtues, vices, and every property of beings, receive from him a local habitation and a name. In fhort lie may perfonify, beflow life, fpeech, and action, on whatever le thin's proper.

It is eafy to imagine what a fource of novelty and variety this mult rpen to a genius capable of conceiving and of employing thefe ideal perfons in a proper manner; what an oppoitunity it affords him to diver-

Of falles, fify his images, and to treat the fancy with changes of objects, whiie he ftrengthens the undertanding, or regulates the paftions, by a fucceffion of truths. To raife beings like thefe into a fate of action and intelligence, gives the faioulit an undoubted claim to that

When thefe perfons are once raifed, we me:t carefully enjoin them proper tafks, and affign them fentiments and language fuitable to their feveral natures
and refpective properties. $\Lambda$ raven thould not be extolled for her voice, nor a bear be reprefented with an elegant fhapc. It were a very obvious inftance of abfurdity, to paint a hare crucl, or a wolf compafionate. An afs were but ill qualified to be general of an army, though he may well enough ferve, perhaps, for one of the trumpeters. But fo long as popular opinion allows to the lion magnanimity, rage to the tiger, ftrength to the mule, cunning to the fox, and buffoonery to the monkey; whly may not they fupport the characters of an Agamemnon, Achilles, Ajax, Ulyfles, and Therfites? The truth is, when moral ations are with judgment attributed to the brute creation, we fcarce perceive that nature is at all violated by the fabulit. He appears at moft to have only tranflated their language. His lions, wolves, and foxes, behave and arguc as thofe creatures would, had they originally been endowed with the human faculties of fpeech and reafon.

But greater art is yet required whenever we perfonify inanimate beings. Here the copy fo far deviates from the great lines of nature, that, without the nicelt care, reafon will revolt againft the fiction. However, beings of this fort, managed ingenioufly and with addrefs, recommend the fabulin's invention by the grace of novelty and of variety. Indeed the analogy between things natural and artificial, animate and inanimate, is often fo very friking, that we can, with feeming propriety, give paffions and fentiments to every individual part of exifence. Appearance favours the deception. The vine may be enamoured of the elm; her embraces teftify her palfion. The fivelling mountain may, naturally enough, be delivered of a moufe. The gourd may reproach the pine, and the fily rocket infult the ftars. The ax may folicit a new handle of the foret: and the moon, in her female character, requeft a fafhionable garment. Here is nothing incongrnous; nothing that flocks the reader with impropriety. On the other hand, were the ax to defire a periwig, and the moon petition for a new pair of boots, probability would then be violated, and the alfurdity become too glaring.

The mof beautiful fables that ever were invented may be disfiguned by the language in which they are of falle fhould be famitia, but alfo elegant.
fable.

The familiar, fiys Mr Lis Motte, is the general tone or accent of fable. It was thought finficient, on its firf appearance, to lend the animals our nof common lauguare. Nor indeed have they any extraordinay pretenfions to the fublime; it being requifite they Thould fpark with the fame fimplicity that they behave.

The familiat alfo more proper for infinuat:on than
the elevated; this being the language of reflection, of rab as the formor is the voice of fentiment. We guard ourfelves againtt the cne, but lie open to the other ; and inftruction will always the molt effectually fivay us, when it appears leaft jealous of its rights and pri-vil-ges.
The familiar ftyle, however, that is here required, notwithtanding that appearance of eafe which is its charater, is perhaps more difficult to write than the more elevated or fublime. A writer more readily perceives when he has rifen above the common language, than he perceives, in fpeaking this language, whether he has made the choice that is moft fuitable to the occafion: and it is, neverthelefs, upon this happy choice that all the charms of the familiar depend. Moreover, the elevated Atyle deceives and feduces, although it be not the heft chofen; whereas the familiar can procure itfelf no fort of refpect, if it be not eafy, natural, juft, delicate, and unaffected. A fabulit mult therefore beftow great attention upon his fylc ; and even labour it fo much the more that it may appear to have coft him $n o$ pains at all.

The authority of Fontaine jullifics thefe opinions in regard to fyyle. His fables are perhaps the beft examples of the genteel familiar, as Sir Roger L'Eftrange atfords the groffef of the indelicate and low. When we read that "while the frog and the moufe were difputing it at fwords-point, down comes a kite powdering upon them in the interim, and gobbets up both together to part the fray;" and "where the fox reproaches a bevy of jolly goflipping wenches making merry over a difh of pullets, that if he but peeped into a hen-roof, they always made a bawling with their dogs and their batards; while you yourielves (fays he) can lie ftuffing your guts with your hens and capons, and not a word of the pudding :" This may be familiar; but it is alfo coarfe and vulgar, and cannot fail to difguft a reader that has the lealt degree of tafte or delicacy.

The fylle of fable then muft be fimple and familiar ; and it muft likewire be correat and elegant. By the former, we mean, that it thould not be loaded with figure and metaphor: that the difpofition of words be natural, the turn of fentences eafy, and their confruction unembarraffed. By elegance, we would exclude all coarfe and provincial terms; all affected and puerile conceits; all obfolcte and pedantic phrafes. To this we we would adjoin, as the word perhaps implies, a certain finiihing polifh, which gives a grace and firit to the whole; and which, thongh it have always the appearance of natare, is almoft ever the effect of art.

But notwithftanding all that has been faid, there are fome occafions on which it is allowable, and even expedient, to change the fyle. The language of a fable nuuft rife or fall in conformity to the fubject. A linn when introduced in his regal capacity, mutt hold difcourfe in a ftrain fomewhat more elevated than a conitry moufe. The lionels then becomes his queen, and the bealts of the forelt are called his fubjects: a method that offers at once to the imagination both the animal and the perfon he is defigned to reprefent. Again, the buffo n-monkey thould avoid thert pomp of phrafe, which the owl eniploys as her beft pretence to
s re. wifdom. Unlefs the ftyle be thas judiciounly varied, it will be impollible to preferve a juft diftinction of chamater.

Defcriptions, at once concife and pertinent, add a grace to fable; but are then mof liappy when included in the a.ction: whercof the fable of Boreas and the Sun affords us an example. An cpilhet well chofen is often a defcription in iffe!f; and fo much the more agreeable, as it the lei's retards us in our purfuit of the catallrophe.

Laftly, little ftrokes of humour when arifing naturally from the fubject, and incidental reflections when kept in due fubordination to the principal, add a valuc to thefe compofitions. Thefe latter, however, fhould be employed very fparing!y, and with great addrefs; be very few, and very fhort: it is fcarcely enough that they naturally fpring out of the fubject; they hould be fuch as to appear necelfary and effential parts of the fable. And when thefe embellifhments, plealing in themfelves, tend to illuftrate the main action, they then afford that namelefs grace remarkable in Fontaine and fome few others, and which perfons of the beft difeernment will more eafily conceive than they can explain.

## Sect. X. Of Satirr.

This kind of poem is of very ancient date, and (if we believe Horace) was introduced, by way of interlude, by the Greek dramatic poets in their tragedies, to relieve the audience, and take off the force of thofe ftrokes which they thought too deep and affecting. In thofe fatirical interludes, the feene was laid in the country ; and the perfons were rural deities, fatyrs, country peafants, and other ruftics.
The firft Tragedians found that ferious ftyle Too grave for their uncultivated age, And fo brought wild and naked Satyrs in (Whofe motion, words, and flape, were all a farce) As oft as decency would give them leave; Becaure the mad, ungovernable ront, Fuil of confufion and the fumes of wine, Lov'd fuch variety and antic tricks.

Rosconmon's Horace.
The fatire we now have is generally allowed to be of Roman invention. It was firf introduced withont the decorations of feenes and action; but written in verfes of different meafures by Emnius, and afterwards moulded into the form we now have it by Lucilins, whom Horace has imitated, and mentions with efteem. This is the opinion of molt of the critics, and particulally of Eoileatu, who fays,

Lucilius led the way, and, bravely bold, To Roman vices did the mirror hold ; Protefled humble goodnefs from reproach, Shotv'd worth on foot, and rafcals in a coach. Horace his pleafing wit to this did add, That none, uncenfur'd, might be fools or mad: And Juvenal, with rhetorician's rage, Scourg'd the rank vices of a wicked age ; Tho' horrid truths thro' all his labours fhine, In what he writes there's fomething of divine.

Our fatire, therefore, may be difinguifled into two Vol. XV.
kinds; the jocofe, or that which makes fport with vice
Sutire. and folly, and fets them up to ridicule; and the fo. risus, or that which deals in aficrity, and is fevere and acrimonious. Iforace is a perfect mafter of the firn and Juvenal mach admired for the lath. The one is factions, and dmiles: the other is angry, and forms. The foibles of mankind are the object of one; but crimes of a decper dye have engaged the uther. They both agrec, howcver, in being pungent and biting: and frum a due ecnfidcration of the writings of thete 164 anthors, who are our mafters in this art, we may de- Defination fine fatire to be, A free, (and often jocofc), witty, and of it. Tharp poem, wherein the follies and vices of men are lafhed and ridiculed in order to their reformation. It; fubject is whatever deferves our contempt or abhortence, (including cvery thing that is ridiculous and abfurd, or fcandalons and repugnant to the golden precepts of selizion and virtue.) Its manner is invarive; and its end, תaane. So that fatire may be tooked upon as the phylician of a diftempered mind, which it endeavours to cure by bitter and unfavoury, or by pleafant and $f_{d}$ lutary, applications.

A good fatirift ought to be a man of wit and ad- Qualitics drefs, fagacity and eloquence. He thould alfo have a of a good great deal of good-nature, as all the fentiments which fatritht. are beautiful in this way of writing mult proceed from that quality in the author. It is good-nature produces that difdain of all bafenefs, vice, and folly, which prompts the poet to exprefs himfelf with fuch fmartnefs againit the errors of men, but without bitternefs to their perfons. It is this quality that keeps the mind even, and never lets an offence unfeafonably throw the fatinit out of his charader.

In writing fatire, care fhould be taken that it be true and general; that is, levelled at abufes in which numbers are concerned: for the perfonal kind of fatir=, or lampoon, which expofes particular charagers, and affects the reputation of thofe at whom it is pointed, is fcarce to be dillinguifhed from fcandal and defamation. The poet alfo, whilt he is endeavouring to correct the guilty, mult take care not to ufe fuch expreflions as may corrupt the innocent: he mult therefore avoid all obfcene words and images that tend to delare and miflead the mind. Horace and Juvenal, the chief fatirits among the Romans, are faulty in this refpect, and ought to be read with caution.

The flyle proper for fatire is fometimes grave and Proper animated, inveighing againft vice with warmth and fyle of earneftnefs; but that which is pleafant, fportive, and, fatire. with becoming raillery, banters men out of their bad difpofitions, has generally the beft effect, as it feems only to play with their fullies, though it omits no opportunity of making them feel the lafll. The verfes ihould be fmooth and flowing, and the language nanly, juf, and decent.

Of well-chofe words fome take not care enougl, And think they flould be as the futject rough:
But fatire muft be more exactly made,
And fharpeft thoughts in fmootheft words convey'd.
Duke of Bucks's Essat:
Satires, either of the jocofe or ferious hind, may be written in the epifolary manncr, or by way of dialogute. Horace, Juvenal, and Perfius, have given us examples

250
satira. of hoth. Nay, fome of Horace's fatires may, without incongruity, be called epifles, and his epiftes falires. But this is obvious to every reader.

Of the facetions kind, the fecond fatire of the fecond book of Horace imitated by Mr Pope, and Swift's veifes on his own death, may be referred to as examples.

As to thofe fatires of the ferious kind, for which Juvenal is fo much diftinguilhed, the characteriltic properties of which are, morality, dignity, and feverity; a better example cannot be mentioned than the poem entitled London written in imitation of the third fatire of Juvenal, by Dr Johnfon, who has kept up to the fpitit and force of the original.

Nor mult we omit to mention Dr Young's Love of Fame the Univerfal Pafion, in feven fatires; which, though characeriftical, abound with morality and good fenfe. The characiers are well felected, the ridicule is high, and the fatire well pointed and to the purpofe.

We have already obferved, that perfonal fatire approaches too near defamation, to deferve any countenance or encouragement. Dryden's Mack Flecknoe is for this reafon exceptionable, but as a compofition it is inimitable.
${ }^{167}$ We liave dwelt thus long on the prefent fubject, be-well-con- caure there is reafon to apprehend, that the benefits ductell fa. zire. arifing from well-conducted fatire have not been fufficiently confidered. A fatire may often do more fer-
vice to the caufe of religion and virtue than a fermon; fince it gives pleafure, at the fame time that it creates fear or indignatinn, and couveys its fentiments in a manner the moft likely to captivate the mind.

> Of all the ways that wifeft men could find To mend the age and mortify mankind, Satire well writ has mof fucceffful prov'd, And cures, becaufe the remedy is lov'd.

Duke of Bucks's Ess.s\%:
Eut to produce the defired effect, it mult be jocofe, free, and impartial, though fevere. The fatirit thould always preferve good humour; and, however keen he cuts, fhould cut with kindnefs. When he lofes temper, his weapons will be inverted, and the ridicule he threw at others will retort with contempt upon himfelf: for the reader will perceive that he is angry and hurt, and confider his fatire as the effect of malice, not of judgement; and that it is intended rather to wound perfons than refonn matmers

Rage you mutt hide, and prejudice lay down:
A fatyr's fmile is flarper than his frown.
The belt, and indeed the only, method to expofe vice and tolly effectually, is to turn them to ridicule, and hold them up for public contempt; and as it molt offeids thefe ohjects of fatire, to it lealt hurts ourfelves. One paffin frecuuently drives out another; and as we camot look with indifference on the bad actions of men (for they mult excite either our wrath or conterapt), it is prudent to give way to that which mot ofends vice and fully, and leatts affects ourfelves; and to ineer and lugh, rather than be angry and foold.

Burlefque poetry, which is chiefly ufed by way of drollery and ridicule, falls properly to be fooken of under the head of fatire. An excellent example of

## T R Y.

this kind is a poem in blank verfe, intitled Tios Spladid $\underbrace{\text { Fpigra }}$ Shilling, written by Mr John Philips, which, in the opi- 268 mion of one of the bef judges of the age, is the fineft Burferf 28 burlefque in the Englinh langnage. In this poem the poetry. author has handled a low fubjeet in the lofty atyle and splendi numbers of Milton; in which way of writing Mr Phi- Shilling lips has been imitated by feveral, but none have come up to the humour and happy turn of the original. When we read it, we are betrayed into a pleafure that we could not expect; though, at the fame time, the fublimity of the ftyle, and gravity of the phrafe, feem to chattife that laughter which they provoke.

There is another fort of verfe and flyle, which is mon frequently made ufe of in treating any fubject in a ludicrous manter, viz. that which is generally called Hudibrafic, trom Butler's admirable poem entitled Hudibras. Almof every one knows, that this poem is a fatire upon the authors of the civil diffenfrons in the reign of king Charles I. wherein the poet has, with abundance of wit and humour, expofed and ridiculed the hypocrify or blind zeal of thofe unlhappy times. In fhort, it is a kind of burlefque epic poem, which for the oddity of the rhymes, the quaintnefs of the fimilies, the novelty of the thoughts, and that fine raillery which runs through the whole performance, is not to be paralleled.

## Sect. XI. Of the Epigram.

The Epigran is a little poem, or compofition in verfe, treat- Charac $\begin{aligned} & \mathbf{3 6 0}\end{aligned}$ ing of ome thing only, and rubofe difinguifbing charazers are of the e brevity, teanty, and point.

The word epigyam fignifies "infeription"" for epigrams derive their origin from thofe infcriptions placed by the ancients on their fatues, temples, pillars, triumphal arches, and the like; which, at fiff, were very fhort, being fometimes no more than a fingle word; but afterwards, increafing their length, thicy nade them in verfe, to he the better retained by the memory. This fhort way of writing came at haft to be ufed upon any occafion or fubject; and hence the name of eptigrain has been given to any little cepy of verfes, without regard to the original application of fuch poems.

Its ufual linits are from two to 20 verfes, though fometimes it extends to 50 ; but the fhorter, the better it is, and the more perfett, as it partakes more of the nature and character of this kind of poem: befides, the epigram, being only a fingle thought, ought to be exprefied in a little compafs, or elfe it lofes its force and frength.

The beauty required in an epigram is an harmony and apt agreement of all its parts, a fiweet fimplicity, and polite language.
The point is a tharp, lively, unexpected turn of wit, with which an epigram ought to be concluded. There are fome critics, indeed, who will not admit the point in an epigram; but require that the thought be equally diffufed thre ugh the whole poem, which is ufually the practice of Catulus, as the former is that of Martial. It is allowed there is more delicacy in the manner of Catullus; but the point is more agreeable to the general talte, and feems to be the chief characteriltic of the epigram.

100
This fort of poem admits of all marmer of fubjects, of what provided that brevity, beauty, and point, are prefer- fubjects

The epigram written on the leaves of a fan by Dr Atterbury, late bithop of Rochefer, contains a pretty thought, expreffed with eafe and concifenefs, and clofed in a beautiful manner.

## On a Fan.

Flavia the leaft and flightent toy
Can with reliflefs art employ. This fan in meaner hands would prove An engine of fmall force in love: Yet fle, with graceful air and mien, Not to be told or fafely feen, Directs its wanton motion fo, That it wounds more than Cupid's bow, Gives coulnefs to the matehlefs dame, To every other breaft a flame.
We flall now felect fome epigrams of the biting and ror their fatirical kind, and fuch as turn upon the pun or equi- 1 oint. voque, as the French call it ; in which fort the point is more confpicuous than in thofe of the former character.

The following diftich is an admirable epigram, having all the neceffary qualities of one, efpecially point and brevity.

On a Compary of bad Dancers to good Mufic.
How ill the motion with the mufic fuits ! So Orpheus fiddled, and fo danc'd the brutes.
This brings to mind another epigram upon a bad fiddler, which we fhall venture to infert merely for the humour of it, and not for any real excellence it contains.

## To a bad Fiddler.

Old Orpheus play'd fo well, he mov'd Old Nick; But thou mov'lt nothing but thy fiddle-fick.
One of Martial's epigrams, wherein he agreeably rallies the foolifh vanity of a man who hired people to make verfes for him, and publifhed them as his own, has been thus tranflated into Englifh:

Paul, fo fond of the name of a poet is grown, With gold he buys verfes, and calls them his own. Go on, mafter Paul, nor mind what the world fays, They are furely hisown for which a man pays.
Some bad writer having taken the liberty to cenfure Mr Prior, the poet very wittily lafhed his impertinence in this epigram :
While fafter than his coftive brain indites, Philo's quick hand in flowing letters writes, His cafe appears to me like honeft Teague's,
When he was sun away with by his legs.
Phocbus, give Philo o'er himelf command;
Quicken his fenfes, or reftrain his hand:
Let him be kept from paper, pen, and ink;
So he may ceafe to wite, and learn to think.
Mr Wefley has given us a pretty epigram, alludirg to a well known text of feripture, on the fetting up a monnment in Weftminfter Abbey, to the memory of the ingenions Mr Buter, anthor of Ihudibras.

252
P O E T R Y.
Philips! whofe touch harmonious could remove The pangs of guilty pow'r and haplefs love, Reft here, diftrelt by poverty no more; Find here that calm thou gav'it fo oft before : Sleep undilturb'd within this peaceful thrine, Till angels wake thee with a note like thine.
It is the juft obfervation of an eminent critic, that the beft fubject for epitaphs is private virtue; virtue exerted in the fame circumflances in which the bulk of mankind are placed, and which, therefore, may admir: of many imitators. He that has delivered his country from oppreffion, or freed the world from ignorance and error, befides that he flands in no need of monumental panegyric, can excite the emulation of a very imall number. The bare name of fuch men anfwers every purpofe of a long infcription, becaufe their atchievements are univerfally known, and their fame is immortal.But the virtues of Kim who has repelled the temptations of poverty, and difdained to free himfelf from diftrefs at the expence of his honour or his confcience, as they were practifed in private, are fit to be told, becaufe they may animate multitudes to the fame firmnefs of heart and fteadinefs of refolution. On this account, there are few epitaphs of more value than the following, which was written by Pope on Mrs Corbet, who died of a cancer in her breat.

> Here refts a woman, good without pretence, Blef with plain reafon, and with fober fenfe :
> No conquelt The, but o'er herfelf defir'd; No arts effay'd, but not to be admir'd. Paffion and pride were to her foul unknown, Convinc'd that virtue only is our own. : So unaffected, fo compos'd a mind, So firm, yet foft, fo ftong, yet fo refin'd, Heav'n, as its pureft gold, by tortures try'd; Tbe faint fuftain'd it, but the woman dy'd.

This epitaph, as well as the fecond quoted from Ben Jonfon, has indeed one fault: the name is omitted. The end of an epitapls is to convey fome account of the dead; and to what purpofe is any thing told of him whofe name is concealed? The name, it is true, may be infcribed by itfelf upon the fone; but fuch a fhift of the poet is like that of an unkilful painter, who is obliged to make his purpofe known by adventitious help.

Amonglt the epitaphs of a punning and ludicrous cat, we know of none prettier than that which is faid to have been written by Mr Prior on himfelf, wherein he is pleafantly fatirical upon the folly of thofe who value themfelves upon account of the long feries of anceftors through which they can trace their podigree.

Nobles and heralds, by your leave,
Here lie the bones of Mathew Prior,
The fon of Adam and of Eve:
Let Bourbon or Naffau go higher.
The following epitaph on a mifer contains a good caution and an agreeable raillery.

Reader, beware immoderate love of pelf:
Here lies the worft of thieves, who robb'd himfelf.
But Dr Swift's epitaph on the fame fubject is a maAtrpiece of the lind.

174
Epitaphs in verfe, with remarks upon them.

These compofitions generally contain fome eulogium of the virtues and good qualities of the deceafed, and have a turn of ferionfnefs and gravity adapted to the nature of the fubject. Their elegance confifts in a nervous and expreflive brevity; and tometimes they are clofed with an epigrammatic point. In thefe compofitions, no mere epithet (properly fo called) (hould be admitted; for here illuffration would impair the ftrength, and render the femtiment too diffufe and languid. Words that are fynonymous are alfo to be rejected.

Though the true charafterific of the epitaph is fejioufnefs and gravity, yet we may find many that are jocofe and ludicrous: fome likewife have true metre and rhyme; while others are between profe and verfe, without any certain meafure, though the words are truly poetical; and the beauty of this laft fort is generally heightened by an apt and judicious antithefis We fhall give examples of each.

The following epitaph on Sir Philip Sydney's fifter, the countefs of Pembroke, faid to be written by the famous Ben Jonfon, is remarkable for the noble thought with which it concludes.

## On Mary Countefs-lowager of Pembroke.

Underneath this noble marble hearfe, Lies the fabje: of all verfe, Sidney's fifter, Pembroke's mother: Death, ere thou hat kill'd another Fair, and learn'd, and good as the, Time fhall throw a dart at thee.
Take another epitaph of Ben Jorfon's, on a beautiful and si tuous lady, which has been defervedly admired by very good judges.

Underneath this fone dothlie
As much virtue as could die;
Which when alive did vigour give
To as much beauty as could live.
The following epitaph by Dr Samuel Johnfon, on a mufician much celcbrated for his performance, will bear a comparifon with thefe, or per haps with any thing of the kiad in the Englifh language.

Beneath this verdant hillock lies Demer, the wealthy and the wife. His heirs, that he might fafely ref, Have put his carcafe in a cheft : The very cheft, in which, they fay, His other Self, his money, lay. And if his heirs continue kind To that dear felf he left behind, I dare believe that four in five Will think his better half alive.
We flall give but one example more of this kind, which is a merry cpitaph on an old fiddler, who was remarkable (we may fuppofe) for beating time to lis own mulic.

## On Stephen the Fiddler.

Stephen and time are now both even;
Stephen beat time, now time's beat Stephen.
We are come now to that fort of epitaph which rejeets rhyme, and has no certain and determinate meafure ; but where the diation muft be pure and ftrong, every word have weight, and the antithefis be preferred in a clear and direct oppofition. We cannot give a better example of this fort of epitaph than that on the tomb of Mr Pulteney in the cloifters of Wefmin-fer-abbey.

## Reader,

If thou art a Briton,
Behold this Tomb with Reverence and Regret : Here lie the Remains of Dantel Pulteney, The kindef Relation, the truef Friend, The warmeft Pariot, the worthieft Man. He exercifed Virtues in this Age,
Sufficient to have diftinguifh'd him even in the bcf. Sagacious by Nature, Induftious by Habit, Inquifitive with Art;
He gain'd a complete Knowledge of the State of Britain, Forcign and Domeftic ;
In moft the backward Fruit of tedious Experience,
In him the early acquifition of undiff:pated Youth.
He ferv'd the Court feveral Years:
Abroad, in the aufpicious Reign of Queen Anne;
Athome, in the Reigncf thatexcellent prince K. George I.
He ferved his Country always,
At Court independent,
In the Senate unbias'd,
At every Age, and in every Station:
This was the bent ot his generous Soul,
This the bufinefs of his laborious Lifc.
Public Men, and Public Things,
He judged by one conflant Standard, The True Intereft of Britian:
He made no other Diftinction of Party, He abhorred all other. Gentle, humanc, difinterefted, beneficent,
He created no Enemies on his own Account : Firm, determin'd, infexible,
IIe feared none he could create in the Caufe of Britain. Reader,
In this Misfortune of thy Country lament thy own: For Know,
The Lofs of fo much private Virtue Is a public calamity.

That poignant fatire, as well as extravarant praife, Fpiaph. may be conveyed in this manner, witl te feen by the following cpitaph written by Dr Arbuthnot on Fran- Satirica! cis Clartres; which is too well known, and ton mach admircd, to need our commendation.

Hera continueth to rot
The Body of FRANCIS CHARTRES,
Who with an inflexible Constancy,
And inimitable Uniformity of Life, Persisted,
In fipitc of $\mathrm{A}_{\mathrm{ge}}$ and $\mathrm{I}_{\text {nfirmities, }}$
In the Practice of every Human Vice,
Excepting Prodigality and Hypocrisy:
His infatiable Avarice exempted him fiona the firf,
His matchlefs Impudence from the fecond.
Nor was he more fingular
In the undeviating Pravity of his Manars,
Than fucceisful
In Accumulating Wealth:
For, without Trade or Profession, Without Trust of Public Money, And without Brabe-worthy Servicc, He acquired, or more properly created, A Ministerial Estate.
He was the only perfon of his Time
Who could cheat without the Mafl of Honestay
Retainhis Primæval Meanness
When poffeffed of Ten Thousand a-year;
And having daily deferved the Giebet for what he dill,
Was at laft condemn'd to it for what he could not do.
Oh indignant reader !
Think not his Life ufelefs to mankind;
Providence conniv'd at his execrable defigns,
To give to After-ages
A confpicuous Proof and Example
Of how fmall eftimation is Exorbitant Wealth In the Sight of GOD,
By His befowing it on the moll Unworthy of ale Mortals.
We fhall conclude this fecies of poetry with a droll and fatirical epitaph written by Mr Pope, which we. tranfcribe from a monument in Lord Cobham's gardens at Stow in Buckinghamfire.

> Tothe Memory
> of
> Signior Fido,

An Italian of good extraction ;
Who came into Englkind,
Not to bite us, like moft of his Countrymen,
But to gain an honế Livelihood.
He hunted not after Fame,
Yctacquir'd it ;
Regardlers of the Praire of his Friends,
But molt fenfible of their Love,
Though he liv'd amongt the Great,
He neither learnt nor flatter'd any Vicc.
He was no Bigot,
Though lee doubted of none of the 39 Articles.
And, if to follow Nature,
And to refpect the laws of Society,
Be Philofophy,
He was a perfect Philofopher,
A faithful Friend,
An agreeable Compunion,

Verfifica. tion.

A loving Hufband, Dintinguilh'd by a numerous offspring, All whicls he liv'd to fee take good Courfes. In his old age he retired To the honie of a Clergyman in the country, Where he finifhed bis earthly Race, And died an Honour and anexampletothe whole Species.

Reader,
This Stone is guillefs of Flattery;
For he to whom it is infcrib'd
Was not a Man, Buta
Gaey-hound.

## Part III. On VERSIFICATION.

177
Iftentials of verfe.
${ }^{178}$
Regulation of paufes.

ON this fubject it is meant to confine our inquiry to Latin or Greek hexameters, and to French and Singlifh heroic verfe; as the obfervations we fhall have occadion to make, may, with proper variations, be eaflly transferred to the compofition of other forts of verfe.

Before entering upon particulars, it muft be premifed in general, that to verfe of every kind five things are of importance. 1 th, The number of fyllables that compofe a line. 2d, The different lengths of fyllables, i. e. the difference of time taken in pronouncing. 3 d , The arrangement of thefe fyllables combined in words. 4 th, The paufes or fops in pronouncing. 5 th, Pronouncing fyllables in a high or low tone. The three firlt mentioned are obvioully effential to verfe: if any of them be wanting, there cannot be that higher degree of melolly which diftingu:fheth verfe from profe. To give a jult notion of the fourth, it mult be obferved, that panfes are neceffary for three different purpofes: one, to leparate periods, and members of the fanie period, according to the fenfe : another, to improve the melody of verfe: and the laft, to afford opportunity for drawing breath in reading. A paufe of the firlt kind is variable, being long or thort, frequent or lefs frequent, as the fenfe requires. A paufe of the fecond kind, being determined by the melody, is in no degree arbirrary. The laft fort is in a meafure arbitrary, depending on the reader's command of breath. But as one camnot read with grace, unlefs, for drawing breath, opportunity be taken of a paufe in the fenfe or in the melody, this paufe onght never to be diainguithed from the others; and for that 1 eafon thall be laid afide. With refpect then to the paufes of fenfe and of melody, it may be alfirmed without hefitation, that their coincidence in verfe is a capital beanty : but as it cannot be expected, in a long wouk elpecially, that every line fhould be fo perfect ; we thall afterward have occation to fee, that, unlefs the reader be uncommonly fkilful, the paufe neceffary for the fenfe muft often, in fome degree, be facrificed to the verfe-paufe, and the latter fometimes to the former.

The pronouncing fyllables in a hish or low tone contributes alio to melody. In reading, whether verfe or profe, a certain tone is aflumed, which may be called the key-note; and in that tone the bulk of the words are iounded. Sometimes to humour the fenfe, and fometimes the melody, a particular fy llable is founded in a higher tone, and this is termed aceentins, a Jyllable, or gracing it with an accent. Oppofed to the accent is the cadence, which, however, being entirely regulated by the fenfe, hath no peculiar relation to verfe. The cadence is a falling of the voice below the key-note at the clofe of every period ; and fo litt'e is it effential to verie, that in eotrect reading the final fyllable of every line is accented, that fyllable only excepted which clofes the period, where the fente requires a cudence.

Though the five requifites above mentioned enter the compofition of every fecies of verfe, they are however governed by different rules, peculiar to each fpecies. Upon quantity only, one gencral obfervation may be premifed, becaufe it is applicable to every ipecies of verfe. That fyllables, with refpest to the time taken in pronouncing, are long or thort; two flort fyllables, with refpect to time, being precifely equal to a long one. Thefe two lengths are effential to verfe of all kinds; and to no verfe, it is believed, is a greater variety of time necelfary in pronouncing fyllables. The voice indeed is frequently made to reft longer than ufual upon a word that bears an important fignification; but this is done to humour the fenfe, and is not neceffiary for meiody. A thing not more neceffary for melody occurs with refpeet to accenting, fimilar to that now mentioned : a word fignifying any thing humble, low, or dejected, is naturally, in profe as well as in verfe, prononnced in a tone below the key-note.

We are now fulficiently prepared for particulars; begiming with Latin or Greek hexameter, which are the fame. The obfervations $u p \sim n$ this fecies of verfe will come under the four following heads; number, arrangement, paufe, and accent; for as to quantity, what is obferved above may fuffice.
I. HeXAMETER Lines, as to time, are all of the fame length; being equivalent to the time taken in verfes pronouncing twelve long fyllables of twenty-four fhort. the Gre An hexameter line may confit of feventeen fyllables; and Ro and when regular and not fondaic it never has fewer manis of than thirteen: whence it follows, that where the fyl-feet. lables are many, the plurality mult be fhort; where few, the plurality mut be long.

This line is fufceptible of much variety as to the fucceflion of long and fhort fyllables. It is, however, fubjefted to laws that confine its variety within certain limits: and for afcertaining thefe limits, grammarians have invented a rule by dactyles and Spondees, which they denominate fect.

Among the ancient Grechs and Romans, thefe feet regulated the pronunciation, which they are far from doing among us; of which the reafon will be difoovered from the explanation that we tha'l give of the Englith accent. We thall at prefent content ourfelves with pointing out the difference between onr pronanciation and that of the Romans in the firf line of Virgil's eclogues, where it is fearcely credible how much we pervert the quantity.

## 'Tit'yre tú pat'ulæ rec'ubans fub teg'nine dági.

It will be acknowledged by every reader who has an ear, that we have placed the accentual marls upon every fyllable, and the letter of every fyllable, that an Eng.

#### Abstract

lifhman

## III.

 P O Eificz- lifhman marks with the itus of his voice when he recites the line. But, as will he feen prefently, a fyllable which is pronounced with the firefs of the voice upon a confonant is uttered in the fhorteft time politible. Hence it follows, that in this verfe, as recited by us, there are but two long fyllables, $t u$, and fá; though it is certain, that, as recited by a Roman, it contained no fewer than cight long fyllables.

But though to pronounce it in this manner with the voice dwelling on the vowcl of each long fyllable would uadoubtedly be correct, and preferve the true movernent of the verfe, yet to an Englith ear, prejudiced in belaalf of a different movement, it founds fo very uncouth, that Lurd Kames has pronounced the truc feet of the Greek and Roman verfes extremely artificial and complex; and has fubflituted in their fead the following rules, which he thinks more fimple and of more eafy application. Ift, The line muft always commence wich a long fyllable, and clofe with two long preceded by two thort. 2d, More than two fhort can never be found together, nor fewer than two. And, 3 d, Two long fyllables which have been preceded by two fhort cannot alfo be followed by two fhort. Thefe few rules fulfil all the conditions of an hexametes line with relation to order or arrangement. For thefe again a fingle rule may be fubflituted, which has alfo the adrantage of regulating more affirmatively the confruction of every part. To put this rule into words with perfpicuity, a hint is taken from the twelve long fyllaoles that compofe an hexameter line, to divide it into twelve equal parts or portions, being each of them one long fyllable or two flort. The rule then is: "The $1 \mathrm{~A}, 3 \mathrm{~d}$, 5 th, 7 th, 9 th, Ith, and 12 th portions, mut each of them be one long fyllable; the 1 oth muft always be two hort fyllables; the $2 \mathrm{~d}, 4 \mathrm{th}$, 6 th, and 8 th , may either be one long or two fliort." Or to exprefs the thing fill more fhortly, "The $2 \mathrm{~d}, 4$ th, 5 th, and 6 th portions may be one long fyllable or two thort; the ioth muft be tivo fhort fy liables; all the reft muft confit each of one long fyllable." This fulfils all the conditions of an hexameter line, and comprehends all the combinations of dactyles and fpondecs that this line admits.

Next in order comes the paufc. At the end of every hexameter line, every one nult be fenfible of a complete clofe or full paufe; the caufe of which follows. The two long fyllables preceded by two fl:ort, which always clofe an hexameter line, are a fine preparation for a panfe: for long fyllables, or fyllables pronounced flow, refermbling a flow and languid motion tending to reft, naturally incline the mind to reft, or, which is the fame, to paufe; and to this inclination the two preceding fhorr lyllables coutribute, which, by contraft, make the flow pronunciation of the final fyllables the more confpicuous. Befide this complete clofe or full paufe at the end, others are alfo requifite for the fake of melody; of which two are clearly difcoverable, and perhaps there may be more. The longeft and moft remarkable fucceeds the 5 th portion: the other, which, being fhorter and more faint, may be called the femipaufe, fucceeds the Sth portion. So friking is the paufe firtt mentioned, as to be diftinguifhed even by the rudeft ear: the monkifh rlymes are evideutly built upon it; in which, by an invariable

T R Y.
rule, the final word always chimes with that which Verfifionimmediately precedes the paufe :
tion.
De planctu cudo || metrum cum carminc nudo
Mingere cum bumbis \|res eft fuluberrima lumbis.
The difference of tince in the prufe and femipaufe occations another difference nut lefs renarkable; that it is lawful to divide a word by a femipaufe, bat never by a paufe, the bad cffeet of which is fenfibly felt in the following examples:

Effufus labor at\|que immitis rupta Tyrarni Again :

Obfervans nido imliplumes detraxit; at illa u Again :

## Loricam quam De||moleo detraxerat ipfe

The dividing a word by a femipaufe has not the fame bad effeet :

Jamque pedem referen.s 月 cafus e|vaferat omnes. Again:
Qualis populea || merens Philo|mela fub umbra Again:
Ludere que vellem || calamo per|milit agrefl.
Lines, however, where words are left entire, without being divided even by a femipaufe, run by that means much, the more fweetly.

Nee gemere aërea || ceffabit | turtur ab ulmo.
Again:
Quadrupedante putrem || fonitu quatit |ungula campum. Again:

Eurydicen toto || referebant | fummine ripx.
The reafon of thefe obfervations will be evident upon the flightert refiection. Between things fo intimately counected in teading aloud as are fenfe and found, every degree of difcord is unpleafant : and for that reaforn it is a matter of importance to make the mufical paufes coincide as much as poffible with thofe of renfe; which is requifite more efpecially with refpeit to the paufe, a deviation from the rule being lefs remarkable in a femipaufe. Confidering the matter as to melody folely, it is indifferent whether the paufes be at the end of words or in the middle ; but when we carty the fenfe along, it is difagreeable to find a word fplit into two by a paufe, as if there were really two words: and though the difo agreeablenefs here be connected with the feale only, it is by an cafy tranfition of perceptions transferred to the found; by which means we conceive a line to be harfh and grating to the car, when in reality it is only fo to the underfanding.

To the rule that fixes the paufe after the 5 th portion there is one exception, and no more. If the fyllable fueceeding the $5^{\text {th }}$ portion be fhort, the paufe is fometimes poftponed to it:

## Pupillis quos dura || premit cufodia matrum

Again:
In terras opprefla il gravi fub religione

## Again:

Et quorum pars magna || fui ; quis talia fando
This contributes to diverfify the melody ; and, where the words are fmooth and liquid, is not ungraceful ; as in the following examples:

Formofam:

Verifica. tun.

Formofam refonare\|doces Amaryllida fylvas Again: Agricolac, quibus if fa\|l|procul difcordibus armis
If this paufe, placed as aforefind after the fhort fyllable, huppen aifo to divide a wort, the melody by thefe circumftances is totally annihilated. Witnefs the following line of Ennius, whish is plain profe:

Rome mocnia terru\|it impiger|IIannibal armis.
Hitherto the arrangement of the long and flort fyl. lables of an hexameter line and its diferent paufes have been conlidered with refpeet to melody: but to have a juft notion of hexameter verle, there particulars muft alfo be confidered with refpect to fenic. There is not perhaps in any other fort of verfe fuch latitude in the lorg and fhort fylables; a circumflance that contributes greatly to that richnefs of melody which is remarkable in hexametcr verfe, and which made Aritotle pronounce that an epic poem in any other verfe would not fucceed*. One defer, however, mult not be diffembled, that the fame means which contribute to the richnefs of the me. lody render it lefs fit than feveral other forts for a narrative poem. There cannot be a merc artful contrivance, as above obferved, than to clofe an hexameter line with two long fyllables preceded by two fhort : but unhappily this couftruaion proves a great embarrafinent to the fenfe; which will thus be evident. Asingeneral dere ought to be a frist concordance between the thought and the words in which it is dreffed; fo, in particular, every clofe in the fenfe ought to be accompanied with a clofe in the found. In profe this law may be ftrially obferved, but in verfe the fame ftrietnefs would occafion infuperable difficulties. Willing to facrifice to the melody of verie fome fhare of the concordance between thought and expreffion, we freely excufe the feparation of the mufical paufe from that of the fenfe during the courfe of a line ; but the clofe of an hexameter line is too confpicuous to admit this liberty: for which reafon there ought always to be fome paufe in the fenfe at the end of every hexameter line, were it but fuch a paufe as is marked by a comma; and for the fame reafou there ought never to be a full clofe in the fenfe but at the end of a line, becaufe there the melody is clofed. Au hexameter line, to preferve its melody, cannot well admit any great relasation; and yet, in a narrative poem, it is extremely difficulit to adhere thictly to the rule even with thefe indulgences. Virgil, the chief of poets for verlification, is forced often to end a line without any clofe in the fenfe, and as often to clofe the fenfe during the running of a line; though a clofe in the melody during the movement of the thonght, or a clofe in the thought during the movement of the melody, cannot be agreeable.
The accent, to which we proceed, is not lefs effential than the ocher circumilances above handled. By a good car it will be differned, that in every line there is one fyllable difinguiflable from the relt by a capital acsent : That fyllable being the feventla portion, is invariably long

Nec bene promeritis\|capitur nec|tangitur ina Again :

Non fibi fed totof genitûm fe / crodere mundo Again:

Qualis felunca||fubitó com mota columba

In thefe examples the accent is laid upon the lait fyl. Verfi, lable of a word; which is favourable to the melody in the following refpest, that the paufe, which for the fake of reading diftinctly mult follow every word, gives opportunity to prolong the accent. And for that reafon, a line thus accented has a more fpirited air than when the accent is placed on any other ij 1 able. Compare the foregoing lines with the following.

Aloa neque Affyrio||fucâtur|lana venemo Again:

Panditur intere:|||domus òmripo|tentis Olympi Again:

Olli fedato||refpôndit |corde Latinus.
In lines where the paufe comes after the fhort fyllable fucceeding the 5th portion, the accent is difplaced, and rendered le's fentible : it feems to be fplit into two, and to be laid partly on the 5 th portion, ard partly on the 7 th, its ufual place; as in

Nuda genu, nodơque|ffimûs colllecta fuentes. Again:
Formofam rcfonâren||docês Amar|yllida fylvas.
Befide this capital accent, flighter accents are laid upon other portions; particularly upon the 4 th, unlefs where it confifts of two fhort fyllables; upon the gth, which is always a long fyllable; and upon the 11th, where the line concludes with a monofyliable. Such conclufion, by the by, impairs the melody, and for that reafon is not to be indulged unlefs where it is expreffive of the fenfe. The following lines are marked with all the accents.

Ludere qux vêllem calamó permifit agrefi Again:

Et duræ quêrcus fudâbunt tớcida mella Again:

Parturiunt môntes, nafcêtur ridiculûs mus.
Refleating upon the melody of hexameter verfe, we order find, that order or arrangement doth not conftitute the arrang whole of it: for when we compare different lines, equally ment regular as to the fucceffion of long and thort fyllables, not co the melody is found in very different degrees of per- whole fection; which is not occafioned by any particular com- lody, bination of dactyles and fpondecs, or of long and thort hexam fyllables, becaufe we find lines where dactyles prevail, verfe. and lines where fpondees prevail, equally melodious. Of the former take the following inftance:

FEneadum genitrix hominum divumque voluptas. Of the latter:

Molli paulatim flavefcet campus arifa.
What can be more different as to melody than the two following lines; which, however, as to the fucceffion of long and fiom fyllables, are conltructed precifely in the fame marner ?
Spond. Doct. Spound. Epoud. Dact. Spond Ad talos itola dimilia et circumdata palla. Hor. Spond. Datt. Spond. Spond 0 iet, Spond,
Placatumque nitet diffufo lumine colum. In the former, the paufe falls in the middle of a word, which is a great blemifh, and the accent is difurbed by a harth elifion of the vowel $a$ upon the particle et. In the later, the paufes and the accent are all of then diftinct
diftinct and full: there is no elifion: and the words are more liquid and founding. In thefe particulas couffits the beauty of an hexanmeter line with refper to melody; and by neglecting thefe, many lines in the fatires and epifles of Horice are lefs agrceable than plan profe; for they are neither the one nor the other in perfeation. To draw melody from thefc lines, they mult be pronounced without relation $t$ the fenfe: it muft not be regarded that wor ds are divided by paufes, nor that harlh clifions are multiplied. To add to the avcount, profaic low-founding words are introduced; and, which is till worfe, accents are laid on them. Of fuch faulty lines take the following inflances.

Candida rectaque fit, munda hactenus fit neque longa.
Jupiter exclamat timul atque audirit; at in fe
Cuftodes, leftica, ciniflones, parafitx

## Optimus ef modulator, ut Alfenus Vafer omni

Nunc illud tantum quxram, meritone tibi fit.
Thefe obfervations on paufes and femipaufes, and on the feructure of an hexameter line, are doubtlefs ingenious; but it is by no means certain that a ftrict attention to them would affift any man in the writing of fuch verfes as would have been plealing to a Roman ear. Many of his Lordihp's rules have no other foundation than what refts on our improper mode of accenting Latin words; which to Virgil or Lucretius would probably have been as offenfive as the Scotch accent is to a native of Middlefex.
II. Neat in order comes English heroic verse; which fhall be examined under the heads of number, accent, quantity, movemest, and pauje. Thefe have been treated in fo clear and mafterly a manner by Sheridan in his Art of Reading, that we fhall have litcle more to do than abridge his doctrine, and point out the few inflances in which attachment to fytem and partiality to his native tongue feem to have betrayed him into .error, or at leaft made him carry to an extreme what is juft only when ufed with moderation.
"Numbers, in the ftrict fenfe of the word*, whether with regard to poetry or mufic, confint in certain imprefions made on the ear at fated and regular diffances. The loweft fpecies of numbers is a double ftroke of the fame note or found, repeated a certain number of times, at equal diftances. The repectition of the fame fingle note in a continued feries, and exactls at equal diftances, like the tickling of a clock, has in it nothing numerous; but the fame note, twice fruck a certain number of times, with a paufe between each repelition of double the time of that between the frokes, is numerous. The reaton is, that the pleafure arifing from numbers, confifts in the obfervation of proportion; now the repetition of the fame note, in exactly the fame intervals, will admit of no proportion. But the fame note twice fruck, with the paufe of one between the two ftokes, and repeated acain at the diltance of a paufe equal to two, admits of the proportional meafurement in the paufes of two to one, to which time can be beaten, and is the loweft and timpleft fpecies of numbers. It nay be exemplified on the drum, ds tu'm-tu'm-.tu'm-tu'm.-tu'm-tum, \&c.
" The next progrefion of numbers is, when the fame note is repeated, but in fuch a way as that one males a Voz. XV.
more fenfible imprefiun on the car than the other, by being more forcibly truck, and tierefore having a greator degree of loudneis; as ti-tu'm-ti tu'm ; or, tu'm.ti -tu'miti: or when two weak notes precede a more forcible one, as tilti-tu'm-ti-ti-lu'm; or when the weak notes follow the forcible one, tu'm-tht-ti- w'mtit.ti.
"In the firft and loweft fescies of numbers whiciz we have mentioned, as the nutes are cxactly tie fame: in every refpect, there can be no propertion obferved but in the time of the paufes. In the fecond, whicl: rifes in a deyree juft above the otlicr, though the notes are fill the fame, yet there is a diverfity to be ubferved in their refpective loudrefs and fortneis, and therefure a meafurable proportion of the quamity of found. In them we muft likewife take into conlideration the order of the notes, whether they proceed from ftreng to weak, or from weak to frong; for this diverlity of order occafions a great difference in the imprefions inade upon the ear, and in the effects produced upon the mind. To exprefs the diverfity of order in the notes in all its feveral kinds, the common term movement may be ufed, as the term meafure will properly enough exjrels the different proportions of time both in the paules and in the notes."

For it is to be obferved, that all notes are not of the fame length or on the fame key. In poetry, as well as in mulic, notes may be high or low, flat or tharp; and fome of them may be prolonged at pleaiure. "Poetio numbers are indeed founded upon the very fame principles with thofe of the mufical kind, and are governed by fimilar laws (fec Music). Proportion and order ate the fources of the pleafire which we receive from both; and the beauty of each depends upon a due obfervation of the laws of meafure and movement. The effential difference between them is, that the matter of the one is articulate, that of the other inarticulate founds; but fyllables in the one correfpond to notes in the other; poetic feet to mufical bars; and verfes to ftrains; in a word, they have all like properties, and are governed by laws of the fame kind.
"From what has been faid, it is cvident, that the effence of numbers confifts in certain impreffions made on the mind through the ear at ftated and regular diftances of time, with an obfervation of a relative proportion in thofe diftances; and that the other circomiftances of long or fhort in fyllables, or diverfity of nites in utter. ing them, are not effentials but only actilents of pnetic numbers. Should this be queftioned, the objenter might be filenced by having the experiment tried on a drum, on which, although it is incapable of producing long or fhort, high or low notes, there is no kind of metie which may not be beat. That, therefore, which regulates the feries and movement of the impreflions given to the ear by the recitation of an Englifl verfe, muft, when properly difpofed, conftitute the ellence of Eng. lith peetic numbers; but it is the accent which particularly imprefics the found of certain fyllables or leiters upon the ear; for in every word there is a fyllable or letter accented. The nccellity and ufe of the accent, as well in profe as in verfe, we fhall therefore proceed to explain.
"As words may be formed of vari us numbers of fyllables, from one up to eight or nine*, it was a•cef- * Art et fary that there flowld be fome peculiar matk to diftim- Keading K k
guifh vol. i.
quith words from dijointed fyllables, otherwife fpeech would be nothing but a coatinued fucciffion of fyllables convering no ideas. 'Thlis diftinction of one word from anothor might bs made by a peaceptible paufe at the end of each in fpeaking, analogous to the dittance made between them in writing and in printing. But there paufes would make difcourfe difgutingly tedinus; and though they might render words fufficiently diftinet, they would make the meaning of fentences extremely confufed. Words might alfo be dittinguithed from each other, and from a collection of derached fyllables, by an eleadion or defr flon of the voice upon one fyllable of each word; and this, as is well hown to the learned, was the practice of the Greeks and Romans. But the Englifh tongue has for this purpofe adopted a mark of the eafieft and fimpleft kind, which is called accent. By accent is meant, a certain ftrefs of the voice, upon a particular letter of a fyllable, which diftinguilhes it from the reft, and at the fame time diftinguifhes the fyllable itfelf to which it belongs from the other fyllables which compofe the word. Thus, in the word balit, the accent upon the $b$ diftinguifhes that letter from the others, and the firft fyllable from the latt; add more fyllables to it, and it will ftill do the fame, as halitable. In the word accep't, the $p$ is the diftinguifhed letter, and the fyllable which contains it the diftinguifhed fyllable ; but if we add more fyllables to it, as in the word ac'septalle, the feat of the accent is changed to the firf fyllable, of which $c$ is the dillinguifhed letter. Every word in our language of more fyllables than one has one of the fyllables diftinguifhed from the reft in this manner and every monofyllable has a letter. Thus, in the word bat' the $t$ is accented, in bate the vowel $a$, in $c u b^{\prime}$ the $b$, and in cuibe the $u$ : fo that as articulation is the effence of fyllables, accent is the effence of words; trhich without it would be nothing more than a mere fuccefion of fyllables."

We have faid, that it was the practice of the Greeks and Romans to elevate or deprefs their voice upon one fillable of each word. In this elevation or depreffion confifted their accent ; but the Englifh accent confilts in the mere ftrefs of the voice, without any change of note. "Among the Greeks, all fyllables were pronounced either in a high, low, or middle note ; or elfe in a union of the ligh and low by means of the intermediate. The middle note, which was exadly at an equal diflance between the high and the low, was that in which the unaccented fyllables were pronounced. But every word had one letter, if a monofyllable; or one fyllable, is it conlifted ol more than one, diftinguilhed from the reft ; either by a note of the voice perceptibly higher than the midille note, which was called the acute accent ; or by a note perceptibly, and in an equal proportion, lower than the middle one, which was called the grave accent ; or by an union of the acute and grave on one fyllable, which was done by the voice pafling from the acute, through the middle nnte, in continuity down to the grave, which was cailed the circumfex."
"Now in pronouncing Enerlith words, it is true that one fyllable is always difinguilhed from the reft, but it is not by any perceptible eievation or deprefion of the voice, any high or low note, that it is done, but merely by dwelling longer upon it, or by giving it a more forciblefroks. Whea the ftels or accent is on
the vowcl, we dwell longer on that fyllable than on the reft; as, in the words glory, fatber, boly. When it is on the confonant, the voice, paffing lapidly over the vowel, gives a fmarter Itroke to the confonant, which diftinguifhes that fyllable from others, as in the words bat'tle, bab'it, bar'rozu."

Having treated folargely of accent and quantity, the next thing to be confidered in verfe will be quickly difculfed; for in Englifh it depends wholly on the feat of the accent. "When the accent or ftrefs is on the vowel, the fyllable is necelfarily long, becaufe the accent cannot be made without dwelling on the vowel a longer time than ufual. When it is on the confonant, the fyllable is fhort; becaufe the accent is made by paffing rapidly over the vowel, and giving a fmart ftroke of the voice to the following confonant. Thus the words ad'd, lect', lid', cub', are all fhort, the voice paffing quickly over the vowel to the confonant; but for the contrary reafon, the words áll, läid, bíde, cuibe, are long; the accent being on the vowels, on which the voice dwells fome time before it takes in the found of the confonant."
"Obvious as this point is, it has wholly efcaped the obfervation of many an ingenious and learned writer. Lord Kames affirms*, that accenting is confined in *El. of Englifh heroic verfe to the long fyllables; for a fhort Crit. vo fyllable (fays he) in not capable of an accent : and Dr ii. Forfter, who ought to have underflood the nature of the Englifh accent better than his Lordfhip, afks, whether we do not 'employ more time in uttering the firfl fyllables of beavily, bafily, quickly, fowly; and the fecond in folicit, miftaking, refearches, delufive, than in the others ?' To this queltion Mr sheridan replies $\dagger$, that + Art of " in fome of thefe words we certainly do as the Doctor Reading fuppofes; in bọflily, flówly, mifláking, dclüfive, for inftance; where the accent being on the vowcls renders their found long: but in all the others, beav'-ily, quick'. $l y$, folis'-it, re-fear'oches, where the accent is on the confonant, the fyllables heav', quick', lis', for', are pronounced as rapidly as poffible, and the vowels are all fhort. In the Scotch pronunciation (continues he) they would indeed be all reduced to an equal quantity, as thos; lái-vily, láis-tily, quéck-ly, Jów-ly, fo-lée-cit, re-fäir-ches, de-lú.jve. But here we fee that the four fhort fyllables are changed into four lo g ones of a different found, occafioned by their placing the feat of the accent on the vowels inltead of the confonants: thus inftead of bev" they fay büv ; for quick', qucek; for lis', léece; and for Ser', fär.
"It appears therefore, that the quantity of Englifh fyllables is adjutted by one eafy and timple rule; which is, that when the feat of the accent is on a vowcl, the fyllable is long; when on a confonant, fhort; and that all unaccented fyllables are fhort. Without a due obfervation of quantity in reciting verfes there will be no poetic numbers; yet in compofing Engl th verfes the poet need not pay the leaft aitention to the quantity of his fyllables, as meafure and movement will refult from the obfervation of other laws, which are now to be explained.

It has been affirmed by a writer* of great authority L.ord among the critics, that in Englifh heroic verfe every Kames. line confilts of ten fyllables, five fhart and five long; from which there arc but two exceptions, both of them
fifica. rare. The firit is, where each lise of a couplet is made eleren fyllables, by an additional fhort fyllable at the end.
Thére héroes wit's are kep.t in pond'rous váfes, And beaus' in finuff-boxes and tweezer cales.
The other exception, he fays, concerns the fecond line of a couplet, which is fometimes ftretched ont to twelve fyllables, termed an Alexandrise line

A needlefs Alexandrinc ends the fong,
That, like a wounded fnake, drags its flow length along.
After what has been jut faid, it is needlefs to fop for the purpofe of pointing out the ingenious author's mifake refpecting long and thort fyllables. Every attentive reader of what has been already laid down, mult perceive, that in the firl line of the former couplet, thought there are no fewer than fix accented fyllables when it is properly read, yet of thefe there are but three that are long, viz. thofe which have the accent on the vowel. Our bufinefs at prefent is, to fhow the falfity of the rule which reftrains the heroic line to ten fyllables; and this we fhall do by producing lines of a greater number.

## And the flhrill founds ran echoing through the wood.

This line, though it confifts of eleven fyllables, and has the laft of thofe accented, or, as Lord Kames would fay, long, is yet undoubtedly a heroic verfe of very fine found. Perhaps the advocates for the rule may contend, that the vowel o in echoing ought to be ftruck out by an apoftrophe ; but as no one reads,
And the fhrill founds ran ech'ing through the wood,
it is furely very abfurd to omit in writing what cannot be omitted in utterance. The two following lines have each cleven fyllables, of which not one can be fuppreffed in recitation.
Their glittering textures of the filmy dew,
The great hierarchal ftandard was to move.
Mr Sheridan quotes as a heroic line,
O'er many a frozen, many a firy Alp;
and obferves what a monftrous line it would appear, if promounced,

## O'er man' a frozen, man' a firy Alp,

inftead of that noble verfe, which it certainly is, when all the thirteen fyllables are diftinctly uttered. He then pr duces a couplet, of which the former line has fourteen, and the latter twelve fyllables.

And many an amornus, many a humorous lay,
Which many a bard had chaunted many a day.
That this is a couplet of very fine found cannot be controverted; but we doubt whether the numbers of it or of the other quoted line of thirteen fyllables be truly heroic. To our ears at leaft there appears a very perceptible differcnce between thic movement of thele verfes and that of the verfes of Pope or Dryden; and we think, that, though fuch couplets or fingle lines may, for the fake of varicty ex expreflion, be admitted into a heroic poem, yet a poem wholly compofed of them
would not beconfidered as licroic verfe. It lids a mucls greater refemblance to the verfe of Sipencer, which is now broke into two lines, of which the firt has cight and the fecond fix fyllables. Nothing, lonwever. feems to be more evident, from the other quoted inftances, than that a heroic line is not confiue 1 to the fylhable. and that it is not by the number of fyllables that an Englifh verfe is to be meafured.
But if a heroic veric in our tongue be not compofed, as in Frencl, of a certain number of fyllables, how is it formed? We anfwer by feet, is was the hex.meter line of the ancients; thongh hetween their feet and ours there is at the fame time a great difference. The poetic feet of the Greeks and Romans are formedby quantity, thofe of the Englifl by ftrefs or accent. "Though thefe terms are in continual ufe, and in the mouths of all who treat of poetic numbers, very confufed and erroneous ideas are fometimes annexed of them. Let as the knowledge of the peculiar genius of our language with regard to poetic numbers and its charaterifical difference from others in that refpeet, depends upon our having clear and precife notions of thofe terms, it will be neceffary to have them fully explained. The general nature of them has been already fufficiently laid open, and we have now only to make fome obfervation on their particular effects in the formation of metre.
"No fcholar is ignorant that quantity is a term which relates to the length or the fhortneís of fyllables, and that a long fyllable is deuble the length of a fhort one. Now the plain meaning of this is, that a long fyllable takes up double the time in fuunding that a thort one does; a fatt of which the ear alone can be the judge. When a fyllable in Latin ends with a confonant, and the fubfequent fyllable commences with one, every fchool-boy knows that the former is long, to ufe the technical term, by the law of pofition. 'This rule was in pronunciation Atriftly obferved by the Romans, who always made fuch fyllables long by dwelling on the vowels; whereas the very reverfe is the cafe with us, becaufe a quite contrary rule takes place in Englifh words fo confructed, as the accent or itrefs of the voice is in fuch cafes always transferred to the confonant, and the preceding vowel being rapidly palfed over, that fyllable is of courfe fhort.
"The Romans had another rule of profody, that when one fyllable ending with a vowel, was followed by another beginning with a vowel, the former fyllable was pronounced Thort; whereas in Englifh there is generally an accent in that cafe on the former fyllable, as in the word pious, which renders the fyllable long. Pronouncing Latin therefure by our own rule, as is the former cafe, we make thofe fyilables fhort which were founded long by them, fo in the latter, we make thofe fyllables long which with them were thort. We fay ar'ma and virum'que, inftead of árma and virun'que; fíio and táus, inftead of fció and tuus'.
"Having made thele preliminary obret vations, we proceed now to explain the nature of poetic fect. Feet in verfe correfpond to bars in mufic : a certain number of fyllables conneeted form a foot in the one, $a$, a certain number of notes make a bar in the other. They are called feet, becaufe it is by their aid that the voice as it were fleps along through the verfe in a meafured pace ; and it is neceflary that the fyllatiles which mork this regular movement of the vuise thould in fome $\mathrm{Kk}=$ meature
[1013.

Verfifica- meafure be diftingnithed from the othcrs. This di-
tion. Atination, as we have already obferved, was made among
the ancient Romans, by dividing their fyllables into long and fhort, and afcertaining their quantity by an exact preportion of time in founding them; the long being to the flont as two to one; and the long fyllables, being thus the more important, marked the movement of the verfe. In Englifh, fyllables are divided into accented and ueaccented; and the accented fyllables being as frongly diftinguifhed from the unaccented, by the pea culiar ftrefs of the voice upon them, are as capable of marking the movement, and pointing out the regular paces of the voice, as the long fyllables were by their quantity among the Romans. Hence it follows, that our accented fyllables correfiponding to their long ones, and our unaccented to their thort, in the fructure of poetic feet, an accented fyllable followed by one unaccented in the fame foot will anfwer to their trochee; and preceded by an unaccented one, to their iambus: and fo with the ref.
"All feet ufed in poetry confift either of two or three fyllables; and the feet among the ancients were denominated from the number and quantity of their fyllables. The meafure of quantity was the fhort fyllable, and the long one in time was equal to two fhort. A foot could not confitt of lefs than two times, becaufe it muft contain at leaft two fyllables; and by a law refpecting numbers, which is explained elfewhere (fee Music, a poetic foot would admit of no more than four of thofe times. Confequently the poetic feet were neceffarily reduced to eight ; four of two fyllables, and four of three. Thofe of two fyllables mult cither confift of two flort, called a pyrrhic; two long, called a fpondce; a long and a fhort, called a trochee; or a fhort and a long, called an iambus. Thofe of three fyllables were, either three fhort, a tribrach; a long and two fhort, a dadyl; a fhort, long, and fhort, an amphibrach; or two fhort and a long, an amapaff ( y ).

We are now fufficiently prepared for confidering what feet enter into the compofition of an Englifh heroic verfe.

The Greeks and Romans made ufe of but two feet in the fructure of their hexameters; and the Englifh heroic may be wholly compofed of one foot, viz. the iambic, which is therefore the foot moft congenial to that fpecies of verfe. Our poetry indeed abounds with verfes into which no other foot is admitted. Such as, The pow"rs | gave éar | and grán|ted hálf | his práy'r, 'The rest' | the winds | difpérs'd | in emp|ty áir.
Our heroic line, however, is not wholly reftrained to the ufe of this foot. In the opinion of Mr Steridan it admits all the eight before enumerated; and it certainly excludes none, unlefs perlaps the zibrach. It
is known to every reader of Englifh poctry, that fome Verffic of the finef heroic verfes in our language begin with a trochee ; and that Pope, the fmnotheft of all our verfiriers, was remarkable for his ufe of this foot, as is evident from the following example, where four fucceeding lines out of fix have a trochaic beginning.

Her lively looks a fprightly mind difclofe, Quick as | her eyes | and as unfix'd as thofe: Favours | to none | to all fhe finiles extends, O'ft fhe | rejects | butnever one offends. Bright as | the fun | her eyes the gazers frike, And like the fun the thines on all alike.
The ufe of this foot, however, is not neceffarily $\mathrm{c}^{\mathrm{n}}$ fined to the beginning of a line. Milton frequently introduces it into other parts of the verfe; of which take the following inflances:
'That all | was loft' | back' to | the thick'|et flunkOf E've | whofe ey'e | dárted contálgious fire.
The laft line of the following couplet begins with a pyrrlic:

She fáid, -and mé|ting as in tears fhe lay, Iň ă | foft sil'ver ftream diffolv'd away ;
But this foot is introduced likewife with very good ef. fed into other parts of the verfe, as
Pánt on | thy lip' | añd to | thy heárt | be preft. |
The phantom fies me | ăs undkind as you.
Leaps o'er the fence with eafe $\mid$ into $\mid$ the fold.
Aud thĕ|fhrill' foúnds | ran echoing through the wood.
In this laft line we fee that the firft foot is a pyrrbic, and the fecond a $\int p$ pondee; but in the next the two firft feet are fpondees.
Hill's peép | o'er hill's | and Alps | on Alps | arife.
In the following verfe a trochee is fucceeded by two fpondees, of which the former is a genuine fpondee by quantity, and the latter equivalent to a fpondee by accent.
Sée thě | böld yōūth | Atráin up' | the threat|'ning Ateep. We flalll now give fome inflances of lines containing both the pyrrbic and the Spondee, and then proceed to the confideration of the other four feet.
Thăt ơn | wēàk wings | from far purfues your fight.
'Thrơ' thĕ | fairr fcēne | röll flow | the ling'ring ftreams. On hěr | white breas't | a fparkling crofs the wore.
Of the four triffyllabic feet, the firf, of which we hall give inftances in heroic lines, is the claiyl; as
Mur'muring, |and with | him' fled | the fhades | of night.
(y) For the convenience of the lefs learned reader we flall here fubjoin a fcheme of poetic feet, ufing the marks $(-\dot{U})$ in ufe among the Latin grammarians to denote the genuine fect by quantity; and the following marks (i) to denote the Englifh feet by accent which anfwer to thofe.

|  | Roman | Englifh |  | Romian | Englifl |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Trochee | - | , u | Dactyl | -u | $\bigcirc$ |
| lambus | - | 0 , | Amphibrach | u-u |  |
| Spondec |  | , ' | Anapreft |  |  |
| Pyrrhic |  |  | Tribrach |  |  |

Hov'cring | on wing | min'ler $\mid$ the cápe | of hell'. Timorous | and flothful yet he pleafed the ear. Of truth | in word | mightier $\mid$ than they |in arms.
Of the anapaf? a fingle inttance flall fuffice; for except by Milton it is not often u.f.d.

The grcat | hǔr rár|chal flandard vas to move.
The amphibrach is employed in the four following verfes, and in the three laft with a very fine effect.
With wheels | yet hóvering o'er the ocean hrim Rous'd from their flumber on | thăt fié|ry | coueh. While the | prömis'curcus crowd ftood yet aloof. Throws his fteep flight | in mány̆ | ăn ailry whirl.
Having thus fufficiently proved that the Englifh heroic verfe admits of all the feet except the tribrach, it may be proper to add, that from the nature of our accent we have duplicates of thefe feet, viz. fuch as are formed by quantity, and fuch as are formed by the mere iffus of the voice; an opulence peculiar to our tongue, and which may be the fource of a boundlefs variety. But as feet formed of fyllables which have the accent or iffus on the confonant are neceffarily pronounced in lefs time than fimilar feet formed by quantity, it may be objected, that the meafure of a whole line, confltucted in the former manner, muft be fhorter than that of another line conftructed in the latter; and that the intermixture of verfes of fuch different meafures in the fame poem mult have a bad effect on the melody, as being deftructive of proportion. This objection would be well founded, were not the time of the thort accented fyllables compenfated by a fmall paufe at the end of each word to which they belong, as is evident in the following verfe:

Then rus'|tling crack' $\mid$ ling crafh|ing thun'|der down. This line is formed of iambics by accent upon confonants, except the laft fyllable; and yet by means of thefe foft paufes or refts, the meafure of the whole is equal to that of the following, which confifts of pure iambics by quantity.

O'er hēāps | of rū|in fālk'd | the ftatelly hind.
Movement of fo much importance in verfification, regards the order of fyllables in a foot, meafure their quantity. The order of fyllables refpects their progrefs from thort to long or from long to fhort, as in the Greek and Latin languages; or from ftrong to weak or weak to ftrong, i. e. from accented or unaccented fyllables, as in our tongue. It has been already obferved that an Englifh heioic verfe may be compofed wholly of iambics; and experience fhows that fuch verfes have a fine melody. But as the ftrefs of the voice, in repeating verfes of pure iambics, is regularly on every fecond yyllable, fuch uniformity would difgutt the ear in any long fucceffion, and therefore fuch changes were fought for as might introduce the pleafure of variety without prejudice to melody; or which might even contribute to its improvement. Of this nature was the introduction of the trochee to form the firft foot of an heroic verfe, which experience has fhown us is fo far from fooiling the melody, that in many cafes it heightens it. This foot, however, cannot well be admitted into any other part of the verfe without prejudice to the melody, becaufe it interrupts and fops the
ufual movement by another diriclly oppolite. But Verfifica. though it be excludal with regard th pure nieldeds, it may often be admitted into any part of the verfe with advantage to expretion, as is well known to the raders of Milton.
"The next change admitted for the fake of varicty, without prejudice to nelody, is the intermixture of pyrthics and fpondees; in which two impreflions in the one foot make up for the want of one in thie other; :and two long fyllables compenfate two floit, fo as to make the funs of the quantity of the two feet equal to two iambics. That this may be donc without prejudice to the melody, take the following inftances :

Of hěr | white brēan | a fparkling crofs the wore. Nơr thĕ | dëep trāct | of hell-fay firft what caufe.-~
This intermixture may be employed al lilitunn, in any part of the line; and fometimes two fpondees may be placed together in one part of the verfe, to be compenfated by two pyrrhics in another; of which Mr Sheridan quotes the following lines as infances:
Stōod rül'd | fōōd vāft | infinilitưde | confined.
Shē âll | nīght lōng | ȟ̌er ămölrŏus děs|cant fung.
That the former is a proper example, will not perhaps be queftioned; but the third foot in the latter is certainly no pyrrhic. As it is marked here and by him, it is a tribrach; but we appeal to our Englith readers, if it ought not to have been marked an amphibrach by accent, and if the fourth foot be not an iambus. To us the feet of the line appear to be as follow:
Shē äll | nïght lŏng | hĕr am'ölrŏus des'|cănt fun'g.
It is indeed a better example of the proper ufe of the amphibrach than any which he has given, unlefs perlaps the two following lines:

## Up tn | thĕ fíllry con|căve tow'ěrling high

Thrōws his | fēeep fīght | in man'ỳ | àn ãilry whirl.
That in thefe three lines the introduction of the amphibrach does not hurt the melody, will be acknowledged by every perfon who has an ear; and thofe who have not, are not qualified to judge. But we appeal to every man of tafte, if the two amphibrachs fucceeding each other in the laft line do not add much to the expreffion of the verfe. If this be queftioned, we have only to change the movement to the common iambic, and we fhall difcover how feeble the line will become.

Throws his | fteep flight | in man|y ailry whirls.
This is fimple defcription, inftead of that magical power of numbers which to the imagination produces the object itfelf, whirling as it were round an axis.

Having thus fhown that the iambus, fpondee, pyrrhic, and ampibrach, by accent, may be ufed in our meafure with great latitude; and that the trochee may at all times begin the line, and in fome cafes with advantage to the melody; it now remains only to add, that the dactyl, having the fame movement, may be introduced in the place of the trochee; and the anapreft in the place of the iambus. In proof of this, were not the article fwelling in our hands, we could adduce many inflances which would how what an inexhauftible fund of riches, and what an immenfe variety of materials, are prepared for us, "to build the lofty rhymc." But we hatter

Verificia- haften to the next thing to be confidered in the art of tion. verfifying, which is known by the name of paufes.
"Of the poetic panfes there are two forts, the cefural and the final. The cefural divides the verfe into equal or unequal paits; the final clofes it. In a verfe there may be two or more cefural paufes, but it is evident that there can be but one final. As the final paufe concerns the readcr more than the writer of verfes, it has been feldom treated of by the critics. Yet as it is this final paufe which in many cafes diftinguifhes verle from profe, it cannot be improper in the prefent article to flow how it ought to be made. Were it indeed a law of our verfification, that every line fhould terminate with a fop in the fenfe, the boundaies of the meafure would be fixed, and the nature of the final paufe could not be miftaken. But nothing has puzzled the bulk of rcaders, or divided their opinions, more than the manaer in which thofe verfes ought to be recited, where the fenfe does not clofe with the line; and whofe latt words have a neceffary connestion with thofe that begin the fubfequent verfe. "Some (fays Mr Sheridan) who fee the neceffity of pointing out the metre, pronounce the laft word of each line in fuch a note as ufually accompanies a comma, in marking the fmalleft mem. ber of a fentence. Now this is certainly improper, becaufe it makes that appear to be a complete member of a fentence which is an incomplete one ; and by difjoining the fenfe as well as the words, often confounds the meaning. Others again, but thefe fewer in number, and of the more abfurd kind, drop their voice at the end of every line, in the fame note which they ufe is marking a full fop; to the utter annihilation of the fenfe. Some readers (continues our author) of a more enthufiatic kind, elevate their voices at the end of all verfes to a higher note than is ever ufed in the ftops which divide the meaning. But fuch a continued repetition of the fame high note becomes difgufting by its monetony, and gives an air of clanting to fuch recitation. To avoid thefe feveral fanlts, the bulk of readers have chofen what they think a fafer courfe, which is that of running the lines one into another without the leaft paufe, where they find none in the fenfe; hut by this mode of recitation they reduce poetry to fomething worfe than profe, to verfe run mad.

But it may be afked, if this final paufe mult be mark. ed neither by an elevation nor by a depreffion of the voice, how is it to he marked at all? To which Mr Sheridan reples, by making no clange whatever in the voice before it. This will fufficiently diftinguifh it from the other paufes, the comma, femicolon, \&c. becanfe fome change of note, by raifing or deprefling the voice, always precedes then, whilt the voice is here only fufpended.

Now this paufe of fufpen'ion is the very thing wanting to preferve the mel.ody at all times, without interfering with the fenfe. For it perfealy marks the bound of the metre: a:ad being made only by a fufpenfion, nit by a change of note in the voice, it never can affert the fenfe; becaufe the fentential fops, or thofe which affect the ienfe, being all made with a change of note, where there is mof fuch change, the fenfe cannot be affected. No. is this the orly duvantage gained to numbers by this otop of furpenfion. It alfo prevents the monotony at the end of lines; which, however pleafing to a rude, is difgulting to a delicatc, ear. For as this ftop has
no peculiar note of its nwn, Lut always tabes that which Verfifi
belongs to the preceding word, it changes continually with the matter, and is as various as the fenfe.

Having faid all that is neceflary with regard to the final, we proceed now to confider the cefural, paufe. To thefe two paufes it will be proper to give the denomination of $m u / f_{c a}$, to dittinguilh them from the comma, femicolon, colon, and full itop, which may be called fertential paufes; the office of the former being to mark the melody, as that of the latter is to point out the fenfe. The cefural, like the final paufe, fometimes coincides with the fentential; and fometimes takes place where there is no Rop in the fenfe. In this lant cafe, it is exactly of the fame nature, and governed by the fame laws with the paufe of fufpenfion, which we have juft defcribed.

The refure, though not effential, is however a great ornament to verfe, as it improves and diverfifies the melody, by a judicious management in varying its fituation; but it difcharges a fill more important office than this. Were there no cefure, verfe could afpire to no higher ornament than that of fimple melody; but by neans of this paufe there is a new fource of delight opened in poetic numbers, corref, ondent in fome fort to harmony in mufic. This takes its rife from that act of the mind which compares the relative proportions that the members of a verfe thus divided bear to each other, as well as to thofe in the adjoining lines. In order to fee this matter in a clear light, let us examine what effect the cefure produces in fingle lines, and afterwards in comparing contiguous lines with each other.
With regard to the place of the cefure, Mr Pope and others lave exprefsly dechared, that no line appeared mufical to their ears, where the cefure was not after the fourth, fifth, or fixth fyllable of the verfe. Some have enlarged its empire to the third and feventh fyllables; whilf others have afferted that it may be admitted into any part of the line.
"There needs but a little diftinguifhing (fays Mr Sheridan) to reconcile thefe different opinions. If melody alone is to be confidered, Mr Pope is in the right when he fixes its feat in or as near as may be to the middle of the verfe. To form lines of the firt melody, the cefure muft either be at the end of the fecond or of the third foot, or in the middle of the third between the two. Of this movement take the following examples:
I. Of the cefure at the end of the fecond foot.

Our plenteous ftrćams i| a various race fupply ; The bright-ey'd pcr'ch || with fins of Tyrian dye; The filver eél || in thining volumes roll'd; 'The yellow carp' || in fcates bedrep'd with gold.
2. At the end of the third foot.

Will tender billet-doúx || he lights the pyre,
And breathes three amorous sighs i| to raife the fire.
3. Between the two, dividing the third foot.

The fields are rávilh'd $\|$ from the induftrious fiwains, From men their cíties, || and from gods their fanes.
Thefe lines are certainly all of a fine melody, yet they are not quite upon an equality in that refpect. Thofe which have the cefure in the middle arc of the firt order;
ifica- der ; thofe which lrave it at the end of the fecond foot are next ; and thofe which lave the paufe at the end of the third foot the laft. The readon of this prefercnce it may not perhaps be difficult to allizn.

In the plealure ariling from comparing the proportion which the parts of a whole bear to each other, the more eatily and difinstly the mind perceives that proportion, the greater is the plcafurc. Now there is nothing which the mind more inftataneoufly and clearly difcerns, than the divifion of a whole into two equal parts, which alone would give a fuperiority to lines of the firft order over thofe of the other two. But this is nst the oully claim to furcriority which fuch lines porfefs. The cefure being on them always on an unaccented, and the final prauie on an accented, fyllable, they lave a mixture of variety and equality of which neither of the other orders can boaft, as in thefe orders the cefural and final paufes are both on accented fyllables.

In the divifion of the other two fpecies, if we refpest quantity only, the proportion is exactly the fame, the one being as two to three, and the other as three to two ; bnt it is the order or novement which here makes the difference. In lines where the cefure bounds the fecond foot, the finaller portion of the verfe is firft in order, the greater laft; and this order is reverfed in lines which have the cefure at the end of the third foot. Now, as the latter part of the verfe leaves the frongeft and moft lafting impreffion on the ear, where the larger portion belongs to the latter part of the line, the impreftion muft in proportion be greater; the effcet in found being the fame as that produced by a climax in fenfe, where one part tifes above another.

Having fhown in what manner the cefure improves and diverfifies the melody of verfe, we fhall now treat of its more important office, by which it is the chief fource of harmony in numbers. But, firf, it will be neceflary to explain what we mean by the term barmony, as applied to verfe.
Melody in mufic regards only the effects produced by fucceffive founds; and harmony, Ariefly fpeaking, the effects produced by different co-exifting founds, which are found to be in concord. Harmony, therefore, in this fenfe of the word, can never be applied to poetic numbers, of which there can be only one reciter, and confequently the founds can only be in fucceffion. When therefore we fpeak of the harmony of verfe, we mean nothing more than an effect produced by an action of the mind in comparing the different members of verfe already conftructed according to the laws of melody with each other, and percciving a due and beautiful proportion between them.

The firft and loweft perception of this kind of harmony arifes from comparing two members of the fame line with each other, divided in the manner to be feen in the three inftances already given; becaufe the beauty of proportion in the numbers, according to each of thefe divilions, is founded in nature. But there is a perception of harmony in verfification, which arifes from the compaifon of $t$ wo lines, and obferving the relative propostion of their members; whether they correfpond exactly to each other by fimilar divifions, as in the couplets already quoted; or whether they are diverfified by cefures in different places. As,

See the bold youth || frain up the threatening feep,
Rufh thro' the thickets $\|$ down the valleys fireep.

Where we find the cefure at the end of the fecond font of the firlt line, and in the middle of the third foot of the latt.

Hang e'er their courfers heads $\|$ with cager ipeed, And carth rolls b:ick || beneath the flying fteed.
Herc the cefure is at the end of the third font in the former, and of the fecond in the latter line-T. The perception of this fpecies of harmony is far fuperior to the former; becaule, to the pleafure of comparing the members of the fame line with each other, there is fuperadded that of comparing the different members of the different lines with each other; and the harmony is enrichad by having four members of comparifon inItead of two. The pleafure is fill increafed in comparing a greater number of lines, and oblerving the rela. tive proportion of the couplets to each other in point of fimilarity and diverfity. As thus,

Thy forefls, Windfor, $|\mid$ and thy green retreats,
At once the monarch's $\|$ and the mufe's feats,
Invite my lays. $\|$ Be prefent fylvan maids,
Unlock your fprings || and open all your fhades.
Here we find that the cefiure is in the middle of the verfe in each line of the firtt conplet, and at the end of the fecond foot in each line of the latt; which gives a fimilarity in each conplet diftinetly confidered, and a diverfity when the one is compared with the other, that has a very pleafing effect. Nor is the pleafure lefs where we find a diverfity in the lines of each couplet, and a fimilarity in comparing the couplets themfelves. As in thefe,
'Not half io fwift || the trembling doves can fis, When the fierce eagle || cleares the liquid fiy ;
Not half fo fwiftly $\|$ the fierce eagle moves,
When thro' the clouds $\|$ he drives the trembling doves.
There is another mode of dividing lines well fuited to the mature of the couplet, by introducing femipaufes, which with the cefure divide the line into four portions. By a femipanfe, we mean a fmall reft of the voice, during a portion of time equal to half of that taken up by the cefure ; as will be perceived in the following fine couplet:

Warms | in the fun || refrefhes | in the breeze, Glows | in the ftars || and bloffoms | in the trees.
That the harmuny, and of courfe the pleafure, refulting from poetic numbers, is increafed as weil by the femipaufe as by the cefiure, is obvions to every ear; becaufe lines fo conftructed furnifh a greater number of members for comparifon: but it is of more importance to oblerve, that by means of the femipaufes, lines which, feparately confidered, are not of the finelt harmony, nay yet produce it when oppofed to each other, and compared in the couplet. Of the truth of this obfervation, the following couplet, efpecially as it fucceeds that immediately queted is a ftriking proof:

> Lives | thro' all life || extends | thro' all extent,

Spreads | undivided || operates | unfpent.
What we have advanced upon this fpecies of verfe, will contribute to folve a poetical problem thrown out by Dryden as a crux to his brethren: it was to account for the pecular beanty of that celebrated couplet in Sir John Denham's Cooper's Hill, where he thas defcribes the Thames:

Verfification.

Tho' deep | yet clear || tho' gentle | yet not dull. Strong | without rage || without o'crflowing | full. This defcription has great merit independent of the harmony of the numbers; but the chief beanty of the verfification lies in the happy difpofition of the paufes and femipaufes, fo as to make a fine harmony in each line when its portions are compared, and in the couplet when one line is compared with the other.

Having now faid all that is neceffary upon paufes find femipaufes, we have done the utmoft jultice to our fubject which the limits afligned us will permit. Feet and paufes are the confticuent parts of verfe; and the proper adjuftment of them depends upon the poet's knowledge of numbers, accent, quantity, and novement, all of which we have endeavoured briefly to explain. In conformity to the practice of fome critics, we might have treated feparately of thyme and of blank verfe; but as the effentials of all heroic verfes are the fame,
fuch a divifion of our fubjee would have thrown no light upon the art of Englifla verification. It may be juit worth while to obferve, that the paufe at the end of a couplet ought to ccincide, if potfible, with a flight paufe in the fenfe, and that there is no neceflity for this coincidence of paufes at the end of any particular blank verfe. We might likewife compare unr her oic line with the ancient hexameter, and endeavour to appreciate their refpective merits; but there is not a reader capable of attending to fuch a comparifon who wiil not judge for hin.felf; and it may perhaps be queftioned, whether there be two who will form precifely the fame judgment. Mr Sheridan, and all the were Englifh critics, give a high degree of preference to our heroic, on account of the valt variety of feet which it admits; whillt the readers of Greek and Latin poetry prefer the hexameter, on accuunt of its more mufical notes and majeltic length.

1ogge logy. See Cottus, ni 2.

POGGE, the cataphractus cottus in ichthyo-
pOGGIUS Bracciolinus, a man of great parts and learning, who contributed much to the revival of knowledge in Europe, was born at Terranuova, in the territories of Florence, in 1380 . His firlt public employment was that of writer of the apoftolic letters, which he held 10 years, and was then made apoftolic fecretary, in which capacity he officiated 40 years, under feven popes. In 1453 , when he was 72 years of age, he accepted the employment of fecretary to the republic of Florence, to which place he removed, and died i:1 1459. He vifited feveral countries, and fearched many monafteries, to recover ancient authors, numbers of which he brought to light : his own works confilt of moral pieces, orations, letters, and A Hiltory of Florence from 1350 to 1455 , which is the moft confiderable of them.

POGO, is a name by which the inhabitants of the Philippine iflands diftinguifh their quail, which, thou ght fmaller, is in every other refpect very like thofe of Britain.

POICTIERS, an ancient, large, and confiderable town of France, capital of Poictou. It was a bithop's fee, an $f$ contained four abbeys, a mint, an univerfity famous for law, 22 parifhes, 9 convents for men, and 12 nunneries. There are here feveral Roman antiquities, and particularly an amphitheatre, but partly demoiihed, and hid by the houfes. There is alfo a triumphal arch, which ferves as a gate to the great freet. It is not peopled in propostion to its extent. Near this place Edward the Black Prince gained a decifive victory over thé lirench, tiking King Jolin and his fon Philip prifone:s, in 1356, whom he afterwards brought aver into England. See France, ri 7 r, \&ic.-It is teated on a hill on the tiver Clain, 52 miles foutn-welt of Tours, and 120 north by ealt of Dourdeaux. E. Long. o. 25. N. L.at. +6.35 .

POICTOU, a province of France, bounded on the north by Bretagne, Anjou, and part of 'Touraine : on the eaft by Touraine, Berry', and Manche; on the fouth by Angoumois, Saintonge, and the teritury of Aunis; and on the weft by the fea of Gafony. It is divided
into the Upper and Lower; and is fertile in corn and wine, and feeds a great number of cattle, particularly poincii mules. It was in polfeftion of the kings of England for a confiderable time, till it was loft by the unfortunate Henry VI. Poictiers is the capital town.

Colic of Poictou. See Medicine, $\mathrm{n}^{\circ} 303$.
Poinciana, Barbadoes flower-fence: A genus of the monogynia order, belonging to the decandria clafs of plants; and in the natural method ranking under the 33 d order, Lomentacea. The calyx is pentaphyllous; the petals five, the uppermoft larger than the reft ; the ftamina long, and all fertile ; the feed veffel a legumen. There is only one fpecies, viz. the pulcherrima, a native of both Indies. It rifes with a flraight ftalk 10 or 12 feet high, which is covered with a grey bark, and is fometimes as thick as the fmall of a man's leg, dividing into feveral fpreadir.g branches at the top, which are armed at each joint with two fhort, crooked, ftrong fpines, and garnifhed with decompound winged leaves, each leaf conlifting of fix or eight pair of fimple winged leaves. They are of a light green colour, and when bruifed emit a flong odour. The branches are terminated by loofe fpikes of flowers, which are fometimes formed into a kind of pyramid, and at others difpofed more in the form of an umbel. The footfalk of each flower is near three inches long; the flower is compoied of five petals, which are roundilh at the top, but are contracled to narrow tails at the bale. They fpread open, and are beautifully variegated with a deep red or orange colour, yellow, and fome fputs of green; and emit a very agreeable odour. After the flower is paft, the germen beconees a broad flat pod threc inches long, divided into three or four cells by tranfiverfe partitions, cach including one fiattifh itregular feed. The plant is propagated by feeds; but, being tencer, is to be conftantly kept in the bark-ftove. It is very impatient of moiture in winter: and if the leat dimp feizes its top, it either kids the plant or deffroys its head. In fome parts of Europe it may be nade to grow taller than in the phaces where it is mative ; bot its items will not be thicher than a man's finger. In Bab idses it is planted in hedges to divide the lands, whence it has

## POI [ 265 POI

the name of forver-fence. In the Wert Indies, its leaves are made ufe of as a perge intead of ferna; and in Jamaica it is called fomm.

POINT, a term ufed in varions arts.
Poist, in grammar, a character ufed to mark the divifions of difcourfe (Sec Comma, Colon, \&c.) A point proper is what we otherwife call a full fop or period. See Punctuation.

Point, in geometry, according to Euclid, is that which hath neither parts nor magnitude.

Point, in mulic, a mark or note anciently ufed to diftinguilh the tones or founds: hence we fill call it fimple counter-point, when a note of the lower part anfwers exanly to that of an upper ; and figurative counterpoint, when any note is fyncopated, and one of the parts makes feveral notes or inflections of the voice, while the other holds on one.

We ftill ure a point, to raife the value of a note, and prolong its time by one half, c. $g$. a point added to a lemibreve infead of two minims, make it equal to three; and fo of the other notes. See the article Time.

Point, in aftronomy, a term applied to certain points or places marked in the heavens, and diftinguifhed by proper epithets.

The four grand points or divifions of the horizon, viz. the caft, welt, north, and fouth, are called the cardinal points.

The zenith and nadir are the vertical points; the points wherein the orbits of the planets cut the plane of the ecliptic are called the nodes: the points wherein the equator and ecliptic interfect are cahled the equinoctial points; particularly, that whence the fun afcends towards the north pole, is cailed the vernal point; and that by which he defcends to the fouth pole, the autumnal point. The points of the ecliptic, where the fun's afcent above the equator, and defcent below it, terminate, are called the folfititial point; particularly the former of them, the eflival or fummer-point; the latter, the brumal or winter-point.

Point is alfo ufed for a cape or headland jutting out into the fea : thus feamen fay, two points of land are in one another, when they are fo in a right linc againt each other, as that the innermof is hindered from being feen by the outermof.

Point, in perfipective, is ufed for various poles or places, with regard to the perfpective plane. Sce Perspectife.

Ponst is alio an iron or fteel inftriment, ufed with fome variety in feveral arts. Engravers, etchers, cutters in wood, \&ic. ufe points to trace their detigns on the copper, wood, tone, \&c. Sce the articles Engra. ning, \&ic.

Point, in the manufactories, is a general term, ufed for all kinds of laces wrought with the reedle; fuch are the point le Venice, point de France, point de Genoa, ic. which are diftinguifhed by the particular economy and arrangement of their points.-Point is fometimes ufed for lace woven with bobbins; as Englifh point, point de Malines, point d'Havre, scc.

Ponst, in poetry, denotes a lively brik turn or conceit, nitally found or expected at the clofe of an epigran. See Pobiry, $\mathrm{n}^{\circ} 169$.

Ponct Blamk, in gunnery, denotes the fhot of a gun levelled horizontally, without either mounting or finking the muzzle of the piece.-In hooting point-blank, Vol. XV
the fhot or builet is fuppofed to go direßly furward in a fraight line to the mark; and not to move in a curve, as bombs and highly clevated random funts dn.-W When a piece flands upon a level plane, and is laid level, the diftance between the piece and the point where the flot touches the ground firtt, is called the point-blant range of that fiece ; but as the fame piece ranges more or lefs, according to a greater or lefs charge, the pointblank range is taken from that of a piece loaded with fuch a charge as is ured commonly in action. It is therefore neceflary that thefe ranges of ail pieces thould be known, fince the gunner judges from thence what elevation he is to give to his pieces when he is either farther from or nearer to the object to be fircd at ; and this he can do pretty nearly by fight, after confiderable practice.

POINTING, in grammar, the art of dividing a difcourfe, by points, into periods and members of periods, in order to thow the proper paufes to be made in reading, and to facilitate the pronunciation and undertanding thereof. See the article Punctuation.

POINTS, in heraldry, are the feverul different parts of an efcutcheon, denoting the local pofitions of any figure. See Heraldry, p. 44t. col. 2.

Points, in electricity, are thofe acute terminations of bodies which facilitate the paffage of the electrical fluid from or to fuch bodies. Sce Electricity.

Points, or Vozuel Points, in the Hebrew language. See Philologit, Sect. 1. no 31, \&cc.

POISON, is any fubflance which proves deftrutive to the life of animals in a fmall quantity, either taken by the mouth, mixed with the blood, or applied to the nerves. See Medicine, $n^{\circ}$ 261, 269, 303, 322, 408, \&c. \&c.

Of poifons there are many different kinds, which are exceedingly various in their operations. The mineral poifons, as arfenic and corrofive mercury, feem to attack the folid parts of the fomach, and to produce death by eroding its fubitance: the antimonials feem rather to attack the nerves, and to kill by throwing the whole fyttem into convulfions; and in this manner alfo moft of the vegetable poifons feem to operate. All of thefe, however, feem to be inferior in Arength to the poifons of fome of the more deadly kinds of ferpents, which operate fo fuddenly that the animal bit by them will be dead before another that had fwallowed arfenic would be affected.

Much has bcen written concerming a poifon maje ufe of by the African negroes, by the Americans, and by the Eaf Indians. 'Io this very Atrange effeets have been afcribed. It has been faid that by this prifori a man might be killed at any cortain time; as, for infance, after the interval of a day, a week, a month, a year, or even feveral years. Thefe wonderful effects, however, dn not feem worthy of credit; as the Abbe Fontana has given a particular acceunt of an American poifon called licunas, which in all probability is the fame with that ufed in Africa and the Eant Indies; and from his account it is extremely improbable that any fuch effects could be prodaced with certainty.

With this poifon the Abté was furnifhed by Dr He. berden. It was clofed and fealed up in an cantion pot inclofed in a tin-cafe. Within the tin-cafe was a rote containing the following words: "Indian poiton, brought from the banks of the river of the Amazons L. 1

## PO I

Po: Ooh.
by Don Pedro Maldonado. It is one of the forts men$\mathrm{N}^{\circ}$ 12." In the volume of the Philofophical Tranfactons here quoted, mention is made of two poifons little different in their activity; the one called the poifon of Lamas, and the other of Ticunas. The poison in the earthen velfel ufed by the Abbe Fontana was that of the ticunas; he was aldo furnifled with a number of American arrows dipped in poifon, but whether that of the lamas or ticunas he could not tell.
Our author begins bis account of the nature of this poison with detecting forme of the miftakes which had been propagated concerning it. -It had been alerted, that the Ticunas poifon proves noxious by the mere effflavin, but much more by the team which exhales from it in boiling or burning: that, among the Indians, it is prepared only by women condemned to die; and that the mark of its being fufficiently prepared is when the attendant is killed by its fear. All thee afterlions are by the Able refuted in the cleareft manner. He exposed a young pigeon to the fuel of the poison when the veffiel was opened, to the fleam of it when boiling, and to the vapour of it when burning to the fides of the veffel, without the animal's being the leaf injured; on which, concluding that the vapours of this prion were not to be dreaded, he expofed limfelf to them without any fear.

This poifon diffolves very readily even in cold water, and likewife in the vegetable and mineral acids. With oil of vitriol it becomes as black as ink, but not with the reft of the acids. In oil of vitriol it alpo diffolves more lowly than in any of the reft. It does not efffervefce with acids or alkalis; neither does it alter milk, nor tinge it, except with the natural colour of the poifon; nor does it tinge the vegetable juices either red or green. When examined by the microfcope, there is no appearance of regularity or cryftallization; but it for the molt part appears made up of very fall, irregular, roundish bodies, like vegetable juices. It dries without making any noife, and has an extremely bitter taft e when put upon the tongue.

The ticunas poison is harmless when put into the eyes; nor is it fatal when taken by the mouth, unless the quantity is confiderable. Six grains of the fold poifon, diffolved in water, killed a young pigeon which drank it in left than 20 minutes. Five grains killed a fall Guinea-pig in 25 minutes. Light grains killed a
rabbit in an hour and eight minutes, \&cc. In thole experiments it was obferved that much lees poifon was required to kill an animal whore fomach was empty than one that had a full ftomach. Three rabbits and two pigeons were killed in left than 35 minutes by taking a dole of three grains each on an empty fornach; but when the experiment was repeated on five animals with full fomachs, only one of them died.

The mon fatal operation of this poifon is when mixed with the blood. The fmalleft quantity, injected into the jugular vein, killed the animal as if by a flroke of lightning. When applied to wounds in fuck a manner that the flowing of the blood could not waft it away, the animal fell into convuifions and a train of fatal nervous symptoms, which put an end to its life in a few minutes. Yet, notwithstanding there feeming affections of the nerves, the poiron proved harmless when applied to the naked nerves themfetves, or even to the medullary fubfance of them flit open.

The ftrength of this poifon feems to be diminifhed, and even deftroyed, by mineral acids, bat not at all by alkalis or ardent fpirits; but if the frefh poifon was ap. plied to a wound, the application of mineral acids impmediately after could not remove the pernicious effects. So far, indeed, was this from being the cafe, that the application of nitrous acid to the wounded muffle of a pigeon killed the animal in a fort time without any poifon at all. -The effects of the arrows were equally fatal with thole of the poifon itself (1).

The poison of the viper is analogous in its effects to that of ticunas, but inferior in frength ; the latter killing more infantansoufly when injected into a vein than even the poison of the mon venomous rattlesnake.

The Abbe has, however, observed a difference in the action of the two poisons upon blood taken out of the body. He cut off the head of a pigeon, and received its blood into two warm conical glalles, to the amount of about 80 drops into each. Into the blood contained in one porringer, he put four drops of water ; and into the other four drops of the poifon diffolved in water as ufual. The event of this experiment was, that the blood, with which the water only was mixed, coagulated in a fort time; but that in which the poifon was mixed did not coagulate at all. The poifon of the viper alfo hinders the blood from coagulating, but gives it a much blacker tinge than the poifon of the ticunas. The poison of the viper also proves certainly fatal when injected
(A) Mr Paterfon, in his travels in Africa, in the years 1787-8.9, fell in with an European woman who had been wounded with a poifoned arrow. Great pains had been taken to cure her, but in vain; for at different periods of the year an inflammation came on which was fucceeded by a partial mortification. She told him that the wound was cafi'y healed up; but in tho months afterwards there was a certainty of its breaking out again, and this had been the cafe for many years. The Hottentots poifon their arrows with a fpecies of euphorbia. See Euphorbia.The amaryllis ditticha, a large bulbous plant growing about the Cape of Good Hope, called mad poifon, is ufed for the fame purpofe. The natives tale the bulbs when they are putting out their leaves, cut them tranfverfely, extract a thick fluid, and keep it in the fan till it acquires the confiftence of gam, when it is fit for ult. With arrows pnifoned with this gum they kill antelopes and other fall animals intended for food. After they are wounded, the animals generally run for feveral miles, and are frequently not found till next day. When the leaves of this plant are young, the cattle are very fond of them, though they occafion infant death. Mr. ParerIn merton another flabby plant producing a nut, called by the Dutch woolf gift or wolf poison, the only poison useful to the European inhabitants. The nuts are rafted like coffee, pulverized, and fluffed into forme pieces of meat or a dead dog, which are thrown into the fields. By this means the voracious hyenas are gens.rally killed. See Rus.

## POI

n. injefted into the veins, eren in very fmall quantity; but it produces a kind of grumens coagulation and blacknefs in the bhoul when dawn from a vein, though it prevents the proper coagulation of that fluid, and its teparation into cralamentum and feam as uftual. Sce Viper.

In the Prilofophical Tranfutions, No 335. we have a number of experiments which thow the effets of many different poifors upen animals; from whence it appears, that many fublances which are not at all accounted poifonous, set prove as certainly fatal when mixed with the blood as even the poifon of rattlefinakes, or the ticunas itfelf.-An ounce of emctic wine, being injected into the jugular vein of a large dog, produced no eflect for a quarter of an hour. At the expiration of that fyace lie became fick, had a continual vomiting, and cyacuation of fome hard excrements by fool. By thefe evacuations he feemed to be fomewhat relieved ; but foon grew uneafy, moved from place to place, and vomited again. A fier this he laid himfelf down on the ground prett; quiecty; but his reft was diflurbed by a return of his vomiting, and his ftrength greatly decreafed. An hour and an half after the operation he appearcd half dead, but was greatly revived by laving fome warm broth poured down his throat with a funnel. This, however, proved only a temporary relief; for in a fhort time the vomiting returncd, he made urine in great quantity, howled miferably, and died in convul-fions.-A dram and an half of fal ammoniac diffolved in an ounce and an hallf of water, and injected into the jugular vein of a dog, killed him with convulfions almuft inftantly. - The fame effect followed from injecting a dram of falt of tartar diffolved in an ounce of warm water; but a dram and an half of common falt injected into the jugular produced little other bad confequence than a temporary thirft-A dram of purified white vitriol, injected into the crural vein of a dog, killed him immediately:-Fifteen grains of falt of urine diffolved in an ounce of water, and injected into the crural vein of a dog, threw him into fuch violent convulfions that he feemed to be dying; neverthelefs he recovered from a fecond dofe, though not without a great deal of difficulty: but an ounce of urine made by a man fafting produced no bad effect. Diluted aquafortis injested into the jugular and crural vein of a dog killed him immediately by coagulating the blood. Oil of fulphur (containing fome quantity of the volatile vitriolic acid) did not kill a dog after repeated tials. On the contrary, as foon as be was let go, he ran into all the corners of the room fearching for meat: and having found fome bones, he fell a grawing them with firange aridity, as if the acis, by injection into his veins, had given him a better appetite. Another dog who had oil of tartar injected into his veins, fwelled and died, after fuffering great torment. His blood was found florid, and not coagulated. - A drachm and a half of fpirit of falt diluted with water, and injected into the jugular vein of a dog, killed him immediately. In the right ventricle of the heart the blood was found partly grumous and concreted into harder clots than ordinary, and partly frothy. Warm vinegar was inje.ted withont doing any manifett harm. -Two drachms of fugar difficlved into an ounce of water were injected into the jugular vein of a dog without any lurt.

Thete are the rcfults of the experiments where faline
fubfances were injected into the veins. Many acrids proved equally fat.l. A decoation of two drams of white hellchorc, injected into the jugulat vein of a d es, killed him like at troke of lightning. Ato ?her cioz. was killed in a moment by an injofion of an onnce of rectifich pipit of wine in which a drano of camphorr viat diffolved.-T'en drams of highly reatitid fpisit of wine. injeated inio the crural vein of a dar, killeul him in a very flart time: he died quietly, and licking his jaws with his tongue as with pleafure. In the vera cava and right ventricle of the heart the blout was congu'a. ted into a great many little clots. - Threedracims of rectified fpirit of wins injected into the crural vein of a fmall dog made him apoplestic, and as it were half dead. In a little time he recovered from the apoplexy, and became giddy; and, when he endeavoured to go, reelec! and fell down. Though his ftength increafed by degrees, yet his drunkennefs continued. His eyes were red and fiery ; and his fight fo dull that he farce feened to take notice of any thing: and when he was beat, he would farce move. However, in four hours be began to recover, and would eat bread when offered him; the next day he was out of d.rnger. - Five omnces of ftrong white-wine injected into the crural vein of a dog made him very drunk for an Eew hours, but did not produce any other confequences. An ounce of frong decoction of tobacco injefted into a vein killed a dog in a very flort time in terrible convulfions. Ten drops of oil of fage rubbed with half a dram of fugar, and chus difolved in water, did no harm by being injected into the blood.

Mercury, though feemingly void of all acrimony, proves alfo fatal when injected into the blood. Soon after the injection of half an ounce of this mineral into the jugular vein of a dog, he was feized with a dry fhort cough which came by intervals. About two days after, he was troubled with a great difficulty of breathing, and made a noife like that of a brokenwinded horfe. There was no tumnar about the root of the tongue or the parotid glands, nor any appearance of a falivation. In four days be died; laving been for two days beforc fo much troubled with an orthup. neea, that he could fleep only when he leaved his lred d againtt romething. When opened, sbout a pint of blondy ferum was fond in the thorax, and the cutfide of the lungs in mof places was bliftered. Some of the blifers were larger and others finaller than a pea, but molt of them contuined mercurial globules. Several of them were broken; and upan being preffed a little, the mercury ran out with a misture of a little fanits; but upon fronger prefiure, a comfiderable quantity of fanies illiued out. In the right ventricle of the heart fome particies of quichfilver were found in the ve:\% middlecs the coagulated blood lodged there, and the tame thing alfo was obferved in the pulmonary artery. Some blond alfo was found coacyulated in a very frange and unufual manner betwecn the colunna of the right ventricle of the heart, and in this a greater quantity of quick filver than anywherecle. In the left ventric le was found a very tenacoous blood, coagulated, and ficking to the great v.lve, including the terdons of it, auda little refembing a polyfus. No mercury could be fonnd in this ventricie by the mont diligent fearch ; whence it appears, thit the mercury had paffed no farther than the extremities of the pulnmary artery, where it had Ruck and oce:ifioned fatal otilriac-tions.-In another dog, which had mercury inje?cd

## POI

In fon.
into the jugular, it appcars to have paffed the pulmonury artery, as part of it was found in the cavity of the abdomen, and part alfo in fume other cavities of the body. All the glandules were very tuagid and full of liquor, efpecially in the ventricles of the brain, and all round there was a great quantity of ferum.

In like manner, oil of olives proves certainly fatal when injected into the blood. Half an ounce of this, injected into the crural vein of a dorg, produced no effect in hall a quarter of an hour : but after that, the animal barked, cried, looked dejected, and fell into a deep apopleny; fo that his limbs were deprived of all fenfe and motion, and were flexible any way at plealiure. His refpiration continued very frong, with a fnorting and wheezing, and a thick humour fometimes mixed with blood flowing out of his mouth. He loft all external fenfe: the eyes, thrugh they continued open, were not fenfible of any objects that were put to them; and even the cornea could be touched and rubbed, without his being the leat fenfible of it : his eyelids, howevcr, had a convulfive motion. The hearing was quite loft; and in a fhort time the feeling became fo dull, that his claws and ears could be bored with red. hot pincers without his exprefing the leaft fenfe of pain. Sometimes he was feized with a convulfive motion of the diaphragm and mufcles fubfervient to refpiration; upon which he would bark ftrongly, as if he had been awake: but this waking was only in appearance; for all the time of this barking he continued as infenfible as ever. In three hours he died; and on opening his body, the bronchix were flled with a thick froth.An ounce of oil of olives injected into the jugular of anothor dog killed him in a moment; but a third lived an hour after it. He was feized with a great fleepinefs, fnorting, and wheezing, but did not bark like the firf. In all of them a great quantity of thick froth was found in the lungs.

We come now to fpeak of thofe poifons which prove

- ece Chic. mittry, $n^{\circ}$ 225, 1256, \&.c. Metlipine as ahove reficred to, and tharsuacy, pafini. mortal ( B ) when taken by the mouth. The principal of thefe are, arfenic, corrofive mercury, glafs of antimony, and lead*. What the effects of thefe fubfances arc when injected into the blood, cannot be related, as no experiments feem to have been made with them in that way, excepting antimony, whofe effects have been already mentioned. The effects of opium, when injected into the veins, feem to be fimilar to its effects when taken by the mouth. Fifty grains of opium, diffolved in an ounce of water, were injected into the crural rein of a cat. Immediately after the operation fhe feemed much dejected, but did not cry; only made a low, incorupted, and complaining noife. This was
fucceeded by trembing of the limbs, convulfive motion; of the eyes, ears, lips, and almolt all parts of the body, with violent convulfions of the breaft. Sometimes the would raife up her head, and feem to look about her; but her eyes were very dull, and looked dead. Though fhe was let loofe, and had nothing tied about her neck, yet her mouth was fo filled with froth, that the was almoft ftrangled. At laft, her convulfive montions continuing, and being feized with ftretching of her limbs, fie died in a quarter of an hour. Upon opening the body, the blood was found not to be much altered from its natural ftate. - A dram and an half of opium was difolved in an ounce and an half of water, and then injected into the crural vein of a lufty ftrong dog. He Itruggled violently; made a Joud noife, though lis jaws vrere tied : had a great difficulty of breathing, and palpitation of the heart ; with convullive motions of almoft all parts of his body. Thefe fymptoms were fucceeded by a profound and apoplectic fleep. Having untied him, he lay upon the ground without moving or making any noife, though feverely beaten. About half an hour after he began to recover fome fenfe, and would move a little when beaten. The fleepiners fill decreafed; fo that in an hour and a half he would make a noife and walk a little when beat. However, he died in four days, after having voided a quantity of fetid excrements, in colour refembling the diluted opium he had fivallowed.

The oil of tobacco has generally been reckuned a very violent poifon when introduced into the blood; but from the Abbé Fontana's experiments, it appears to be far inferior in flrength to the poifon of ticunas, or to the bite of a viper. A drop of oil of tobacco was put into a fmall incifion in the right thigh of a pigeon, and in two minutes the animal could net ftand on its right foot. The fame experiment was repeated on mother pigeon and produced exactly the fime effeet. In another cafe, the oil was applied to a flight wound in the breaft ; three minutes after which, the animal could not ftand on the left foot. This experiment was alfo repeated a fecond time, with the fame fuccels. A tooth-pick, fteeped in oil of tobacco, and introduced into the mufcles of the breaft, made the animal fall down in a few feconds as if dead. Applied to two others, they threw up feveral times all the food they had caten. Two others treated in the fame manner, but with empty flomachs, made many efforts to vomit.-In general, the vomiting was found to be a conftant effect of this poifon: but the lofs of motion in the part to which the poifon is applied, was found to be only accidental. None of the animals died by the application

for. application of oil of tobacco. Dr Leakc however afferts the contrary; faying, that this oil, which is ufed by the Indians in poifoning arrows, when infufed into a frefh wound, befides fieknefs and vomiting, occafions convulfions and death. See I'ractical IIffay on Difiafes of the $V_{i j c e r a, ~ p . ~}^{67}$.

The pernicious effett of laurel-water are tahen notice of under the article Medicine, $\mathrm{n}^{\circ} 2 \mathrm{Gt}$. The account is coafirt:ed by the experiments of the Abbé Fontana ; who tells us, that it not only kills in a flort time when taken by the mouth, but that, when given in fmall dofes, the animal writhes fo that the head joins the tail, and the vertebre arch out in fuch a manner as to ftrike wilh honvor every one who fees it. In order to :.fcertain the effects of this water when taken into the blood, our author opened the fkin of the lower belly of a pretty large rabbit, and made a wound in it about an inch long ; and having flightly wounded the mufcles under it in many parts, applied two or three tea fpoonfuls of laurel-water. The animal fell down consulfed in lefs than three minutes, and died foon after. The experiment was repeated with fimilar fuccefs in other animals; but was always found to act moft powerfully, and in the fhorteft time, when taken by the mouth, or injected by way of clyfter. From thefe experiments, however, he concluded, that laurel-water would kill by being injected into the blood: but in this he was deceived; for two rabbits had each of them a large teaspoonful injected into the jugular vein, without any in. convenience either at the time of injection or afterwards. It proved innocent alfo when applied to the bare nerves, and even when introduced into their medullary fubfance.

We ought now to give fome account of the proper antidotes for each kind of poifon; but from what has been related concerning the estreme activity of fome of then, it is evident that in many cafes there can be but very litile hope. Peoplc are moft apt to be bit by ferpents in the legs or hands; and as the poifon, from the Abbé Fontana's experiments, appears to act only in confequence of being abforbed into the blood, it is plain, that to prevent this abforption is the clief indication of cure. We have recommended feveral methods for this purpofe under the article Medicine, $n^{\circ} 408$.; but the Abbé Fontana propofes another not inentioned there, namely, ligature. This, if properly applied between the wounded part and the heart, muft certainly prevent the bad effects of the poifon: but then it tends to produce a difeafe almoft equally fatal; namely, a gangrene of the part; and our author gives inftances of animals being thus deitroyed after the effects of the poifon were prevented; for which reafon he prefers amputation. But the good effects of either of thefe methods, it is evident, muft depend greatly on the nature of the part wounded, and the time when the ligature is applied or the amputation performed. If the teeth of the ferpent, or the poifoned arrow, happens to ftrike 2 large vein, the only pomit.ility of efcaping infant death is to con:prefs the trunk of the vein above the wounded place, and to enlarge the wound, that the blood may flow freely and in large quantity, in order to wafh away the poifon, and difcharge the infesed parts of the blood itfelf. If this is neglectel, and the perfon falls into the agonies of death, perhaps Arongly ftimulating medicines given in large dofes, and continucd for a
length of time, may enable nature to counteract the ri- Poifone rulence of the poifon. For this purpofe volatile alkalis feem moft proper, ats aiting fooneft. See Mrdicist, 1P: 346. col. 2. and P. 347. col. I. ; and perhaps a combination of them with ether might be advantagenus, as by the volatility of that medicine the activity of the alkali would probably be increafed. In the I'hilofophical Tranfactions, we lave an account of the recovery of a dog feemingly by means of the volatile alkali, when probably he was in a dying condition. This dog indeed feems to have had a remarkable ftrength of conititution. The poor creature had firlt got two nunces of the juice of nighthate, which he bore withnut any inconvenience. An equal quantity of the juice of hemlock was then given him without effed. He then got a large dofe of the rout of wolfshane with the lame fuccefs. Two drachms of white hellebore root were next given. Thefe caufed violent romitings and purgings, but fill he outlived the operation. He was then made to fwallow five roots of the colchicum, or meadow-faffron, dug frefh out of the earth. The effect of thefe was fimilar to that of the white hellebore, but itill he did not die. Laftly, he got two drams of opium; and he even outlived this dofe. He was firft calt into a deep fleep by it; but foon awaked, and was feized with violent romitings and purgings, which carried off the effect of the opium. Seeing then that the animal had refifted the moft violent poifons, it was refolved to try the efferts of the bite of a viper; and he was accordingly bit three or four times on the belly a little below the navel by one enraged. The immediate confequence of this was an incipient gangrene in the parts atdjoining to the wound, as appeared by the riling of little black bladders filled with a fanious matter, and a livid colnur which propagated itfelf all around. The motion of the heart became very faint and irregular, and the animal lay without Arength or fenfation, as if he had been feized with a lethargy or apoplexy. In this condition his wound was cupped and fcarified, and Venice treacle (a famous antidote) applied tn it. In two hours after this all the fymptoms were increafed, and he feemed to be nearly dead ; upon which half a drachm of volatile falt of harthorn mixed with a little broth was poured downhisthroat; and the confequence was, that in a flort time he was able to Aand on his feet and walk. Another dofe entirely difpelled his lethargy, and the heart began to recover its ltrength. However, he continued very weak; and though he eat no folid meat for three days, yet at the end of that time his ftrength was evidentiy increafed. The firlt day he drank water plentifully and greedily, and on the fecond day he drank fome broth. On the third day he began to cat folid meat, and feemed out of danger ; uniy fome large and foul ulcers remained on that part of the belly which was bit, and before thefe were healed he was, killed by another dog.
From comparing this with fome other obforvations, indeed, it would feem that volatile alkali is the beft antidote againft all poifons which fuddenly kill by a mixture with the blood, and even of fome others. Indeed its effeits in curing the bite of fnakes feems to be put. beyond all doub:, by a papor in the 2d volume of the Afiatic Refearches, p. 323. "From the effect of a ligature applied between the bitten part and the heart (fays Mr Williams, the author of the paper), it is crident

## POI [ 270 ] POI

Pafor nthat the peifon diffufes itfelf over the body by the returning venous blood; deftroying the itritability, and sendering the fyftem paralytic. It is therefore probable, that the volatile caullic alk:li, in refifting the difeafe of the prifon, does not act fo much as a fecific in deftroying its qual ty, as by counteratting the effect on the fyilem, by himulating the fibres, and preferving that irritability which it tends to defroy."

Put whatever be the mode of its operation, the medicine is unqueftionably powerful. Mr Williams ufed either the volatile caullic alkali, cr eau-de-luce; the former of which he feems to have preferred. Of it he gave oo drops as a dofe in water, and of the eau-de-luce he gave 40, at the fame time applying fome of the medicine to the prart bitten, and repeating the dofe as he found occafiun. Of feven cafes, fome of which were apparently very defjerate, only onedied, and that appears to have been occationed by bad treatment after the cure. Many of the patients were perteily recovered in feven or eight minates, and none of them requirel more than two hours; On the whole, Mr Williams fays that he " never knew an iuftance of the volatile cauftic alkali friling in its offect, where the patient has been able to twallow it." Dr Mead afferts, that the alkali comteracis the deadly effects of laurel water; we have feen its effects in curing the bite of a viper, and of fnakes; and from Dr Wolie's experiments on hydrophobous patients, it may even clainı fome merit there. Still, however, there is another method of attempting a cure ia fuch deploable cafes; and that is, by injecting into the veims any thing which will not deftroy life, but will defloy the effects of the poifon. It is much to be regretted, that in thofe criel experiments which we have already related, the intention feems almof always to have been to kill the animal at all events; whereas, it ought to have been to preferve him alive, and to afcertain what medicines conld be fafely injected into the blood, and what could not, with the effects which followed the injelion of different quantities, none of which were fufficient to deftroy life. But in the way they were manarged, fearce any conclufion can be drawn from them. Indsed it appears that little good is to be expesed from this mode; it is mere feculation, and future experiments mult how whether it ever thall be uted fur the cure of poilons, or for any other purpofes: its being now totally laid afide, feems to militate ftrongly againft the efficacy of it; befides, the extreme cruelty of the operation will ever be allrong bar to its general introduction. See Injection.

There itill remains another method of care in deiperate cafes, when there is a certainty that the whole mafs of blood is infected; and that is, by the bold attempt of changing the whole difeated flum for the blood of a found animal. Experiments of this hind have alin been tried; and the method of making them, together with the confequences of luch as are recorded in the Philofophical Tranfations, we flall motice under the article Transfusion.

Dr Mead, finding that many pretenders to philefo. phy have called the goodneis of the Creator in cueftion, for having created frbftances whofe manifer and obvious qualities are nosious and defrudive, remarks, by way of anfwer, that they hive alin falutary virtues. But, befides their phyfical effects, they are likewife ford for anim ls which affor dus good nouriflanent, goats and
quails being fattened by hellebore, ftarings by hemlock, and hogs innocently eating henbane; befides, fome of thofe vegetables, which were formenly thought poifonous, are now wfed in medicine, and future difooveries may probably increafe the number. The poifon of many regetables is their only defence againtt the ravages of animals; and by means of them we are often enabled to defend uleful plants from the deftroying infeet; fuch as by fpinkling them with effential oil of turpentine ; and by means of fone fubltances poifonous to them, we are entoled to deftroy thore infects which infeft the human body, and the bodies of domeftic animals, \&c.-As for poifonous minerals, arfenic for example, Dr Mead obferves, that it is not a perfect mineral, but only an active fubitance, made ufe of by nature in preparing feveral metals in the earth, which are of grcat lervice to mankind; and, after confirming this by feveral intances, he concludes by faying, the cafe will be found much the fame in all matural productions of this kind. As for poifonous animals, \&ic. their noxions q̧ualities may eafily be accuunted for, by reflecting that it is their only mode of felf.defence. See Aranea, p. 195. and Serpent.

Polson of Copper. This metal, though when in an undiffolved fate it produces no fenfible effects, becomes exceedingly active when diffolved; and fuch is the facility with which the folution is effected, that it becomes a matter of fome confequence to prevent the metal from being taken into the human body even in its proper form. It doth not, however, appear that the poifon of copper is equally pernicious with thofe of arfenic or lead; much lefs with fome others treated of in the laft article. The reafon of this is, that it excites vomiting fo fpeedily as to be expelled, even though taken in confiderable quantity, before it has time to corrode the fomach. Roman vitriol, whicls is a fulution of copper in the vitriolic acid, has been ufed as a merlicine in fome difenfes with great fuccefs. Verdigrile allo, which is another very aftive preparation of the metal, has been by fome phyficians prefcribed as an emetic, efpecially in cafes where other poifons had been fiwallowed, in. order to procure the moft fpeedy evacnation of them by vomit. Where copper is not ufed with this view, it has been employed as a tonic and antifpaimodic, with which it has been admitted into the Edinburgh Difpenfatory under the tiile of Cuprume Ammoniacalc. The effeets of the metal, howcver, when taken in a pretty large quantity, and in a diflolved fate, or when the fomach abounds with acid juices fufficient to difiove it, are very diagrecable and ceven dangerous; as it occafions violent vomitinge, pains in the fomach, faintings, and fometimes convulfions and death. The only cure for thefe fymptoms is to expel the pifon by vomiting as foon as polible, and to obuund its acrimony; fur which purpure drinking watm milk will probably be found the mof efficacious remedy. In order to prevent the entrance of the poifin into the body, no copper vefiels fhould be ufed in preparing food but fuch as are either well tinned or kept exceedingly clean. The praftice of giving a fine blue or green colour to pickles, by preparing them in copper veflels, ouglit not to be tolerated: fur Dr Falconcr, in a treatife on this fubject, alfures us, that theie ane fometimes fo frongly impregnated by this methed of

## P O I

preparing them, that a fmall quantity of them will produce a flight naufea. - Mortars of brafs or bellmetal ought for the fame reafon to be avoided, as by this means a confiderable quantity of the pernicious metal may be mixed with our food, or with medicines. In other cafes, an equal caution ought to be ufed. The cuftom of keeping pins in the moath, of giving copper halfpence to children to play with, \&c. ought to be avoided; as thus a quantity of the metal may be infenfibly taken into the body, after which its effects mutt be unccrtain.-It is proper to obferve, however, that copper is much more eatils diffolved when cold than when hot; and therefore the greateft care flould be taken never to let any thing defigned for food, even common water, remain long in copper veffels when cold; for it is obferved, that though the confectioners can fafely prepare the moft acid $i$ jrups in clean copper veffels without their receiving any detriment whillt hot, yet if the fame fyrups are allowed to remain in the veffels till quite cold, they become impregnated with the pernicions qualities of the meaal.
Po:son of Lead. See Medicine, $\mathrm{n}^{\circ} 303$.
Parson-Tree. See Rhus.
Poisov- Tree of Yava, called in the Malayan language tohun upas, is a tree which has often been deferibed by naturalifts; but its exitence has been very generally doubted, and the defcriptions given of it containing much of the marvellous, have been often treated as idle fictions. N. P. Foerfch, however, in an account of it written in Dutch, afferts that it does exift ; and tells us, that he once doubted it as much as any perfon; but, determined not to turf general opinions, he made the moft particular inquiries poffible; the refult of which was, that he found that it is fituated in the ifland of Java, about 27 leagues from Batavia, 14 from Soura Charta, the emperor's feat, and about 19 from Tinkjoe, the refidence of the fultan of Java. It is furrounded on all fides by hills and mountains, and the adjacent country for 12 miles round the tree is totally barren. Our author fays he has gone all round the fpot at about IS miles from the centre, and on all fides he found the country equally dreary, which he afcribes to its noxious eflluvia. The poifon procured from it is a gum, ifluing from between the bark and the tree; and it is brought by malefactors who have bcen condemned to death, but who are allowed by this alternative to have a chance for their life. An old ecclefiatic, our author informs us, dwelt on the outfide of the furronuding hills, whe fe bufffinefs it was to prepare the criminals for their fate, if death fhould be the confequence of their expedition. And indeed fo fatal is its efluvia, that he acknowledged that fearcely two out of 20 returned from above 700 whom he lind difmiffed.
Mr Foerfll farther tells us, that he had feen feveral of the criminals who had returacd and who told hin, that the tree flands on the borders of a rivulet, is of a middling fize, and that five or lix young ones of the fame kind fland c.ofe to it. They could not, however, fee any other plant or flarub near it; and the ground was of brovinifh fand, full of fones and dead bodies, and dificult to pafs. The Malayans think this tran was thus rendered norious and uninhabitable by the judgement of God, at Mahomet's defire, on aiconat of the fins of the inhabitants. No animal whaterer is ever
feen there; and fuch as get there by any means never return, but have been b:ought out dead by fuch of the criminals as have themeleles efcaped death.

Our author relates a circumentec which harpened in the year 1775 , to about 400 familics ( 1600 fouls), who refufed to pay lome duty to the emperor, and who were in confequence declared rebeis and banifled : they petitioned for leave to fettle in the uncultivated parts round Upas: the conferuence of which was, that in lefs than two months their number was reduced to :bout 300 fouls, who begged to be recenciled to the emperor, and were again reccived under his protection. Many of thefe furvivors Mr Foerfch faw, and they had jult the appearance of perf ns tainted with an infectious diforder.

With the juice of this tree arrows, lancets, and other offonfive weapons, are pcifoned. With lancets thus poifoned, Mr Foerfich obferves, that he faw 13 of the emperor's concubines executed for infidelity to his bed in February 1776 . They were lanced in the middle of their breafts; in five minutes after which they were feized with a tremor and fubfiltus tendinum, and in 15 mi nutes they were dead. Their bodies were full of livid fpots, like thofe of petechis, their faces fwelled, colour blue, and cyes yellow, \&c. Sonn after he faw feven Malayans executed in the fame way, and faw the fame effects follow; on which he refolved to try it on other animals, and found the operation fimilar on three pup. pies, a cat, and a fowl, none of which furvived more than is minutes. He alfo tried its effects internally on a dog feven months old; the animal became delitious, was feized with convulfions, and died in halt an hour. From all which our author concludes, that at is the moit violent of all vegetable poifons, and that it contributes greatly to the unhealldinefs of the ifland in which it grows. By means of it many cruel and treacherous murders are perpetrated. He adds, that there exitts a fort of cajoe-upas on the coaft of Macaffar, the poifon of which, though not near fo violent or malignant, operates nearly in the fime manner.
To this account our reakers will give fuch a degree of credit as they think is due; it is our bufinefs however to add, that it has been controverted in all its parts in a memoir of Lambert Noll, M. D. fellow of the Batavian Experimental Society at Rotterdam, (iee Gentleman's Mag. May 1794, P. 433.) This memoir was procured from Joinn Mathew a Rhyn, who had bee: 23 years, from ${ }^{1763}$ to 1786 , relident in the illand, and therefore had every opportunity of informing himfelf on the fpot. In this memoir we are told, that Foerch's account of the tree is extremely furpicions, from a variety of circumfances: 1. Though ine had leters of introduction, he went to no couliderabie houfc, and afterwards privately withdrew among the Einglifh. 2. When the emperor was afled refpecting Foorfch, ind the facts he relates, he anfiveled, that he had never heard cither of him or of the tree. 3. The ditances given to mark the fituation of the tree are not accurate. 4. The execution of criminals is different from what he reprefents. 5. The circumflance of ieveral criminals returning when Foerfoh was there has a fufpicious appearance. 6. There exitts no fuch tradition, as that the tree was pla. ced there by Mahomet. 7. There were no fuch difturbances in 1775 as Foerlich reprefents, the traxt to

## 1 OL

which he alludes having fubnitted to the Dutch Eaf nations indeed are involved in fable; but the Poles neIndia Company as early as 1756 . 8. The inand is not unhealthy, as Foerfch afferts; nor are violent or premature deaths frequent. 9. The Javanefe arc a curious and intelligent people, and of courfe could not be fo ignorant of this tree it it had any exiftence. 10. The affertions and protended facts of Fecrifh have no colateral evidence; and every thing which we gather from the accounts of others, or from the hiltory of the people, invalidates them. For the ee and other reafons, Dr Nolft concludes, that very little credit is due to the reprefentations of Foerfch, and that the ifland of Java produces no fuch tree, which, if it really grew there, would be the moft remarkable of all trees.
POL.A, in ichthyology, is the name of a flat fifh, refembling the foal, but fomewhat thorter'and fmaller. It is called cynoglofus and linguatula. It abounds in the Mediterranean, and is fold both in Rome and in Venice for the table.

POLACRE, a flip with three mafts, ufually navigated in the Levant and other parts of the Mediterranean. Thefe vefiels are generally furnifhed with fquare fails upon the main maft, and latren fails upon the fore malt and mizen-maft. Some of them, howcecr, carry fquare fails upon all the three mafts, particularly thofe of Provence in France. Each of their mafts is conimonly formed of one piece, to that they have neither top-maft nor topgallant-maft; neither have they any borjes to their yards, becaufe the men ftand upon the top-fail-yard to loofe or furl the top-gallant-iail, and on the lower-yard to ref, to loofe, or furl, the top-fail, whore yard is lowered fufficiently down for that purpofe.

POLAEDRASTYLA, in natural hifory, is the name of a genus of cryftals, derived from the Greek Tovus, nany, sopze, fides, the primitive particle $\alpha$, not, and stroc, a column; and means a cryftal with many planes; and without a column.

The bodies of this genus are cryftals of two octangular pyrainids, with the bafes joined, the whole hody confifting of 16 planes. Of this genus there are only two fpecies known: 1. A brown kind with thort pyramids, found in great plenty in Virginia on the fides of hills; and, 2. A colourlefs one, with longer pyramids. This has yet been found only in one place, which is the great mine at Goffalaer, in Saxony, where it ufually lies at great deplhs.

POLAND, a kinglom of Europe, in its largen ex. tent bounded by Pomerania, Brandenburg, Silelia, and Moravia, to the welt; and, towards the ealt, by part of Ruffar and the leffer Tartary; on the north, it has the Baltic, Rufia, the grand province of Livoria, and Samugitia; and on the fouth, it is bounded by Befiurabia, Trenfylvania, Moldavia, and Hungary. Gecgraphers generally divide it into the provinces of Poian a Proper, Lithuania, Samogitia, Courland, Pruffia, Mafovia, Polachia, Polefia, Little Rullia called li'eewfe Ruffa Rabra or Red Rufía, Podolia, and the Ukrain. Now, however, it is very confiderably reduced in cxtent, as will appear in the courfe of its hiftory. For a map of Poland, Lithuania, and Pruffa, fee Plate CCCCX.

With regard to the hiftery of Poland, we are not to gather the earlier part of it from any accounts tranf. mitted to us by the natives. The early hiltories of all
ver had even a fabulous hiftory of their own nation. The reafon of this is, that it was not the cuftom with that uation to entertain itinerant poets for the amufement of the grcat ; for to the fongs of thefe poets entertained among other nations we are obliged for the early part of their Liftory; but this affiftance being deficient in Poland, we muft have recourfe to what is recorded concerning it by the hiftorians of other nations. The fovercigns of Puland at firf had the title of duces, dukes or generals, as if their office had been only to lead the armies into the field. The firf of thefe is nniverfally allowed to have been Lechus or Lecht; and to render him more illuftrious, he is faid to have been a lineal defeendant from Japhet the fon of 1 ,echu Noah. According to fome writers, he migrated at firld duk the head of a numerous body of the defcendants of the ancient Sclavi from fome of the neighbouring nations; and, to this day, Puland is called by the Tartars the Kingdom of Lechus. Bufching, however, gives a different account of the origin of the Poles. Sarmatia, he obferves, was an extenfive country, inhabited by a variety of mations of different names. He fuppofes the Polcs to be the defcendants of the ancient Lazi, a people who lived in Colchis near the Pontus Euxinus; whence the Poles are fometimes called Polazi. Crofsing feveral rivers, they entered Pofnania, and fettled on the borders of the Warta, while their neighbours the Zechi fettled on the Elbe, in the 550 th year of Chritt. As to the name of Poland, or Polka, as it is called by the natives, it comes from the Sclavonic word Pole, or Poln, which fignities a country adapted to hunting, becaufe the whole country was formerly covered with valt forefts, exceedingly proper for that employment.
Of the tranfactions of Lechus during the time that vifiimo he enjoyed the fovereignty, we have no certain ac- the fecor count. His fucceffor was named $V$ ijcimer, who is ge- duke. nerally fuppofed to have been the nephew of Lechus. He was a warlike and fuccefsful prince, fubduing many provinces of Denmark, and building the city of Wifmar, fo called from the name of the fovercigu. But the Danifh hiforians take no notice of his wars with their country; nor do they even mention a prince of this name. However, he is faid to have reigned for a long time with great glory; bat to have left the people ingreat diftrefs, on account of the difiputes which arofe about a fuccelfor.

After the death of V:fcimer, the nobility were on the point of electing a fovcreign, when the people, haraffed by the grievous burdens occafioned by the wars of Vifimer, unanimoully demanded another form of government, that they might no longer be liable to fuffer from ambition and tyramy. At firt the nobility pretended to yield to this humour of the peopls with great reluctance; however, they after wards determined on fuch a form of government as threw all the power into their own hands. Twelve palatines, or vaivodes, were chofen; and the Polifh dominions divided into as many provinces. Thelic palatines exercifed a defpotic authority within their feveral jurifdictions, and aggravated the mifery of the people by perpetual wars among themfelves; upon which the Poles: worn out with opprefion, refolved to return to their old form of government. Many affemblies were held

## P O L

nd. for this purpofe; but, by reafon of the oppofition of the vaivodes, they came to nothing. At laft, however, they caft their eycs upon Cracus, or Gracus, whore wealth and popularity had railed him to the highelt honours among his countrymen. The Poles fay that he was a native of Poland, and one of the 12 vairodes; but the Boliemians affirm that he was a native of their country ; however, both agree in maintaining, that he was defcended from the ancient family of the Gracchi in Rome; who, they fay, were banifhed to this country. He is faid to have fignalized himfelf againft the Franks, whom he overthrew in fome defperate engagements, and afterwards built the city of Cracow with their fpoils. He did not enlarge his dominions, but made lis fubjects happy by many excellent regulations. At laft, after ? long and glorious reign, he expired, or, according to fome, was affafinated by.a nobleman who afpired to the crown.

Cracus left three children; Cracus, Lechus, and a daughter named Vandi. The firft fucceeded to the dukedom in virtue of his birthright; but was foon after murdered by his brother Lechus. However, it feems the thoughts of the crime which he had committed, fo difturbed his confcience, that the fecret could not be kept. When it was known that he had been the murderer of his late fovereign, he was depofed with all pofible marks of ignominy and contempt, and his fifter Vanda declared duchefs. She was a moft beautiful and accomplifhed lady; and foon after the had been raifed to the fovereignty, one Rithogar, a Teutonic prince, fent an ambaffador demanding her in marriage, and threatening war if his propofals were refufed. Vanda marched in perfon againft him at the head of a numerous army, and the event proved fatal both to Rithogar and herfelf. The troops of Rithogar abandoned him without ftriking a blow, upon which he killed himfelf in defpair; and Vanda, having become enamoured of him, was fo much concerned for his death, that the drowned herfelf in the river Viftula or Wefel. From this unfortunate lady the country of Vandalia takes its name.

The family of Cracus having become extinet by the death of Vanda, the Yoles were again left at liberty to choore a new fovereign or a new form of goverment. Through a natural levity, they changed the form of goverment, and reftored the vaivodes notwithftanding all that they had formerly fuffered from them. The confequences were the fame as before: the vaivodes abufed their power ; the people were oppreffed, and the fate was diftracted between foreign wars and civil contentions. At that time the Hungarians and Moravians had invaded Poland with a numerous army, and were oppofed only by a handful of men almoft ready to furrender at difcretion. However, one Premiflaus, a private foldier, contrived a ftratagem by which the numerous forces of the enemy were overthrown ; and for his valour was rewarded with the dukedom. We are ignorant of the other tranfactions of his reign ; but all hitorians inform us that he died deeply regretted, and without iffue; fo that the Poles had once more to choofe a fovercign.

On the death of Preminaus feveral candidates appeared for the throne; and the Poles determincd to prefer him who could overcone all his competitors in a horfe race. A Atone pillar was eceted near the capital, on which

Voz. KV.
were laid all the cnfigns of the ducal authority ; and an herald proclaimed, that he who firlt arrived at that pillar from a river at fome diftance, named Pouderic, was to enjoy them. A Polifh lord named hachus was refolved to fecure the victory to himfelf by a ttratagem; for which purpofe he caufed iron fpikes to be driven all over the courfe referving only a path for his own horfe. The fraudulent defign took effect in part, all the reit of the competitors being difmounted, and fome feverely hurt by their fall. Lechus, in confequence of this victory, was about to be proclaimed duke ; when, unluckily for him, a peafant who had found out the artifice op. pofed the ceremony; and upon an examination of the fact, Lechus was tom in pieces, and the ducal authority conferred upon the peafant.

The name of the new monarch was alfo Lechus. He attained the fovereignty in the year 774, and behaved with great wifdom and moderation. Though he poffeffed the qualities of a great warrior, and extended his dominions on the fide of Moravia and Bohemia, yet his chief delight was to make his fubjects happy by peace. In the decline of life he was obliged to engage in a war with Charlemagne, and is faid by fome to have fallen in battle with that powerful monarch ; though others affert that he died a natural death, having lived fo long that the fprings of life were quite worn out.

Lechus III. was fucceeded by his fon Lechus IV. who inherited all his father's virtues. He fuppreffed an infurrection in the Polifh provinces, by which he acquired great reputation; after which he led his army againt the Greek and Italian legions who had overrun Panonia. He gained a complete viflory over his enemies. Nor was his valour more confpicuous in the battle than his clemency to the vanquifhed: for he difmiffed all his prifoners without ranfom ; demanding no other conditions than that they fhould never again ditturls the peace of Poland, or the allies of that kingdom. This duke is faid to have been endowed with many virtues, and is charged only with the vice of incontinence. He left 20 natural children, and only one legitimate fon, named Popiel, to whom he left the fovereignty. Popiel was alfo a virtuous and pacific prince, who never had recourfe to arms but through neceflity. He removed the feat of government from Cracow to Gnefna, and was fucceeded by his nephew Popiel II. a minor.

The young king behaved with propriety as long as he was under the tuition of others; but as foon as he had got the reins of government into his own hands the face of affairs was altered. Lechus III. who as hath been already mentioned, had 20 illegitimate children, had promoted them to the govemment of different provinces; and they had difcharged the duties of their offices in fuch a manner as fhowed that they were worthy of the confidence repofed in them. However, as foon as Popiel came of age, being feduced by the advice of his wife, an artful and ambitious woman, he removed them from their polts, treated them with the utmolt contempt, and at laft found means to poifon them all at once at an entertainment. A dreadful punifhment, however, according to the hiltorians of thofe times, attended his treachery and cruelty. The bodies of the unhappy governors were left unburied; and from them ilfued a fwarm of rats, who purfued $\mathbf{P}$ cpicl, his wife,fand children, wherever they went, and at laft devcured them. The nation now became a prey to civil difcord at the fame time that it was

b ng of Po
haraffed by a forcign eneny; and, in fhort, the fate feemed to be on the verge of diflolutiok, when Piatus was proclaimed duke in 830 , from whom the natives of ducal or regal dignity were called Piafes. See P'istus. This excelient monarch died in 80 r , and was fucceeded by his fon Ziemovitus, who was of a more watike difpofition than his father, and who fift introduced a repular dicipline among the Polith troops. He maintained a refpectable army, and took great pains to acquire a pertect knowledge of the att of war. The confentuence of this was, that he was vidorious in all his battles; and retcok from the Germans and Hangarians not only all that they had gained, but enlarged his dominions beyond what they had been. After his death nothing renarkible happoned in Poland till the time of Mieczflaus I. who attained the ducal authority in 964 . IIe was born blind, and continued fo for feven years: afier which he recovered his fight without ufing any medicine ; a circumfance fo extraor inary, that in thofe times of ignorance and fupertition it was accounted a miracle. In his reign the Chrillian religion was introduced into Poland. The moft probable account of the manner in which Cluriftianity was introduced is, that Mieczflaus having by ambaffadors made his addreffes to Daborwha daughter to the duke of Bohemia, the lady rejected his offer unlefs he would fuffer himfell to be baptized. To this the duke confented, and was baptized, after having been inftructed in the principles of Chrifianity. He founded the archbilhoprics of Gnefna and Cracow; and appointed St Adalbert, fent by the fontiff to propagate Chriftianity in Poland, primate of the whole kingdom. On the birth of his fon Boleflaus be redoubled his zeal; founding feveral bifhoprics and monatheries; ordering likewife that, when any part of the Gofpel was read, the hearers thould half draw their fwords, in teftimony of their readinefs to defend the failh. He was, however, too fuperftitious to attend to the cuties of a fovereign; and fuffered his dominions to be yavaged by his barbarous neighbour the duke of Ruffia. Yet, with all his devotion, he could not obtain the title of king from the pope, though he had warmly folicited it ; but it was afterwards conferred on his fon, who fucceeded to all his dominions.

Boleflaus I. the firt hing of Poland, furnamed CBrobry fuccecded to the fovereignty in 999. He alfo pro. feffed and cherifhed Chitianity, and was a man of great valour and prudence. However, the firt trardaction of bis reign favoured very much of the ridiculous piety of thofe times. He romoved from Prague to Gnefna the remains of a faint which he had purchaied at a confiderable price. The emperor Otho III. made a pilgrimage, on accoust of a vow to the somb of this faint. He was hofpitably received by P (llenaus, whom, in return, he invefte 3 with the regal dignity; an $九$ dt which was confirmed by the prope. This new dignity added nothing to the power of Boleflaus; though it increafed his confequence with lis own fubjects. He now aficened nore ttate than before: his body gua:ds were confiderably angmented; and he was conflantly attended by a numeruss and fplendid retinue whenever he ftirred out of his palace. Thus he infpired his people with an idea of his greatnets, and confequently of their con importance; which no doub: was necellary for the accemplithment of a defign he had formed, namely, an offentive war with Rullia: but when be was upon the poitt of
fetting out on this expedition, he was prevented by the breaking out of a war with the Bohemians. The elevation of Boleflaus to the regal dignity had excited the envy of the duke of Boliemia, who had folicited the fame honour for himfelf, and had been refufed. His jealouly was further excited by the connection between Boletlaus and the emperor, the former having married Rixa the emperor's niece. Without any provoration, therefore, or without giving the lealt intimation of his delign, the duke of Bohemia entered Poland at the head of a numerous army, committing everywhere dreadful ravages. Boleflaus immediately marched againtt him, He conand the Bohemians retired with precipitation. Scarcity quers be of provifions, and the inclemency of the feafon, prevent- hemia. ed Doleflus at the time from purfuing ; but as foon as thefe oblacles were removed, he entered Bohemia at the head of a formidable army, with a full refolution of taling an ample revenge. The Bohemians were altogether unable to refift ; neither indeed had they courage to venture a batule, though Boleflaus did all in his power to force them to it. So great indeed was the cowardice of the duke or his army, that they fuffered Prague, the capital of the duchy, to be taken atter a fiege of two years; having never, during all that time, ventured to relieve it by fighting the Polith army. The taking of th.is city was quickly followed by the reduction of all the places of inferior note: but though Boleflaus was in pofiefion of almolt all the fortified places in Bohemia, he could not believe his conquefts to be complete until he became mater of the dake's perfon. This unfortunate prince had fhut himfelf up with his fon in his only remaining fortrefs of Willogrod, where he imagined that he fhould be able to foil all the attempts of the Polfh monarch. In this, lowever, he found himfelf difappointed. Boleflaus invelted the place, and made his approaches with fuch rapidity, that the garrifon, dreading a general afiault, refolved to capitulate, and perfilted in their refolution notwithltanding all the intreaties and promifes of the duke. The confequence was, that the unhappy frince fell into the hands of his enemics, and had his eyes put out by Boleflaus; after which, his fon Jaremir was put into perpettal and clore confinement.

From Bohenia Bolenaus marched towards Moravia; but no fooner did he arive on the frontier than the whole province fubmitted without a blow. He then refumed his intention of invading Rufla; for which he had now a very fair opforturity, by reafon of a civil war which raged with violence among the children of duke Volodomir. The chief competitors were Jariflaus and Suantepolk. The latter having been defeated by his brother, was obliged to take refuge in Polnod, where he ufed all the argurnents in his power with king Boledlaus in order to induce him to revenge his caule. Boleflaus having already an intention of invading that country, needed but litule intreaty; and therefore moved towards Ruffit at the head of a very numerons amy: giving out that he had no other defign than to revenge the in uftice donc to Suantepolk. He was met on the banks of the river Bog by Jariflaus at the head of an army much fuperior in number to his own; and for fome days the Polith army was kept at bay by the Ruffians. At laft Doleflaus, growing impatient, efolved to pafs the river at all events; and therefore forming his cavalry in the bcat manner lor breahing the the Ruf

## POL

torrent, he expofed his own perfon to the utmoft of its furce. Eneouraged by his example, the Poles avvanced breall-high in the water to the oppofite fhore ; from whence they gave the enemy all the annoyance in their power. In fipite ol all oppofition, hoxever, the Poles reached the bank, and foon gained a complete vifory, Jarifaus being obliged to fly to hionia. This city was immediately involted; but jarillans retired farther into the country in ordor to reeruit his army, leaving the city to its late, The garrifon made a brave delence, but were at lalt compcled to furrender at difcretion. A valt treafure was found in the place; great part of which was diltrinuted by Bolentaus among the foldiers.

Though the king of l'oland had now become matter of the greatelf part of Ruflia, he knew that the only poffible means of keeping the country in filbjection was by placing a natural fover cign over the inhabitants. For this reafon he reinfated Sauntepolk, though his pretenfions were flill difputed by Jarillans. The latter had formed a tying camp, and meditated a fcheme of furprifing and carrying off his rival brother; but having friled in this attempt, he retired to Novogorod, where the attachment of the inbabitants enabled him to make fume reflance, till at laft he was attacked and defeated by Bolenlaus, which feemed to give the finithing froke to his affairs. The king of Polmd, however, now met with a more dangerous enemy in the perfidious and ungrateful Suantepolk than he had exper ienced in Jarillaus. The Rufian prince, imagining himfelf a dependent on Boleflaus, formed a compiracy againtt him; by which be projected nothing lefs than the deftruction of him and his whole army. The maffacre was already begun when Boleflaus receired intelligence. The urgency of the cafe admitted of no delay: the king therefore mounted his horfe; and having with the utmoft hafte affembled part of his army, fell upon the traitors with fuch fury, that they were obliged to betake themfelves to fight, and Bcleflaus got fafe into Poland. But in the mean time Jariflus having affentbled frefh forces, purfued the Polifh army ; and having come up with them juft as one half had crofted the river Borifthenes, attacked them with the utinoft fury. Bolenaus defended himfelf with the greateft refulution; but, by reafon of his furces being divided, viftory was dubious for a long time. At latt, when the army had wholly croffed, the Ruffians were entirely put to the rout, and a terrible carnage enfued. The victory, however, though complete, was not decifive ; for which reafon Boleflaus thought proper to continue his setreat, without attenpting to conquer a country too estenfive for him ever to keep in fubjection. Still, however, his martial inclination continued, and he led bis army into Saxony. The inlabitants of this country had hitherto refitted all attempts that had been made on their freedom, and fill made a violent fruggle for liberty; thongh in fpite of their utmof efforts, they werc obliged at latt to fubmit to the yoke. On his withdrawing the troops from Saxeny, however, the king thought proper to leave the people to their liberty, contenting himfelf with a rich bonty. The boundaries of his empire he now fixed at the river Elbe; where be erefted two iron columns, in order to tran!mit the memory of his conquell to poterity.

Boleflats, fill urated with vifory, now meditated
the conquef of Pruffia and Pomerania; the inter of which provinces had, iil the furmer civil wars, been dif membered from Poland. H:s arn?s were attended wibl equal fuccefs againft boch: indwed the very tertir of has name feemed to anfwer all the purnofes of a formidible arms. Thefe, however, he leemst have detighent in be the latt of his warike enterprifes; for he now applicd himfilf wholly to the enteting of whonefome lave fois tha' benefit of his peopic. But in the midfo of timis tranquillity Jaminaus allembled the mon nunserouramy that had ever been heard of in RuTia, with which he appeared on the frontiers of Poland. Boleflitus, though non: adranced in years, marched out apainll his atveraries, and met them on the banks of the Borilhencs, rendered famous by the viftory he had late!y gained there. The Poles croffed the fiver by fiwimmin?; and attacked the enemy before they had time to dran up in order of batile with fuch impetuofity, that a total rout foni enfued. The Ruflims were feized with a puti-, and Jarillaus was hurried away and aimoft trampled to death by the fugitives. Miny thoufind prifoners were talion, but Boleflaus releafed them unon very eafy conditions; contenting himfeif with an inconfidarable tribute, and endeavouring to engage the effestions of the people b: his kindnefs. This well timed clemency produced fuch an happy effect, that the Ruffians voluntarily fubmitted to his jurifdiction, and again became his fubjects. So $n$ I:olfilus after this he died in the year 1025, after having dies. vafly extended his dominions, and rendered his fubjects happy.
Boleflaus was fucceeded by his fon Mieczflus II. but he poffefled none of the great qualities of his father, boing indolent and debauched in his behaviour. In the very begiuning of his reign, the Rufians, Bohemians, and Moraviant, revolted. However, as the fipit and difcipline introduced by Boleflaus ftill remained in the Polilh army, Mieczflans found no great difficulty in reducing them again to obedience: after which, devoting himfelf entirely to voluptuonfnefs, he was feized with a frenzy, which put an end to his life in the year 1034. The bad qualities of this prince proved very detrimental to the interef of his fon Calimir; though the latter had received an exellent education, and was poffefled of many virtues. Intead of electing him king, they chofe Rixa his mother queen-regent. She proved tyramical, and fo partial to her countrymen the Germans, that a rebellion enfued, and the was forced to fly to Germany ; where fhe obtained the protection of the emperor by means of the immenfe treatures of Boleflaus, which the had caufed to be traniported thither before lier. Her bad behaviour and expulfion proved fill more fatal to the aff airs of Catimir than even that of his father. He was immediately driven cut of the kingdo m; and a civil war taking place, a great many preetaders to the chown appeared at once. To the niferies escalioned by this were added thofe of a foreign war; for the Bohemians and Ruflians invaded the kirgutny ir different places, committing the mof dreadiul ravages. The confequence of thefe accumulated ditrer?es was, that the nobility come at lat to the refolut on of recalling Cafimir, and clefting him fovereign. However, before they took this meafure, it was thought proper to fend to Rome to complain of the belaviour of the dule of Bo. hemia. The deputies werc at fift rece:ve!! faycuratly;

Boland.

24 Cafimirrecalled and elected ling.
but the influence of the duke's gold prevailing, no redrefs was obtained; fo that at laft it was refolved, without more ado, to fend for Cafimir.

The only difficulty was where to find the fugitive prince ; for he had been gone five years from the kingdom, and nobody knew the place of his retreat. At laf, by fending an embalfy to his mother, it was found out that he had retired into France, where he applied clofely to ftudy at the univerfity of Paris. Afterwards he went to Italy; where, for the fake of fubfiftence, he took upon him the monaftic habit. At that time he had returned to France, and obtained fome preferment in the abbey of Clugni. Nothing now obftructed the prince's return but the facred function with which he was invefted. However, a difpenfation was obtained from the pope, by which he was releafed from his ecclefiaftical engagements, on condition that he and all the kingdom thould become fubject to the capitation tax called Peter-pence. Some other conditions of lefs confequence were added; fuch as, that the Poles fhould fhave their heads and beards, and wear a white linen robe at feftiva!s, like other frofeffors of the Catholic religion. Great preparations were made for the reception of the young prince: and he was met on the frontier by the nobility, clergy, and forces of the nation; by whom he was conducted to Gnefna, and crowned by the primate with more than ufual folemnity. He proved a virtuous and pacific prince, as indeed the diftracted fituation of the kingdom would not admit of the carrying on of wars. However, Cafimir proved his courage in fubduing the banditii by which the country was over-run; and by marrying the princels Mary, filter to the duke of Ruflia, all quarrels with that nation were for the prefent extinguilhed. Upon the whole, the hingdom flourifhed during his reign; and became more refpectable from the wifdom and lability of the adminiftration tham it could have been by many victories. Atter a happy reign of 16 years, he died beloved and regretted by all his fubjects.

By the happy adminiftratiou of Cafimir the kingdom recovered fufficient frength to carry on fuccefsful wars againt its foreign enemies. Boleflaus II. the fon of Cafimir, an enterprifing and valiant prince, fucceeded to the throne; and foon made himfelf fo famous, that three unfortunate princes all took refuge at his court at once, having been expelled from their own dominions by their rebellious fubjects. Thefe were, Jacomir, fon of Britenaus duke of Bohemia; Bela, brother to the king of Hungary; and Zallaus duke of Kiovia, eldeft fon to Jeriflans duke of Ruflia, and coulin to the king of Poland. Eoleflaus determined to redrefs all their grievances; but while he deliberated upon the mot proper means for fo doing, the duke of Bohemia, dreading the confequence of Jacomir's efcape, affembled an army, and without any declaration of war, marched through the Hercynian foreft, defolated Silefia, and laid walte the fronticrs of Poland with fire and fword. Boleflaus marched againf him with a force greatly inferior; and, by mere dint of fuperior capacity, cooped up his adver. fary in a wood, where he reduced him to the greatef difirefs. In this extremity the duke fent propofals for accommodation ; but they were rejected with difdain by Boleflaus; upon which the former, ordering fires to be kindled in his camp, as if he defigned to continue there, removed with the utmo:t fllence in the night-time;
and marching through narrow defiles, was advanced feveral leagues before Doleflaus received advice of his retreat. The king purfued him, but in vain; for which reafon he returned, after having ravaged the frontiers of Moravia. The next year he entered Bohemia with it numerous army; but the duke, being unwilling to encounter fuch a formidable adverfary, fubmitted to fuch terms as Boleflaus thought proper to impofe. In thefe the king of Poland Atipulated for certain conditions in favour of Jacomir, which he took care to fee punctually executed; after which he determined to march towards Hungary, to aflift the fugitive prince Bela.

This prince had been for fome time folicited by a And to 18 party of difaffected nobility to return, as his brother, la prince the reigning king, had alienated the hearts of his fub- Hungary jects by his tyrannical behaviour: as foon therefore as Boleflaus had finifhed the war in Bohemia, he was dolicited by Bela to embrace fo favourable an opportunity, and put him in poffefion of the kingdom of Hungary. This the king readily complied with, as being agreeable to his own inclinations; and both princes entered Hungary by different routes, each at the head of a numerous body. The king of that country, however, was not difconcerted by fuch a formidable invafion; and being largely allifted by the emperor, advanced againlt his antagonifts with a valt army; among whom was a numerous body of Bohemians, who had come to his affitance, though in direct violation of the treaty fubfifting between the duke and the king of Poland. At laft a decilive battle was fought, in which the Germans behaved with the greateft valour, but were entirely defeated through the treachery of the Hungazians, who in the heat of the battle deferted and went over to Bela. Almoft all the foreign auxiliaries were killed on the fpot; the king himfelf was feized, and treated with fuch infolence by his perfidious fubjects, that he died in a flort time of a broken heart; fo that Bela was placed on the throne without further oppofition, except from a revolt of the peafants, which was foon quelled by the Polifh army.

Bolenlaus, having fucceeded fo happily in thefe two Heproje ${ }^{30}$ enterprifes, began to look upon himfelf as invincible; and, inftead of defigning only to affift Zaflaus, as he had lirt intended, now projected no lefs than the fubjection of the whole country. He had indeed a claim to the fovereignty by virtue of his defcent from Mayy, queen of Poland, fifter to Jarillaus; and this he endeavoured to frengthen by marrying a Ruflian princefs himfelf. Having therefore affembled a very numerous and well-difciplined army, he entered the duchy of Kiovia, where he was oppofed by Wiffellaus, who had ufurped the fovereignty with a vaft multitude of forces. Boleflaus, however, continued to advance; and the Meetsw Ruflian prince being intimidated by the number and furprilin good order of his enemies, deferted his own troops, and ficd away privately with a flender retinue; upon which his force difperfed themfelves for want of a leader. The inhabitants of the city of Kiovia now called to their afiftance Suantoflaus and Wfzevold two brothers of Wilfenlaus; but thefe princes acting the fart of mediators, procured pardon for the inhabitants from Zaflaus their natural fovereign. With the fame facility the two princes recovered all the other dominions belonging to Zallaus; only one city venturing to ftand a fiege, and that was foon reduced. But in the mean time the king
d. of Hungary dying, a revolt enfued, and the two fons of Belat were on the point of being deprived of their paternal dominions. This Boleflaus no fooner heard than he marched direstly into Hungary; where by the bare terror of his name, he re-efablithed tranquillity, and confirmed the princes in the enjoyment of their kingdom. In the time that this was doing, Zaflaus was again driven from his territories, all the conquefts that hrad been formerly made were loft, and Suantoflaus and Wfzevold more powerful than ever. The king's vigour, however, foon difconcerted all their meafures. He ravaged all thofe territories which compofed the palatinates of Lulac and Chelm, reduced the ffrong city of Wolyn, and tranfported the booty to Poland. The campaign was finifhed by a battle with Wfzeveld; which proved fo bloody, that though Boleflaus was victorious, his army was weakened in fuch a manner that he could not purfue his conquefts. In the winter he made numerous levies; and returning in the fpring to Kiovia, reducedit, after feveral defperate attacks, by famine. On this occafion, inflead of treating the inhabitants with cruelty, he commended their valour, and friaty prohibited his troops from pillaging or infulting them ; diftributiag provifions among them with the utmof liberality.

This clemency procured the higheft honour to the king of Poland; but his ftay here produced a moft terrible difafter. Kiovia was the moft diffolute, as well as the richeft city, in the north; the king and all his foldiers gave themfelves up to the pleafures of the place. Boleflaus himfelf affected all the imperipus frate of an eaftern monarch, and contrafted an inclination for the groffef debaucheries. The confequence had almot proved fatal to Poland. The Hungarian and Ruflian wars had continucd for feven ycars, during all which time the king had never been at home excepting once for the fhort fpace of three months. In the mean time the Polifh women, exafperated at hearing that their hufbands had neglected them and conncted themfelves with the women of Kiovia raifed their llaves to the beds of their mafters; and in thort the whole fex confpired in one general fcheme of proftitution, in order to be revenged of the infidelity of their hubands, excepting one fingle woman, namely, Margaret, the wife of count Nicholas of Demboifin, who preeierved her fidelity in fpite of all folicitation. Advice of this flrange revolution was foon received at Kiovia, where it excited terrible commotions. The foldiers blamed the king for their difhonour ; forgetting how much they had to accufe their own conduft in giving their wives fuch extreme provocation. The effect of thefe difcontents was a general defertion, and Boleflaus faw himfelf fuddenly Ielt almoft alone in the heart of Ruflia; the foldiers having unanimoully refolved to return home to take vengeance of their wives and their gallar:ts.

A dreadful kind of war now enfued. The women knew that they were to expect no mercy from their enraged hufbands, and therefore perfuaded their lovers to take arms in their defence. They themielves fought by the fide of their gallants with the utmolt fury and fought out their hufbands in the heat of battle, in order to fecure themfelves from all danger of punifhment by their death. They were, however, on the point of being fubdued, when Boleflaus arrived with the few remaining Poles, but affiled by a valt army of Ruffians,
with whom he intended to take equal vengeance on the women, their gallats, and his own foldiers who lad deferted him. This produced a carnage more drcadful than ever. The foldiers united with their formor wive. and their gallants argainf the common enemy, nud fought againft Boleflaus and his Ruflians with the furv of hions. At lalt, however, the fortune of the king prevailed; the rebels were totally fubdued, and the lew who efcaped the fword were tortured to death, or cied in prifon.
To add to the calamities of this unhappy kingdom, the fchifms which for fome time had prevailed in the church of Rome found their way into loland alfo; and the animofity of parties became aggravated in proportion to the frivoloufnefs of their differences. By perverfe accident the matter came at laft to be a contention for wealth and power between the king and clergy. This foon gave occafion to bloodithed; and the biftop nolctiaus of Cracow was maffacred in the cathedral while he was ilepofedty performing the duties of his office. This and fome other the pope, enormous crimes in a fhort time brought on the moft fignal vengeance of the cle rgy. Gregory VII. the pope at that time, thundered ont the mott dreadful anathemas againft the king, releafed his fubjeats from their allegiance, deprived him of the titles of fovereignty, and laid the kingdom under a general interdict, which the archbifhop of Gnefna faw punctually enforced. To this terrible fentence Boleflaus in vain oppofed his authority and recalled the fpirit which had formerly rendered him fo formidable to the neighbouring flates. The minds of the people were blinded by fupernition, fo that they deemed it a lefs heinous crime to rife in rebellion againft their fovereign than to oppofe the tysanny of the holy fee. Conipiracies were daily formed againt the perfon and government of Boleflaus. The whole king dom became a fcene of confufion, fo that the king could no longer continue with fafety in his owa dominions. He fled therefore with his fon Mieczflaus, and took refuge in Hingary; but here alfo the holy vengeance of the clergy purfued him, nor did they ceafe perfecuting him till he was brought to a miferable end. Auchors differ widely with refpe ner of his death. Some fay that he was murdered by the clergy as he was hunting; others, that he killed himfelf in a fit of defpair ; and one author tells us bat he wandered about in the woods of Hungary, lived like a favage upon wild beafts, and was at laft killed and devoured by dogs. The greatelt number, however, tell us, that being driven from place to place by the perfecutions of the clergy, he was at lalt obliged to become a cook in a monaftery at Carinthia, in which mean occupation he ended his days.
The deftruction of Boleflaus was not fufficient to allay the papal refentment. It extended to the whole kingdom of Poland. Mieczflaus, the fon of Boleflaus, was not fuffered to afeend the throne; and the kingdom continued under the moft fevere interdie, which could be removed only by the force of gold, and the molt ab. jeot conceflions. Befides the tax called Peter-fence, new impofitions were added of the moft oppreffize nature ; till at length the pontif, having fatiated his avarice, and impoverilhed the country, confented that the brother of the decealed monarch thould be raifed to the fovereignty, but only with the title of duke. This, prince, named Uladifaus, being of a meek difpofition,

Foland. wih little anlition, theught it his duty to acquicfee implicitly in the will of hic pope; and therefore accepted the terms offered, fending at the fame time an cmbafy to Kome, carnefly intreating the removal of the interdict. The requef was granted; but all his endeavour, to recover the regal dignity proved fruitlets, the pope laving, in conjunction with the emperor of Germany, conlerred that honour on the duke of Bohe. mia. This was extremely mortilying to Uladiflaus, but it was abforbed in confiderations of the utmoft confequence to himfelf and his dominions. Rufia took the opportunity of the late civil dituabances to throw off the yoke; and this revolt drew atter it the revolt of Prufit., Pomerania, and other provinces. The fmaller provinces, however, were foon reduced; but the duke had no fooner returned to Poland, than they agan rehe.led, and hid their families in impenetrable forents. Uladiflaus marehed agaist them with a conliderable army ; but w.ts entirely defeated, and chliged to return back with difgrace. Next year, however, he had better fortu:a; ; and, having led againlt them a more numerons army than before, they were content to fubmit and deliver up the ringleaders of the revolt to be punifled as the duke thought proper.

No foomer were the lomeranians reduced, than civil diffenfions took place. Sbigneus, the fon of thadiAlaus by a concubine, was placed at the head of an army hy the difcontented nobility, in order to fubvert his fa. ther's government, and difpute the title of Buleflaus, the legitimate fon of Uladilaus, to the fucceffion. The wal was terminated by the defeat and captivity of Sbigmous; who was at firlt confined, but afterwards releafed on condition that he thould join his father in punifhing the palatine of Cracow. But before this could be done, the palatine found means to effert a reconciliation with the duke; with which the young princes being difpleared, a war took place between them and their father. The end of all was, that the palatine of Cracow was banifhed, and the princes fubmitted; after which, Uladifaus, having chattifed the Pruffians and Pomeramians who had again revolted, died in the year 1103, the 5 gth of his age.

Bencrofity
of Bule.
of Buleflaus, and ingratitude of Sbigncus,

Uladiflaus was fucceeded by his fon Boleflaus III. 1 who divided the dominions equally betwixt his brother Sbigneus and himfelf. The former being difatisfied with his fhare raifed cabals againit his brother. A civil war was for fome time prevented by the good offices of the primate : but at laf Sbizneus, having privately ftirrad up the Bohemians, Saxens, and Moravians, againht lis brother, made fuch formidable prepatations as threatened the conquelt of all Poland. Boleflaus, being unprovided with forces to oppofe fuch a formidable power, had recourfe to the Ruffians and IHungarians; who readily embraced his caufe, in expectation of turning it to their own advantage. The event was, that Sbigneus was entirely defeated; and might eafily have been obliged to furrender himfelf at difcretion, had nut Doleflaus generouly left him in quiet poffeffion of the duchy of Mazovia, in order to maintain himflelf fuitably to the digitity of his bittin. This kindnefs the ungrateful Sbigntus repaid by entering into another confpiiacy; but the plot being difoovercd, he was feined, bawinhed, and declared a traitor if ever he fet foot again in Poland. Even this feverity did not produce the deGired effell: Sbigncuis perfuaded the Pomeranians to
arm in lis beha'f; but he was defeated, taken prisner, and again banithed. Almoft all the nobility folicited the king to put fuch an ungrateful traitor to death; however, that generous prince could not think of polluting his hands with the death of his brother, notwithfanding all he had jet done. Nay, he even took him back io Poland, and appoinsed him a maintenance fuitable to his rank: but he foon had reafon to repent his hindnefs; for his umatural brother in a thort who time began to raife frefh difturbances, in confequence of laft pu which he foon met with the death which he deferved. death,

Bolellaus was farce free 3 from the intrigues of his brother, when he found himfelf in greater danger than ever from the ambition of the emperor Heary IV. The emperor had attacked the king of Hungrary, with whom Boleflaus was in clofe alliance, and from whom lie hiid received afliftance when in great diftrefs himfelt. The king of Poland determined to affit his friend; and therefore made a powerful diverfion in Bohemid, where he repeatedly defeated the Imperialins : upon which, the emperor collecting all his forces, ravaged Silefia, and even entered Poland, where he laid fiege to the ltrong town of Lubufz; but was at laft obliged to abandon the enterprife, atter having fuftained much lofs. However, Hemry was not difcouraged, but penetrated ftill farther into Poland, and was laying watle all before him, when the fuperior fkill of Bole. flaus compelled him to retire, after having almolt deftroyed his army with fatigue and famine, without once coming to atton. Enraged at this difappointment, Henry laid fiege to Giogaw, in hopes of drawing the Poles to an engagement before he thould be obliged to evacuate the country. The fortifications of the place were weak; but the firit of the inhabitunts iupplied their deficiencies, and they gave the Imperialifts a moft unexpected and vigurous reception. At lalt, however, they were on the point if firrendering to fuperior force ; and actually agreed to give up the place, provided they did not receive any fuccours durng that time. Boleflaus determined, however, nut to let fuch a brave garrifon fall a facrifice to their loyalty ; and therefore prevailed on the befieged to break the capitulation ratther than furrender when they were on the point of being delivered. All this was tranfacted with the utmolt fecrecy; fo that the emperor advanced withont thoughts of meeting with any refiltance, to take poffellion of the city; but, being received by a furious dilcharge of arrows and juelins, he was fo incenfed, that he refolved to form the place, and give no yuarter. On the approach of the army, the Imperialits were aftonifhed to fee not only the breaches filled up, but new walls, fecured by a wet ditch, reared behind the old, and erected during the furpenfion of hoftilities by the indullry of the belieged. The attack however, went on; but the inhabitants animated by defpair, defended themfelves with incredible valour, and at lat obliged the Imperialifts to break up the fiege with precipitation. Next day Bolenlaus arrived, and purfued the emperor with fuch vigour, that he obliged him to fly with difgrace into his own country. This fonn biought on a peace, which was confirmed by a marriage between Boleflitus and the emperor's fifter.

Hitherto the glory of Boleflaus had equalled, or his ow even eclipfed, that of his namefake and predecellor Bo- creduli leflaus the Great; but about the year 1135 he wis

POL dulity. He was impoled upon by an artiul fory patch. cd up by a certain Hungarian ; who infinnated himfelf fo far into his affections, that be gave him the govern. ment of Wiflica, a ftrong town on the river Nida. But the traitor gave up the place to the Rullians, who pillaged and burnt it; carrying the inhabitants at the fame time into flavery. Bolellotus was incenfed, and entered immediately upon a war with Ruffid, by which means he only heaped one calamity upon another. He received a deputation from the inhabitants of Halitz, to implore his affitance in favour of a young prince, who had been banifhed into Polind. Beleflaus marched to their relief with a choice body of troops; but as he was preparing to enter the town, he was attacked by the whole Riliinan army, and, after a mof violent confict, entircly defeated. By this difgrace the duke was fo much aflicted, that he died in a thort time, atter haring reigned 36 years.

Boleflaus, by his will, left his dominions equally divided among his four fons. Uladiflaus, the eldeft, had the provinces of Cracow, Sirad, Lencici, Silefia, and Pomerania. Bolelaus, the fecond fon, had for his thare the palatinates of Culm and Cujava, with the duchy of Mazovia. The palatinates of Kalefzh and Pofnania fell to Mieczflaus the third fon; and in Henry, the fourth fon, were afigned thofe of Lublin, and Sando. mir. Catimir the youngeft child, then an infant in the cradle, was entirely forgor, and no provifion made for him. There have been but very few initarces where dominions were thus divided, that the princes remained fatisfied with their refpective fhares; neither did the fons of Bolenaus long continue at peace with one another. By the will of the late duke, all the brothers were obliged to own the fupremacy of Uladillaus, who was declared duke of all Poland: they were reftrained from forming allidnces, declaring war, or concluding peace, withont his apprubation: they were obliged to take the field with a certain number of troops, whenever the duke required it; and thes were forbid to meddle with the guardianfhip of the infant prince Cafimir, his education being left entirely to the fovereign. The harmony of the princes was firtt difturbed by the ambition of Chritina, the wife of Uladiflaus, who formed a fcheme to get polfetfion of all Poland, and deprive the younger childien of the benefit of their father's will. Having obtained her huband's concurrence, fhe affembled the flates of Poland, and made a long ffeech, fowing the dangers which might arife from a partition of the ducal dominions among fo many ; ard concluded with attempting to fhow the neceflity of revoking the ratification of the late duke's will, in order to enfure the obedience of the prinees and the tranquillity of the republic. Many of the nobility expreffed their iefentment again? this fpeech, and fully refuted every article in it ; but they were all afterwards gained over, or intimidated by Uladifaus; fo that none appeared to take the part of che young princes except a noble Dane, who lof his life for fo doing.

ITadiflaus now having got the nolility on his fide, fint drove Boleflaus out of his territories; next, he marched againt Henry, and difpoffelled him alf, forcing beth to take refuge with Niectllaus in Pofnania, where all the three brethers were befieged. Several of the robility interpofec, and ufed all their influence to

## PO i

effect a reconciliation, but in vain; fer Uladiflaus way as incxorable as if he had received an injury, and there. fore infited that the hefieged princes the uld furrender at diteretion, and fibmit to the will of the conqueror. 'Thus driven to defpair, the brothers fallied out, and attacked the duke's army with fuch impettofity, that they cbtained a complete victory, and took all his baggage and valuable effects. The brothers improved their vietory, and laid fiege to Cracow. The Ruflans, who had alfilted Uladinaus at firft, now entirely ahandoned him, and evacuated Poland, which obliged him to fhut himelf up in Cracow; but, finding the ithabitants little difpofed to ftand a fiege, lie retired into Germany in order to folicit affitance from lis wife's friends. lut here he found himfelf mitaken, and that thefe friends were attached to him only in his profperity; while in the mean time the city of Cracow furrendered, the un- And is deo fortunate Uladinams was formally depofed, and his bro- pofed. ther Boleflaus raifed to the fupreme auliority.

The new duke began his adminiftration with an at of generofity to his brother Uladiflaus, to whom Le gave the duchy of Silefit, which was thus feparated from Poland, and has never fince been re annexed to it. This had no other effect upon Liladiflaus than the putting him in a condition to raife frefh difturbances; for he now found means to perfuade the emperor Conrade to invade Poland: but Brleflaus fo haralfed and fatigued his army by perfetual marches, ambufcades, and kirmifhes, that he was obliged in a fhort time to return to his own co:intry; and for fume years Puland enjoyed a profourd tranquillity.

During this interval Heary entered rn a crufade; and, though be loft almoft all his atmy in that enthu. fiaftic undertaking, he is celebrated b; the fuperfitious writers of that age, as the bulwark of the church, and one of the greateit Chriftian heroes: however, in all probability, the reafon of this extrao:dinary fame is, that he made large donations to the knights of St John of Jerufalem. Son after the re:urn of Henry, Po. Poland in. land was irvaded by the emperor Frederic Batbaroffa, vaded iy who was perfuaded to this by the folicitations of Ula- the empediflaus and his wife Chritina. The number of the Im- ror isurbao perialifts was fo great, that Boleflaus and his brothers did not think proper to oppofe them in the field; they contented themfelves with cutting off the convoys, pla. cing ambufcades, harafing them on their march, and keeping them in perpetual alarms by falfe attacks and fkirmithes. With this view the three brothers divided their forces, defolated the country before the enemy, and burnt all the towns and cities which were in no condition to ftand a fiege. Thus the emperor advancing into the heat of a defolated country where he could not fubfit, was at laft reduced to fuch a fituation that he cuuld neither go forward nor retreat, and was obliged to folicit a conderence with Bo!etlaus. The lat- Who is ter was too prudent to ir:itate him by an unfeafonable obiged to buutine and the baughtiness, and therefore went to the German camp attended only by his brothers and a flight guard. This inflance of confidence was to agreeable to the emperir, that a treaty was foon agreed upon, which was confirmed by a marriage between Adelaide, niece to the emperor, and Nieczilaus duke of Pofnania.

Bolellaus having thus lappily eforaped from fo great a danger, took it into his head to attempt the conquelt of Prultia, for no cther reafon but becaure the inhabi-

## PO I. <br> [ 280

Polond. tants were hearhens. Having unexpectedly invaded che country with a very numerous army, he fucceeded in his enterprife; great numbers of infidels were converted, and many churches fet up: but no fooner was Boleflaus gone, than the inhabitants returned to their old religion. Upon this Boleflaus again came againft then with a formidable power; but, being betrayed by fome Pruffians whom he had taken into his fervice and raifed to pofts of honour, his army was led into defiles and almoft entirely cut off, duke Henry was killed, and Boleflaus and Mieczilaus efcaped with great difficulty.

This misfortune was quickly followed by another ; for now the children of Uladillaus laid claim to all the Polifh dominions which had been poffefled by their la ther, moft of which had been beftowed upon young Cafimir. They were fupported in their pretenfions by a great number of difcontented Poles, and a confiderable body of German auxiliaries. Boleflaus, finding himfelf unable to withftand his enemies by force, had recourfe to negociation, by which means he gained time to recruit his army and repair his loffes. An affembly of the fates was held, before which the duke fo fully refuted the claims of the children of Uladiflaus, that it was almolt unanimoufly voted that they had kindled an unjuft war; and to take away every pretence for renewing the civil difcords of Poland, they were a fecond time invefted with the duchy of Silefia, which for the prefent put an end to all difputes. After this, Boleflaus applied himfelf to promote, by all means, the happinefs of his fubjects, till his death, which happened in the year 1174

On the death of Boleflaus, the ftates raifed his brother Mieczflaus to the ducal throne, on account of the great opinion they had of him. But the moment that Mieczflaus ceafed to be a fubject, he became a tyrant, and a flave to almolt every lind of vice; the confe quence of which was, that in a very fhort time he was depofed and his brother Cafimir elected in his ftead.
Cafimir was a prince of the greateft juftice and benevolence, infomuch that he ferupled to accept of the honour which the ftates had conferred upon him, left it fhould be a trefpafs againft the laws of equity. However, this fcruple being foon got over, he fet himfelf about the fecuring peace and tranquillity in all parts of his dominions. He redreffed all grievances, fuppreffed exorbitant impofts, and aflembled a general diet, in which it was propofed to refcue the peafants from the tyianny of the nobility; an affair of fuch confequence, that the duke could not enter upon it by his own authority, even though fupported by the clergy. Yet it proved lefs dificult than had been imagined, to perfuade the nobility to relinquith certain privileges extremely detrimental to natural right. They were influenced by the example of their virtuous fovereign, and immediately granted all that he required; and, to fecure this declaration in favour of the peafants, the archbilhop of Gnefna thundered out anathemas againft thofe who thould endavour to regain the unjut privileges which they had now renounced; and to give a till greater weight to this decifion, the acts of the diet were tranfmitted to Rome, where they were confirmed by the pope.

But though the nobility in general confented to have their power fomewhat retrenched, it proved matter of difcontent to fome, who for this reafon immediately became the partifans of the depofed Mieczllaus. This un-
fortunate prince was now reduced to fuch indigence, that he wrote an account of his fituation to his brother Calimir; which fo much affected him, that in an af. fembly of the diet he propofed to refign the fovereignty in favour of his brother. To this the ftates replied in the moft preremptory manner : they delired him never more to mention the fubjeet to them, left they mould be under the necefity of depofing lim and exclud. ing his brother, who, they were determined, fhould never more have the dominion of Poland. Cafimir, however, was fo much concerned at the account of his brother's misfortunes, that he tried every method to relieve him, and even connived at the arts practifed by fome di contented noblemen to reftore him. By a very fingular generofity, he facilitated the reduction of Gnefna and Lower Poland, where Mieczllaus might have lived in peace and fplendor, had not his heart been fo corrupted that it conld not be fubdued by kindnefs. The confequence was, that he ufed all his art to wreft from his brother the whole of his dominions, and actually conquered the provinces of Mizovia and Cujava; but of thefe he was foon difpoffeffed, and only fome places in Lower Poland were left him. After this he made another attempt, on occafion of a report that Ca fimir had been poifoned in an expedition into Ruffia. He furprifed the city of Cracow: but the citadel refufed to furrender, and his hopes were entirely blafted by the return of Cafimir himfelf; who, with an unparalleled generofity and magnanimity, afked peace of his brother whom he had vanquifhed and had in a manner at his mercy.-The laft action of this amiable prince was the conquit ${ }^{55}$ conqueft of Ruflia, which he effected rather by the re-Rullia. putation of his wifdom and generofity than by the force of his arms. Thofe barbarians voluntarily fubmitted to a prince fo famed for his benevolence, juftice, and humanity. Soon after his return, he died at Cracow, lamented as the beft prince in evcry refpect who had ever filled the throne of Poland.

Cafimir left one fon, named Lechus, an infant; and the ftates, dreading the confequences of a long minority, hefitated at appointing him fovereign, confidering how many competitors he mult neceffarily have, and how dubious it muft be whether he might be fit for the fovereignty after he had obtained it. At laft, however, Lechus was nominated, chiefly through the intereft he had obtained on account of the reputation of his father's virtues. The confequence of his nomination was precifely what might have been expected. Mieczflaus formed an alliance againtt him with the dukes of Oppelen, Pomerania, and Breflau; and having raifed all the men in Lower Poland fit to bear arms, took the road to Cracow with a very numerous army. A bloody battle was fought on the banks of the river Mozgarva; in which both fides were fo much weakened, that they were unable to keep the field, and confequently were forced to retire for fome time in order to repair their forces. Mieczflaus was firft ready for action, and therefore had the advantage: however, he thought proper to employ artilice rather than open force ; and therefore having attempted in vain to corrupt the guardians of Lechus, he entercd into a treaty with the duchers-dowager his mother. To her he reprefented in the flrnngeft manner the miferies which would enfue from her refufal of the conditions he propofed. He ftipulated to adopt Lechus and Conrade, her foas, for his own : tn
fursender
nd. furrender the province of Cujavia for their prefent fup. port; and to deelare them heirs to all his dominoms. The principil robility oppofed this accommodation, but it was arecopted by the ducleefs in fpite of all their remonftrances; and fificcaflatus was once more put in polletion of the citpital, after having taken a folemn O:th to executc punctually every article of the treaty.

It is not to be limppolici that a prince of fucle a perfidious difpoficion at Micczflaus would pay much regard to the obligations of a timple contract. It was a maxim with him, that a fovereign is no longer obliged to keep his oath than while it is nether fafe nor bencfical to break it. Having therefore got all the power into his hands, he behaved in the very fanme manner is if 110 treaty with the duchefs had fublifted. The duchefs, Jucciving herlelt duped, formed a frong pasty, and excied a general infurrecticn. 'The rebellion conld not be withilood: Miccrllaus was driven out of Cricow, and on the point of being redaced to his former circumfances, when he found matas to pr xluce a variance betweer the duchefs and palatine of Cracow; and thus once more turned the fcale in his farour. Ihe forces of Mieczfaus now became fuperior, and he, in confequence, regained polrellion of Cracow, but did not lons cnjoy his profperity, falling a victim to his intemperance; fo that Lechus was reftored to the fovereignty in the year 1226.

The government of Lechus was the mof unfortumate of any of the Sovereigns of Poland. In this time the Tartars made an irruption, and comnitted everywhere the mof crucl ravages. At laft they came to an en. gagement with the Poles, allited by the Rulians; and after an obfinate and dreadful confiat, obtained a complete victory. This incurfion, however, terminated as precipitately as it commenced; for without any apparent realon they retired, juft as the whole kingdom was ready to firbmit; but the devaftations they had committed produced a famine, which was foon followed by a plague that depopulated one of the moft populous countries of the noith. In this unhappy fituation of affairs, death ended the misfortunes of Lechus, who was murdered by his own \{ubjects as he was bathing. A civil war took place after his death; and the hiftory for fome time is fo confufed, that it is difficult to fay with certainty who was his fuccerfor. During this unfortunate fate of the country, the Tartars made a fe. cond irruption, lisid all defoldte before them, and were advancing to the capital, when they were attacked and defeated with great llaughter by the palatine of Cracow with only a handful of men. The power of the enemy, however, was not broken by this victory; for, next year, the 'Iartars returned, and committed fuch barbarities as can fcarce be imagined. Wholc provinces were defeated, and every one of the inhabitants mar. facred. They were returning, laden with fpoil, when the palatine fcll upon them a lecond time, but not with the fame fuccefs as before : for, alter an obfinate engagenrent, lie was cefeated, and tlus all Poland was laid open to the ravages of the barbarians; the nobility fled into Hungary, and the peafants fought an afylum among rochs and impenctrable forelts. Cracow, being leftemirely defencelefs, was foon taken, pillaged, and burnt ; after which the barbarians, penetrating into Silefia and Moravia, defolated thefe countrics, deftroying Breflau and othe: cities. Nor did Hungary efcape the Vol. XV
fury of their barbarity; the king gare hatile to the 'lartars, but was delcated with vatt Cuughter, and had the mortifeati an to fec his capital diol in thes, and above 100,000 of his lubjects perifh by lire and furd. The arms of the Tartars were invincible ; 1.0thons could withit and the prodiginus number of forces which they brought into the fiek, and the fury with whil? they lought. They fixed their lead quarters on tise frontiers of kJungary; and fpreaci their devatations on every fide with a celerity and fuccefs that threatened the deftruction of the whole cmpire, as wall as of the neighbouring kingdoms.

In this dreadful fituation was Poland when Bolenaus, furnamed the Chafle, was raifed to the fovereignty; but this, fo far from putting an end to the troubles, only fuperadded a civil war to the reft of the calamities. Bolentans was oppofed by his uncle Conrade the brother of Lechus, who was provoked at becoming the fubject of his own nephew. Hiving afiemb!ed a powerful army, lie gained pofietion of Cracow; affumed the title of Duke of Poland; and might polfibly have kept poffellion of the fovereignty, had not his avarice and pride equally offended the nobility and peafants. In confequence of thair difcontents, they unanimoully invited Bolcflaus, who had Ged into Iungary, to come and head the infurrection which now took place in evary quarter. On lis arrival, he was joyfully received into the capital : but Conrade ftill headed a powerful party; and it is reported that on this occalion the kinghts of the Teutonic order were firft called into Poland, to dilpute the pretenfions of Bolenaus. All the endeavours of Conrade, however, proved unfuccelsful: he was defeated in two pitched battles, and forced to live in a private fituation; though he never ceafed to harafs his nephew, and make frefh attempts to recover the crown. However, of the reign of Boleflaus we have little account, except that he made a vow of perpetual continency, and impofed the fame on his wife; that he founded near 40 monafteries; and that he died after a long reign in 1279, after having adopted Lechus duke of Cujavia, and procured a confmation of his choice by the free election of the people.
The reign of this laft prince was one continued fcenc pota of forcign and domeftic trouble. On his firftaccefilon over-rumby he was attacked by the united forces of Rufia and Li- the Rufthuania aflifted by the Tartars; whom, however, he had fians, Tarthe good fortune to defeat in a pitched battle. By this tars, and victory the enemy were obliged to quit the kingdom ; nianus. but Lechus was fo much weakened, that civil diffor. fions took place immediately after. Thefe increafed ta fuch a degree, that Lechus was obliged to fly to Fungary, the common refource of diftrelfed Pol fly princes. gary, the common refource of diftreffed Pol th princes. duty ; and thefe brave citizens food all the fatigue and danger of a tedious fiege, till they were at laft relieved
by Lechus at the head of an Humgarian army, who de. danger of a tedious fuege, till they were at lat relieved feated the rebels, and reflored to lis kingdom a lefitimate government. He had farce reaicended the throne when the united forces of the Ruffians, Tartars, and Lithuanians, made a lecond irruption into Poland, and delolated the country with the mof favage barbarity. Their forces were vow rendered more terrible than ever by their having alngg with them a vall nunber of large dogs tramed to the art of war. Lechus, however, with an army muall inicrior, ohtained a complete

vitron; the Poles beirg arimated by defpair, as per eeiving, thit, if they were conquered, they mult alio be devoured. Som after this, Lechus died with the reputation of 1 wrilike, wife, bat unfurtunate prince. As le died withut iniue, his crown was contelted, a civil var again enfued; ; and the afteirs of the fate continued in a viry declinirg way till the year 1296 , when Preniilius, the duke at that time, refumed the title of ling. However, they did not revive in any confiderahle degree $t!1$ the year 130 , , when Uladillaus Lodicus, who had feized the throne in 1300 , and afterwards been driven out, was a gain reflored to it. The firf tranfaction of his reign was a war with the 'Fcutonic knights, who had ufurped the greater patt of Pomerania during the late dithrbanees. They had been fettled in the territory of Culm by Conrade duke of Mazovia; but foon extended their dcminion over the neighbouring provinces, and had even got poffeffion of the city of Dantzic, where they maffacred a number of Pomeranian gentlemen in cold blcod; which to much terrified the neighbouring towns, that they fubmitted without a froke. The knights were commanded by the Pope himfelf to renounce their conquefts; but they fet at nought all his thunders, and even fuffered themfelves to be excommunicated rather than part with them. Asfoon as this happened, the king marched into the territories of the marquis of Brandenburg, becaufe be had pretended to fell a right to the Teutonic knights to thofe countries, when he had none to them himfelf. Uladiflaus next entered the territory of Culm, where he laid every thing Wafte with fire and lword; and, being oppofed by the joint forces of the marquis, the knights, and the duke of Mazovia, he obtained a complete victory after a defiperate and blondy engagement. Without purfuing the blow, he returned to Poland, recruited his army, and being reinforced by a body of auxiliaries from Hungary and Lithuania, he difperfed the enemy's forces, and ravaged a fecond time all the dominions of the 'T'eutonic order. Had he improved this advantage, he night eafily have exterminated the whole order, or at leaft reduced them fo lew, that they could never have occafioned any more difturbances in the ftate; but he fuffered himfelf to be fowthed and cajoled by the promiies which they made without any defign of keeping them, and concluded a treaty under the mediation of the kings of Hungary and Bohemia. In a few months he was convinced of the pernidy of the knights; for they not only refufed to evacuate Pomerania as had been ftipulated in the treaty, but endeavoured to extend their nfurpations, for which purpofe they had affembled a very contiderable army. Uladilaus, enraged at their treachery, took the field a third time, and gave them batule with fuch fuceels, that 4000 knights were lett dead on the fpot, and 30,000 auxilianies killed or taken prifiners. Yet, though the king had it once more in his power to deftroy the whole Teutonic order, he fatisfied himfelf with obtaining the territories which had occafioned the war; after which le feent the remainder of his life in pace and tranquillity.

Uladiflans was fucceede 3 by his fon Cafimir III. fur-

over ran the duclis, and annexed it as a province to the crown : alter which he ?pplied himfeif to domeitic af-
fairs, and was the firt who introduced a written code of Po laws into Poland. He was the mof impartial juige, the molt rigid obferver of juftice, and the moft futmillive to the fiws, of any potentate mentioned in the hiftory of Europe. The only vice with which he is charged is that of incontirency ; but even this the clergy declared to be a venial fin, and amply compenfated by his other virtues, particularly the great libstality which he fhowed to the clerical order.

Cafimir was fucceeded in $137^{\circ}$ by his nephew Lnuis Unh: king of Hungary; but, as the Poles looked upon him reigr to be a foreign prince, they were not happy under his loui adminiftration. Indeed a coldnefs between this monarch and his people took place even befure he afcended the throne for in the pacta conventa, to which the Polith monarchs were obliged to fwear, a great number of unufual articles were inferted. This probably was the reafon why he left Poland almoft as foon as his coronation was over, carrying with him the crown, fceptre, globe, and fword of ftate, to prevent the Poles fr m electing another prince during his abfence. He left the government in the hands of his mother Elizabeth; and the would have been agreeabl: to the people, had her capacity for government been equal to the tank. At that time, however, the flate of Poland was too much diftrasted to be governed by a woman. The country was over-run with bold robbers and gangs of villains, who committed the moft horrid diforders; the kingdom was likewife invaded by the Lithuanians; the whole province of Ruffia Nigra revolted ; and the king. dom was univerfally filled with diffenfion. The Poles could not bear to fee their towns filled with Hungarian garrifons; and therefore fent a meffage to the king, telling him that they thought he had been fufficiently honoured in being elected king of Poland himfelf, without fuffering the kingdom to be governed by a woman and his Hungarian fubjecis. On this Louis immediately waifed a numerous atmy, with a defign fully to conquer the fpirit of his fubjects. His firft operations were direeted againft the Ruffians; whom he dofeated, and again reduced to fubjection. Then he turned his arms againft the Lithuanians, drove them out of the kingdom, and re-eftablithed public tranquillity. However, intead of being fa isfied with this, and removing the Hungarian garrifons, he introduced many more, and raifed Hungarians to all the chief pofts of government. His credit and authority even went fo far as to get a fucceffer nominated who was difagreeable to the whole nation, namely Siyifinund marquis of Brandenhurg. After the death of Lonis, however, this election was fet afide; and Hedwiga, daughter of Calimer the Great, was proclaimed queen.
This princefs married Jıgello duke of Lithuania, who was now converted to Chillianity, and baptized by the name of Uladifuus. In confequence of this marriage, the duchy of Lithuania, as well as the vaft provinces of Samomitia and Rulfar Nigra, became annexed to the uriti crown of Poland. Such a for midable acceflion of power duchy excited the jealoufy of the Teutonic knights, who were gethes ferifible that Uladiflatus was now bound to undertake the ${ }_{\text {and }} \mathrm{K}$ reduction of Pomerania, and revenge all the injuries $N$ igra which Poldod hat fuftaned from them for a great num- Pana ber of years. From his firtt accefion therefore they confidered this monarch as their greatef enemy, and endeavoured to prevent his defigns againat them by effect-

## $\mathrm{P} 0 \mathrm{~L} \quad[283$ 〕 $\quad$ 门 L

1. ing a revolution in Lithuania in favour of his brother Andrew. The propert of fuccels was the greater here, as moft of the nobility were difcontented with the late aliiance, and Uladiflaus had propofed to effect a revolution in religicn, which was highly difagrecable. On a fudden, therefore, two armies marched toward; the frontiers of the duchy, which they as fuddenly penetrated, laying walte the whole country, and feizing upon tome important fortreffes b-fore the king of PoJand had any notice of the matter. As foon as he received adrice of thefe ravages, Uladiflaus raifed fome forces with the utmoft celerity, which he committed to the care of his brother Skirgello, who deleated the Teutonic knights, and foon obliged them to abandon all their conquells. In the mean time Uladillaus marched in perfon into the Higher Poland, which was fubjêted to a variety of petty tyrants, who opprefied the people, and governed with intolerable detpotifm. The palatine of Pofnia in particular had diftinguifhed himfelf by his rebellious practices; but he was completely defeated by Uladillaus, and the whole country reduced to obedience.

Having fecured the tranquillity of Poland, Uladiflaus vifited Lithuania, attended by a great number of the clergy, in order to convert his lubjects. This he effected without great difficulty; bat left the care of the duchy to his brocher Skirgello, a man of a cruel, haugh. ty, and debauched turn, and who immediately began to abufe his power. With him the king fent his coutin Vitowda, a prince of a generous, brave, and a miable difpofition, to be a check upon his conduct; but the barbarity of Skirgello foon obliged this prince to take refuge among the Teutonic knights, who were now become the afylum cf the opprefed and difcontented. For fome time, however, he did not affilt the knights in their defigns againft his country; but having applied for protection to the king, and finding him remifs in affording the necefliary affitance, he at laft joined in the fchemes formed by the knights for the deftruction of Poland. Entering Lithuania at the head of a numerous army, he took the capital, burnt part of it, and dellroyed 14,000 perfons in the flames, belides a great number who were maflacred in attempting to make their elcape. The upper part of the city, however, was vigoroufly defended, to that the befiegers were at laft obliged to abandon all thoughts of making themfelves mallers of it, and to content themfelves with defolating the adjacent country. The nest year Vitowda renewed his attempts upon this city, but with the fame ill fuc. cefs; though he got poffefion of fome places of lefs wote. As foon, however, as an opportunity offered, he came to an accommodation with the king, who beftow. ed on him the government of Lithuania. During the firft jears of his goveriment, he beflowed the moit diligent attention upon domeltic afiairs, endeavouring to repair the calamities which the late wars had occaisoned; but his impetuous valour pronpted hins at laft to engage in a war with Tamerlane the Great, after his viciory over l3 jazet the Turkilh emperor. For fome time before, Vitowda had been at war with the neighbouring Tartars, and had been conftantly vikorious, tranfproting whole hordes of that barbarous people into pohand and Lithamia, where to this day they form a colony diftin? in manners and drefs from the other inhabitants. Uladillaus, lowever, difluaded him tromat-
tacking the whole Arength of the nation maite lich if Powni celcbrated commander as 'lamer lane : but Virnw! thas obftinare; he encountced an army of $+00,000$ '1' we"perritle tirs under Ediga, Tamerlane's lientenant, with only al,.-le vilh tenth part of their number. The batte continad for the 1.na whole day; but at laft Vitowda was firmonded :rso by the numbers of his cnemy, and in the utm ., dan er of being cut is prieccs. However, he broke his wist through with prodigions flanglter on boolh fide: ; find came off at latt without at total defeat, having killed :a number of the enemy equal to the whole c: hin own army.
6.7

During the abfence of Vitowda, the Teutonic lnights Wats with had penetrated into Lithuania, committing everywhere the Tew:onthe moft dreadful ravares. On his return he atiached nick kniglits and defeated them, making an irruption into Lis mia, to punilh the inhabitans of that cumetry for the atiltance they had given to the Tcutonic order. This was fucceeded by a long feries of wass between Pol and and Prufia, in which it uecame neceliary for Uladidas limfelf to take the field. The kuights had now one way or other got poffelion of Samogitis, Marovia, Culm, Silefia, and Pomeran:a; for that Thadiflus tefolved to punilh them before they became tno powerful. With this view he affembled an army compofed of feveral different nations, with which he penetrated into Piullia, took feveral towns, and was advancing to Marienbur ${ }^{5}$ the capital of Pomerana, when he was met by the army of the Pruflian knights, who determined to hazard at battle. When the engagement began, thie Poles were deferted by all their auxiliaries, and obliged to Itand the brunt of the battle by themfelves. But the conrage and conduct of their king fo animated then, that after a moft defperate battle they obtained a completa victory; near 40,000 of the enemy being kil'ed in the field, and 30,000 taken prifoners. This terrible overthrow, however, was lefs fatal to the affairs of the Pruffian knights than might have been expected; as Uladi1haus did not improve his victory, and a peace was concluded upon eafier terms than his adverfarics had zny reafon to expect.-Some infraction of the treaty oce fioned a renewal of hoffilities; and Uladilaus was fo much elated with vifory that he would henrken to no terms, by which means the enemy were driven to the defperate refolution of burying themfelves in the ruins of their capital. The fiege was accordingly commenced, and both fides behaved with the g'eaten vignour; but at laft, through the good conduct and valour of the grand matter of the knights named Plazven, the Polilh monarch found himelf obliged to grant them an advantageous peace, at a time when it was univerfilly expected that the whole order would have been exterminated.

Uladiflaus V. died in 1425, and was fucceced by his fon Uladiflaus VI. at that time oniy nine yeno of age. He had farce afcen led the throne, when the kingdom was invaded by the Tartars, who deferted Buccarius the general of the Polifa furces; and committing everywhere dreadiul ravages, returned th the ir own country loaded with booty. A tetw yersafier, the nation was involved in a war with Animath hine emperor of the Turks, who thre.tened to bre th init, Hungary; and $i$ i was thnught by the diet $t$, be g.on 1 policy to affitt the Hungarians at this jumitare, becaure it was impolible to know where the floma might

Poland. fall after Hungary was conquered. But before all things were prepared for the young king to take the fielt, a throng body of auxiliaries were difpatched under the celebrated John IIunniades vaivode of Tranfilwan'a, to oppofe the Turks, and likewife to fupport the clecticn of Uladiflaus to the crown of Hungary. This diatachment furprifed the Tukifh army near the river Morava, and defeated Amurath with the lofs of 30,000 men; after which Hunnindes retook all the places which had been conquered by Amurath, the proud fultan was ferced to fae for peace, and Uladifaus was raifed without eppofition to the crown of Hungary. A treaty was concluded, by whicla the Turks promifed to relinquilh their defigns upon Hungary, to acknowledge the king's light to that crown, and to give up all their conquelts in Rafcia and Servia. This treaty was fealed by mutual oaths: but Uladiflaus broke it at the perfuafion of the pope's legate; whoinfifed, that now was the time for frumbling the power of the infictels; and produced a
fpecial commilion from the pope, abfolving him from the oath he had taken at the late treaty. The confequence of this perfidy was, that Uladiflaus was entirely defeated and killed at Varna, and the greatelt part of his army cut in pieces.

Uladiflaus VI. was fucceeded by Cafimir IV. in whofe reign the Teutonic knights were fubdned, and obliged to yield up the territoties of Culm, Michlow, and the whole duchy of Pomerania. together with the towns of Elbing, Marienburgh, Talkmith, Schut, and Chrillburgh, to the crown of Poland. On the other hand, the king reflored to them all the other conquefts he had made in Pruffia, granted a feat in the Polifh fenate to the grand-mafter, and endowed him with other privileges, on condition that, fix months after his accellion, he fhould do homage for Pruffia, and take an oath of fidelity to the king and republic.

This fuccefs raifed the $f_{p}$ irits of the Polifh nation, which had dronped ever fince the battle of Varna. The diet did not, however, think proper to renew the war againft the Turks, but took under their protection the holpodar of Moldavia; as thinking that this province would make a convenient barrier to the Polifl dominions on one fide. The requeft of the prince who afled this protection was therefore readily granted, an oath of fidelity exacted from him and the inh ibitants, and a tribute required; regular payment of which was made for a great number of years afterwards.

About this time alfo the crown of Bohemia becoming vacant, the people were extremely defirous of being governed by one of the princes of Poland; upon which the barons were induced to beflow the crown upon Uladiflaus, eldeft fon of Cafimir, in oppofition to the intrigues of the king of Hungary. Not 反atisfied with this acquifition, Uladiflus took advantage of the diffenfions in Hungary in order to unite that crown to his own : and this he alfo efiected; by which means his power was greatly augmented, though not the felicity of his peopic. So many foreign expeditions had exhaulted the treafury, and opprefled the peafants with taxes; the gentry were greally dimiHithed l,y a number of blody engagements; agriculture was neglected, and the country almof depopula. ted. Befcre a proper remedy could be applicd for thefe evils, Cafimir died in 1492 ; much more admixed, than belored or regrated, by his fubje?s. It is
related by the hiforians of this period, that in the reign of Catimir IV. the deputies of the provinces firit appeared at the diet, and affumed to themfelves the legiflative power; all laws before this time having been framed by the king in conjunction with the fenate. It is obferved alfo, that before Cafimir's time, the Latin language was undertood only by the clergy of Poland; in proof of which, it is alleged, that at an interview between this prince and the king of Sweden at Dantzick, his Polifh majefty was forced to make ufe of the affitance of a monk to interpret between him and the Swedifh monarch. Cafimir, afhamed of the ignorance fhown by himfelf and court, publithed an edict, enjoining the diligent Audy of the Latin, which in our days is fipoken as vernacular by every Polifh gentleman, though very unclafically.

During the fucceeding reigns of John, Albert, and Alexander, the Polifh affairs fell into decline; the kingdom being haraffed by continual wars with the Turks and Tartars. However, they were retrieved by Sigifmund I, who afcended the throne in 1507 . This monarch, having reformed fume internal abufes, Exploi next fet about rendering the kingdom as formidable as it Sigifm had formerly been. He firt quelled a rebellion which 1 , broke out in Lithuania; after which, he drove the Walachians and Moldavians out of Rulfia Nigra, and defeated the Ruffians in a pitched battle, with the lofs of 30,000 men. In this engagement he was obliged to caufe his cavalry to fwim acrofs the Borithenes in order to begin the attack, while a bridge was preparing for the infantry. Thefe orders were executed with anonihhing celerity, notwithfanding the rapidity of the fream, the fleepnefs of the banks, and the enemy's oppofition. The onfet was led by the Lithuanians, who were directed to retreat gradually, with a view of drawing the enemy within reach of the cannon. This the Ruffians mittook for a real flight; and as they were purfuing with eagernefs, Sigifmund opened his line to the right and left, pousing in grape-fhot from the artillery with dreadful fircefs. The Rufian general, and feveral noblemen of the firt ditindion, were taken prifoners, while the whole lofs of the royal army did not amount to 300 men .

After this complete vifory, the king turned his arms againt the Teutonic knights, who had elected the marquis of Brandenburgh their grand-mafter ; and this prince not only refufed to acknowledge the forcreignty of the crown of Poland, but even invaded the Yolifh territories. Sigimund marched againt him, and gained poffefion of feveral important places in Branderburgh ; but as he was purfuing his conqueft, the marquis was reinforced by 14,000 Germans, led by the duke of Schonenburg, who ventured to lay fiege to Dantzic, after having ravaged all the neighbouring country. The Dantzickers, however, defended themfelves with fo much pirit, that the befiegers were foon obliged to relinquifh their enterprife. In their setreat they were attacked by a ttrong detachment of Polith cavalry, who made prodigious havock among them, and compelled the wretched renains totake fhelter in Pomerania, where they were inhumauly butchered by the peafants. Soon after this the marquis was obliged to fulmit to the cleniency of the conqucror; from whom, however, he obtained better conditions than could have been expected, or indeed than he would

## P O L

would have got, had he not abandoned the intereft of the Teutonic order, and refigned the dignity of grandmafter. In order to fecure him in his intereft, therefore, Sigifmund granted him half the province of Prufia as a fecular duke, and dependent on the crown of Poland; by which means he entirely deprived that order of the beit part of their dominions, and put it quite out of their power to difutb the tranquillity of Poland any more.
The power of Sigimund had now excited the jealot:fy of the houfe ot Auftria; for which reafon they look every method in their power to fir up enemics againft hins. By their mans, the Ruflians, Moldavians, and Tartars, were all excited to fall upon the Polifh teritories at once. The vairode of Walachia, with $50,0 c 0$ men, made an irruption into the fmall province of Pokatior, but was entirely defeated by count Taro at the head of no more than 6000 . This victory is wholly afcribed to the good conduct of the commander, who poffeffed himfelf of fome eminences on the flanks of the cnemy. On thefe he erected batteries; which played with fuch fury as foen put their ranks in difurder: upon which the Poles attacked them fivord in hand, and entirely difperfed then with the lofs of 10,500 killed or taken. The count having then augmented his arny with a flrong body of Lithuanians, attacked the Mufcovites and Tartars, drove them entirely out of the duchy, purfued them into Ruflia, reduced feveral towns, and at latt laid fiege to the Aroug fortrefs of Straradub; in which the regent, together with fome of the beft troops of Ruftia, were inclofed. The garrifon made a gallant defence; and the fortifications were compofed of beams joined together, and fupported by a bulwark of earth, upon which the cannon-fhot made no impreflion: but the count contrived a method of fetting the woor on fire; by which means the regent and nobility were obliged to furrender at difcretion, and Taro carried off upwards of 60,000 prifoners, with an immenfe booty.

In the reign of Sigifmund, we may look upon the kingdom of Poland to have been at its greatelt pitch of glory. This monarch poffeffed, in his own perfon, the republic of Poland, the great duchies of Lithuania, Smolenfko, and Saveria, belides vaft territories lying beyond the Euxine and Baltic; while his nephew Lew is poffefed the kingdoms of B hemia, Hungary, and Silefia. But this glory received a fudden check in 1545, by the defeat and death of Lonis, who perifhed in a battle fought with Solyman the Great, emperor of the Turks. The daughter of this prince married Ferdinand of Auftria; whereby the dominions of Hungary, Bohemia, and Silefia, became infeparably connected with the hereditary dominions of the Auftrian family. This misfortune is thought to have haftened the death of Sigifmund ; though, being then in his $84^{\text {th }}$ year, he could not have lived long by the ordinary courfe of nature. He did not, however, furvive the ncws many months, but died of a lingering diforder, leaving behind him the clarader of the completeft general, the ablen politician, the beft prince, and the Arongeft man, in the north; of which laft, indeed, fome inftances are related by hiforians that are almoft incredible.

Sigifmund AuguRus, who fucceeded his father Sigifmund I. proved alfo a very great and happy prince.

At that time the mon violent and blonely wars were carrying on in Germany, and indeed hrough cater parts of Eurofe, on aceount of alegion; lint bigif. musd wifely avoided interferins in thote cilputes. Wo if nemb would not adnoit into lis den inions any of thote di- wife and ${ }^{3}$ vines who were taxad with l.oluing hectrodes r fitions, valant nor even allow his people the liberty of cometpon ving Ifate with them; yet lie sever perfecused, or employnd any other means for the prefervation of the fate than thofe of a well-conduated and regular policy. Infead of di.: putiag with his iubiccts about fpeculative cjitimi:s, sigifinund applid his.felf diligently to the refurming of abufes, entorcing the laws, emplaing the treatiory, promoting indufry, and redeening the chown-lands wh.re the tithes of the polliciors appeared iliegal. Ont of the revenue recovered ia this manmer he obtained a formidable ftanding aimy, without laying auy additional tax upon the fubjeats; and though he preferred peace to war, he was always able to punith thofe that offercd indignities to his crown or perfon. His knowledge war with in the art of war was foon tried in a conelt with the Rufan. Rullians, who had made an inruption into Livonia, encouraged by the difpuces which had fubfited betwee:a the Teutonic knights and the archbilhop of Riga, coufin to Sigifnund. The province was at that time divided between the knights and the prelate; and the Rullians under pretence of afilting the former, had feized great part of the dominions of the latter. The archbilhop had recourfe to his kinfman the king of Poland; who, after fruitlefs efforts to accommodate matters, marched towards the frontiers cf Livonia with an army of 100,000 men. The knights were by no means able to refint fuch a formidable power; and therefore, deferting their late allies, put themfelves under the protection of the king of Poland. The czar, John Bafilides, though deferted by the knights, did not lofe his courage ; nay, he even infolently refufed to return any anfwer to the propofals of peace made by Sigifmund. His army confilted of $300,0 c 0$ men, with whom he imasined himeffe able to reduce all Livonia, in fipite of the utmolt efforts of the king of Poland: however, having met with lome checks on that quarter, he direstly invaded Poland with his whole army. At firit he carried every thing before him ; but the Pules foon made a vigorous oppofition. Yet the Rublians, though everywhere defeated, fill continued their incurfions, which Sigifmund at laft revenged by invading Rulii.: in his than. Thefe mutual defolations and ravages at lalt made both parties defirous of peace, and a truce for three years was agreed on ; durin's the continuance of which the king of Poland died, and with him was extincuibed the boule of faren, whith hat gore houre Polan Poland for near 200 jears.

On the death of Sigifmund, Polend became a prey to inteltine divifions; and a valt rumber of intigues's were let on foot at the courts of Vienna, France, Saxony, Sweden, and Mradenburgh; each endeavouring to eftablilh a prince of their uwn nation na the throne of Poland. The confequence of all this was, that the jiframed kingdom became one umverial feric of corrmption, fate of loo faction, and confution; the members of the diet con. land. fulted only their own intereft, and weere ready on cerery occafion tn fell thempeives to the be!t bidder. The Proteitants had by this time got a confiderable footing in the kingdom, tad thus religions difputes were in-
termiuglta

3'ciand. temminged with political ones. One good effeet, how-
cuer, thued from this confufion : for a law was paffed, by which it was enated, that no difference in religions opinions fhould make ary contention among the fubivels of the kingdom; and that all the Poles, without dicrimination, thould be capable of holding public offices and tults under the government; and it was alfo icfolvel, that the future kings fhould fwear cxprefsly to cultivate the internal tranquillity of the realm, and cherifh without diftinction their subjects of all perfuafions.

While the candidates for the thrme were feverally attempting to fupport their own interelt in the belt manner they could, Joln Craforki, a Polifh gentleman of great merit, but diminutive ftature, had juft returned from France, whither he had travelled for improvement. His humour, wit, and diverting fize, lad rendered him univerfally agreeable at the court of lirance, :und in a pirticular manner engaged the efteem of Ca tharine de Medicis, which the little Pole had the addeefs to make ufe of for his own advantage. He owed many obligations to the dnke of Anjou; whom, out of gratitude, he reprefented in fuch favourable terms, that the Poles began to entertain thoughts of making him their king. Thefe fentiments were confirmed and encouraged by Crafolki, who returned into France by order of feveral leading men in Poland, and acquainted the king and queen Catharine, that nothing was wanting befides the formality of an embalfy to procure the crown for the duke of Anjou, almolt without oppofition. Charles IX. king of France, at that time alfo promoted the fcheme, being jealous of the duke of Anjou's popularity, and willing to have him removed to as great a diftance as poflible. Accordingly the parties came to an agreement ; and it was itipulated that the duke of Anjou hould maintain the laws, liberties, and cuftoms of the kingdom of Poland, and of the grand duchy of Lithuania; that he floould tranfport all lis effects and annual revenues in France into Poland; that the French monarcl fhould pay the late king Sigifmund's delats; that he fhould maintain 100 young Polih gentlemen at his count; and 50 in other places; that he hould fend a fleet to the Baltic, to affit Poland againt the Ruffians; and laftly, that Henry fhould marry the Princefs Anme, fitter to the late king Sigifmund ; but this article Henry would not ratify till his return to Poland.

Every thing being thus fettled, the young king quitted France, attended by a fplendid retinue, and was accompanied by the queen-mother as far as Lorrain. He was received by lis fubjects on the frontiers of Poland, and conducted to Cracow, where he was foon after crowned. The affections of the Poles were foon engaged by the youth and accomplithments of Henry ; but farce was he feated on the throne, when, by t'le steath of Chatcs IX. he became heir to the crown of France. Of this he was informed by repeated meffages from queen Catharine; he repented his having
accepted the crown of Poland, and refolved to leave it for that of France. But being fentible that the Poles would oppoic his departure, he kept his intentions fecret, and watched an opportunity of Ataling out of the palace in difguife in the night time. The Poles, as might well have been expected, were irritated at being thus abandoned, from the mere motive of intereft, by
a prince whom they had loved and honoured fo much. Parties were difpatched after lim by different roads; and Zamorki, a nobleman who headed one of thefe parties, overtook him fome leagues diftant from Cracow. All the prayers and tears of that nobleman, how. ever, could not prevail on Henry to rcturn; he rode poft to Vienna, and then paffed into France by the way of Italy.

In the mean time, the Poles were fo much exafperated againft Henty and his whole nation, that all tie French in Cracow would have been maftacred if the magiftrates had not placed guards in the freets. Henry, however, had forefeen the confequences of this flight, and therefore endeavoured to apolingife for his behaviour. One Danzai undertook his caufe in full fenate; and with great eloquence explained the hing's motives for his abrupt departure. Henry alfo wrote to the chief nobility and clergy with his own hand. But no. thing could fatisfy the Poles; who now acquainted their king, that if he did not immediately return, they would be obliged to divelt him of the royal dignity, and to choofe another fovereign. Henry began to excufe himfelf on account of the wars in which he was engaged, and promifed to fend men of unexceptionable integrity to govern Poland till lie fhould return: but no excufes could be accepted ; and, on the 15 th of July And is, 1575, he was folemly divented of the regal dignity in pofed. full diet, and the throne derlared vacant.

After the depofition of Henry, commotions and factions again took place. However, the contending parties were now reduced to two ; one who fupported the interelt of Maximilian emperor of Germany ; the other, who were for electing the princefs Ame, and marrying her to Stephen Batori pince of Tranfylvania. The latter prevailed through the courage of one Stephen gentleman, who, in imitation of the power aflumed by liatnric the Roman tribunes, flood up in the full senate, and oppofed the proclamation of Maximilian, declaring that his election was violent and illegal. In this fituation of affairs, it was obvious that Rrength and celerity mult deternine which election was legitimate: both parties wrote to the princes whofe caule they had efpoufed, intreating them to cone with all polfible expedition to take poffelfion of the throne. Batori proved the more alert; for while Masimilian was difputing about certain conditions which the Poles required for the fecurity of their privileges, he entered Poland, married the princefs, and was crowned on the firtt of May 1576.

No oppofition was made to the authority of Batori 80 except by the inhabitants of Dantzic. Thefe adhered revoles. to the interef of Maximilian even after he was dead, and had the prefumption to demand from the ling an oath acknowledging their abfolute ireedom and independence. Betori referred them to the fenate, declaring that he had no right to give up the paivileges of the republic; but admonifhed the citizens to avoid all occation of a civil war, which mult neceftarily terminate in their difadvantage. But the befinate citizens, confruing the king's lenty into feat, fhut the gates againft the ambatfacior, feized upon the forerefs of Grebin, and publifhed a manifeto refembling a libel opon the king and the republic. The king, incenfed at thefe proceedings, marched againit Grebin, retook the caltle, and ravaged certain territories be-

## 1 O

nd, longing to the Dartzokers; who retaliated by burning to the ground a monaftery named $O$.iva, to prevent the Poles from taking polleilion of fo important a lituation.

Notwithlanding thefe outrages, Batori renewed his overtures for an accommodation : but the Dantaickers were deaf to thefe falutary propofals; fo that he was obliged to declare them rehels, and fend againnt thema body of tronps under one Zborowfi. As the number of the Poifh army, however, was not confiderable, the Dantzickess marched ont to give him battle. They were aflifted by a corps of Germans, and a refolution was formed of attacking the Poles in their camp by furprife; but the project was difconcerted by a fudden form, accompanied with dreadful thunder and lightning, which ipread a panic through the army, as if it had been a judgment frem heaven, and obliged the commander, Joln de Collen, to retire into the city. In a thort time, however, they recovered their fpirits, and came to an action with the Poles; but wete defeated with the lofs of 8000 men killed on the fpot, a great many taken prifoners, and the $l$ is of feveral pieces of cannon. But this check, intlead of abating the courage of the Dantzickers, only animated them the mire, and they refulved to hold out to the lalt extremity. In the mean time, the czar of Mufcovy, thinking the prefent opportunity favourable for extending his dominions, laid fiege to Revel ; but, not being able to make himfelf mater of that place, he was obliged to content himfelf with ravaging Livonia, which he did in a dreadful manner. This did not, however, hinder Batori from laying fiege to Dantzic in perfon, and puriuing the operations with the utmof vigour. Colien made many vigorous fallies, in feveral of which he defeated the Poles; but happening at luft to be killed, robody was found capable of dupplying his place, and the citizens were at lalt obliged to furrender at difcretion; though unt till they had obtained a promife from the elector of Saxony and landgrave of Heffe of interpofing as mediaters in their tehalf. The only terms which the king demanded of them were, that they fhould afk his pardon, difmifs their troops, and rebulld the monaltery of Oliva which they had deftroyed; while his majelty, on the other hand, confinmed all their privileges, and granted them full liberty of adhering to the confeffion of Augfourg, for which they had for fome time been itrenuous advocates.

The war with Dantzic was no fooner ended, than the king directed his whole flrength againft the czar of Mifcovy, who had made himfelf malter of feveral important cities in Livonia. The ezar behaved every where with the greatef eruelty, flaughtering all without diftinction who were able to bcar arms, and abandoning the women and children to the thocking brutality of the Tartars who ferved in his army. Such was the horror infpired by the perfidy and cruelty of the czar's conduct, that the inhabitants of Wender chofe rather to bury themfelves in the ruins of their town than to fubmit to fuch an inhuman enemy. For a confiderable time the Rutfians were allowed to proceed in this manner, till the who'e province of Livonia, excepting Riga and Revel, had fuffered the barbarities of this intulting conqueror; but at laft, in 1578 , a body of forces was difpatched into the province, the towns of Wonder and

Dumnenhurg were furptifed, and an army fent by the ezar to furpaile the former was defetted.

At this time the Mulcovites were not the only enemies who oppofed the king of Poland, and oppreffed Livonia. 'That unhappy province was alfo invaded by the Swedes, who profelfed themfelves to be enemics equally to both parties, and who were farce infericr in cruelty to the Rulians themfelves. The king, however, wats not daunted by tine number of his adverfaries; but having made great preparations, and called to his afliftance Chriftopher prince of Tranfylvania, with all the fanding forces of that country, he took the field in perfon againt the Mufenvites, and laid fiege to Poloct, a town of great importance fituated on the river Dwina. Ti:e Rulians no fooner heard of the Siege of approach of the Pulifh army, than they refolved to put Polocz. all the citizens to death, thinking by this means to drike terror into the enemy. When Batori came near the town, the moll fhocking fpectacle prefented itfelf; the river appeared dyed with blood, and a valt number of human budies faltened to planks, and terribly mangled, were carried down its fream. This barbarity, initead of intumidating the Poles, irritated them to fuch a degree, that nothing could refift them. Finding that their canmon made little impreffion upon the walls of the city, which were conftructed of wood, they advanced to the affalt with burning torches in their hands; and would fonn have reduced the fortifications to afhes, had not a violent furm of rain prevented them. The defign, however, was put in execution as foon as the rain flackened; and the barbarous Rnflians were obliged to furrender at difcrecion. It reflects the lighent honour on Batori, that, notwitt fanding the dreadful intances of cruelty which he had before his eyes, he would not fuffer his foldiers to retaliate. Indeed the cruelties committed by the Ruflians on this occalion, feem almoft to have authorifed any revenge that could pofibly have been taken. A number of Germans were found in the city, fome expiring under the mof dread. ful tortures, and others dead of pains which nature could no longer fupport. Several of the officers liad been dipped in canldrons of boiling oil, with a cord drawn under the 1 kin of the umbilical region, which fattened their hands behind; in which fituation their eyes had been torn out from their foclets, or burnt with red-hot irons, and their faces ctherwife terribly mangled. The disfigured carcafes, indeed, plainly fhow. ed the barbarous treatment they had met with; and the dreadful tale was confirmed by the teftimony of the few who furvived. The Polifh foldiers were exafperated almof to madnefs; fo tiat learce all the authority of Batori could reftrain them from cutting in pieces the wretches who had heen the authors of fuch a dreadful tragedy.

86
After the reduction of Polocz, Batori continued the Rufia ra. war with great fuccefs. Two detachments from the vaged by army penerrated the enemy's country by different roads, liatori. walted all before them to the gates of Smolenikn, and returned with the fpoils of 2000 villages which they had pillaged and defroyed. In the mean time the Swedes and Poles thought proper to come to an accommoda. tion: and though John king of Sweden was at that time prevented from bearing his flare of the war, yet Baturi reduced fucl: a number of cities, and committed

Poland.
87
The Czar fuestor peace.
fuch devafation in the Ruflan territories, that the czar wis obliged to fue for peace; which he obtainet on condition of relinquifhing Livonia, after having thrown away the lives of more than 400,000 of his fubjects in attempting to conquer it.

Batori, being thus freed from a mot deftrustive and cruel war, applied hamfelf to the internal government of his kingtion. Fe regulated the Folifh cavalry in fuch a manner as made then become formidable to the Turks and other neighbouring rations: and this is the miltary eftabl:fment to which the Poles have given the name of quatiane ; becaufe a fourth part of the revenue is employed in fupporting them. Batori fent this body of cavalry towards the frontiers of Tartary, to check the incurfons of thofe barbarians; by whicle meams the Ukraine, a valt truf of defert country, was filled with fourilhing towns and villages, and became a Arong harrier aguint the Turks, Tartars, and Rufians. The latt memorable astion of Batcri was his attaching the Collicks to Poland, civilizing and intrusting them in the arts of war and peace. His firt endeavour was to gain their affetions by lis liberality ; for which purpofe, he prefented them with the city of Techtemeravia, dituated on the Borithenes, whith they formed into a magazine, and made the refidence of their chieltains. FIe five them officers of all degrees, eftablifhed difcipline among them, altered their arms, and formed them into a re ular militia, which atterwards performed eminent fervices to the ltate. All hinds of manufactures at that time known in Puland were likewie eltablithed anong the Collacks; the women were employed in fpinning and weaving woullen cloths, while the men were taught agriculture, and other arts proper for their fex.

While Batori was employed in this manner, the Swedes boto the convention into which they had entered with Poland, and were on the point of getting poffeflion of Riga. To this, indeed, Batori himfelf had given occation, by attempting to impofe the Romith religion upon the inhabitants, after having promifed them entire libenty of confcience. This fo irritated them, that they revolted, and were on the point of admitting a Swedifh gartifon into the city, when the king was informed of what was going forward. Upon this he refolved to take a molt exemplary vengenace on the inhabitunts of Riga; but before he conld execute his intention, he died in the year 1586 , the 5 th of his
*age, and roth of his reign.
The death of Batori involved Poland in fref troubles. Four condilates appeared for the crown, viz. the princes Etneft and Maxinisian of the honie of Aubria; Sigifmund prince of Sweden, and Thendose czar of Mufcovy. Each of thefe had a fepuate puty ; but Siofinund and Maximilian managed matters fo well, that in 1587 both of them were clected. The confequence of this was a civil war; in which Maximilian was defated and taken pilioner: and thus Sigifmund III. furnamed $D$ e Pofu, became mater of the throne of Poiand without oppofition. He wagcd a fucceffful war with the Tartars, and was otherwife profperous; but though he fucceeded to the crown of sweden, he found it impolfible for him to retain bo h kingloms, and he was formally dep) fed fre in the Swedith throne. In 1610 he conquered liaflia, and placed his fon on the throne; but the Felifh conquefts of that comery have alwas been but for a hort time. Accordingly the youns
prince was foon after depofed; and the Rufians not only regained their libeity, but began to make encroachments on Poland itfolf. A very unfortunate war alfo tonk place with Siweden, which was now governcd by the great Gultavus Adolphus; the particulars of whicl, with the other exploits of that renownedwarrior, are related under the artical Swenen. At laft Sigilmund, worn out with cates and misfortunes, died in 1629.

After Sigifmund's alcath the affairs of Poland feemed to revive a little under Uladhf.tus VII. ; for he obliged the Ruflans to fue for peace, and Sweden to reftore fome of her conquelts: but having attempted to abridge the liberty of the Cofiacks, they ievolted, and gave the Poles feveral terrible defeats. Nor was the war termina. ted in the lifetime of Uladiflaus, who died in 1648 . His fuccetre, fohn Calimir, concluded at peace with the fe dangerous enemies: but the war was foon after renewed; and while the kingdom was diftracted between thefe enemies and the difontents of its own inhabiants, the Ruffans took the opprrtunity of invading and pillaging Lithuania. In a little after the whole kingciom was fubdned by Chirles Gultavus, fuccetfor to Chrifina queen of Sweden.

Happily for Poland, however, a rupture took place between the courts of Sweden and Copenhagen; by which means the Poles were enabled to drive out the Swedes in 1657. This was fucceeded by civil wars and contefs with Ruflia, which fo much vexed the king, that he refigned the crown in 1668.

For two years after the refignation of Cafimir the kingdom was filled with confution; but on the 17 th of September 1670 , one Michael Coribut Wiefnowifki, collatcrally defcended from the houfe of Jagello, but in a very mean fituation at that time, was chofen king. His reign continued but for three years; cluring which time John Sobielki, a celebrated Polith general, gave the Turks a dreadful overthrow, though their army confifted of more than $300,000 \mathrm{men}$; and had his blow been purfued, the Colfacks would have been entirely fubdued, and very advantageous terms might have been obtained from the fultan. Of that vaft multitude of Turks no more than 15,000 made their elcape, the reft being all either killed or taken: however, the Polifl fuldiers, being bound by the laws of their country only to ftay a certain time in the field, they refufed to purfue this Cignal victory, and fuffered the king to make peace on any terms he could procure.

Wiefnowifki died before the news of this tranfasion reacled Cracow ; and after his death a new fcene of confufion entued, till at lat the fortune of John Sobiefki prevailed, and he was elected king of Poland in 1674 . He was a moft naggnanimous and heroic prince; who, by his valour and good conduet, retrieved the affars of Poland, and entirely cliecked the progref of the Turks weftwars. Thefe barbmians were everywhere defeated, as is particularly related under the article 'Tunur ; but notwithftanding his great q̧ualities, Poland was now fo thoroughly corrupted, and pervaded by a fpirit of dif. affection, that the latter part of this monurch's reign was invoived in troubles, through the ambition and contention of fome powerful noblemen.

Sobiefki died in 1606 ; and with him fell the glo:y of Poland. Molt violent contels took place about the fucielion; the recital of which would 1at exceed cur limits.

## 1 O L <br> 289 P O L

Inits. At laft Frideric Augutus, c.eenor of Sixons; prevailed; but yet, as fome of the moft effentioll cercmonies vere wanting in his ceronation, beeaufe the primate, who was in an oppofite interelt, would not perform them, he fome it extremely difficult to keep his fuljeets in proper obedience. To add to his misfortumes, having engaged in a league with Denmark and Rullia againte Sweden, he was attacked with irrefinible fury by Chailes XII. Thangh Augulus had not been betrayed, as indeed he almolt always was, he was by no means a match for the ferocious Swede. The paticulars of this w.wr, however, as they make great part of the expluits of that northern hern, more properly fall to be related under the article Sweden. Here, therefore, we thall on'y obferve, that Augultus was reduced to t?e hmmiliatiag necefity of renouncing the crown of Poland on oath, and even of congratulating his rival Stan:laus upun his aceeflion to the thrune: but when the powir ui Charies was broken by his defeat at Pul:owa, the fortune of Augultus again prevailed; Stanillaus was diven out ; and the former being abfolved from his oath by the pope, refumed the throne of Poland.
Since that time the Polifl nation hath never made he any tizure. Surrounded by great and ambitious powers, it hath funk under the degeneracy of its inhabitants; fo that it now fearce exills as a nation. This cataftrophe took place in the following manner: On the sth of Otvber $\mathbf{5}^{763}$, died Anguitus III. elector of Saxony, and king of Poland. He was fueceeded by Coint Poniatowiki, a polith grandee, who was proclaimed September $7^{\text {th }}{ }_{1} 7^{6}{ }_{4}$, by the name of Stanilaus Augufus, and crowned on the 25 th of November the fame year.-Duing the interregnum which took place between the death of Augufus III. and the eletion of Staniflaus, a decree had been made by the convocationdiet of Poland, with regard to the dif/alents, as they were called, or deffenters from the Popilh religion. By this decree they were prohibited from the free exercife of their religion, much more than they had formerly been, and totally excluded from all pofts and places under the government. On this Several of the European powers interpoled, at the application of the diflidents, for their good offices. The courts of Rufia, Pruliz, Great Britain, and Denmark, made remonflances, to the diet; but, nctwithftanding, thefe remonftrances, the decree was contermed by the coronation-diet held after the king's elestion.

October 6. 1766 , an ordinary diet was affembled. Here declarations from the courts abovementioned were prelented to his Polith majelty, requiring the reefahlithment of the dilidents in their civil rights and privileres, and the peaceable el joyment of their modes of worthip fecured to them by the laws of the kingdom which had been obferved for two centuries. Thefe privilegec, it was allerged, had been confirned by the treaty of Oliva, concluded by all the northern powers, which could not be altered but by the confent of ail the contracting parties. The Popilh party contended frongly for a co:afirmation of fome decrees made againit the difindents in 1717,1723 , and 1736 . The depuries from the foreimn powers replied, that thofe decrees had paffed in the nidft of inteftine troubles, and were contadisted by the fomal roteltations and expects scela.

Vol. XV.
rations of foreign powers. At laf, after vinlent contefts,
l'olunit. the matter was referred to the bilhops and fenztors for their opinion. Upon a report for them, the diet came to a refolution, 'That they woul.f fully mainath the diflidents in all the rights and prerogatives to which they were intitled by the laws of their country, particu. larly by the conilitutions of the year 1717, \&c. and b; treaties ; and that as to their complants with regard tu the exereife of their religion, the college of archbiflops and bilhops, under the direation of the prince primate, would endeavour to remove thofe difficulties in a manner conformable to juntice and neighbourly love.- By this time, however, the court of Rulia feemed determined to make her remonfrances more effectual, and a fimall body of Rufian troops marched to within two niles of the capital of Poland.
Thefe refolucions of the diet were by no menns agreeable to the difidents. They dated the begruning of their fufferings from the year 1717. The referring their grievanees to the archbithops and bifhops was looked upon as a meafure the molt unreafonable that could be imagined, as that boly of men had always been their oppofers, and in fatt the authors of all the evils which had befallen them.-Shortly after matters were confidered in this view, an additional body of Rullians, to the number of about 15,000, entered Poland.

The diffidents, being now pretty fure of the protec- Confequen. tion of foreign powers, entered, on the 29th of Marell ces of thio. 1767, into two confederacies, at Thorn and Sluck. One of them was figned by the diffidents of Great and Little Poland, and the other by thofe of the Great Duchy of Lithuanid. 'I'he purport of thefe confederacies was, an engagement to exert themfelves in the defence of their ancient privileges, and the free exercife of their religion; profefing, at the fame time, however, the utmof loyalty to the king, and retolving to fend a deputation to him to implore his protection. They even invited thofe of the Cathoiic communion, and all true patriots, to unite wilh then in maintaining the fundamental laws of the kin. ${ }^{\circ}$ dom, the peace of religion, and the right of each one joindy with themelves. They claimed, by virtue of public treaties, the protedtion of tile powers who were gurantees of their rights and li berties; name' $y$, the emprefs of Ruffi.i, and the kings of Sweden, Great Bitain, Denmark, and Pruffia. Lait15 , they prote:ted, that they had no intention of acting to the detwirrent of the Roman Catholic religion, which the: duly refpected; and only aiked the liberty of their own, and the re-eftablimment of their ancient rights. The three cities of Thorn, Elling, and Dantz:c, acceded to the confederacy of Thorn win the 10 th of April; as did the duke and $n$ bi'cs of Courland to that of Sluck on the 15th of May.

The emprefs of Ruflia and king of Pruffa, in the mean time, continued to ifilus forth new deciarations in favour of the diffidents; and the Rufian troops in Puland were gradaally augmented to 30,000 men. Great numbers of other confederacies were alfo formed in different parts of the kingdom. Theie at frift took little part in the affuirs of the difitents; they complained only of the adminitration of public affits, into whith they alleged that innovaiions had been incroduced, and were therefore for fome tine called confederations of matcontents. All thefe confederacies fublifhed manifetoes.

O。

## PO I

Pidand. - - -
in which they recommended too the inhabitants to quar-
ter and treat the Rumian troops as the defenders of the Pulfh liberties.

The different confederacies of malcontents formed in tive 24 diftricts of Lithuania united at Wilnt on the 22d of June; and that general confederacy re-eftablifhed prince Radzivil, who had married the king's filter, in lis liberty, eftates, and honour, of which he had been deprived in 1764 by the ftates of that duchy. On the $23 d$ of Jnne prince Radzivil was chofen grand marfhal of the general confederacy of all Poland, which then began $t$ ) be called the national confedorucy, and was faid to be compoied of 72,000 noblemen and gentlemen.

The general confederacy took fuch meafures as appeared ninft proper for ftrengthening their party. They fent to the feveral waywodes of the king Jom, requiring their complance with the following articles: 1. That all the gentlemen who had not fiened the confederacy fhould do it immediately; 2. That all the courts of infice flould fubfift as formerly, but not judge any of the confederates; 3. That the marhals of the crown fhould not pais any fentence without the participation of at leaft four of the confederates; and, 4. That the mathals of the clown and the treafurers fould be im. madiately reftored to the pallion of their refpeative rigluts. The Catholic party in the mean time were not ithe. The bifhop of Cracow fent a very pathetic and zealous letter to the dietines affembled at Warfaw on the If th of Auguft, in which he exhorted then to arm their nuncios with courage, by giving them orthodor and Fatriotic inftructions, that they might not grant the dilidents new advantages beyond thofe which were fecured to them by the conftitutions of the country, and ireaties with foreign powers, Sc. The pope alfo fent briefs to the king, the great chancellor, the nobleffe, bithops of the kingdom, and to the prince primate, with fuch arguments and exhortations as were thought molt proper to ward off the impending danger. Councils in the mean time were frequently hell at the bithop of Cracow's palace, where all the prelates at Warfaw affembled.

On the 26th of September ${ }^{1767}$ the confederacy of diaidents was united with the general confederacy of malcontents in the palace of prince Radzivil, who on that uccafion expreffed great friendfhip for the diflidents. In al few days after, the Ruflian troops in the capital were reinforced, and a confiderable body of them was polted at abont five miles ditance.

On the 5 th of Ottober an extraordinary diet was held : but the affair of the diffidents met with fuch oppofition, that it was thought neceffary to adjourn the meeting till the 12 th ; during which interval, every ex. pedient was ufed to gain over thofe who oppofed prince Radzivil's plan. This was, to appoint a commithon, furnilhed with a full power to enter into conference with prince Repnim, the Ruflan ambaffator, concerning the affairs of the diffidents. Nothwithltanding all the pains taken, however, the meeting of the 12 th proved exceedingly tumoltonus. The billops of Cracow and Kiow, with fome other prelates, and feveral magrats, declared, that they would never confent to the eftablifhment of fuch a commifion; and at the fame time fooke with more vehemence than cver afiaint the pretenfions of the diffidents. Some of the deputies anfoxered with great warmith; which occafioned fuch ani-
mofities, that the meeting was again adjourned till the sth.
On the $13^{\text {th }}$ the bithops of Cracow and Kiow, the Viuter palatine of Cracow, and the Atarolte of Dolmiki, were proce carried off by Ruflian detachments. The crime alleged ings o againt them, in a declaration publifed next day by Rufla prince Repnin, was, that they had been wanting in refpect to the dignity of the emprefs of Ruffia, by ate tacking the purity of her intentions towards the republic; thoagh the was refolved to continue her protection and alfifance to the general confederacy united for preferving the liberties of Poland, and correating all the abutes which had been introduced into the government, \&c.

It was probably owing th this violent proceeding of the Ruffins, that prince Ridzivil's plan was at laft adopted, and feveral new regulations were made in favour of the dilfidents. Thefe innovations, however, fonn produced a civil war, which at laft ended in the ruin of the kingdom. In the beginning of the year 1768 , a new confederacy was formed in Podolia, a province bordering on Turkey, which was afterwards called the confederacy of Bar. The intention of it was, to Conf abolifh, by force of arms, the new conftitutions, par- cy of ticularly thofe in favour of the diffidents. The members of the new confederacy likewife expreffed great refentment againlt the carrying away the bithrps of Cra. cow, \&c. and Atill detaining them in cuftody.

Podolia was reckoned the fittelt place for the purpofe of the confederates, as they imagined the Rufiidns could not attack thern there without giving umbrage to the Ottoman court. Similar confederacies, however, were quickly entered into throughout the kingdom: the clergy excited all ranks of men to exert themfelves in defence of their religion; and fo much were their exhortations regarded, that even the king's troops could not be trufted to ast againft thefe contederates. The emprefs of Ruffia threatened the new confederates as difturbers of the public tranquillity, and declared that her troops would act againt them if they perfifted. It was, however, fome time before the Rumlan troops were confiderably reinforced ; nor did they at firf feem inclined to act with the vigour which they might have exerted. A good many fkirmithes foon happened between thefe two contending partics, in which the confederates were generally defeated. In one of there the latter being worfted, and hardly preffed, a mumber of them paffed the Nielter, and turk refuge in Muldavia. This province had formerly belonged to Poland, but was now fubject to the Grand Siguior: the Rufians, bowever, purfued their encmies inco Moldavia; but in order to prevent any offence being taken by the Porte, prince Repnin wrote to the Rufian refident at ConAantinople, to intimate there, that the conduet of the Ruffan colonel who commanded the party was quite contrary to the orders of his court, and that therefore be would be turned ont of his polt.

Great crnelty in the mean time was exercifed again@t the difiidents where thele were no Raflian tronps to protect them. Thwards the end of Otober 1769 , prince Mastin Labomirki, one of the fouthern contederates, who had been driven out of Poland, and had taken thelter with fome of his adherents among the mountains of Hungary, got a manifefto pofted up on leveral of the churches of Cracow, in which he irvited

## POL [ 2911 POL

n. the nation to a general revolt, and afluring them of the allifance of the Ottoman Porte, with whom he pretended to have concluded a treaty. This was tle beginning of hoftilities between the Turks and Ruffims, which were not terminated but by a waft effuion of Lleod on both fides.

The uhbappy lingdom of Poland was the firft fcene of this war, and in a thort time was 1 educed to the mot deplonable fituation. In the end of the year 1768, the pealants of the Greek religion at the Polith Lkraine, and province of kiow, touk up arms, and committed the greatell ravages, having, as they pretended, been threatened with death by the confederates unlefs they would tuin Roman Catholics. A gainft thefe infurgents the Ruiliat.s employed their arms, and made great numbers of them prifoners. The reft took relinge among the Haidanacks; by whom they were fon jeined, and in the beginning of 1760 entered the Ukraine in conjundtion with them, conmitting evers where the mat horrid matiacres. Here, however, they were at hat defeated by the Polifh troops, at the fame time that feveral of the confederacies in Poland were feverely chaftifed. Soon atter, the Chan of the Crim Tartars, baving been repulied with lofs in an at:empt on New Servia, entered the Polifh territories, where he left frightful marks of his inhumanity upon fome innocent and defencelefs perfons. This latter piece of conduct, with the cruelties exercifed by the confederates, induced the Polifh coffacks of Braclan and Kiovia, amourting to near 30,000 effective men, to join the Ruffians, in order to defend their country againft thefe deftroyers. Matters continued much in the fame way during the reft of the year 1769; and in 2770, Rirmihhes frequently happened between the Ruffians and confecerates, in which the latter were almof always worted; but they took care to revenge themfelves by the moft barbarous cruelties on the difidents, wherever they could find them. In 177 c , a confiderable number of the confederates of Bar, who had $j$ ined the Turks, and been exceflively ill ufed by them, came to an accommodation with the Ruffians, who took them under their protection on very moderate terms.-A griculture in the mean time had been fo much neglected, that the crop of 1770 was very deficient. This encouraged a number of defperadoes to affociate under the denomination of confiderates, who were guilty of till greater exceffes than the fe who had been under some kind of regulation. Thus a great part of the country was at laft reduced to a mere defert, the inhabitanis being either exterminated, or carried off to fock the remote Ruffan plantations, from whence they never could return.

In the year 1771 , the confederacies, which feemed to have been extinguifhed, fprung up afreth, and inc:eafed to a prodigious degree. This was occafioned by their having been fecretly encouraged and fupplied with meney by France. A great number of French oficers engaged as volunteers in their fervice; who, having introduced difcipline among their troops, they ached with much greater vigour than formerly, and fometimes proved too hard for their enemies. Thefe gleams of fuccefs proved at laft their tetal ruin. The Ruflians were reinforcch, and properly tupported. The Auftriaz and P:ufian troops entered the country, and adranced on diterent fieses; and the contederates
found themfelyes in a fhort time entitely fursund ol by their enemics, who feemed to heve nothing lefs in view than an ablolute conquelt of the country, and tharing it among thenfives.

Before matters came to this crifis, however, the Aliempete confederates formed a defign of affalfating the king, afonmas on account of his fuppofed atathment to the difi- sle kir. dents. Of this fingular occurtencs wo have the foh. lowing account in the travels of Mr Coxe, communicated to the author by Mr Wsuxill.-"A Polifh noblenu:m numed $P_{\text {ahiflit }}$ a general in the amy of the confederates, wats the perfon who planned the atrociots enterprife; and the confpirators who carried it into execution were about 40 in number, and were haded by three chiefs, named Latiarefi, Stravenfli, and $K$, jinfi. Thele three chiefs had been engaged an 1 hised to that purpole by Palafki, who in the town of Cectichokow in Great Poland obliged them to fweat in the mott dolemn natoner, by placing their hands between his, either to deliver the king alive into his hands, or, in cafe that was impoffible, to puthim to death. The three chicfs chore 37 pertons to acconipany thein. On the fecond of Nowember, about a month after they had quitted Czetfchokow, they obtained a dmithon into Wrarfaw, unfulpected or undifcovered, by the following Ir.itagem. They difguifed themfelves as peafants who came to fell hay, and artfully concealed their fuddles, arms, and cloathes, under the loads of hay which they brought in waggons, the more effecually to efcape detestion.
"On Sunday night, the third of September 177 t , a few of thefe confpirators remained in the 0 :irts of the town; and the others repaired to the place of readezvous, the ftreet of the Capuchins, where his majeAty was expected to pafs by about his nital hour ol returning to the palace. The king had been to vifit his uncle prince Czartorifki, grand chancellor of Litheanid, and was on his return from thence to the palace between nine and ten o'clock. He was in a coach, accompanied by at leaft 15 or 15 attendants, belide an aid-decamp in the carriage : fcarce was he at that di- whos Itance of 200 paces from prince Czartorifii's palace, ken priwhen he was attacked by the confpirators, who com- Soner, manded the coachrnan to fop on p.in of intant death. They fircd feveral fhot into the carriage, one of which paffed through the body of a he;duc, who endeavoured to defend his mafter from the violence of the affatims. Almoft all the other perfons who preceded and accom. panied his majelty were difperfed; the aid-de c.imp abandoned him, and attempted to conceal himfelf by flight. Meanwhile the kingt had apened the do.r of his carriage with the defign of effectiag bis efcape under thelter of the night, which was extremely dazk. He bad even alighted, when the afallins ferzed him by the hair, exclaning in Polih, with horrible execration, ' We have thee now ; thy hoar is come.' One if then difcharged a piftol at him fo very near, that he felt the heat of the flafh; while another cut him acrof" the head with his fabre, which penetrated to the bone. They then laid hold of his majelty by the collar, and, mounting on horfeback, dragged him along the grourd between their borfes at full gallop for near roo picus through the ftreets of Warfais.
"Soon finding, however, that he was incapable off fe! lowing them on toot, and that he had alrealy a'mod
ró And vuouade!.

## POL

lof his refpiration from the violerice with which they had dragged him, they fet him on lorfeback; and then redoubled their fpeed for fear of bcing overtaken. When they came to the ditcla which furrounds Warfaw, they obliged him to leap his horfe over. In the attempt the horfe feil twice, and at the fecond fall brok it leg. They then mounted his majefty upon another, all covered as he was with dirt.
"The confpirators had no fooner croffed the ditch, than they began to rifle the king, tearing off the order of the Black Eagle of Pruffia which he wore round his neck, and the diamond crofs hanging to it. He requefted them to leave his handkerchief, which they coufcuted to: his tablets efcaped their rapacity. A gre:t number of the affaffins retired after having thus plundered him, probably with intent to notify to their refpective leaders the fuccefs of their cnterprife; and the king's arrival as a prifouer. Only feven remained with him, of whom Kofiniki was the chief. The night was exceedingly dark; they were abfolutely ignorant of the way; and, as the horfes could not keep their legs, they obliged his majelty to follow them on foot, with only one thoe, the other being loft in the dist.
"They continued to wander through the open meadows, without following any certain path, and without getting to any diftance from Warfaw. They again mounted the king on horfeback, two of them holding him on each fide by the hand, and a third leading his hosfe by the bridle. In this manner they were proceeding, when lis majelty, finding they had taken the road which led to a village callicd Burakorv, warned them not to enter it, becaufe there were fome Rulfians ftationed in that place who might probably attempt to refcue him (A). Finding himfelf, however, incapable of accompanying the allaffins in the painful pofture in which they hcld him kept down on the faddle, he requefted them, fince they were determined to oblige him to proceed, at leaft to give him another horfe and a boat. This requef they complied with; and continuing their progrefs through almolt impaflable lands, without any road, and ignorant of their way, they at length found themfelves in the wood of Bielany, only a league dittant from Wariaw. From the time they had pafled the ditch they repeatedly demanded of Kofrufki their chief, if it was not yet time to put the 3ing to death; and thefe demands were reierated in proportion to the obitacles and difficulties they encountered, till they wcre fuddenly alarmed by a Ruffian patrole or detachment. Inftantly holding council, four of them difappeared, leaving bim with the other three, who compelled limi to walk on. Scarce a quarter of an hour after, a fecond Ruffian guard challenged them nnew. Two of the affaffins then fled, and the king zemained alone with Kofmai the chief, both on font. His majelty, exhaufted with all the fatigue which he nud undergone, implored his condutor to fop, and tuffer him to the a moment's repofe. Kofinkii refufeit it, menacing him with his naked fabre; and at the
fame time informed him, that beyond the wood they frould find a cariage. They continued their walk, till they came to the door of the convent of Bielany. Knfinfki appeared loft in thought, and fo much agitated by his reflections, that the king perceiving his difordcr, and obferving that he wandered without knowing the road, fatid to him, 'I fee you are at a lofs which way to proceed. Let me enter the convent of Bielany, and do you provide fur your own fafety.' 'No (replied Kofiniki), I have fworn.'
"They proceeded till they canse to Mariemont, a fmall palace belonging to the loufe of Saxony, not above half a league from Warfaw : here Kofinki betrayed fome fatistation at finding where he was, and the king itill demanding an inftant's repofe, he confented at length. They fat down together on the ground, and the king employed thefe moments in endeavouring to foften his conductor, and induce him to favour or pcrmit his efcape. His majelty reprefented the atrocity of the crime he had committed in attempting to murder his fovereign, and the invalidity of an oath taken to perpecrate fo heinous an action: Kofinfki lent attention to this difcourfe, and began to betray fome marks of remorfe. But (faid he), if I fhould confent and reconduct you to Warfaw, what will be the confequence ? I thall be taken and executed! I give you my word (anfwered his majefty), that you fhall fuffer no harm; but if you doubt my promife, efcape while there is yet timc. I can find my way to fome place of fecurity; and I will certainly direct your purfuers to take the contrary road to that which you lave chofen. Kofiniki could not any longer contain himfelf, but, throwing himfelf at the king's feet, implored forgivenefs for the crime he had committed; and fiwore to protect him againft every enemy, relying totally on his generofity for pardon and prefervation. His majefty reiteraied to him his affurances of fafety. Judging, however, that it was prident to gain fome afylum without delay, and recollecting that there was a mill at fome confiderable diftance, he immediately made towards it. Kofinfki knocked, bnt in vain; no aniwer was given: he then broke a pane of glafs in the window, and intreated for thelter to a nobleman who had been plundered! y y robbers. The milicr refufed, fuppofing them to be banditti, and continued for more than half an hour to perfitit in his denial. At length the king approached, and fpeaking through the broken pane, endeavoured to perfuade hinn to admit them under his roof, adding, 'If we were robbers, as you fuppofe, it would be very eafy for us to break the whole window, inftead of one pane of glafs.' This argument prevailed. They at length opened the door, and admitted his majefty. He immediaiely wrote a note to General Coccei, colonel of the foot-guards, informing him of his danger and miraculous efcape.
"When the meffenger arrived wilh the note, the afonifhment and joy was incredible. Coccei inflantly rode to the mill, followed by a detachment of the guards.
(1) "This intination, which the king gave to his affafms, may at firl fight appear extraordinary and unaccountabie, but was scally difated by the greatelt addrefs and judgment. He apprehended with reafon that, on the fight of a Rullian guard, they would inftantly put hims to death with their fabres, and fly; whereas by informing them of the danger they incurred, he in fome meafure gained their conadence: in effect, this Lehaviour of the king feemed to folten them a little, and made them believe be did not mean to efcape frons them."

He met Kofinki at the door with his fabre drawn, who admitted him as foon as he know him. The king had funk into a flecp, caufed by his fatigue; and wais ftretched on the ground, covered with the miller's cloak. Coccei immediately threw himfelf at his majefty's feet, calling him his fovercign, and kifing his hand. It is not eafy to paint or defcribe the aftoniflment of the miller and his family, who inftantly imitated Coccei's example, by throwing thenfelves on their knees ( B ). The king returned to warfaw in Ceneral Coccei's carninge, and reached the palace about five in the morning. His wound was found not to be dangerous; and he foon recovered the bruifes and injusies which he had fuffered during this memorable night. So extraordinary an efcape is fearee to be paralleled in hiitory, and affords ample matter of wonder and furprife.
"It is natural to inquire what is become of Fofinfki, the mın who faved his majefty's life, and the other confpirators. He was born in the palatinate of Cracow, and of mean extrastion; having affumed the rame of $K o f i n / k:,(c)$, which is that of a noble family, to give himfelf credit. He had been created an officer in the troops of the confederates under Pulafki. It would feem as if Kofinki began to entertain the idea of preferving the king's life from the time when Lulbawfi and Strawenfik ahandoned him; yet he had great Aruggles with himfelf before he could refolve on this conduct, after the folemn engagements into which he hadertered. Even after he had conduged the king back to Warfaw, he expreffed more than once his doubts of the propriety of what he had done, and fome remorfe for having deceived his employers. He was detained under a very frivt confinement, and obliged to give evidence againt his two companions Lukawfil and Strawenfki, who were beheaded, his majefty having obtained for them from the diet a mitigation of the horrible punifhment which the laws of Poland inflit upon regicides. About a week after the execution of thefe confpirators, Kofinki was fent out of Poland, after the king had fettled upon him an annual penfion which he enjoyed at Semigallia in the papal territories."

Upon the king's return to Warfaw he was received with the utmoft demonfrations of joy. Every one exclaimed with rapture, "The king is alive!" and all Aruggled to get near him, to kifs his hand, or even to tonch his clothes. But neither the virtues nor the popularity of the foveraign could allay the factious fpirit of the Poles, nor prevent the difmemberment of his kingdom.
"The partition of Poland was firt projected by the king of Pruflia. Polifh or Weftern Prufia had long been an object of his ambition: exclufive of its fertility, ing commerce, and population, its local fituation rendered - it highly valuable to that monarch; it lay between his German dominions and Eaftern Prufia, and while pof. feffed by the Poles, cut of at their will all communication between them." The period was now arrived when the fituation of Poland feemed to promife the eafy acquifition of this valuable province. "Frederic pur-

## 293 ] P O L

fued it, however, with all the catation of an ahle politician. On tle commencement of the troubles, he dhowed no eigernefs to inturfere in the affairs of this country; and alchrugh he had roncurred with ti:e cm prefs of Ruffia in raifing Staniflaus Auguitus to the throne of Poland, yet he declined taking any active part in his favour againd the confederates. Afterwards, when the whole kingdom became convulfed throughout with civil commotions ( $[/ G 0)$ ), and defolated litewi?: by the plague, he, under pretence of firming lines to prevent the fipreading of the infection, advanced lis troops into Polifl l'ufia, and occupied that whole d:friet.
"Though now completely matter of the country, and who wins hy no means apprelienfive of any formidable refiftance over the from the difiunited and diftracted Pules, yet, as he was eaperor well aware that the fecurity of his new açuifition depended upon the acquiefence of Rumia and Aufria, he planned the partition of Poland. He communicated furce. the projer to the emperor, either upon their interview at Niefs in Silefia in 1769, or in that of the followirg jear at Neuftadt in Auftria; from whom the overture met with a ready concurrence. To indare the emprefs of Ruffia to acquiefcs in the fame project, he difpatched his brother Henry to Peterfourg, who furggefted to the emprefs that the houfe of Auftria was forming an alliance with the Porte, with which fhe was then at war ; that if fuch alliance took place, it would create a moft formidable combination againft her; that, neverthelefs, the friendfhip of that houle was to he purchafed by acceding to the partition; that upon this condition the emperor was willing to renounce his comention with the Grand Signior, and would fuffer the Rufians to profecute the war withont interreption. Catharine, anxious to pufh her conquelts againtt the Turks, and dreading the interpofition of the emperor in that quarter; perceiving likewife, from the intimate urion between the courts of Vienna and Berlin, that it would not be in her power, at the prefent juncture, to prevent the intended partition-clofed with the propofal, and felected no inconfiderable portion of the Polifh territories for herfelf. The treaty was figned at Peterfourg in the beginning of February 1772 , by the Rufian, Aultrian, and Pruflian plenipotentiaries. It would be tedious to enter into a detail of the pleas urged by the three powers in favour of their feveral demands; it would be no lefs uninterefting to lay before the reader the anfiwers and remonfrances of the king and ferate, as well as the appeals to the other ftates which had gua. ranteed the poffefions of Poland. The courts of Lon-
 don, Pais, Stockholm, and Copenhagen, remonfrated nuembeceu. againft the ufurpations; hut remonftrances without affiltance could be of no effect. Poland fubmitted to the difmemberment not without the molt violent Atruggies, and now for the firt time felt and lamented the fatal effects of faction and difcord.

A diet being demanded by the partitioning powers, in order to ratify the ceffion of the provinces, it met on the 19th of April 1773; and fuch was the fpirit of the members, that, notwithfanding the deplorable fituation
(в) "I have been (fays Mr Wravall) at this mill, rendered memorable by fo fingular an event. It is a wretched Polifh hovel, at a difance from any houfe. The king has rewarded the miller to the extent of hiwifhes in building him a mill upon the Vifula, and allowing him a fmall penfion.".
(c) His real name was John Kutma.

## Univerfal

Hiftury.
of their country, the threats and bribes of the threc jowers, the patition-treaty was not carried through withont much dificulty. For fonie time the majority of the nuncios appeared determined to oppofe the difmemberment, and tile king firmly perfifed in the fame refulution. The ambafiedors of the three courts enforced their requifitions by the mof alarmiag meraces, and threatence the king with depolition and imprifon. ment. They alfo gave out by their cmillaries, that in cafe the diet continued refractory, Warfaw fhould be pillaged. This report was induftrioufy circulated, and inade a fenfiole imprefion upon the inhabitants. By menaces of this fu:t, by corrupting the marfhal of the diet, who was accompanied with a Ruflian guard; in a word, by bribes, promifes, and threats, the members of the diet wereat length prevailed on to ratify the difmemberment.

Of the difmembered countries, the Rufian province is the largeft, the Auftrian the moft populus, and the Prufian the moft commercial. The population of the whole amounts to near $5,000,000$ fouls; the firft contaning 1,500000 , the fecond $2,500,000$, and the third 860,000 . Weftern Prufia was the greatell lufs to Polind, as by the difnemberment of that province the navigation of the Viftula entisely depends upon the king of Prufia: by the lofs confequently of this diftrict a fatal blow was given to the trade of Poland; for his lruffian majelly has laid fuch heavy duties upon the merchandize paffing to Dantzic, as greatly to diminifh the commerce of that town, and to transfer a conliderable portion of it to Memel and Konigflurgh.

The partitioning powers, however, did lefs injury to the republic by difmembering its faireft provi.ces, than by perpetuating the principles of anarchy and confufion, and eftablifhing on a permanent footing that exorbitant liberty which is the parent of fastion, and has proved the decline of the republic. Under pretence of amending the conflitution, they have confirmed all its defects, and have taken effequal precautions to render this unhappy country incapable of emerging from its prefent deplorable flate, as has been lately feen in the failure of the mont patriotic attenipt that was perhaps ever made by a king to reform the conflitution of his kingdom.

The kings of Poland were anciently hereditary and abfolute ; but afterwards became elective and limited, as we find them at this day. In the reign of Louis, towards the end of the 14 th century, feveral limitations were laid on the royal prerogative. In that of Cafimir $I V$. who afcended the throne in 1446 , reprefentatives from the feveral palatinates were firll callicd to the diet; the legiflative power till then having been lodged in the flates, and the executive in the king and fenate. On the deceafe of Sigifmund Augultus, it was enacted by law, "That the choice of a king for the future thould perpetually remain free and open to all the nobles of the kingdom;" which law has accerdingly been hitherto obferved.
"As foon as the throne is vacant, all the courts of juftice, and other ordinary fprings of the machine of government, remain in a fate of ination, and all the authority is transferred to the primate, who, in quality of interrex, has in fome refpeats more power than the king himfelf; and yet the republic takes no umbrage at it, becaufe he has not time to make himfelf firmidable.
he notifies the vacancy of the throne to foreign prin. ces, which is in effect proclaiming that a crown is to be difpofed of; he iffues the aniverfalia, or circular letters for the election; gives orders to the ftarofls (a fort of military officers who have great authority, and whofe proper bufinefs it is to levy the revenue) to keep a Atrict guard upon the fortified places, and to the grandgenerals to do the fame upon the frontiers, towards whicl the army marches.
"The place of election is the field of Wola, at the gates of Warfaw. All the nobles of the kingdom have naanne a right of voting. 'I'he poles encamp on the left fide the ele of the Viftula, and the Lithuanians on the right, each under the banners of their refpe?ive palatinates, which makes a fort of civil army ; confilting of bewcen a hundred and fifty and two huadred thouland men, affembled to exercile the highett an of freedom. Thofe who are not able to provide a horfe and a fabre ftand behind on foot, armed with feythes, and do not fecm at all lefs proud than the reft, as they huve the fame right of voting.
"The field of election is furrounded by a ditch with thee gates in order to avoid confufion, one to the eaft for Great Poland, annther to the fouth for Little P land, and a third to the wef for Lithuania. In the middle of the field, which is called Kulau, is erested a great building of wood, named the fzopa or hall for the fenate, at whofe debates the deputies are prefent, and carry the refult of them to the feveral palatinates. The part which the marthal atts upon this occation is very important; for, being the mouth of the nobility, he has it in his power to do great teivice to the candidates; he is alfo to draw up the inftrument of election, and the king elect mult take it only Irum his band.
"It is prohibited, upon pain of beng declared a public enemy, to appear at the election with regular troops, in order to avoid all viouence. But the nobles, who are always armed with piftols and fabres, commit violence againft one andher, at the time that they cry out 'liberty!'
"All who afpire openly to the crown are exprefsly excluded from the field of election, that their prefence may not conitrain the voters. The king mult be elected nemine contradicente, by all the fuffrages without exception. The law is founded $u_{f}$ on this principle, that when a great famly a opts a father all the children have a right to be pleafed. The idea is plaufible in fpeculation; but if it was rimoroufly kept to, Poland could have no fuch thing as a lawful king. They therefore give up a rcal unanimity, and content themfelves with the appear.nce of it ; or rather, if the luw, which preftibes it, cannct be fulfilled by means of money, they call in the affitance of the fabre.
"Before they come to this exiremity, no cleation can poffibly be carried on with more order, decency, and appearance of freedom. The primate in few words recapitulates to the nobles on horfeback the refpective morit of the candidates; be exhorts them to clooof the mof worthy, invohes lieaven, gives his bleffing to the affemtly, and remains alone with the marfhal of the diet, while the fenators diferfe themiclres into the feveral palatinates, to promnte an unanimity n! fentiments. If they fuccecd, the primate goes himfil: to colled the votes, naming once more all the candidates. -Szoda (aniwcr the nobles), that is the man we choo'e :'

# 1 O L 

and inftantly the air refounds with his name, with cries of vivat, and the noife of piltols. If all the palatines agree in their nominations, the paimate gets on horfeback; and then the profoundent filence fucceeding to the greateft noife, he afks thee times if all are latisfied ? and after a general approbation, three times proclaims the king; and the grand-mathal of the crown repeats the prochamation three times at the three gates of the camp. How glorious a king this, if endued with royal qualities! and how inconteltible his titie in the fuffrages of a whole people! But this Rketch of a free and peaceable clection is by no means a reprefentation of what ufually happens. The corruption of the great, the fury of the people, intrigues and factions, the gold and the arms of foreign powers, frequently fill the foene with violence and blood."

Before the king is proclaimed, the pafa conventa is read aloud to him, which on his knees at the altar he fwears to obferve. As this contract, which is drawn up, methodizcd, and approved, by the fenate and nobility, may be deemed the great charter of Poland, we fhall enumerate the principal articles of which it confifts. Thefe are, that the king fhall not attempt to encroach on the liberty of the people, by rendering the crown hereditary in his family; but that he thall preferve all the cultoms, laws, and ordinances, repecting the freedom of election: that he fhall ratify all tieaties fubfiting with foreign powers which are approved by the diet : that it fhall be his chief Itudy to cultivate peace, preferve the public tranquillity, and piomote the interelt of the realm: that he thall not coin money except in the name of the republic, nor appropriate to himfelf the advan ages arifing from coinage: that in declaring war, concluding peace, making levies, hiring auxiliaries, or admitting foreign troops upon any pretext within the Polifh dominions, the confent of the diet and fenate fhall be geceifary: that all offices and preferments fhall be given to the natives of Poland and Lithuania; and that no pretence fhall excule or palliate the crime of introducing foreigners into the king's council or the departments of the republic : that the officers of his majefty's guards thall be Poles or Lithuanians; and that the colonel thall abfolutely be a native of Poland, and of the order of nobility : that all the officers fhall be fubordinate to the authority of the marefchal: that no individual fhall be vefted with more employments than the law allows: that the king fhall not marry without the approbation of the fenate; and that the houfehold of the queen thall be determined and regulated by the republic: that the fovercign thall never apply lis private fignct to acts and papers of a public nature : that the kiug thall difpote of the offices both of the court and of the republic; and regulate with the fenate the number of forces neceffary for the defence of the kingdom: that he fhall adminiter jullice by the advice of the fenate and his council: that the expences of his civillitt fhall be the fame with thofe of his predeceffors: that he flall fill up all vacancics in the fpace of fix weeks: that this thall be his firf bufinefs in the diet, obliging the chancellor to publifh his appointments in due form : that the king fhall not dimin fh the treafure kept at Cracow; but, on the contrary, endeavour to augment that and the number of the crown-jewels : That he fhall burrow no money without the confent of the diet : that be thall not equip a naval force without
the confent and full approbation of the efpublic: that he Thall profefs the Roman Catholic faith, promote, maintain, and defer:d it, chrough all the Polith dominions: and finally, that all their feveral liberties, rights, and privileges, fhall be preferved to the Polan. ders and Lithuanians in general, and to all the diItricts and proviuces contained within each of thefe great divifions, without change, altcration, or the fmalleft violati in, except by the confent of the republic. To thefe articles a variety of others are added, according to circumftances and the humour of tlee diet; but what we have recited form the fanding conditions, which are farce ever altered or omitted.

The dict of Poland is compofed of the king, the fenate, bithops, and the deputies of the nobility or gentry of every palatinate, called, in the collective capscity, consitia logata; that is, when the flates affemble in the city without arms and horfes; or comiia paludati, when they meet in the fields armed, as during an interregnum, at the diet of election. It is a prerogative of the crown to affemble the diet at any particular place, except on occafion of a coronation, which the cuflom of the country requires fhould be celebrated at the capital. For a number of years, indeed, the diet reguJarly affembled at Warfaw ; but, on complaint made by the Lithuanians, it was agreed, that every third diet fhould be held at Grodno. "When it is propured to. hold a general diet, the king, or, in cafe of an interregnum, the primate, iffues writs to the palatines of the feveral provinces, fyecifying the time and place of the meeting. A fketch likewife is fent of the bufinefs to be deliberated on by the affembly; the fenate is confulted in this particular, and fix weeks are allowed the members to prepare themfelves for the intended feffion. It is remarkable, that the diet never fits more than fix weeks in the moit critical conjunctures and preffing emergencies: they lave been knowa to break up in the middle of an important debate, and to leave the bufinefs to a future meeting. This cuftom bath been jultly efteemed one of the greateft defects of the Polifh conftitution, which probably owes its origin to convenience, but is now fuperftatioully obferved from whim and caprice. On receipt of the king's writ, the palatine communicates the meeting of the diet to all the caltellans, ftaroftas, and other inferior officers and gentry within his jurifdiction, requiring them to affemble on a certais day to elect deputies, and take into eonfideration the bufuefs fpecified in the royal fummons. Thefe meet. Dieti20 bufmeis fpecified in the royal fummons. Thefe meet. Dietiatss ings are called petty disets, dietines, or lantage, in the language of the country ; every gentleman poffefing three acres of land having a vote, and matters being determined by a majority; whercas in the gencral diet de. crees are only valid when the whole body is unanimous. Every palatinate has three reprefentatives, though the bulinefs devolves on one called a nianio, who is electect for his ability and experience; and the other two are added only to give weight to this leading member, and da honour by their magnificent appearance to the palatinate they reprefent. As thefe deputies, fince the reign of Cafimir III. have feats in the dict, it matwrilly divides the general affembly into two bodie, the upper and lower; the one beingr compofed of the fenate, the fuperior clergy, and the great officers; the other of the reprefentatives of the palatinates, who prepare all bufinefs for the fuperior body.

## PO I

"The firt bufincfs of the affenbly is to choofe a marefchal ; upon which occafion the debates and tumults rum fo high, that the whrle time for the feffion of the dict is often confumed in altercation and wrangling abrut the clection of a fpaker, who has now nothing farther to do than return quietly to his own home. After lis election, he kiffis the king's hand; and the clancellor, as the royal reprefentative, reports the matters to be deliberated by the diet. Then the marefchal acquaints the king with the inftructions of the deputies from their conflutuents, the grievances which they would have redreffeit, and the abufes they require to be remedied. He likevife requefts of his majelly to fill up the vacant offices and benefices, according to law; and he is anfwered by a fet fipeech from the chancellor, who re-

## zuitoms ob-

 ferved in the diet. ports the king's inclination to fotisfy his perple, as foon as he hath confulted his faithful fenate. There is fomething very peculiarly abfurd in fome of the cuftoms obferved by the Polifh diet : one in particular merits attention. Not cnly an unamimity of voices is neceffary to pafs any bill, and conftitute a decree of the diet, but every bill muft likewife be aflented $t$ ) unanimoully, or none can take effect. Thus, if out of twenty bills onex22 hould happen to be oppoled by a fingle voice, called The lite- lileman quelo, a!l the reit are thrown out, and the diet run veto. meets, deliberates, and debates, for fix weeks to 2 o purpofe.
"To add to the other inconveniences attending the conftitution of the diet of Poland, a fpirit of venality in the deputies, and a general corruption, hath feized all renks and degrees in that alfenbly. Here, as in fome other countries, the cry of liberty is kept up for the fake of private interelt. Deputies come with a full refolution of profiting by their patriotilm, and not lowering their voice without a gratification. Determined to oppofe the moft falurary meafures of the eourt, they either withdraw from the alfembly, proteft againt all that fhall be tranfacted in their ablence, or elfe excite fuch a clamonr as renders it neceffary for the court to filence them by fome lucrative pention, donation, or employment. Thus not only the bufinets of the affem. bly is obltructed by its own members, but frequently by largeffes from neiglibouring powers, and fonsetimes by the laberality of an open enemy, who has the art of 123 difributing his money with defcretion.
The fenate "Perhaps the moft refpectable department of the of Poland. Polifh government is the fenate, compofed of the bifhops, palatines, caftellans, and ten officers of flate, who derive a right from their dignities of fitiong in that affembly ; in all amounting to 144 m mbers, who are flyled fensiors of the kirtsidon or counfillors of the flate, and have the title of excellony, a dignity fupported by no penfion or emviuments nereflarily annexed. The fenate prefides over the laws, is the guardian of liberty, the judge of right, and the prutector of juftice and equity. All the menbers, except the bifhops, who are fenatoss ex officio, are nominated by the king, and they take an oath to the republic before they are fermitted to enter upon their functions. Their honours continue for life: at the general diet they fit on the right and left of the fovereign, accorling to their dienity, without regard to feaiotity. They are the mediators between the monarch and the fuliject, and, $i_{i a}$ conjunction with the king, ratify all the laws palfed by the nobitity. As a fenater is bound by oath to maintain the libertics
of the republic, it is thought no diircepect to majelty that they remind the prince of his duty. Wley are his counfellors, and this freedom of peech is an infeparable prerogative of their office."

Such was the contitution of Poland before it was new-modelled by the partitioning powers. That it was a very bad conftitution needs no procf; but thofe fos rcign reformers did not improve it. For two centuries at leaft, the Poles have with great propriety denominated their government a republic, becanife the king is fo exceedingly limitect in his prerogative, that he refembles more the chief of a commonvealih than the fovereign of a powerful monatchy. That prerogative, already too confined to afford protestion to the peafants, groaning under the ariltocratic tyranuy of the nobles, was, after the partition treaty, itill further rentained by the eftablilinent of the permanent council, which was vefted with the whole executive authority, leaving to the fovereign nothing but the nime. The permanent council contifts of 36 perions, elected by the dict out of the different orders of nobility; and though the king, when prefent, prefides in it, he cannot exert a ingle act of power but with the confent of the majority of perfons, who may well be called his coll agues.

That the virtuous and accomplifled Staniflaus fhould labour to extricate himfelf and the great body of the people from fuch unparalleled oppreftion, and that the more refpectable part of the nation flould wifh to give to themfelves and their pofterity a better form of government, was furely very natural and very meritorious. The influence of the partitioning powers was indeed ex. erted to make the king contented with his fituation. His revenues, which before did not exceed L. 100,000 , were now increafed to three times that fum. The republic likewife agreed to pay his debts, amounting to upwards of L. 400,000 . It beftowed on him alin, in hereditary poffeflion, four Atarofties, or governments of caftles, with the diftricts belonging to them; and reimburfed him of the money he had laid out for the fate. It was alfo agreed, that the revenues of the republic Hould be enhanced to 33 millions of florins (near two millions Sterling), and ihe army thould cunfift of 30,000 men. Soon after the comclufion of the peace with Turky, the emprefs of Ruffia alfo made the king a prefent of 250,000 rubles, as a compenfation for that part of bis deminions which fell into ber hands.

Thefe bribes, however, were not fufficient to blind Anew ${ }^{12}$ the eyes of Stamilaus, or to cool the ardour of his pa. fitutic triotiom. He labuured for pofterity, and with fuch ap- citaling parent fuccefs, that on the 3 d of May 1791, a new conAtitution of the government of Polnd was eftablifhed by the king, together with the confedemate ftates affembled in double number to reprefent the Polifh nation. That this was a perfect contitution, we are far from thinking; but it was prob,bly as perfect as the inveterate prejudices of the nobles would admit of. It deviated as little as polibice from the old forms, and was drawn up in 11 articles, refpecting the government of the republic; to which were added 21 fections, recrulating the ditines or primary alfemblis of Poland.

Of tiis confitution, the firt article eftablilled the subtas Roman Catholic faith, with all its privileges and immu- of the nities, as the dominant national religion; granting to all other people, of whatever perfufion, peace in matters of fath, and the protedion of gevernment. The
nd. Fecond asticle guaranteed to the nobility or the equeArian order, all the privileges which it eajoyed under the kings of the houfe of Jagellan. The third and fourth aticles granted to the free ropal town internal juriddiations of their oun; and exempted the peafarts from flavery, declating every man irce as foon athe fiets his foot on the ternitosy of the republic. The fifth article, affer declaring, that in civil fociety all power thoutd be derived from the will of the people, cnated that the governnient of the Polith nation thould be compoled of three diflina powers, the lagillative, in the flates affembled; the cxecu ive, in the king and the council of infpection; and the judicial power, in the jurifdictions exifting, or to be eltablifhed. The fixth and feventh articles, is being of more impartance, we thall give in the words of the conltitution itcelf.
VI. Tie Li.t, or the legifative porver, fhall be divided into two loufes, viz. Whe houle of nuncios, or deputies, and the houre of fenate, where the king is to prcfide. The former being the reprefentative and central roint of fupreme national authority, fhall poffefs the preeminerice in the legillature ; therefore all bills are to be decided fi:t in this boufe.
I. All General Lazus, viz. conftitutional, civil, criminal, and perpetual taxes; concerning which matters, the king is to illue his propofitions by the circular letters fent before the dietines to every palatinate and to every diftrict for delibetation, which coming before the houfe with the opinion exprefled in the inftruations given to their reprcfentatives, thall be taken the firff for decifion.
2. I'artichlar Lazus, viz. temporal taxes; regulations of the mint; contrating public debts; creating nobles, and other cafual recompenfes; reparation of public expences, both ordinary and extraordinary; concerning war ; peace ; ratification of treaties, both political and commercial; all diplomatic atts and conventions relative to the laws of nations; examining and acquitting different executive departments, and fimilar fubjeets arifing from the accidental exigencies and circumfances of the fate; in which the propofitions, coming direnly from the throne into the houfe of nuncios, are to have preference in difcuffion before the private bills.

In regard to the houfe of fenate, it is to confift of biflops, palatines, caltellans, and minifters, under the prefidercy of the king; who fiall have but one vote, and the cafting voise in cate of parity, which he may give either perfonally, or by a meffage to the houfe. Its power and duty flall be,
I. Every general law that pafies formally through the houfe of nuncios, is to be fent immediately to this, which is cither accepted, or fufpended till fartber national deliberation, by a majority of votes, as pecfcribed by law. If accepted, it hecomes a law in all its force ; if lufpended, it mall be refumed at the next dict; and if it is then agreed to again by the houfe of nuncios, the fenate muft fubmit to it.
3. Every particular lav or fatute of the diet in matters above lipecifed, as foon as it has been determined by the houfe of nuncios, and fent up to the fenate, the rotes of both hourcs fall be jointly computed, and the majonity, as detcribed by law; , hall be confidered as a decree and the will of the nation. Thofe fenators and miniters who, from their fhare in excestive power, are accountable to the republic, cannot have an adive roice Yob. SV.
in the diet, but may be prefent, in order to give receeffary explanations to the fatates.
'Ineie ordinary legiflative diets ntall have their uninteriupted caifence, and be always ready to meet; renewable crery two ycat:s. The lengeth of fefions thall be determined by the law oncerning diets. If convened out of ordinaly felion upon fome urgent occ.afion, they fhall only cieliberate on the fubject which occationed fuch a call, or on ci:cumftances which may arife out of it.

No law or ftatute enacted by fuch ordinary diet cas be altered or annulled by the fanc. The comj.emerit of the diet flall be compofed of the number of perfons in both houles to be determined hercafter.

The law concerning the dietines or primary cledions, as eftablilhed by the prefent diet, fhall be regarded as a moft effential foundation of civil liberty.

The majority of votes flall decide every thing, and The litisevcrywhere; therefore we abolifh, and utterly amilh: runt veto late, liberum vets, all furts of confederacies and confede. abolithed. rate diets, as contrary to the firit of the prefent confitution, as underaming the government, and as being ruinous to fociety.
Willing to prevent, on one hand, violent and frequent changes in the national conflitution, yet, conlidcring on the other, the necefity of perfecting it, after experiencing its effects on public profperity, we determine the period of every 25 years for an extraordinary Extracrd:conftitutional diet, to be held purpofely for the revifion rary diet and fucl alterations of the conltitution as may be found for sevifing requifite: which diet fhall be circumferibed by a feparate law hereafter.

V1I. The moft perfect government cannot exift or laft without an effectual executive power. The happineis of the nation depends on juft laws, but the good efleats of laws flow only from their execution. Experience has taught us, that the negleating this efiential part of government has overwhelmed Poland with difafters.
Having, therefore, focured to the free Polifh nation the tight of enasting laws for themfelves, the fupreme infpection over the executive power, and the choice of their magiffrates, we entrult to the king and his council the highert power of esecuting the laws. This council thall be called firaz, or the council of infpection.

The duty of fuch executive power fhall be to watch over the laws, and to fee them frietly executed according to their import, even by the means of pubic force thould it be necetfary. All departments and magittracies are bound to obey its directions. To this power we leave the right of controuling finch as are refratory, or of punidhing fuch as are negligent in the execution of their refipective offices.

This executive power cannot alfume the right of maling laws, or of their interpretation. It is expreisly forbidden to contract public debts; to alter the repartition of the national income, as fixed by the dict; to declare war ; to conclude definitively any treaty, or any diplomatic aft; it is only allowed to carry on negocittions with foreign courts, and facilitate tempcrary occurrences, always with reference to the diet.
The crown of Poland we declare to be clective in re- Crown gard to families, and it is fettled to for cver.

Having experienced the fatal effeets of interregna, regard to
Pp periodicully

pcriodically fubverting government, and being defirous of preventing for ever all foreign influence, as well as of infuring to every citizen a perfect tranquillity, we have, from prudent motives, refolved to adopt hereditary fucceffion to our throne: thereforc we enast and declare, that, after the expiration of our life, according to the gracious will of the Almighty, the prefent elector of Saxony thall reign ever Poland, and in his perfon fhall the dynafy of future kings of Poland begin. We referve to the nation, however, the right of clecting to the throne any other houfe or family, after the extinction of the firit.
${ }^{3} 34$
Corvnation uath. Every hing, on his acceffion to the throne, fhall take a lo!emn oath to God and the nation, to fupport the prefent conflitution, to fulfil the pala conventa, which will be fettled with the prefent eleaon of Saxony, as appointed to the crown, and which fhall bind him in the I35 fame manner as former ones.
King'sper- The king's perfon is facred and invinlable ; as no act
fun facred: can proceed immediately from him, he cannot be in any manner sefponfible to the nation; he is n:ot an abfolute monarch, but the father and the head of the people; his revenues, as fixed by the pacta conventa, flall be facredly preferved. All public acts, the afts of magiftracies,

The king, who ought to polfefs every power of doing good, fhall have the right of pardoning thofe that ate condemned to death, except the crimes he againt the flate. In time of war, he fhall have the fupreme command of the national forces: he may appoint the commanders of the army, however, by the will of the ftates. It flall be his province to patentee officers in the army, and other dignitaries, confonant to the regulations hereafter to be expreffed, to appoint bifhops, fenators, and minifters, as menbers of the executive power.
Menlicers if the
the law of nations, and particularly in cafe of a neigh-
bouring war. 2. In cafe of an interal comme bouring war. ${ }^{2}$. In cafe of an internal commetion, menacing with the revolution of the country, or of a collifion between magiftratures. 3. In an evident danger of general faminc. 4. In the orphan fate of the country, by demife of the king, or in cafe of the king's dangerous illnefs. All the refolutions of the council of inpertion are to be examined by the rules :bovementioued. The king's opinion, after that of every member in the council has been heard, tha!l decitive'y prevail. Every refolution of this council fhall be iflued under the king's fignature, counterfigned by one of the minifters fitting thercin; and thus figned, fla'l be obeyed by all executive departments, except in cafes exprefoly exempted by the prefent confitution.

Should ail the members refufe their counterfign to any refolution, the king is obliged to forego his opinion; but if he flould perfift in it, the mathal of the diet may demand the convocation of the diet; and if the king will not, the marfhal himfelf fhall fend his circular letters as above. Miniters compofing this council camnt be employed at the fame time in any other commiffion or department.

If it fhould happen that two thirds of fecret votes in both houfes demand the changing of any perion either in tlie council, or any executive department, the king is bound to nominate another. Wiiling that the council of infpeftion floould be refpcrifible to the nation for their actions, we decree, that when thefe miniters are denounced and accufed before the diet (by the fpecial committee appointed for examining their proceedings) of any tranfgreflion of pofitive law, they are anfwerable with their perfons and fortunes. Such impeachments being determined by a fimple majority of votes, collceted jointly from both houfes, fhall be tried immediately by the comitial tribunal, where the accufed are to receive their final judgment and puniflıment, if found guilty; or to be homourably acquitted on fufficient proof of innocence.

In order to form a neceffary organization of the executive power, we eftablith hereby feparate commiffions, connected with the above council, and fubjected to obey its ordinations. Thefe commiffions are, 1. of edncation; 2. of police; 3. of war; 4. of treafury. It is through the medium of thefe four departments that all the particular orderly commiffions ( D ), as eflablifhed by the prefent diet, in every palatinate a d diftrit, fhall depend on, and receive all orders from, the council of infpeation, in their refpetirc duties and occurrences.
The eighth article regulates the adminiftration of juf. Adne tice, beginning with a very fenfible declaration, that the fration judicial power is incompatible with the legiflative, and juRice. that it cannot be adminitered by the king. It therefore conflitutes primary courts of juftice for each palatinate or diftrict, compofed of judges chofen at the dietine: and appoints higher tribunals, erected one in each of the three provinces into which the kingdom is divided, with which appeals may be lodged from the pri-
mary
(n) Orderly commffions are newly iullituted; each palatinate and diftrif choofes a certain number of commiffaries ; their nffice laft; two years; their principal duty is to maintain palice and good order in their diftrict ; to put into executwn decrees and regulations of fupreme departments; to collect taxes; to keep cafla ; to make fuch payments as afligned by the commiffion of finances; to protest citizens from the military oppreffion; to furnin recruits, belides many other duties of internal management.

## POI

land. mary courts. It appoints likewife for the trial of perfons accufed of crimes againt the itate, one fupreme general tribunal for all clafles, called a comitial tribunal or coult, compofed of perfons chofen at the opening of every dict. The ninth article provides a regeney during the king's minority, in cafe of his fettled alicnation of reafon, or upon the emergency of his being made a prifoner of war. This regency was to be compofed of the council of infeection, with the queen at their head, or, in her ablence, the primate of the kingdom. The tenth article enjoins, that the education of the king's fons fhall be entrufted to the king with the council, and a tutor appointed by the fates; and the eleventh regulates the army in fich a manner, as to frevent it from being employed to overturn the conftitution.

The reguation of the dietines contains nothing that can be interefting to our readers, except what relates to the ele?tinn and duties of nuncios or reprefentatives to the general diet. And here it is enacted, that perfons having a right to vote are all nobles of the equeftrian order; i.e. I. All hereditary proprietors of landed property, or poffeffed of ellates by adjudication for a debt, paying tertitorial tax to government : fons alin of fuch proprictors during the life of their parents, hefore the ex-divifion of patrimony. 2. Drothers inheriting eftates before they have flared their fucceifion. 3. All mortgages who pay 100 forins ( 50 fhillings) of territorial tax per year from their palfeflions. \&. All 1 fe-holders of lands paying territorial tax to the fame am unt. 5. All nobles in the ams polleffed of fuch qualify ing eftates have a vote in their refpertive diftritas in time of peace, and properly furloughed by their conmanders. 6. Legal pofferfion is underlooil to be qualifying when it has been formerly acquired and alually emioyed for twelve calender months previoully.
Perfons who have no right to vote are, r. Thofe of the equeftrian order that are not actually poffeffed of a property, as defrribed in the foregoing article. 2. Such as hold royal, ecclefiatical, or noble lands, even with right of inheritance, but on condition of fome duty or payment to their principals, ennequently dependent thereon. 3. Gentry poffelfing eftates on fendal tenure, called ordynackie, as being bound to certain perfonal fervice thereby. 4. All renters of eftates that have no other qualifing property. 5 . Thofe that have not accomplithed 18 years of age. 6. Crimine notat:, and thoic that are under a decree paffed in default, even in the firlt in. Aance, for having difobeyed any judicial court.

Every perfon of the equeftrian order that pays territorial tax to government for his freehold, let it be ever io fnall, is eligible to all elective offices in his refpective dill rict.

Gentlemen atually ferving in the army, even poffefied of landed hereditary eftate, mint have ferved fix complete yeurs before they are eligible to the ofine of a wuncio only. Lut this cor dition is difpenfed with in fayour of thofe that have filled before fome public ienaion.
Whoerer is not perfonally prefent at the dietiae; whoever has not completed 23 years of age; wheever lus net been in any pubite function, nor paffed the biemial office of a commilfary in the orderly conmifion; thofe that ate not exempted by law from cobligations of lartu ls!lates, which fubjeats all newly nobilitated per-
inns to certain civil reftrigions until the nest generation; and, lanly, all thofe againft whom may be objened : decree in contumaciam in a civil caufe ; are not cligibl?.

During the bufincfs of elcation, the prelident who opened the meeting, with the reft of the committe:, except thofe who are aflelfers, flatl prepare inftugion; for procedure; and in regard to the propofitions fint by the king and the council of infpection, thefe in:franions faall be worded thus: "Our nuncios fhall minfic vote affrmative to the article $\Lambda^{\top}$;" or, "Our nuncios tion to the fhall vote negative to the article $N$," in cafe it is found contrary to the opinion of the dictine : and fhould any amendment or addition be deemed necefiary and agreed on, it may be,inferted in the infruthor.s at the end of the relative propofition.
At the meeling of the die:ibics, after the diet has fat, the nuncios are bound to appear before their conflituents, and to bring their report of the whole proceedings of that affembly; firft, refpening the aids Whate of legiflature ; nest, with refpeet to the particular pro- accounsjects of their palatinate or diftrit recommended to them by the infructions.

It is at thefe dietines that nuncios, after they hare rendered to their conflituents a clear account of their proceedings and of the diet, may be either confirmed or changed, and new opes elected in their fread till the general election for the following ordirars diet.
New nuncios are chofen, 1 . In the rocm of the deceafed. 2. In the roorn of thofe that are become fenators or minifters of ftate. 3. In cafe of refignation. 4. In the room of fuch as are difqualified by the diet. 5. When any of the affembly delires a new clection, to fubflitute another nuncio in the room of one expreftre pointed out; which requen muft be made in writing, figned by 12 members befides, and be delivered to the marfhal of the dietine. In this laft cafe, the marthal is to read the name of the nuncio objected to, and to make the following propofition: "Shall the muncio $N$ be confirmed in his function ? or, Shall there be a new election made in his ftead ?" The opinion of the meetins being taken by a divifion, the majority fhall decide the queftion, and be declared by the marflhal. If the majority approves the conduct of the nuncio, the marfhal and the affeffors thall certify this confirmation on the diploma; and in cafe of difapp:obation, the marihal thall declare the vac:mes, and begin the form of a new election.

Such are the outlines of the Polifh confitution efla- This conblifhed by the king and the confederates in 179\%. It fitution: will not bear a comparifon with that under which wee thonzh finhave the happineis to live; but it is furely infinite- perior to ly fuperior to that motly form of government which the former, for a century pat, has rendered Poland a perpetual proteRcd icene of war, tumult, tyranny, and rebellion. Mrany of fiome cocthe corrupe nobles, however, perceiving that it wonid nupt nocurb their ambition, deprive them of the bafe means bles, which they had long enjoyed of gratifying their ararice by fetling the crown to dale, and render it impofiible for them in continue with impunity their tyrannical opprefion of the peafants, protefled again? it, and withdrew from the confederates. This was nothing mose than what might have been expested, or than what the king and his friends undoubtedly did expert. But the malcontents were not fatisfied wihh a fimple proeert; they pueferred their complaints to the emprefs of Rof
soland.

And op pofed ly the Ruffianc.
*Ner: An-
mual Kegi-

fia, who, ready on all occafions, and on the nightelt Fretence, to invade Poland, potred her armies into the republic, and furrounding the king and the diet with fcrocions foldiers, compelled them, by the mof furious and indecent menaces, to undo their glorious labour of love, and to reftore the conflitution as fettled after the pastition treaty.

Of the progrefs of the Ruflims in th is work of darknefs, our readers will be pleafed with the following manly and indignant narrative, taken fiom a periodical work * of acknowledged merit.
"It was on the 21 ft of April 1792, that the diet received the firft notification from the king, of the in.
 them that, without the thadow of pretence, this avow. ed enemy of the rights of mankind hat determined to invade the territory of the republic with an army of 60,000 men. This formidable banditti, comrnanded by generals Soltihow, Michelfon, and Kolakowiki, was afterwards to be fuppoited by a corps of 20,000 and by the troops then acting in Moldavia, amounting to 70,000. The king, however, profeffed that he was not dicouraged, and declared his readinefs to put himfell at the head of the national troops, and to terminate his cxiftence in a gionious conteft for the libertics of his country. Then, and not before, the diet decreed the organization of the army, and its augmentation to 100,000 . The king and the council of infection were invefted with unlimited authority in every thing that regarded the defunce of the kingdom. Magazines were ordered to be conftratted when it was too late, and quarters to be provided for the army.
14s rifes ta maintainits independence.
"The diet and the nation rofe as one man to maintain their independence. All private aninofities were obliterated, all private interefts were facrificed; the greatelt encouragements were held forth to volunteers

189 ふj天it ot flie nobi. lizy. to enroll themfelves under the mational ftandard, and it was umanmoufly decreed by the diet, that all private loffes fhould be compenfated out of the putlic treafury.
"On the 18 th of May, the Ruflian ambafiador delivered a declaration, which was worthy of fuch a caufe. It was a tillue of falfehood and lyppocrify. It alferted, that this wanton invafion, which was evidently againft the fente of almoft every individual Polander, was meant entirely for the good of the republic. It cenfured the precipitancy with which the new conftitution was adopted, and afcribed the ready confent of the diet to the influence of the Warfaw mob. It reprefented the conftitution as a violation of the principles on which the Polith republic was founded-complained of the licentioufnefs with which the facred name of the emprefs was weated in fome fpeeches of the members; and concluded by profeling, that on thefe accounts, and in behulf of the emigrant Poles, her imperial majelty had ordered her troups to enter the territories of the republic.
" At the moment this declaration was delivered to the dist, the RuThan troops, accompanied by counts POiocki, Rzewnki, Branicki, and a few Polifh apoftates, appeared upen the frontiers, and entered the territories of the republic in feveral columns, before the clofe of the mon:h. The fipirit manifefted by the nobility was truly honourable. Some of them delivered in their plate to the mint. Prince Radzvil engaged voluntarily to furnith 10,000 ftand of arms, and anothera train of artillery. The
courage of the new and haftily embodied foldiers corre. fponded with the patriotifm of their nobles. Prince Poniatowfi, neplew to the king, was appointed commander in chief; and though his force was greatly inferior to the enemy, it mult be confefed that he made a noble thand. On the $24^{\text {th }}$ of May, the enemy's Colfacks were repulied, and purfued by the patroles of the republic to the very entrenchments. On the 2Gth, about one o'clock, the piquets of the republic difeovered a large body of Don Coffacks approaching the outpofts : and a fquadron of cavalry, commanded by Lieutcnant K wal. niewiki, fupported by Lieutenant Golejowiki withtwo fquadrons more, in all about 300 , marched out in meet them. They attacked the Coffacks with fuccefs, but purfued them with more valour than prudence to the fide of a wood, where they found thentelves drawn into an ambufcade, and furrounded by 2000 horfe, two battalions of chafieurs, and fix pieces of camon. The intrepid Poles bravely fought their way through the Rullian line, and killed upwards of 200 of the enemy. The Poles in this engagement loft 100 men and two Dfficers; one of whom, Licutenant Iiwafnicwfi, was wounded and made prifoner. The remaiader of the detachment reached their quarters in fafety.
"Perlaps the hiftory of man can farcely furnifo an $\mathrm{Con}^{\mathrm{r}}$ ( P inftance of perfidy, meannefs, and duplicity, equal to the cour that which was manifefted by Pruffia on this occation. of lierli By the treaty of defenfive alliance, folemnly contracted between the republic of Poland and the king of Pruffia, and ratificd on the 23 d of April 1790, it is exprefsly ftipulated, "That the contracting parties fhall do all in their power to gurantee and preferve to each other reciprocally the whole of the territories which they refpectively pofiefs: That, in cafe of menace or invation from any foreign power, they thall afift each other with their avlole force, if neceffary:'-and by the fixth article, it is further fipulated, 'that if any fureign power whatever thall prefume to interfere in the internal affairs of Poland, his Pruffan majefty fhall confider this as a cafe falling within the meaning of the alliance, and fhall athit the republie according to the tenor of the fourth article," that is, with his whole force. What then is the pretext for abandoning this treaty? It is, that the emprefs of Rufia has bown a decided opinfition io ibe urder of things cflablifhed in Poland on the third of May 179i, and is provoked by Peland prefuning to put berfelf into a fonfure to difent it.- It is known, however, by the molt authentic documents, that nothing, was effected on the third of May 1791, to which Prufia had not previoully affented, and which fhe did not afterwards limetion; ard that Pruffia, according to the afiertion of her own king, did not intimate a firgle doubt refpecting the revolution till one month (and according to the Prufian minifter till fix months) after it had taken place ; in thort, to ufe the monarch's own words as fully explanatos y of his double politics, " not till the general traquillity of Europe perinitted him to explain him.felf."- Intead, thercfore, of affifting Poland, Prufia infultirgly recommended to Poland to retace her fteps; in which cafe, the faid that the would be ready to ctiempt un acommodation in loer favour. This attempt was never made, and probably never intended; for the emprefs purfued her meafures.

The duchy of Lithuania was the great fcene of action in the beginning of the war ; but the Rufians had made

## P O L

little progrefs before the middle of the momuth of June. On the roth of that month, General Judycki, who commanded a detachment of the Polith troops, between Mire and Swierznit, was attacked by the Rufians; but, alter a combat of foms hours, he obliged them in retire with the lofs of 500 man dead on the field. - The general was defirous of profiting by this advantage, by purfining the enemy, but was prevented by a molt violent fall of rain. On the ficceeding day, the Rullians rallied again to the attack; and it then too fatally apppeared, that the Poles were too young and undifciplined to contend with an inferior force againk experienced troops and able generals. By a matterly manceuvre, the Rulfians contrived to furround thoir antagoniRs, at a moment when the Polifh gencral fuppofed that he had obliged the encmy to retteat; and though the ficld was contefted with the utmolt valour by the tronps of the republic, they were at length compelled to give waty, and to retire towards Niefwiefy.

On the It th another engagement tobk place near Lubar on the banks of the river Slucz, between a dctachment of the Rufian grand army and a party of Polilh cavalry, difpatched by Prince Jofeph Poniatowfk i , to intercept the enemy. The patriotic bravery of the Poles was victorious in this contelt; but upon reconnoitering the force of the encmy, the prince found himfelf incapable of making a fuceefsful fland againtt fuch furerior numbers. He therefore gave orders to ftrike the camp at Lubar, and commenced a precipitate retreat. During their march, the Polifh rear was haralled by a body of 4000 Rufians, till arriving at Borufkowec, the wooden bridge unfortunately gave way, under the weight of the cavalry. The enemy, in the mean time, brought their artillery to play upon the rear o! the fugitives, who loft upwards of 250 men. The Polifh army next directed its courfe toward Zielime, where meeting, on the 17 th, with a reinforcement from Zaflow, it halted to give battle to the enemy. The Rullims were upwards of 17,000 ftrong, with 24 pieces of cannon, and the force of the republic much inferior. After a furious conteft from feven in the morning till five in the afternoon, the Ruflians were at length obliged to retreat, and leave the field of battle in pofficfion of the patriots. The Rufians were computed to have loft 4000 men in this engage ment, and the Polcs about 1100.
Notwithanding thefe exertions, the Folcs were obliged gradually to retire before their numerous and dif. ciplined enemies. Niefuez, Wilna, Mink, and feveral other places of lefs comequence, fell into their hands one after another. On a truce being propofed to the Ruffian general Kochowni, the propofal was baughtily rejected; while the defertion of vice brigadier Rudnicki and fome others, who preferred difhonour to perfonal danger, proclaimed a tottcring caufe The pro. grels of the armies of Catharine was marked with devaftation and cruelty, while, fuch was the averfion of the people both to the caurc and the manner of conducting it, that, as they approached, the country all around became a wildernefs, and fearcely a human being was to be feen.

In the mean time, a feries of little defeats, to which the inexperience of the commanders, and the intemperate valuur of new raifed tronps, appear to have greatly contributed, ferved at once to diltrefs and to difpirit
thefe defenders of thic country. Pimee Poniatowfi:
1'ohusd. continnad to retecat, and on the 1 -tho of July, his rear being attacked by a very fuperior force, it fuffered a contiderable lofs, though the thill and courage of Gcneral Kofeciufo cialled him to make a moll refpectabic defence. Con the 18th, a ofeneral engagement took phace between the tw, armies. 'The Ratian line extaded oppofite Dubienki, along the river Bog, as far as Opalia. 'The mincipal column, confitting of 14,000 men, was chicily direted againtt the divifinn of Gencral Kificiufko, which cunfited of 5000 men only. After a mut vigorous retildance, in which the Rulians loft upwards of 4000 mcn , and the troops of the republic only fome hundreds, the latter was compelled to give way before the fuperior numbers of the chemy, :ud to retire further into the eountry.

This uncqual conteft was at lail promaturely termi- The king nated. The hing, whofe bencwolent intentions were, properss ${ }^{*}$ perhaps, ovetpowered by his mental imbecillity, and fabmifinuo whofe age and infumities, probally, rendereit him unequal to the difficulties and dangers which muft attend a protrated war, inflead of putting himfelf, according to his firft refolvc, at the head of his army, determined, at once, to furrender at difcretion. On the 23 d of July, he fummoned a council of all the deputics at that moment in Warfaw. He laid beforc them the hatt difpatches from the emprefs, which infinted npon total and unreferved fubmifion. He pointel out the danger of a difmemberment of the repullic, fhould they delay to throw themfelves upon the clemency of the emprefs, and to intreat her protection. He mentioned the fatal union of Aufria and Pruffia with Ruffia; and the difgraceful fupinenefs manifefed by every othcr court in Europe.

Four citizens, the intrepid and patriotic Malachowfki, the princes Sapicha, Radzvil, and Soltan, vehemently protelled againt thefe dattardly proccedings; and the following evening a company of gentlemen from the different provinces affembled for the fame purpofe. The affembly waited immediately on thefe four difinguithed patriots, and returned them their acknowledgements for the fpirit and firmnefs with which they had refifted the ufurpations of defpotifm. The fubmifion of the king to the defigns of Ruffia was no fooncr made known, than Poland was bereft of all her beft and mont refpectable citizens. Malachowfli as marfhal of the diet, and Prince Sapieha grand marthal of Lithuania, entered ftrong protefs on the journals of the diet againtt thefe hoftile proreedings, and declared folemnly that the diet legally affembled in 1788 was not diffolved.
On the feennd of Augul a confederation was form- Confederaed at Warfaw, of which the grand apoftate, Potncki, tion at was chofen Marhaill. The aहts of this colifederation Warfaw were evidently the defpotic diftates of Ruffia, and were overawed calculated only to reflore the ancient abufes, and to refteresthe place the coustry under the aggravated oppreflion of a former foreign yokc.
conflithe
It is remarkable, that at the very moment when Po, t:on. land was furrendering its liberties io its defpotic invaders, the generous fympathy of Great Britain was evinced, by a liberal fubfription, fupported by all the moft relpectable eharaters in the nation, of every party and of every fect, for the purpole of affifting the king and the republic to manatan their independence. Thought

Poland.

154
The cm -prefsfeizes upon part of the Polinh territory,
the benevolent defign was fruftrated, the far remains on record as a noble tellimony of the ipirit of Eritons in the caufe of freedom, of the indignation which fills every liberal heart at the commifion of injuftice, and of the liberality with which they are difpofed to allitt thofe who fuffer from the oppreflion of tyrants.
Not fatisfied with reftoring the nld wretched conftitution, the emprefs of Rufiia feized upon part of the tertitnry which, at the laft partition, the and her coadjutors had left to the republic; and her ambalfidor entoring into thed dict with a crowd of al med ruffians, compelled the king and that affembly to grant the form of legality to her ufurpations. The nation, however, did not fubmit. General Kofiufko kept together a few retainers, whom he was foon enabled to augment to the number of an army; and feizing on the perfon of the king, he hes ever fuce waged againft Ruflia a war, of which, it mult be confeffed, the object is doubtiul. His enemies accufe him of cherifhing in the republic the principles of the Freach Jacobins; and fome late occcurrences give a countenance to the accufation. Yet it is known he protefted at firt that his aim reached no farther than to reftore the conflitution of 170 : and if public report may be credited, an inturreaion has lately taken place in Great Poland, or fouth Pruffia, in faveur of that conflitution. If other Polcs have been diven to idemocracy, they hate only, with the common weaknefs of human nature, fun from one extrems to anoher; and in flying from the tyranny of their invaders, hive fallen into the horrors of anurchy. That Koftiuf: w will fucceed againtt the powerful emfire of Ruflia, there is not the fmallett probability: and if there were, the court of Berlin, to complete its charater, has withdrawn from the molt honourable alliagce in which it was ever engaged, and feems to have employed the fubfidy which it received from Great Britain for the maintenance of that alliance, to co-operate with the emprefs in amihilating the kingdom and republic of Poland. What will be the ultimate fate of that unhappy country, aud its amiable fovereign, it is impolfible to fay; but appearances at prefent indicate a divifion of the whole territory among the three hoftile powers who formerly rebbed it of fome of its mof valuable provinces; and when that divifion is made, the virtucus Staniflaus may be removed to a better world by the dagger, by the bowl, by the gripe of a giant, or

Is 6 Air, climate, \&c. of Poland. by a red hot fpit!

The air of this kingdom is cold in the north, but temperate in the other parts both in fummer and winter, and the weather in both more fettied than in many other countries. 'Thic face of the country is for the moft part level, and the hills are but few. The Crapack or Carpathian mountains feparate it from Hungary on the fouth. The foil is very fruitful both in corn and pafturare, bemp and flax. Such is the luxumance of the paltures in Poidin, that it is faid one can hardly fee the cattle that are grazing in the mendows. Vaft yuantities of corn are yearly fent down the Vilula to Dantzic from all parts of Poland, and bought up chiefly by the Dutch. The eaftern part of the country is full of woods, forefte, lakes, marihes, and rivers; of the laft of which, the moft conliderable in Poland are, the Viltula, Nieper, Niefer, Duna, Bog, Warta, and Mem.l. The metals found in this country are iron and lead, with fome till, goll, and tilver; but
there are no mines of the two laft wrought at prefent. The other produas of Poland are moft forts of precions flones, ochre of all kiuds, fine rock-cryftil ; Mufcovy gldfs, talc, alum, faltpetre, amber, pitcoal, quick filver, ipar, fill gem, lapis calaminaris, and vituol. In Leffer Poland are falt-mines, which are the chief riches of the country, and bing molt money into the exchequer. In the weods, which confift moftly of oak, beech, pine, and nir-trees, befides the more common will beafts, arc clks, will afies, wild oxen or uri, lynxes, wild horfes, wild theep with one horn, kions, hyrnas, wild goats, and buffitoes. In the meadows and femny ground is gathered a kind of manna; and the kermes-berries produced in Briain are ufed both in dying and medicine.

The inhabitants confit of nobles, citizcns, and peafants. The firlt poffefs great privileges, which they enjoy partly by the indulgence of their kings, and partly by ancient cuftom and prefreption. Some of them have the title of prince, count, or lazon; but no fuperiority or pre-eminence on that account over the reit, which is only to be obtained by fone public poft or dignity. They have the power of life and death ove: their vaffals; pay no taxes; are fubject to none but the king; have a right to all mines and falt-works on their cfates; to all offices and employments, civil, military, and ecclefaftic ; cannot be cited or tried ont of the kingdom; may choote whom they will for their king, and lay him under what reftraints they pleafe by the Pafa Conventa; and none but they and the burgh. ers of fome particulas towns can purchafe lands. In flort, they are almof entirely independent, enjoying many other privileges and prerogatives befides thofe we have fpecified; but if they engage in trade, they forfeit their nobility.

The Polifh tongue is a dialect of the Sclavonic : (fee Laug Philology, $n^{\circ}$ 222.). It is neither cupious nor harmonious. Many of the words, as they are written, have not a fingle vowel in them; but the High Dutch and Latin are underfood and fpoken pretty commonly, haough incorrectly. The language in Lithuania differs much from that of the other provinces. True learning, and the fludy of the arts and fciences, have been little attended to in Poland, till of late they began to be regarded with a more favourable eye, and to be not only patronized, but cultivated by leveral of the nobles and others, both laymen and ecclefiaftics.

There are two archbifhops in the kingdom, viz. Arch thofe of Gnefna and Laopol, and about a dozen bi- flopr thops. The archbifhop of Gnefna is always a cardi- ic. nal, and primate of the kingdom. The prevailing religion is Popery, but there are great numbers of Lutherans, Calvinifts, and Greeks, who are called Diffrdents, and by the laws of the kingdom were intitled to toleraration; but were moch oppreffed till very latels. The Jews are indulged with great privileges, and are very numerons in Poland; and in Lithuania, it is faid there are a multitude of Mahometan Tartars. We may judge of the numbers of Jews in this country by the produce of their amual poll-tax, which amounts to near 57,000 rixdollars.

There are few or no manufictures in the kinfrdom ; Mani if we eacept fome linen and woollen clothes and hard- tures. wares; and the whole trade is conflied to the city of Dantzic, and other towns on the Viftul. or Baltic.

Before the prefent troubles the king's reventie was Reven

## POL

all clear to himfulf; for he paid no troops, not even his own guards; but all the forces, as well as the officers of llate, were paid by the republic. 'The public revenues arnfe chictly from the crown-lands, the falt-mines in the palatinate of Cracow, from the rents of MarienI urg, Dirhau, aud Regenhus, from the government of Cracow, and diffris of Niepolomicz, and from ancient tnlls and cuftoms, particularly thofe of Elbing and I Ant2ic. From what inurces thote revenues now arife, it is difficult to fay; but Pruflia has got polfefion of the molt lucrative cuftoms.

The order of the White Eagle was inflicuted by Atrgunus II. in the year 1705. Ite entign is a crofs of O.d enamelled with red, and appendant to a blue ribLon. The motto, Profuíe, rege, of lege.

The flanding forces of Polind are divided into the crewn-a: niy, and that of Lithuania, confiting of horfe and toot, and amounting to between 20,000 and 30,000 men. Theie troups are molty cantoned on the crown lands, and in Poland are paid by a capitation or poll-tax; but in Lithuania other taxes are levied for ti.is purpofe. Mott of the fnot are Germans. On any Ludden and imminent danger, the whole body of the nobility, with their valfats, are obliged to appear in the field on horleback; and the cities and towns furnifh a certain number of toot-foldiers, with carriages, and military fores: but for want of proper arms, provifurns, fubordination, and difcipline, and by being at liberty atter a few weeks to return home, this body has proved but of little advantage to the republic. Dantzic is the only place in the Polith dominions that deferves the name of a fortrefs, and it is now in the poffellion of Pruffia. Foreign auxiliaries are not to be brought into the kingdom, nor the national troops to march out of it , without the confent of the fates.

Such was the military eftablifhment of Poland before the partition treaty. What it has been fince, and is at prefent, we cannot poficively fay.

The Poles are perfonable men, and have good complexions. They are efeemed a brave, honett people, without difimulation, and exceedingly hofpitable. They clothe themfelves in furs in winter, and over all they throw a fhort cloak. No people keep giaader equipages than the gentry. They look upon themfelves as fo many fovereign princes; and have their guards, bands of mufic, and keep open houres: but the lower fort of jeople are poor abject wretches, in the loweff fate of ilavery: The exercifes of the gentry are hunting, riding, dancing, vaulting, \&c. They refide montly up. on their eftates in the country; and mairtain themfelves and familes by agriculture, breeding of bees, and grazing.

POLAK, in general, fomething relating to the poles of the world, or poles of the attificial globes.

PoLAK Regions, thofe parts of the world which lie near the noriliand fouth poles. See the article Pole.

POLARITY, the quality of a thing confidered as having poles, or a tendency to turn itfelf into one certain pofture; but chiefly ufed in fpeaking of thee maçnet.

POLE (Reginald), cardinal, and arclibifhop of Cantelbury, a younger fon of Sir Rielh. Pole, Lord Montague, was born at Stovert in cafte, in Staffordfhire, in the year 1500 . At feven years of age he was fent to a Carthufian monalleryat Shene, neat Richmond in Surry; ard thence, when he was abut 12 years old, removed

## P O L

to Magdalen college in Oxford, where, by the inftuctions of the celebrated Lineacre and Latimer, he made confiderable progrefs in learning. In 1515 he took the degree of bachelor of arts, and was admitted to deacon's orders fome time after: in 1517, he was made preberdary of Salifbury, and in 1519 dean of Wimborne and dean of Exeter. We are not furprized at this young noblem:n's carly preferments, when we conlider him as the kinfinan of Hemy V1II. and that he was bred to the church by the king's fipceial command.

Deing now about the age of 19 , he was fent, according to the faltion of the times, to finifh his fudies at Paduain Italy, where he refided fome time in yrest fplendor, having a handfome penfion from the King. He returned to England in 1525 , where he was moit graeioully received at court, and univerfally admired for his talents and addrefs; but preferting fudy and fequefration to the pleafures of a court, lie retired to the Carthufian convent at Shene, where he had contimued about two years, when the pious king began to divulge his foruples of confcience concerning his marriare with Catharine of Spain. Pole forefaw that this affair would necellarily involve him in difficulties; he therefore determined to quit the kingdom, and accordingly obtained leave to vilit Paris. Having thus avoised the form for the prefent, he returned once more to his convent at Shene; but his tranquillity was again interrupted by the king's refolution to fhake off th: pope's fupremacy, of which Pole's approbation was thought indifentably neceffary. How he managed in this atfair, is not very clear. However, he obtained iedve to revifit Italy, and his penfion was continued for fome time.

The ling, having now divoreed Queen Catharine, married A me Boylen, and being refolved to throw of the papal yoke, ordered Dr Richard Sampfon to write a book in jultification of his proceedings, which he fent to Pole for his opinion. To this Pole, fecure in the pope's protestion, wrote a feurrilous anfwer, entitled Pro Unitate Ecclefiafica, and fent it to the kins; who was fo offended with the contents, that he withdrew his penlion, Aripped him of all his preferments, and procured an an of attainder to be paffed againt him. In the mean time, Pole was created a cardinal, and fent nuncio to different parts of Europe. King Henry made fevcral attempts to have him fecured and brought to England, but without effect. At lengh the pope fixed him as legate at Viterbo, where he continued till the year $15+3$, when he was appointed legate at the council of Trent, and was afterwards employed by the pope as his chief counfellor.
Pope Paul III. dying in 1549, Pole was twice elected his fuccefor, and we are told, twice refufed the papal dignity: firf, becaule the clestion was made in too great hafte; and the fecond time, becaufe it was done in the night. This delicacy in a cardinal is truly wonderful: but the intrigues of the French party feem to have been the real caufe of his mifcarriage; they farted many. objestions to Pole, and by that means gained time to procure a majority again! him. Cardinal Maria de Monte obtained the triple crown; and Pole, having kiifed his flipper, retired to the convelit of Magazme near Verona, where he continued till the death of Euward VI. in the year 1553 . On the accefion of queen Mary, Pole was fent legate to England, where he was reccived by her majefty with great veneration, and con-

## POL

Cranmer being at that time prifoner in the tower. He immedia'cly appeared in the Hoafe of Lords, where he made a long fpeech; which being reported to the commons by their fpeaker, both thefe obfequious homes concurred in an hunible fupplication to be reconciled to the iee of Rome. They prefented it on their knees to her majefly, who interceded with the cardinal, and he gracioufly condefcended to give them abfolution. This bulinefs being over, the legate made his public entry into London, and immediately fet abour the extirpation of herefy. The day after the execution of Cranmer, which he is faid, though we believe falfely, to have ad. vilcd. he was confecrated archbithop of Canterbury. In the fame year, 1556, he was clected chancellor of the univerlity of Oxford, and foon after of Cambridge; both which he vifited, by his comniffioners. He died of a donble quartan ague in the year 155 s , about 16 hous after the death of the queen; and was buried in the cathedral of Canterbury.

As to his character, the Romifh writers afcribe to him every virtue undcr heaven: even Bilhop Burnet is extremely lavifh in lis praie, and attributes the cruelties of Mlary's reign to the advice of Gardiner. In this Mr Hume agrees with the bithop, and, reprefents lole as the advocate of tolcration. By every impartial account, he feems to have been a nan of mild manners, and of real worth, though undoubtedly a zealons member of the cl.urch of Rone.-He wrote, Pro unitate ccclyfiaftiea, De ejuflem poteffate, A 'T'reatife on Juftification, and vanious other tracts.

Mr Philips publifhed a very well written, though a very partial account, of Pole's life, to which Glocefter Ridley replied. This laft work, which is intitled a Reviecu of MIr Pbsilips's Life of Regiviald Pole, was publifhed in 1766 . It is a complete confutation of the former, and is a very learned and temperate vindication of the doctrines of the Reformation.

Pole, in aftronomy, that point in the heavens round which the whole fphere feems to turn. It is alfo ufed for a point direatly perpendicular to the centre of any circle's plane, and diftant from it by the length of a radius.

Pole, in geography, one of the points on which the terraqueous globe tuns ; each of them being 90 degrees diftant from the equator, and, in conferfuence of their fituation, the inclination of the earth's axis, and its parallelifn during the annual motion of our globe round the fun, having only one day and one night throughout the year.
It is remarkable that thongh the north in Hebrew, Greek, Latin, and French, derives its name from glonm, obfeurity, and darknefs, the poles enjoy mone light than any other part of the work. The ancients beheved the north to be covered with thick darknefs; Strabo, tells us, that Fiomer, by the word ospcs, which properly fignifies ol feurity or darknefs, meant the north; and thus Tïbullus, fpeaking of the north, fays,

## Illic et denfa tellus ab̄fonditur umbra.

Paneg. ad Mifel.
The Arabians call the northern ocean the dark fea; the Latins gave the name of Aquilo to the north wind, becaufe aquilus fignifies black; and the Frencla call it la bife, from bis "black." According to the ancients, the

Cimmerians lived in darknefs, becaufe they were placed near the not th. But all this is mere prejudice; for there are no places in the world that enjoy light longer than the arctic and antarctic poles; and this is accounted for by confidering the nature of twilight. In the torrid zone, and under the line, night immediately follows the fetting of the fun, without any fenfible twilight; whereas the twilight begins and continues increating in proportion as places are diftant from the equator or approach the pole. To this long twilight we muft add the aurora boreais, which appears in the northern regions, Greenland, \&ic. in clear nights, at the beginning of the new inoon, cafting a light equal to that of full moon. See Gafiendi ia the life of Pcyrefc, book iii. and La Perere in his Account of Greenlend. There is alfo long moonlight at the poles during winter. See Asrronomy, 373. But though there is really more light in the polar regions than clfewhere, yet owing to the obliquity with which the rays of the fun fall upon them, and the great length of winter night, the cold is fo inteufe, that thofe parts of the globe which lie near the poles have never been fully explored, though the attempt has been repeatedly made by the molt celebrated navigators. Indced their attemps have chiefly been confined to the northern regions; for with regard to the fouth pole, there is not the fame incitement to attempt it. The great cbject for which mavigators have ventured themelves in there frozen feas, was to find out a more quick and more ready paflage to the Eaf In. dies *; and this hath been attempted three feveral ways: - See one by coatting along the northern parts of Europe and p. 3! A fia, called the north-enft pafage; another, by failing col. round the northern part of the American continent, called the nortb-wefl paffase; and the third, by failing diresty over the pole itfelt.

We have already given a fhort account of feveral unfucceffful attempts which have been made from England to difcover the firt two of thefe. See NorthWeft Paffage, and North-Eaft Pafago. But before we proceed to the third, we fhall make a few further obfervations on them, and mention the attempts of fome other nations.
During the laft century, various navigators, Ditch- Atter men particularly attempted to find out the north-eafs to fin palfage, with great fortitude and perieverance. They always found it impofible, however, to furmount the obftacles which dature had thrown in the way. Sublequent attempts are thought by many to have demonftrated the impofibility of ever failing eaftward along the northern coaf of Afa; and this impofibility is accounted for by the increare of cold in proportion to the extent of land. See America, $n^{\circ} 3$-5. This is indeed the cafe in temperate climates; but much more fo in thofe frozen regions where the influence of the fun, even in furnmer, is but firall. Hence, as the continent of Afia extends a valt way from weft to eaft, and has befides the continent of Europe joined to it on the weft, it follows, that about the middle part of that trat of land the cold flould be greater than anywhere elfe. Experience has determined this to be fatt and it now appears, that about the middle part of the northem coaft of Alia he ice never thaws; neithcr have even the hardy Ruflans and Si'beriaus them!elves been able jurorth to overcome the diffculties they met with in that part coalt of their royage. In order to make this the mere plain Afia.
and the following accounts more intelligible, we fhall obferve, that from the north-wehlem extremity of Europe, called the Nor:b Cape, to the north-eaftern cxtremity of Afia, called the Promontory of the Tchuthki*, is a fipace including about 1 ro degrees of longitude, viz. eries from to to 200 eaft from Ferro: the phat of Archan, and gel lies in about 57 degrees calt longitude, Nova Zem. Dha between 70 and 95 ; which laft is alfo the fituation of the mouth of the great river Oby. Still father eaftward are the months of the rivers Jenifey in $100^{\circ}$; Piatida in $105^{\circ}$; Chatanga in $124^{\circ}$; Lena, which has many mouths, between $13 t^{\circ}$ and $142^{\circ}$; Indigirka in $162^{\circ}$; and the Kovyma in $175^{\circ}$. The coldeft place in all this trat, therefore, ought to be that between the mouths of the Jenifcy and the Chatanga; and indeed hete the unfurnountable difficulty has always been, as will appear from the following accounts of the voyages made by the Rulfials with a view to difoover the northe:ltp.afinge.

In $\mathrm{I}_{73} 4$, licutenant Morzovi.ff failed from Archangel towards the river Cby, but could fcarce advance 20 degrees of longitude during that feafon. The next funnmer he palfid throngh the ftraits of Weygatz into the fea of hara ; but did not double the promontory which. feparates the fea of Kara from the bay or mouth of Oby. In 173s, the lientenants Malgyin and Shurakoff doubled that promontory with great difficulty, and entered the bay of Oby. Several unfuccefsful attempts were made to paifs from the bay of Oby to the Jenifey; which was at laft effected, in 1738, by two velfels commanded by lieutenants Otzin and Kofkeleff. The fame year the pilot Feodor Menin failed eattward from the Ienifey to the mouth of the Pialida: bat here he was flopped by the ice ; and finding it impolible to force a pallige, he returned to the Jenifey.

In July 1735, lieutenant Pronthiftcheff failed down the river Lena, in order to paris by fea to the mouth of the Jenifey. The weftern nouths of the Lena were fo choased up with ice, that he was obliged to pafs thro' the moft caiterly one; and was prevented by contrary winds from getting out till the $1 \xi^{\text {th }}$ of Auguft. Having ftered northereft along the iflnonds which lie feattered before the mouths of the Lena, he found himfelf in lat. 70.4.; yet even here he faw pieces of ice from $2+$ to 60 feet in height, and in no place was there a free channel left of greater breadth than 100 or 200 yards. His veflel being much damaged, he entered the mouth of the Olenek, a fmall river near the weltern nouth of the Lena; and here he continued till the entuing feafon, when he got out in the beginning of Augult. But before he could reach the mouth of the Chutanga, he was fo entirely furrounded and hemmed in with ice, that it was with the utmoft difficulty he could get loofe. Obferving then a large field of ice fretched into the fea, he was obliged to fail up the Chatanga. Getting free once more, he procceded northward, doubled ule cape called Taimura, and reached the hay of that name, lying in about $15^{\circ}$ calt from Ferro; from thence he attenipted to proceed weftward along the coalf. Near the thore were feveral fmall inlands, between which and the thore the ice was immoveably fixed. He then directed his courfe towards the fea, in order to pafs round the chain of inands. At firlt he fiand the fica more free to the north of thefe iflands, but clferved mach ice lying between them. At laft he Vol. XV.
arrived at what he took to be the laft of the inanus, lying in lat. 77.25. Between this ifind and the frore, as well as on the other fide of the iflud whichloty nout to the north, the ice was firm and immovealbe. H: attempted, however, to flecr fill more to the nert!: ; and having advanced about fix miles, he was prevented by a thick $\log$ from procceding: Whis fog being dif. perfed, he fiw nothing crerywhere but ice, which at laft drove him ealtward, and with nuch danger and dif. ficulty he got to the mouth of the Olenck on the egth of Augnif.
Another attempt to pafs by fea from the Lemal to the of ChuriJeniley was made in 1739 by Chariton Lapticfi', but ton Lappwith no betier fuccefs than that juit mentioned. This tief. voyager relates, that between the rivers Pidtida and Traimura, a promontory frctches into the fea, which he could not double, the fea being entirely frozen up lefore he conld pafs round.
Befides the Rufinans, it is certain that fome Englifh Mr Core's and Dutch veffels have palfed the ifland of Nova Zem- obierva. bla into the fea of Kara : "But (fays Mr Coxe in his tiotio" Account of the Ruflian voyages) no veffiel of any n.ttion has ever paffed round that cape which extends of the north of the Jiatida, and is laid down in the Rufla, charts in about $7^{50}$ lat. We have already feen that no Rullian veffel has ever got from the Piatida to the Chatanga, or from the Chatanga to the liafidd; and yet fome authors have pofitively aflerted that this promontory has been failed roand. In order thercfore to elude the Rufian accounte, which clearly affert the contrary, it is pretended that Gmelin and Muller have purpofely concealed fome parts of the l゙uflian joursals, and have impofed ou the world by a mifreprefentation of facts. But without entering into any difpute upon this head, I can venture to affirm, that no fufficient proof lits been as yet advanced in fiupport of this allertion; and therefore, until fome pofitive information fhill b: pruduced, we camot deny plain faets, or give the prefio rence to hearfay evidenie over circumftantial and weil attefted accounts."

The other part of this north-eaft paffage, viz, from of the nathe Lena, to Kamfchatka, though fufficiently difficult vigation. and dangerous, is yet practicable; as having been once from the performed, if we may believe the accounts of the Ruf. I.en3 to iians. According to fome authors indeed, futs Mr Coxe, Kan. this navigation h.ts been open a century and an half; and feveral vellels at different times have pafied round the north caftern extremity of Afia. But if we confult the Ruflian accounts, we thall find that fiequent expeditions h.ive been unqueftionably made from the Lena to the Kovyma, but that the vosage from the Kovyma round Thchutikoi Nofs into the Eallern Ocean kas been performed but once. According to Mre Muller, this formidable cape was doubled in the year $6_{4}$ s. The material incidents of this remarkable voyage are as fullow.
"In IG48 feven kotches, or weffels fuitcl from the vo to mouth of the river Kovy nia, in order to penetrate into Dethninf, the Eaftern Ocean. Of thefe, four were never more Anstinheard of: the remaining three were commanded by Si . noff, \&o. mon Defhneff, Gerafim Ankudinoff, and Fedot Alexeeff. Delhneff and Ankudinoff quarrclled before their departure concerning the divifion of profits and honours to be aequired by their voyage; which, however, was not fo eatly accomplined as they had imagine l. Yet
tions from the ice, nor probably did he meet with any; for he takes norice that the fea is not every year fo frec from ice as it was at that time. The velfels failed from the Koryma on the zoth of June, and in September they reached the promontory of the Thfhutki, where Ankudinoff's veffel was wrecked, and the crew diftibuted among the other two. Soon after this the two veliels loft tight of each other, and never joined again. Defhneff was driven about by tempeftuous winds till Otober, when he was fhipwrecked confiderably to the fouth of the Amadyr. Having at latt reached that river, he formed a fcheme of returning loy the fame way that he had come; but never made the attempt. As for Alexeeff, after being alfo thipwrecked, he had died of the fcurvy, together with Ankudinoff; part of the crew were killed by the favarges, and a few efcaped to Kamfchatka, where they fettled."

- Sre

Cooke's
Difiove-
ries, $n^{\circ}$
95-100. eafern parts of $\Lambda$ fia, it appears, that it is pofibic to double the promontery of Trchuthi without any great difficulty : and it now appears, that the continents of Afia and America are feparated from one another but by a narrow frait, which is free from ice; but, to the northwards, that experienced navigator was evcruwhere fopped by ice in the month of Auguft, fo that he could neither trace the American continent farther than to the latitude of $70^{\circ}$, nor reach the mouth of the river Kovyma on the Afintic continent ; though it is probable that this might have been done at another time when the fituation of the ice was altered either by winds or currents.

On the whole, therefore, it appcars that the infurmountab'e obftacle in the north-eaft paffage lies between the rivers Piafida and Chatanga; and unlefs there be in that frace a connection between the Afiatic and American continents, there is not in any other part. Ice, however, is as cffcetual an obfruction as land: and though the woyage were to be made by accident for once, is never coald be efteemed a paffage calculated for the purpofes of trade, or any other beneficial purpofe whatever.

With regard to the north-weft paflage, the fame difor the worth weff ficulties occur as ia the other. Captain Cook's voyage phatue. las now aftured us, that if there is any ftrait which divides the continent of America into two, it muft lic in a higher latitude than $70^{\circ}$, and confequently he perpetuaty frozen up. If a north-welt paffage can be found then, it muft be by failing roand the whole American cemtinent, infend of feeking a paffage through it, which tome have fuppoled to exift in the botton of B:ffin's Buy, But the extent of the American continent to tie nothward is yet unknown; and there is a pofibiley of its being joined to that part of Afa between the 1rafod and Chatanga, wh:ch has never yet been circum1.avigated*. It remains thesefore to confider, whether there is any pofibility of attaining the wifhed for paffage by fuiling direaly north, between the callern and peftern continems.

Of the practicability of this mothod, the Honourable Daines Barnington is very confident, as aprears by feveral traats which he publifhed in the years 5775 and 3706 , in ecnfequerce of the unfinceffful aticmpts made by Captain Mhips, now Lora Mulyrave. Sce Nozarlafl Pefige, d. 1és. col. I. top of the page - In there have reached very high northern latitudes; nay, fome who have been at the pole itfelf, or gone beyond it. Thefe inflances are, 1. One Captain Thomas Rubertfon alfured our author, that he had been in latitude $82 \%$, that the fea was open, and he was certain that he could lave reached the latitude of $83^{\circ}$ - -2 . From the teltimony of Captain Cheyne, who gave anfwers to certain queries drawn up by Mr Dalrymple concerning the polar feas, it appears that he had been in the latitude of $82^{\circ}-3$. One Mr Watt informed our author, that when he was 17 years of age, at that time making his firit vogage with Captain M.Callarn, a bold and fikiful navigator, who cominanded a Scotch whale-filhing fhip, as during the time that the whales are fuppofed to copulate no filhing can be carried on, the captain refolved to employ that interval in attempting to reach the north pole. He accordingly proceeded without the leat obfruction to $83 \frac{1}{2}$, when the fea was not only open to the northward, but they had feen no ice for the laft three degrees; but while he fill advanced, the mate complained that the compafs was not leady, and the captain was obliged with relutance to give over his attempi.-4. Dr Campbell, the continuator of Harris's voyages, informed Mr Barrington, that Dr Dallic, a native of Holland, being in his youth aboard a Dutcls fhip of war which at that time was ufually fent to finperintend the Greenland fifhery, the captain determined, like the Scotchman abovementioned, to make an attempt to reach the pole during the interval between the firit and fecond fifheries. Hie penetrated, according to the beft of Dr Campbell's recollecton, as far as $\$ 8^{\circ}$; when the weather was warm, the fea free from ice, and rolling like the bay of Bifcay. Dallic now preffed the captain to proceed: but he anfivered, that he had aiready gone too fur, and fhould be blamed in Holland for neglecting bis fation; upon which account he would fuffer no journal to be kept, but returned as foon as poffible to Sp:tforgen.-5. In the year $1662-3, \mathrm{Mr}$ Oldenburg, then fecretary of the Royal Society, was ordered to regifter a paper, entitled "Several inquiries concerning Greenland, anfweredby Mr Gray, who had vifited thefe parts." The 19th of thefe queries is the following: How near hati any one been known to approach the pole:- The anfwer is, "I once met upon the coalf of Greenland a Hollander that fwore he had been half a degree from the pole, thowing me his journal, which was alfo attefted by lis mate; where they had feen no ice or land, but all water."-6. In Captain Wood's account of a voyage in queft of the north-eat pallise, we have the following accuunt of a Dutch thip which reached the latitude of $89^{\circ}$. "Captain Goulden, who had made above 30 voyages to Greenland, did relate to his majelly, that being at Greenland fome 20 years before, he was in company witi two Hollanders to the eaftward of Edge's ifland ; :und that the whales not appearing on the flore, the Hollanders were determined to go farther northward ; and in a fortnight's time returned, and gave it out that they had failed into the latitude $80^{\circ}$, and that they did not meet with any ice, but a free and open fea, and that there run a very hollow grocusi feal like that of the Bay of Difcay. Mr Goulden being not fatisfied with the bare rclation, they produced lim four journals out of the two thips, which teftified the fame, and that they all agreed within fous minutes."
minutcs."-7. In the Philoforlical Tranfations for 1675 we linve the following palitge: "For it is well known to all that dal mothward, that mott of the northern coatts are frowen up for many learues, thongh in the open lea it is not for, roo aor ander the pole isfolj, unlel's by accident." In which partage the having reached the pole is alluded to as a hinown fact, and as fith feated to the Royal Society.-3. Mr Miller, in his Gardener's Jiftionary, mentions the voyage of one Captain Johnfon, who teathed is degress of latitude. Mr Barrington was at pans to find a full account of this voyage; but met only with the following paliage in Buffon's Natural Hiftory, which he tales to be a confmmation of it. " I have been affured by perfons of credit, that an Inglill captain, whofe name was Monfon, infead of deaking a palage to China between the northern countries, had direlted his courfe to the pole, and had approached it within two degrees, where there was an open fon, without any ice." Here he thinks that Mr Juffon has mittaken Johnfon for Monfon.-9. A map of the northern hemifphere, publifhed at Berlin (under the direction of the Academy of Sciences and Delles Lettres), places a thip at the pole, as having arrived there according to the Dutch accounts.-Io. Moxon, lhydrographer to Charles II. gives an account of a Dutch hip laving been two degrees beyond the pole, which was much telied on by Wood. This velel found the weather as warm there as at Amfterdam.

Befides thefe, there are a great number of other teftimonies of thips winch have reached the lit. of $8 \mathrm{i}, 82$, $\mathrm{S}_{3}, \mathrm{~S}_{4}$ (4), \&ec.; from all which our author concludes, that if the voyage is attempted at a proper time of the year, there would not be any great dificulty of reaching the pole. Thofe vatt pieces of ice which commonly obitruct the navigators, he thinks, proceed from the mouths of the great Aliatic rivers which run northward into the frozen ocean, and are driven eantward and wefward by the currents. But though we Mould fuppore them to conte direetly from the pole, ftill our author thanks that this affords an undeniable proof that the pole itfelf is free from ice; becaufe, when the pieces leave it, and come to the fonthward, it is imponible that they can at the fame time accumulate at the polc.

The exteme cold of the winter ais on the continerts wh A fia and Americ: lats aforded ronm for fufpicion, that the pole itfelf, an! for fererel degrees whe why we fouthward of it, the far niult be frezen to a valt depth catint fupin one folid cake of ice; but this Mr. Dartington refutes pect the from feveral confutcrations. in the firlt piace, he fars, fonill that on fuch a fuppofition, boy the conemat imenfity rome tul be of the cold, and the accumulation of finsw and irozea i.oan. vapour, this cake of ice mult have been increafing in thicknefs fince the creation, or at leafe fince the deluze ; fo that now it muft bee equal in height to the lighere't mountains in the world, and be vifible at a great diftance. Befides, the pieces broken off from the lides of fuch an immenfe momtain mull be much thicker than any ice that is met with in the northen ocean; nonc of which is above two yards in height above the furface of the who ter, thofe immenfe pieces called $i, c$-mountaius being :ilways formed on land.

Again, the fytem of nature is fo formed, that all narts of the earth are expofed for the fame length of time, or nearly fo, throughout the jear to the rays of the fun. But, by reafon of the fpheroidal figure of the terraque. ous alobe, the poles and polar regions enjoy the tun fomewhat longer than others; and hence the Dutch who wintered in Nova Zembla in $1 G_{i} 2$ faw the din: $:$ fortnight fooner than they ought to have done by alfronomical calculations. Dy reafon of this flatnefs about the poles, too, the fun not only fhines for a greater fpace of time on thefe inhofpitable regions, but with lefs obliquity in the fummer-time, and hence the effer of his rays mult be the greater. Now Mr Barrington confiders it is an abfurd fuppofition, that this glorious luminary flould fhine for fix months on a ca'ie of barren ice where there is neither :nnimal nor vegetable. He fays that the polar feas are alligned by nature as the habitation of the whales, the largelt animals in the creation; but if the greatelt part of the polar feas are for ever covered with an impenetrable cake of ice, thefe huge animals will be coufined within very narrow bounds; for they can:ont fubfilt without frequently coming to the tup of the water to breathe.
